(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

**PILE AND WHARF SUPPORTING STRUCTURE.**—No. 772,160. Oct. 11, 1904. H. C. Holmes, San Francisco, Cal.; one-half assigned to Carl Uhlig of same place. This invention is designed more particularly to be used where more or less hard ground or solid bottom can be found and in which it is not necessary to use a cluster of piles, but in which is used a single pile driven into the bottom, and the surrounding inclosing casing with the filling of concrete and metal bond will answer the purpose required. It consists of various parts of construction adapted to bring about the desired result.

**DRAIN TRAP.**—No. 772,091. Oct. 11, 1904. A. W. Edwards, Sacramento, Cal. This invention relates to an improved trap for use in catch basins, slop hoppers and the like, or wherever the back flow of sewer gas is to be guarded against. Its object is to provide a simple effective trap which may be readily applied to present sewerage systems and which will permit of easy access to the pipe or sewer leading from the hopper or catch basin. The improvement resides especially in the formation of a combined hinged gravity-actuated inclosure and water seal in connection with the catch basin or other reservoir and its outlet.

**CENTER FIRE BALANCE ENGINES.**—No. 772,109. Oct. 11, 1904. R. A. Morton, San Jose, Cal. This invention relates to improvements in engines of the type employing opposed pistons operated simultaneously in a single cylinder through the expansive force of a propelling medium introduced between the pistons. Its object is to provide a motor suitable for use in automobiles, launches, yachts and the like which shall be simple in construction and operation of high efficiency, practically noiseless and free from all vibration.

**ELECTRIC CLOCK.**—No. 772,002. Oct. 11, 1904. T. A. Schluter, Oakland, Cal. This invention relates to devices for operating a clock or clocks which may be hung in such places as to be readily seen and where it would be difficult to reach to wind or set. The object of the invention is to provide a means for actuating a clock mechanism and the escapement thereof by means of weights mounted upon a fulcrum lever and so counterbalanced that one is sufficiently heavier than the other to actuate the escapement and to use the momentum of the two weights to give a greater radius of action.

## New Patents.

**DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY**, 380 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING OCTOBER 11, 1904.

772,018.—PRESERVING FRUITS—E. N. Alexandrian, Fresno, Cal.  
771,855.—RETORT—G. W. Arper, Oakland, Cal.  
772,324.—FORCEPS—N. D. Asdell, S. F.  
772,270.—VEHICLE—H. Beckwith, Oakland, Cal.  
771,856.—IRONING BOARD—W. O. Bowman, Oakland, Cal.  
772,273.—MASK—A. Braverman, Fresno, Cal.  
771,970.—OIL BURNER—L. E. Coleman, Santa Ana, Cal.  
771,814.—HASP LOCK—J. Davy, Oakland, Cal.  
772,091.—DRAIN TRAP—A. W. Edwards, Sacramento, Cal.  
772,223.—VINE CUTTER—F. M. Ewell, Egypt, Wash.  
772,230.—STRAINING MACHINE—F. J. Farner, Seattle, Wash.  
771,979.—CUSPIDOR CARRIER—C. H. Gunn, Stockton, Cal.  
772,036.—ACCOUNT BOOK—C. L. Haggard, Seattle, Wash.  
772,313.—ELECTRIC CONTROLLER—A. W. Harrison, Los Angeles, Cal.  
772,097.—BEEF TOPPER—G. L. Hayes, Roseburg, Or.  
771,981.—OIL BURNER—T. W. Hill, Los Angeles, Cal.  
772,098.—SCREEN—E. Hipolito, Los Angeles, Cal.  
772,100.—PILE AND WHARF SUPPORT—H. C. Holmes, S. F.  
772,043.—BORING APPARATUS—C. Kleinschmidt, Seattle, Wash.  
772,157.—RATCHET LEVER—H. W. Kochler, Oswego, Or.  
772,045.—OIL BURNER—H. Luckenbach, S. F.  
772,047.—HOISTING MECHANISM—G. W. Menefee, Berkeley, Cal.  
772,109.—CENTER FIRE BALANCE ENGINE—R. A. Morton, San Jose, Cal.  
772,173.—MUSIC LEAF TURNER—O'Neil & Edwards, Lafayette, Or.  
771,997.—LATHES—A. Palm, Ventura, Cal.  
771,999.—WATERPROOF FEATHERS—C. A. Potter, S. F.  
772,254.—CLAMP—J. C. Reckweg, Los Angeles, Cal.  
772,049.—DOOR OPENER—G. Rischmuller, S. F.  
772,003.—ELECTRIC CLOCK—T. A. Schluter, Oakland, Cal.  
771,866.—GAME APPLIANCE—F. H. Smith, S. F.  
771,948.—BUGGY TOP—G. H. Taylor, Goldendale, Wash.  
771,857.—CRUSHING ROLLS—J. A. Thomas, Los Angeles, Cal.  
771,949.—CRUSHING ROLLS—J. A. Thomas, Los Angeles, Cal.  
772,072.—SNATCH BLOCK—A. Uren, Seattle, Wash.  
772,303.—FEED WATER REGULATOR—T. M. Wilkins, Seattle, Wash.  
37,185.—DESIGN FOR PORTIERE—M. M. Harding, Monrovia, Cal.

## SITUATIONS WANTED.

**A FOREMANSHIP OR SUPERINTENDENCY.** Twelve years' experience, practical mining. Possesses technical knowledge necessary for economical ore extraction. Address Edward W. Ralph, 602 W. Broadway, Butte, Montana.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 380 Market St., S. F.

**MINE SUPERINTENDENT WANTS POSITION.** Capable miner, mill man, cyanide man and assayer. Address R. P., this office.

**MINING COMPANIES AND MINING ENGINEERS** installing steel cyanide tanks and desiring a first-class boiler maker familiar with class of work to do the erecting and riveting for them, address Box 25, this office. Best of references.

**POSITION DESIRED BY AN ELECTRICAL** and Gas Engineer; technical graduate; three years' experience in electrical work, eight years' experience in the operation of gas engines; will accept position in either line, but prefer to combine the two. Address R. W. Shoemaker, 613 E. Sixth St., Los Angeles, Cal.

**POSITION WANTED BY COMPETENT MILL** Man, Assayer, Analyst. Practical and technical education. References. Address J. R., this office.

**PRACTICAL PROSPECTOR AND PROSPECT** Examiner. Have your work done by me and you will know where and when to invest your money. Address A. J. Davis, Pine Flat, Sonoma Co., Cal.

**TWO EXPERIENCED YOUNG MEN PROSPECTORS** wish to be grubstaked to go to Mexico, where they know of properties that should be investigated. Best references. Address Box 42, care of this office.

**WANTED—POSITION AS SUPERINTENDENT** or assistant supt by a practical man; first-class chemist and assayer. Specialty: Reduction work, milling and smelting. Address X, this office.

**YOUNG MAN, TECHNICALLY EDUCATED,** who has had over two years practical experience, desires position with mining company or engineer. Good references. Address H. C., care of this office.

**THE ENGINEERING AGENCY, CHICAGO,** furnishes free to reliable employers information leading to employment of Mining Engineers, Draftsmen, Mine or Mill Superintendents, Assayers, Chemists, Cyanide Men, Electroplaters, etc. In successful operation eleven years. Let us know your need and competent, high-grade men whose complete professional and personal records have been thoroughly investigated will be referred to you at once.

## HELP WANTED.

**COMPETENT APPLICANTS FOR ANY ENGINEERING** positions furnished to employers without charge. Experienced men wanting such positions should write for terms. Cleveland Engineering Agency, Rose Building, Cleveland, O.

# MINING AND SCIENTIFIC PRESS

Whole No. 2310.—VOLUME LXXXIX.  
Number 18.

SAN FRANCISCO, CAL., SATURDAY, OCTOBER 29, 1904.

THREE DOLLARS PER ANNUM.  
Single Copies, Ten Cents.

The Mexican Patio. (See Page 239.)

## True - Fissure Veins and Zones of Mineralization.

An important question which arises in connection with the exploitation of every mineral vein which descends into the earth is, to what depth will the vein pay? It is generally assumed that superficial deposits, and those veins and deposits which approach the horizontal in position, will offer no material change in mineralogical or physical character which will radically influence the commercial side of the proposition, and that these factors will remain practically constant, but in the case of deposits and veins which descend to great depths it is different. There is no prejudice in favor of fissure veins, as compared with all other types of mineral deposit, but that such bias is warranted by the known characteristics of the simple or so-called "true-fissure" vein is not apparent. An investigation of the facts leads to the conclusion that the simple fissure vein is no more reliable and no more productive of great values and profits than many other forms of mineral veins and deposits. Fissure veins are often traceable along the surface for great distances—many thousands of feet, and in some instances for several miles—but deep mining has not proven that fissures of this character can be depended upon to go to a depth in any degree approximating their length.

Another important feature of fissure veins in great depth is their tendency to split up into several veins or to form zones of mineralization which can no longer be considered as simple fissures. The greatest mineral deposits and veins are not simple fissures, but broad zones of mineralization, due to the crushing, shearing and alteration of rocks subjected to severe compressive stresses and their subsequent mineralization by infiltration of mineral solutions, which deposit their contents in the interstitial spaces and often substitute mineral atoms for those of the original rock mass. These broad zones of mineralization often have illy-defined walls, or, at least, but one wall, and where two distinct walls do occur a considerable distance apart, investigation usually discovers sufficient evidence to warrant the belief that these walls represent but two of a possibly great number or series of parallel fissures within the zone of fracture and movement. Often these interior fissures result in giving the vein a banded appearance, which in some cases has been mistaken for a successive series of depositions upon the walls of an open fissure or crevice—a condition improbable, if not physically impossible, upon a large scale.

The occurrence of masses of barren rock in large ore deposits of the character here referred to has often been accounted for on the assumption that these masses have fallen into the fissure from the hanging wall, and in the case of simple fissure veins the appearance of a "horse" in the vein has frequently been ascribed to a similar cause. In the first instance, masses of barren rock occurring in a broad zone of mineral undoubtedly represent masses of the original rock which have, to a great extent, escaped the crushing due to the pressure and movement which has fissured and crushed the surrounding mass, and being thus practically unaltered is consequently better able to resist the decomposing influences of the mineral solutions, and remains as a barren mass of the original rock. In the second case the fissure has simply divided and the movement of the walls has crushed the rocks along its course, and subsequently the minerals have been deposited in the zone of crushing, or in part in an open fissure, leaving the inclusion of barren wall rock as a "horse" in the vein, surrounded by mineral.

The type of vein formation known as "comb structure," often illustrated in text books, is of comparatively rare occurrence and of limited extent—sometimes existing as a series of lenses, pinching and swelling and indicating clearly the extreme rarity of the very extensive open fissure.

The conditions under which ore deposition has occurred and the subsequent alteration of the original deposit resulting in the impoverishment of one portion and the enrichment of another, are being studied more thoroughly than ever before, and the theories of ore genesis are undergoing many radical changes, with a decided tendency toward a more rational solution of the various problems presented. Thus far the deepest and most profitable mines are

not opened on simple fissure veins, but on beds of conglomerate or other fragmental rock, and on broad zones of mineralization which presents no suggestion of the simple "true-fissure" vein.

Mining is a thoroughly practical business and is not usually carried on to demonstrate scientific theories, but incidentally the study of vein formation, as exposed in mine working, is both interesting and necessary to the greatest success, and speculation and investigation as to the probable genesis of the vein or deposit is of interest. In this connection, what may be expected of veins at depth exceeding 5000 feet is becoming a matter of importance, as there are numerous mines approaching this depth on the vein in several of the mining districts of the United States.

## Mining in the Stock Market.

Stock speculation in mining shares is one of the marked features of the mining industry. In some instances it is, in fact, almost the only feature. When the stock of any mine alternately rapidly rises and falls in price in the open market it is almost always noticeable that that mine is not a producer which steadily turns out a stated monthly output, but that the property is in the development stage, or is erratic in its monthly production. "Rich strikes" and "no ore" are frequently mentioned in connection with such a property. The announcement of a new strike is immediately noticeable on the market, while the statement that a dividend is to be passed, no matter for what purpose, or that the vein has "petered," as quickly causes the high price of shares to tumble like a house of cards. A curious and oft repeated feature of the stock market in connection with the mines of the Comstock lode at Virginia City, Nev., is that stocks will bound upward under reports of new strikes and a demand for shares, and often the market prices are far above the value of the property, but immediately upon the payment of dividends, when higher prices would naturally be expected, the stock drops at once in price, carrying everything along the line downward with it in sympathy. A mine which month after month, "year in and year out," steadily runs and declares its dividend seldom shows rapid fluctuations of stock prices. That particular property comes to be recognized as a substantial industry, more sure in its results than any manufacturing concern, or other commercial enterprise, and is not suitable as a speculative investment, but one to hold. Without doubt the assessments paid in by the public on mining stocks makes possible many undertakings which private owners would not give consideration. Often they are of a speculative nature and far from certain in their outcome, but the investing public is willing to take the risk for the possibilities involved. Not infrequently these speculative ventures have a fortunate outcome, and in these instances the wisdom of the risk taken remains unquestioned, but more often the result is less satisfactory, but the public, always optimistic, is willing to venture again. In these speculative stocks but little is required to send prices upward. If one mine in a camp makes a rich strike all the others in camp are more or less directly affected. The speculators are not looking for, nor even expecting dividends—they are waiting for a chance to unload at an advance. It is such investors as these that keep many enterprises alive, which, were their support withdrawn, must quickly die and be forgotten.

THE farmers and stock raisers in the valleys of the Rio Grande, Arkansas and Las Animas rivers in Colorado are complaining that they are losing stock due to poisonous waters and salts on the flats and in the streams and are seeking State aid to abate this alleged condition. As usual in such cases, the matter is greatly magnified and many absurd theories are advanced and statements made which are not entitled to credence. Among the latter is the statement that the slimes from the quartz mills cover fish eggs and kill them. Mining is the principal industry in the State of Colorado, and if mining were to cease in that State the small farmers of the mountain valleys would find life without object or success, as everything depends upon the mines. An investigation may be made, but the report will without doubt show that the damage, if any really exists, is relatively so small as to be unworthy of legislative attention.

HEROIC measures were promptly adopted at the Baisley-Elkhorn mine, near Baker City, Oregon, a few days since when a neighboring creek was turned into the mine workings. It is not always convenient to extinguish a mine fire by turning a river into the workings; but without doubt, this method of fighting fire is superior to steam or the pouring of large volumes of carbon dioxide into the mine. It is true that the damage from water would be much greater than where steam or gas is employed as the extinguisher, but the water is direct and effective, although its cost may be somewhat greater. At the time of a fire in the Utica-Stickles mine, at Angels, Cal., several years ago, 1800 cubic feet of water per minute were turned into the workings for ninety hours, when it was thought the fire had been extinguished. It then required constant bailing and pumping with the regular skips and pumps and several extras for eight weeks to remove the water poured into the mine and that which had accumulated. It was an expensive experiment, but it worked perfectly and quickly extinguished the fire which occurred in a stope several hundred feet above the bottom levels of the mine.

LATE letters received from the Stewart peninsula of Alaska state that as the winter will interfere with placer mining many of those who remain in the country will devote their attention to prospecting and developing the tin-bearing veins of the Cape York and Ear Mountain regions. The tin placers have thus far been somewhat disappointing, so it is said, but the veins promise not only greater permanency but a better reward for capital invested.

## CONCENTRATES.

THE disc, bar and jib machines are among the devices used in electrical coal cutting in Great Britain, the former being of most marked economy in use.

BUT sixty-three days remain to do the necessary assessment work on an unpatented mining location to hold it for 1904. This applies to any such location made since January 1, 1903.

IN product assays, should particles of zinc be observed floating on the surface of the molten lead and giving off fumes of zinc oxides, the assay should be discarded for the results would be too low.

THE coil spring can be thus straightened: Heat it to a dull cherry red; place it on a rod or bolt in the hardy of an anvil, and, taking hold of one end with a blacksmith's tongs, pull it out straight.

THE muffled furnace works on the ventilated principle. Some operators claim that it gives more rapid work than a closed muffle. The results in either case will correspond when the work is accurate.

DIRECTOR OF THE MINT ROBERTS estimates the output for the year 1903 for Colorado to have been \$22,540,100 gold and \$7,014,078 silver, figured at commercial value. Official returns are not yet complete.

THE safe speed for flywheels is generally calculated to be about 5000 feet peripheral velocity per minute. If greatly exceeding this, unless the flywheel be wire bound, there is a constant element of danger.

THE consulting engineer mentioned is deemed competent. A \$500 fee in such a case would be economy. It might save twenty times that amount in unwise expense occasioned by lack of expert and specific information.

TO CALCULATE the weight of the round mine timbers of yellow pine, the dimensions being in feet, multiply thirty-eight times the length by one-quarter of the product of the mean girth and the diameter. The product will be the weight in pounds.

THE lines of a junior location may be laid across a senior location for the purpose of defining extralateral rights of the junior location, and the lines may be so laid across any unpatented public land, and, it is believed, also across patented land, if done peaceably and openly.

THE steam turbine presents the possibility of using highly superheated steam, uniform rotation and high speed. No lubrication is required in the steam chambers; hence the steam itself is not contaminated with oil, but can be condensed and pumped back into the boilers without purification.

THE amount of lime to be added to a ton of pulp in the cyanide process must be determined by experiment. The fact that at the Dakota mill at Deadwood, S. D., six pounds per ton is required is not a safe index for a charge of ore elsewhere, as more or less may be necessary to have the desired effect.

FOR line shafting, where the speed is not over 400 revolutions per minute, an alloy of eight parts zinc and two parts block tin will wear longer than the babbitt now being used. It will also resist the force of a heavy load. The tin counteracts the shrinkage, so that the metal will adhere to the box if it is not overheated.

THE most important tungsten minerals are wolframite, hubnerite and scheelite. The test for tungsten is to boil the finely powdered mineral with a mixture of four parts hydrochloric acid and one part nitric acid for two hours in a porcelain dish, when, if the ore contains tungsten, yellow spots of tungsten-trioxide will show.

THE amount of annual assessment work to be performed on the unpatented mining claim is determined by the cost of labor in the camp or district where the claim is located. Ten feet of work is sufficient if it is actually worth \$10 per foot to break and remove the rock. In many cases it can be done for one-half or even one-fourth of this amount.

ZIRCON ( $ZrSiO_4$ ) is found in commercial quantities in the United States in but one locality thus far—Zirconia, Henderson county, N. C., where it occurs in a pegmatite dike. Besides the use made of the transparent varieties for gems, the oxide of zirconium is extracted and used with yttrium oxide in the manufacture of the glowler for the Nernst electric lamp.

CHALCOPYRITE of the purest kind is a mixture of copper sulphide and iron sulphide. Often the ore appears to consist of a single mineral (copper sulphide), with no impurities; but under the microscope the iron sulphide is always easily discernible as a mechanical and not a chemical admixture. Quartz in fine grains is also disseminated throughout the ore in particles invisible to the unaided eye. It is due to these foreign admixtures that chalcopyrite has a greatly varying value. The

highest copper content in chalcopyrite recognized by Dana is 34.5%.

WHEN blasting fuse does not burn regularly, or is found improperly wound, it should be returned to the manufacturer. On nothing does the safety of miners depend to so great an extent as upon the quality of the fuse. No attempt should be made to improve it by wrapping it with tape, greasing it or otherwise fixing it. It should be refused if not perfect.

COPPER ORE occurs frequently in quartz porphyry, but it also occurs abundantly in other rocks, notably in limestone and in amphibolite schist, mica schist, granite and in many other kinds of rock. It is a mistake to search for a mine in a certain kind of rock, and with a prejudice against other kinds, for in this way valuable mineral deposits may be overlooked.

A STAMP BATTERY which has large crushing capacity by reason of coarse screens, low discharge, and other devices employed to facilitate crushing capacity is rarely a good inside amalgamator. Lower capacity due to higher discharge is more in keeping with the idea of inside amalgamation, but where it can be successfully accomplished outside amalgamation is advisable.

IN the assay of cyanide solutions zinc dust has the advantage of being more easily measured and somewhat quicker in action. Where zinc shavings are used, five or six grams are to be added for every ten assay tons of solution operated on, thus producing as much zinc sulphate. The stated quantity of zinc shavings may be added a gram at a time at about two-minute intervals.

THE slag from the 50-ton crucible smelter is hardly sufficient to make its money value of daily importance. The resultant slag from so small a plant can better be reduced every four or five months in a lead bath when enough has accumulated to warrant such operation. At the San Jose de Gracia plant, Sinaloa, Mexico, such operation is performed in an ordinary Mexican vaso.

A CONCRETE FLOOR in front of the mortars and beneath the open plates of a quartz mill is superior to any sort of wood floor. It should have a slope away from the battery and end in a trough-like depression, also having a small grade, to a collecting basin or launder, that all sweepings, which usually contain small amounts of mercury and amalgam, may be saved for treatment.

MINING CLAIMS owned by two or more co-partners may be partitioned into segregated parcels, if the co-owners can agree upon what is considered an equitable division of the property; but generally, owing to the unequal distribution of ore in the veins or deposits, both in quantity and quality, such agreement can not be reached, and the only satisfactory way to then divide the property is by sale and division of the proceeds.

THE residue (essentially iron oxide) from the roasting of pyritic ores might be used for the manufacture of iron or steel if the sulphur were driven off (a "dead roast" obtained). But there usually remains a considerable percentage of sulphur after treatment in the chemical works. Sulphur is detrimental to steel. It is stated that at certain works in Spain the residue from the manufacture of sulphuric acid is used for making steel.

THE rate of progress in shaft sinking cannot be anticipated unless a shaft has been sunk in the vicinity and the rate of sinking observed. Many shafts do not exceed a rate of 2 feet per day owing to hardness of the ground and amount of water to be handled. On the Rand, in South Africa, an average of over 7 feet daily has been maintained in several shafts for months. Three feet is a good average rate of sinking under fair conditions.

THE capacity of screens and trommels is dependent upon the length of screen, the mesh, the square feet of surface, its inclination, the kind of material to be screened and the presence or absence of various devices for jarring or cleaning the screens. The capacity per twenty-four hours of a 6-foot, 30-mesh trommel with two hammers, 38 square feet of surface, 24 inches diameter, an inclination of 1 in 7½, is eight tons; 30 inches diameter and 47 square feet is ten tons.

THE use of pyrite as a substitute for sulphur, particularly in the manufacture of sulphuric acid, is increasing, due largely to the rise in prices of Sicilian sulphur. The world's principal supply of native sulphur is from Sicily, of which production the United States is the largest consumer. Deposits of sulphur are known in the United States—in Louisiana, Texas, Arizona, Nevada, California, Utah, Idaho, Oregon and Alaska—but, except the first two named, the output is irregular.

MANGANESE ORES and manganiferous iron ores are used in the manufacture of spiegeleisen, a white cast iron containing manganese and used in the manufacture of steel by the Bessemer process. In the Lake Superior region some of the iron ores mined carry up to 20% manganese. The Colorado ores of this class, though containing a higher percentage of manganese, are used mainly as flux by the smelters. In the manufacture of zinc from the ores (franklinite) of northern New Jersey, a "clinker" is obtained containing iron and manganese,

which is used in the production of spiegeleisen. During 1903 there were 73,264 long tons—value \$1 per ton—of this clinker produced in the United States. Most of the manganese ores used in the United States are imported from foreign countries.

IN drifting in swelling ground it is as necessary to "open lag" the back of the drift as it is the sides, and to relieve the back as well as the sides. In some instances where this is done much smaller timbers have been found to last as long as the large ones. All miners familiar with this sort of ground know that size counts for little, as the support from 30-inch logs is limited to a few weeks, or at most a few months, and where proper relief is afforded small timbers will last as long as large ones.

THE true course of the side lines are to be laid with exact reference to the course of the vein, parallel therewith, and not more than 300 feet from each side of its center—600 feet in width. Should more be taken up in locating the claim, any excess must be discarded. The middle of the vein should be in the center of the location. Any area excluded from the original location—if on public land—is, of course, subject to location. If a location is made crosswise of the vein, the side lines become end lines.

ACCORDING to "Mineral Resources for 1903," issued by the United States Geological Survey, consumption of crystalline graphite is divided as follows: "Fifty-five per cent for crucibles, 15% for stove polish, 10% for foundry facings, 5% for paint and 15% for all other purposes, including pencils, powder glazing, electrotypes, steam packing and other minor uses." The coarser forms (lump and chip graphite) are used for crucibles, pencils, lubricants and electrotypes. The bulk of the world's supply of crystalline graphite is obtained from Ceylon island. The difficulty of purification of amorphous graphite prevents its use for lubricants, the better quality of pencils, electrotypes, etc. The principal uses of the amorphous variety are in manufacture of paints and for foundry facings.

MONAZITE is an anhydrous phosphate of the rare earth metals—cerium, lanthanum and didymium—and carries usually a varying percentage of thorium (thought to be mechanically mixed). It occurs as an accessory constituent of gneissoid rocks in certain regions, particularly North Carolina and Brazil. It is brittle; color, hyacinth-red, clove-brown, reddish or yellowish brown; resinous to vitreous luster; specific gravity, 5. The commercial value of monazite is due to the thorium ( $ThO_2$ ) contained (up to 9%). The thorium, with lanthanum and didymium oxides, is used in the manufacture of the cylindrical mantle of incandescent gas lamps. Production of monazite in the United States for 1903 was 862,000 pounds, value \$64,630, an increase of 60,000 pounds over 1902. Monazite is obtained in the same manner as cassiterite, by sluicing.

THE failure to record assessment work in California under the existing law, which is somewhat involved, does not work a forfeiture. The performance of the work is the principal thing, and if it can be proven that it has been done, there is no danger of losing the claim. Assessment work cannot be done at any time for the following calendar year. The work can only be made to count for the year in which it is done, or, in the case of neglect to promptly perform the work which has been begun late in the year and extending into the following year, it may be counted for the past year. Work begun in December, 1904, may be continued into 1905 for the year 1904. In no case can work be done in 1904 for the year 1905, nor in 1905 for 1906. If work is not done at all in 1904 and the claim has not been relocated January 1, 1904, the owner may begin work at any time prior to its being claimed by another, and the work then done may apply for 1905—the year 1904 being skipped entirely, there having been no work done upon it that year.

ONE good way to protect steam pipes covered with non-conducting material from damage, resulting from water in a wet mine, is to cover the pipes and asbestos, or other non-conductor, with galvanized iron pipe, and where this has been done, and it is subsequently found that water has reached the pipe covering and damaged it, it will probably be found that either the galvanized pipe was not properly put on, or having been put on right with tight joints, that subsequently the pipe line was damaged by concussion due to blasting, or that there were leaks in the steam line within the covering and that this caused deterioration in the non-conducting covering within the galvanized pipe. If nothing better can be done, compressed air might be substituted for steam underground. For pumping, running hoists, etc., the air is available and is successfully used in many mines for this purpose. Special arrangements must be made as to exhaust, etc., to prevent freezing. There is low efficiency in a plant of this description if the pipe lines be of great length, and it is not feasible to reheat the air underground, but there is probably not a greater loss than would occur by condensation of steam in long pipes underground in a wet mine. Moreover, the air line does not heat up the air as steam does. In a dry mine the heat radiating from steam pipes may be quickly reduced by carrying the pipe in a wooden box in which asbestos packing is loosely packed around the steam pipe.

## Preliminary Examining of Milling Ores.

Written for the MINING AND SCIENTIFIC PRESS by  
ALFRED HARVEY.

The examination of an ore from a mine—the "mine run"—before it is sent to the mill, is a matter well worth careful attention. The preliminary crushing, as it were, has taken place in the process of blasting and other methods of breaking.

The adaptability of the explosive used will have a good deal to do with the condition of the broken ore, and if the values are mainly carried in a mineral which pulverizes readily, a high-power explosive may produce too much fine ore, resulting in loss in the mill. On the other hand, an explosive of insufficient power leaves a maximum amount of breaking of rock to be done.

The values may be unevenly distributed in the ore and perhaps almost entirely carried in the fines and medium size. Or the larger rocks may carry a goodly share.

If the former condition exists, an inexpensive screening arrangement can be used, separating the coarser material and sending only the medium and fines to the mill, thus obviating the cost of treating waste rock and useless wear of the machinery. If the latter is the case even then it may be prudent to screen into two or three sizes, which may mean that number of grades of ore, and perhaps a modified treatment for one or the other.

Where practiced, the above method has given satisfactory results, and usually followed by remarkably close saving in the process of ore dressing, in some cases the finer ore going directly to the mill and the larger size hand picked before passing through the crusher.

In many low-grade ores hand picking pays where labor is cheap, and even when this condition does not altogether exist hand sorting, with little or no spalling, can be economically practiced on circular tables and conveyor belts.

A convenient method, where much sorting is to be done, is to have a rock house. Screens can be arranged in this house and the ore automatically dumped onto them, screening the ore into two or three sizes at one operation. The sizes not to be sorted run onto a conveyor belt, thence to the mill. The size to be sorted is run onto the belt after hand picking. A water hose should be used on the ore, washing it sufficiently to bring out the colors, which materially assists in the sorting. Drains should be arranged to collect any fines washed from the ore.

There are instances where a single operation of sorting on floors has taken out from 12% to 30% of worthless material from an ore at a cost of from 11 cents to 24 cents per ton milled.

Even if the values are fairly evenly distributed through the ore it seems reasonable to screen through grizzlies or other device, feeding the coarse only to the crusher, thus avoiding the recrushing, to a certain extent, of that portion of the ore already fine enough. The best way to treat slimes is to make as little as possible of them, although there are good sliming machines on the market, which make good savings and clean separations.

Intelligent study of the ore in the mine usually results in economy of treatment. The mining end is perhaps too often overlooked, especially where the ore is being broken by contract. The tendency of miners to carry the workings too large when breaking ore at so much per ton, thus getting a great deal of waste, and others when driving by the lineal foot carrying their workings too small and searching for soft spots, are details only too well known. But even when men are working by the shift, watchfulness on the part of those in charge will prevent unnecessary mixing of waste with the ore.

The vein from which the ore is referred to below is taken in in gneissic-granite. The wall rock is frequently so like the vein stuff that considerable care has to be exercised to keep out the waste. The vein filling is a material composed chiefly of quartz, feldspar and clay, through which is distributed in various forms iron pyrite, copper pyrite (chalcopryrite), and in smaller quantity galena, and occasionally small quantities of zinc blende and grey copper.

The gold is found mainly in the iron pyrite, and when copper pyrite is present (sometimes the copper runs to 3%), the gold value is usually higher. The galena carries the greater part of the silver. Zinc blende and grey copper, when present, are in small quantities. There would not be space here to go into details of hardness, structure and fracture, crystallization, etc., of the minerals composing this ore, nor the settling powers of spherical particles compared with those of rugged surfaces, or in sheet form, but these are among the details to be studied in the dressing of an ore. Suffice it to say that careful screen and mill tests, together with water sizing, brought to light many points which enabled the owners of the mill, which was treating the above ore and making a poor saving, to remodel it on such lines that a very good saving in values resulted.

Another instance is that of a stamp mill. The property is so far from railroad and smelters that freight and other costs were very high. The mill was making a very unsatisfactory saving. The writer

was called upon to do some testing with such conveniences as were at hand. Some screens and other appliances were missing, but the following were results obtained from a sample of a few hundred pounds taken by the manager, somewhat higher in value than the average "mine run," but the testing greatly assisted the subsequent experimental work, which was done on a larger scale. The gangue was quartz, porphyry and some clay, carrying iron pyrite, with very little copper and occasionally galena.

### CRUDE ORE ASSAYED.

Au. 1.66 oz. @ \$20.00 =	\$33.20
Ag. 4.4 ozs. @ 0.56 =	2.46
Total	\$35.66

After a series of experiments the following screen test was made. Commencing with 30-mesh screen; diameter of wire .016 inch, maximum size of particles (for 30 mesh) .0173 inch:

No. 1 passed through 30-mesh, but remained on 40.	18%
No. 2 passed through 40-mesh, but remained on 60.	28%
No. 3 passed through 60-mesh, but remained on 80.	15%
No. 4 passed through 80-mesh, but remained on 100.	32%
No. 5 passed through 100-mesh	9%
Total	100%

Saved by amalgamation. .43 94%

Total savings. .92 20%

It was demonstrated that a better saving could be made by amalgamating entirely on the outside plates and lowering the discharge of the mortar. Amalgamating inside the mortar caused considerable "sickening" of the quicksilver and consequent loss.

Although the subsequent experimental work did not exactly correspond with the above hand testing (a good deal of which was done in a gold pan), it was sufficiently near for all practical purposes and materially assisted in getting at satisfactory results. The tailings (if sufficiently valuable) were found to be in good shape for cyaniding. With facilities for testing ores at the mines, in a small way, and the experimental work which can be done at a reliable testing works, it would seem that risk should be minimized in designing a mill to treat an ore satisfactorily.

## Mining in China.

Besides the Shantung Railway Co., with its rights to mining on both sides of its line, there is a separate Shantung Mining Co.—a Germany company—opening mines in various parts of the province of Shantung. The mines in Anch'iu and Ch'anglo are under the management of Mr. Vorschulte. A huge steel tower is erected on a bare hillside, and a gang of coolies working a drill have gone down 700 feet. This is in southern Ch'anglo. Ten miles farther south, in Anch'iu, Mr. Vorschulte is honeycombing sundry small hills and tapping half a dozen veins of silver.

The work is only in the experimental stage, but already there are about 1300 feet of horizontal tunneling, besides over 600 feet of shafts in various spots. The rocks are andesites. The veins are but little inclined from the vertical and the gangue is barytes and fluorite. How rich the ores may be is not known until the proper analyses have been completed.

## The Modern Patio Process.\*

Written for the MINING AND SCIENTIFIC PRESS by  
ARTHUR H. HALLORAN.

The patio process is one of the oldest and simplest of metallurgical methods for the treatment of silver ores. For over three centuries this process has been successfully used in Mexico, Peru and Chili. In all this time but little change has been made; in many places it is still carried on in the primitive manner of the inventor, Bartholome Medina. It is of consequent interest to note that during the past year a series of improvements have been introduced in Pachuca, Mexico, the native town of the inventor, that even further cheapens and simplifies this old-time cheapest and simplest of processes. To understand the full significance of this advance it were well to note the primitive method of working still almost universally used.

The ore from the mine is hand sorted and broken, ordinarily giving a rich smelting ore, a poorer ore for the patio process, and waste. The second product is of present concern and is first crushed in a primitive stamp mill run by mule power. The stamps are usually of wood, shod with iron, weighing from 100 to 200 pounds each; the mortars are flat stones. The ore is crushed to about the size of a wheat grain. It is then ground in either an arrastra or a Chilian mill to a perfect slime or mud.

An arrastra consists of a carefully paved floor over which heavy crushing stones are dragged by mules, the mechanism being a vertical shaft and crossarms. The ore is slowly charged with water and ground to the proper consistency. If silver ore is being treated a small amount of coarse ore is added from time to time, and the mud or slime drawn off from the top, where it is settled and made ready for the patio. The Chilian mill differs from the arrastra in utilizing a large revolving stone wheel to crush the ore, rather than the dragging stones. (See illustration front page).

The fine slimy mud from the Chilian mill or arrastra is sun dried in vats and then removed to a number of circular spaces, from 20 to 40 feet in diameter, surrounded by frames of wood or low walls of stone, all in a large open space, with a slight incline to allow the water to run off. The pulp is spread as a

soft layer from 6 inches to 1 foot thick, and when dry enough a small percentage of salt is added, and mules, or other animals, driven over it to tread the pulp and mix it thoroughly. It is then allowed to rest for a day or two, when magistral and mercury are added. Magistral is a mixture of roasted copper pyrites, iron pyrites and common salt. The amount of mercury and other chemicals used in a charge depends upon the value and character of the ore under treatment. The time of treatment varies from fifteen to forty-five days, depending largely upon the heat of the sun. It is trodden by the animals until assay shows that complete amalgamation has taken place. The exact reaction by which this takes place is doubtful, but in the process the NaCl reduces the CuSO<sub>4</sub> of the magistral to CuCl<sub>2</sub>, which in turn reduces the Ag<sub>2</sub>S to Ag. Considerable mercury is lost as calomel. (See illustration of patio on front page).

The next operation is to wash the whole mass and separate the amalgam. This is usually done either in the "lavadero" or in the "planilla." The former is a tank settler, in which the pulp is agitated by men, mules, water or steam power. The planilla is a kind of hand buddle used throughout Mexico for the concentration of all kinds of slimes or residues containing the precious metals. Its operation is best understood from the illustration on the front page. The operator begins by spreading a 3-inch layer of tailings over the surface of the steep sloping back

\* See illustrations on front page.

part of the planilla. Then squatting on a board laid across the water tank he sweeps up the water with a gourd, bowl or small horn, letting it fall on the lower part of the bed of tailings. The water flowing down washes the light stuff and leaves the sulphurets sticking on the back plane. This process is repeated and the concentrates hand washed in bateas. The final sulphide product is usually shipped to the smelters for treatment, and the silver amalgam obtained from the batea is retorted.

In the past many unsuccessful attempts have been made by engineers to do away with the manual and animal power used in the primitive processes of the patio, substituting the results of modern research for those of ancient trial. Thus bluestone has largely replaced magistral as a source for copper sulphate, being cheaper and more uniform in composition. Rolls have largely replaced stamps for the preliminary crushing, the modern steel Chilean mill is often used in place of its stone prototype. Steam has replaced the mule for running the arrastra.

But until this year none of the various appliances invented as substitutes for treading by horses and mules have proven successful. The perfection of the mixture and the intimate contact of the particles of silver mineral with finely divided globules of mercury are the most important factors in determining the time necessary for amalgamation. This treading is very injurious to the animals. In the great majority of cases the hair and the skin of the fetlock are completely eaten away and the whole surface is cut and jagged. In this condition they have to travel round and round for eight hours without rest or water, beneath a broiling sun, almost knee-deep in a thick mud, which is 5% quicksilver. Sometimes a horse lasts only a few months under these terrible conditions, frequently dying or becoming permanently disabled from copper and mercury poisoning, following ulceration of the legs, or caused by licking up the ore mud for the salt which it contains, and this in spite of care taken to wash their legs immediately after work, and every precaution taken to prevent their licking the saline mud. In spite of these drawbacks the greater effectiveness of animal treading as a mixer and amalgamator has prevented the adoption of machines. Some of the old patio men believe that the heat from the horses' feet and the chemical action of their hoofs were indispensable factors for successful amalgamation.

Early in the present year the Real del Monte Co. completely equipped the Loretta mill, the largest in Pachuca, with a device which seems destined to re-

has prevented the introduction of the modern concentration. At the Loretta mill twenty-six Johnston concentrators are now in use, of which twelve are shown in the picture on the front page. Thirteen of these concentrate directly from Chilean mills. An average extraction of 38% was obtained with six different classes of ore during a three months' run. The extraction depended largely on the kind of ore, 20% to 25% resulting with one kind, and 50% with another. Each table handled an average of 15.6 tons per twenty-four hours. Four Wilfleys are used for the tailings from the patio, after which they pass over four Johnstons, when the extraction is so complete that the hundreds of Mexicans who formerly made a living by panning in the ravine below the mills are now out of a job. These concentrates are composed largely of silver amalgam, which is light and flaky and very difficult to save. At present mechanical concentrators are widely used throughout Mexico.

### Getting Rid of Cylinder Oil in Boilers.

I have seen some large, double-ended Scotch marine boilers successfully treated for the removal of cylinder oil as follows, says a writer in Southern Mills:

The boiler was emptied and a temporary connection of 3-inch or 1-inch pipe was made from the steam line to the lower part of one of the water gage columns. About seventy-five gallons of kerosene were poured into the boiler, after which the boiler was closed up. Steam was turned on the water gage column, allowing the steam to enter the boiler at the bottom, but only so as to start the kerosene boiling. If there was not enough kerosene to cover the steam connection inside the boiler, enough water was pumped in to do so. If there was time to do a good job of it, the boiling was allowed to continue until enough steam had condensed to show the water at the usual steaming level in the boiler; with less time in which to do the job, a few strokes of water was pumped into the oiler with the feed pump once every two hours. When the water reached the steaming level, steam was shut off (the boiler held forty tons of water when at steaming level) and after allowing it to cool down some the top manhole plate was removed and the boiler flooded so as to allow the oil on the surface to float off. The boiler was emptied and all manhole plates removed. An inspection at this stage showed splendid results, for the cylinder oil had loosened up so that, aside from the necessity of wiping it off at a few places, all there remained to be

but there can be no doubt that the extensive alluviums are rich in gold. Remoteness from the centers of mining effort has prevented their effective exploitation by suitable machinery. At present the only apparatus in use is the ordinary type of sluice with three or four 12-foot boxes, each containing riffles, and washed by shifts of from four to six men, who extract from 6 to 10 cubic meters per day. This primitive method of washing is naturally wasteful and allows much of the value to escape in the tailings. Prospecting is stated to have been going on busily for several years past to determine values with a view to the use of dredgers. According to an Argentine paper, one dredger is already in operation at Porvenir, though whether of the bucket, grab or suction type is not stated. While the island is well provided with ports which are within a comparatively short distance of the placers, too little is at present known about the industrial conditions prevailing there to speak with confidence of the mining prospects. There is, it is true, plenty of wood, while a certain amount of white labor is employed upon working the beaches under the payment of a daily royalty. Whether, however, the existing labor is of the character that managers would prefer seems doubtful.

### Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER VI.

Written by C. H. FULTON.

The treatment of the slimes at the Hidden Fortune mill is similar, but differs in details. The slimes vats are first filled with barren solution and the slimes pulp is charged at the center of the vat through a large pipe which leads to within a few feet of the bottom of the vat. The clear solution overflows continually around the whole of the periphery, being collected by an annular launder and taken to the battery sumps. When the outgoing solution becomes cloudy the charging of the slimes is stopped and slimes are permitted to settle, the clear solution at the top, in the meantime, being decanted to the battery sump, in a similar way described for the Horse-shoe mill. When the solution has been decanted to within an inch or two of the slimes, the top layer of thin slimes to a depth of 3 or 4 inches is pumped to the vat that is filling with slimes, the object of this being to remove as much solution as possible in order to have the next dilution as efficient as possible. The first wash of barren solution is then added, this being added through the perforated air pipes at the bottom of the vat. This method of adding the barren solution is adopted, first, to keep the perforations of air pipes clear, and second, to secure the agitation and moving of the heavier slimes at the bottom of the vat. After the addition of barren solution the charge of slimes is agitated with air at 40 pounds pressure per square inch, then permitted to settle and the clear solution decanted as described.

The slimes receive three washes with barren solution and one with water. Before the slimes are finally discharged the top layer, to a depth of 3 or 4 inches, is again pumped to the vat which is filling. The total time required for the treatment of the slimes is between three and four days. Three washes are found sufficient at the Hidden Fortune mill, since the slimes receive an unwatering before going to the slimes vats, as has been described. At this mill the extraction made on slimes, as determined by the assays on the washed tailings, is 80%. The actual recovery is but 75%, as determined by the unwashed tailings, showing a loss of gold of 5% which goes out with the slimes tailings in the dissolved form.

The second method of treatment in which the slimes are successively transferred from one vat to another is illustrated by the practice at the Dakota mill. The slimes from the cones are alternately charged into the loading vats, Nos. 1 and 2, which are 20 feet in diameter and 137 inches deep. Each vat is filled for twelve hours, then permitted to settle for ten hours, the clear solution at the top being continually decanted off—finally to within 1 inch of the settled slimes. The settled slimes are then pumped by a centrifugal pump having a 4-inch suction to vat No. 3, barren solution being continually added to the suction of the pump during the transference, which takes from one to three hours. In vat No. 3 the slimes are permitted to settle again for ten hours, the clear supernatant solution being decanted off meanwhile. The slimes are then transferred to vat No. 4 by the pump, barren solution being added to the suction. In vat No. 4 the slimes receive an additional agitation by pumping for about one hour, the slimes being drawn off at the bottom of the vat by the pump and returned over the top. The settling and decanting is then repeated and the slimes transferred to vat No. 5. From this vat, after the settling and the decantation of solution, the slimes are transferred to vat No. 6, but this time with wash water, instead of barren solution. The amount of wash water added is equivalent to the amount of moisture in the slimes. In vat No. 6 the last settling takes place, the solution is de-

Machine Mixer for Patio.

place this inhuman practice. As seen in the accompanying engraving it consists of a rectangular frame, 12 meters long and 1½ meter wide, formed by two parallel I-beams. This rectangular frame is capable of running the length of the patio by means of flanged wheels attached to the four corners and running on rails firmly fixed in the stone walls which form the sides of the inclosure. In the channels of the girders two smaller frames are placed, one on each side of the center, in such a manner that they can be run from either side to the center by means of an endless chain running over pulleys at each end of the machine and attached to these smaller frames. These latter have a number of plows connected to them by a sliding bearing, so that they may be raised or lowered as necessary. The whole machine is drawn from end to end of the patio by means of a reversible cable. At each end there is an arrangement by which the smaller frames are shifted so that the plows keep continually changing their position from side to center and vice versa, during the time that the whole machine is being run from end to end. The practical success of the machine is due to Carlos F. de Sander, a vice-president of the American Institute of Mining Engineers, and Manager Quintanilla of the Real del Monte Co. The machine was invented by Aguilino M. de Parres and Stephen Waters of Pachuca.

The results show the average cost of working to be 65% less, a saving of 25% to 30% of quicksilver, and an appreciable saving in time and amount of reagents.

While the planilla concentration process seems costly and primitive, yet, till within the past few years, the cheapness of both the appliance and labor

done to finish the cleaning was to give the boilers a good washing out with a strong stream of water from a fire hose.

When a boiler is thus boiled out and opened, care must be taken that no fire or open lights are brought near the manholes before the boiler has been washed out and well ventilated, for there is danger of igniting the kerosene vapor and causing an explosion.

I have also seen large surface condensers boiled out in the same manner with equally good results.

I may as well mention another attempt to remove cylinder oil in a boiler. In this case the water was boiled out with 150 pounds of washing soda, and naturally the result was a waste of time and labor, waste of steam and fuel, waste of water and washing soda; for the cylinder oil stuck to the boiler as hard as ever.

### The Placers of Tierra del Fuego.

Attempts are being made in certain parts of South America to reawaken interest in the gold placers of the island of Tierra del Fuego, which have long been subjected to intermittent exploitation in primitive fashion, but are soon, apparently, to be systematically worked by machinery. More than one company has been formed in London to work auriferous deposits in the same region, but these have not operated to much purpose, says the London Mining Journal. Reports which from time to time have reached Europe as to the deposits have been mainly the results of hurried examinations made by geologists or mining engineers who have touched at the island on their way through the Straits of Magellan;

\* Bulletin No. 7, South Dakota School of Mines.

canted and the slimes are discharged. Lime for the coagulation of the slimes is added to the extent of six pounds per ton of ore to the batteries. The time required for the treatment of the slimes is five days.

The following figures on slimes treatment at the Dakota mill are of considerable interest: In 5.5 months 6681.67 tons of slimes were treated, the slimes amounting to 33% of the ores crushed. The average value of ore during this period was \$4.75 per ton. The slimes tailings dried and unwashed assayed \$1.31 per ton, giving a recovery on the slimes of 72.28%. The washed slimes tailings assayed \$0.912, showing a solution of the values of 80.7% and a loss of soluble gold of 40 cents per ton, or 8.42% of the value of the ore. The slimes are discharged with 50% moisture, this moisture consisting of solution having a strength of 1.07 pound of cyanide per ton. Since there is a ton of this solution going to waste for every ton of dry slimes discharged, in the 5.5 months which the above period covers, there were lost 7147.6 pounds of cyanide, which, at 23 cents per pound, had a value of \$1644. Adding to this the loss in dissolved gold, amounting to \$2672, the total loss is \$4316, or 64 cents per ton.

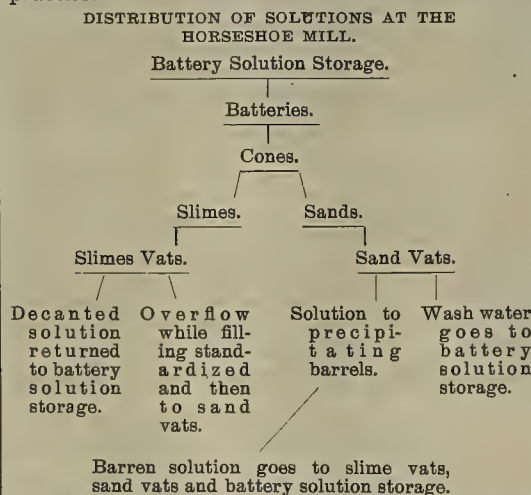

These figures show clearly the weak points of the decantation system of slimes treatment. The Dakota mill is one of the most successful mills in the district, treating what is practically the lowest grade of siliceous ores handled in the district. The results on sands at this mill are discussed under sand treatment. The treatment of the slimes at the Maitland mill is similar to that at the Dakota. Each ton of dry slimes receives a treatment by 5.38 tons of barren solution and 0.96 ton of wash water. The solution going out with the slimes as moisture contains \$0.46 in gold per ton. The head slimes solution, or the solution first decanted from the slimes while filling, has a value of about \$2 per ton.

At the Lundborg, Dorr & Wilson mill the Moore slimes process is used on the slimes. There are three rectangular vats 15 feet long, 7 feet wide and 5.5 feet deep. The first tank has a double hopper bottom, the sides inclined at 45°, to more readily collect the heavy slimes which sometimes fail to be taken on the filter frames. There is a set of thirty-five frames, 4.5x6 feet in area, and made of 2-inch material. The filtering medium is 18-ounce duck. Both sides of the frames are effective as filters and the total filtering area is 1836 square feet. The interior of the frames are connected with a pump, which produces suction, and also with a compressor. The suction is equivalent to 18 inches of mercury. The set of frames is suspended from a hydraulic crane, which transfers the frames from one vat to the other. The method of treatment is as follows: The slimes, after agitation by air and a centrifugal pump in an 8-foot sheet iron cone, are run to the first tank of the Moore process, the frames are immersed in the slimes and the suction is started. A coating of slimes deposits on the filters and the clear solution is discharged by the pump. When the slimes layer on the filters has accumulated to the thickness of an inch, which amounts to a load of four tons on the set of frames, and takes from 40 to 65 minutes, the frames are lifted out with their adherent load of slimes, suction meanwhile being continued, and immersed in the next vat, which is filled with barren solution. This barren solution is sucked through the slimes for forty minutes, when the frames are transferred to the next vat, which is filled with water. This water is sucked through the slimes for forty minutes, when the frames are lifted out, transferred to above the discharge hopper, the suction changed to pressure, which causes the slimes to peel off into cars below the hopper. Some little scraping has to be done to clean the frames. No figures are as yet available concerning the results of the Moore process, permitting of a comparison with the decantation process. It is a fact, however, that the process discharges dryer slimes, those at the Lundborg, Dorr & Wilson mill containing from 34% to 36% moisture, as against 50%, which is the usual figure for the decantation process. At the mills where the upper layer of slimes is pumped off, as described for the Hidden Fortune mill, the slimes are discharged with 46% to 47% moisture. Some of the mills of the district, which must confine their tailings within narrow limits and can not let them flow freely to waste, experience considerable trouble from the high moisture contents of their slimes tailings. The slimes tailings from the Moore process are much more easily held in check. In making a general comparison between the Moore and the decantation process it must be borne in mind that the slimes are under treatment in the Moore process only two or three hours, and in that time receive practically no agitation, so that the solution of the gold must take place practically before the slimes go to the Moore process. The Moore process, even with separate agitation, however, shortens the time on the slimes materially and a large capacity can be installed within a small space.

Filter press experiments have been made on a fair sized scale at one of the mills in the district, which indicated that slimes could be made containing about 25% moisture and that these slimes, on account of the close washing feasible, carried very little cyanide and dissolved gold. It would not be surprising to eventually see filter pressing replace the decantation process, at least in part.

THE DISTRIBUTION OF SOLUTIONS IN THE MILLS.—

The distribution of solutions in the mills is quite complex, and the following diagrams show the general practice:

It will be noticed that the only solution going to the precipitating boxes is that which has passed the sands. This amounts to from 800 to 1000 tons per day. The battery solution has a gold value of approximately \$1 per ton. This value is derived for the greater part from the decanted slimes solution. The cyanide needed to bring up the strength of the solution is added to a comparatively small amount of decanted slimes solution, more particularly the overflow solution from the slimes vats while these are filling. This is brought up to three to four pounds of cyanide per ton and run on the sands so that these get the benefit of what is practically a strong solution.

In the scheme of the Maitland mill which follows, it will again be noticed that the only solution that is precipitated is that which has passed the sands. This is the general practice at all of the mills. The

## Milling on the Rand.

The treatment of the ores of the Witwatersrand forms a topic which is always interesting to mining men. In that district a great deal of attention is given to the metallurgical branch. Many innovations are made and experiments with a view to improvement is constantly carried on. The accompanying engraving and description of the new mill of the Village Deep mine are from the London Mining Journal. The battery consists of a heavy casting 2 feet 9 inches in height, under each ten stamps, so designed as to give great rigidity under the blows of the stamps. It weighs about 28,000 pounds and is embedded on a timber cushion about 14 inches deep, composed of timbers laid side by side and firmly bolted together. This in turn rests on a solid concrete foundation block, containing 66 cubic yards of concrete, provided with vertical grooves for the reception of the holding-down bolts, which pass through the base of the anvil block and the timber cushion, and are kept firmly in position by means of timber-straining pieces at their lower ends. This method of construction allows of any bolt being easily removed without hanging up the stamps or stopping the battery. To ensure an even bed for the anvil block, a layer of pitch is run on to the timber cushion before placing the block in position.

The old type of anvil block, as originally tried on the Rand, at the Geldenhuis Deep battery, consisted of a cast iron block or slab 6 inches thick, which was bolted down directly to the concrete foundation. This foundation was much the same shape as that already described, but the bolts were embedded in the concrete, pockets being provided for screwing up the bolts at their lower ends. In case of removal the nuts had to be unscrewed and the bolts drawn, the stamps being hung up while this operation is in progress. No timber cushion was used, with the result that the constant pounding of the stamps caused the concrete to gradually crumble. The casting also was not of sufficient depth and weight, and, taking everything into consideration, this type cannot be said to have been as successful as it might have been. It is fully expected that with the anvil blocks in the new

Iron Anvil-Blocks, Village Deep Mill, Johannesburg, S. A.

solution is restandardized ahead of the zinc boxes in order to get more efficient precipitation as there is some copper in the solution. The strength of the various solutions at the different mills is given under the discussion of the treatment of the sands. The battery solution in the case of the Maitland mill has a value of about 50 cents of gold per ton and the barren solution about 10 cents per ton. About 1100 tons of battery solution are pumped per day and close to 500 tons of solution are precipitated every day, which, after precipitation, becomes the barren solution, so that the mill handles per day about 1600 tons of solution, which, with a capacity of 120 tons of ore per day, is 13.1 tons of solution per ton of ore. The pumping expense of a wet crushing mill per day is appreciable and in the design of a mill the question of handling the solutions is a very important one. At one of the mills the restandardization takes place in the battery sump so that the strongest solution is used in the battery. The practice is for obvious reasons not the best.

(TO BE CONTINUED.)

form 15% to 20% may be added to the mill's contribution to the output. As each stamp earns about £260 per month, taking the Rand mine subsidiaries as a basis, it follows that the product of each unit if augmented to the extent of 15% will be about £300 per month, while the old type of wooden blocks lasted at most ten to twelve years. The new type is of sufficient size and strength to be practically everlasting.

## Looking Up Mexican Ore.

Representatives of the United States Steel Corporation have made a recent investigation of the mountain of iron ore at Durango, Mexico, with a view to its purchase.

This mountain is over 400 feet high, about 2 miles long and 1 mile wide. In 1884 it attracted the attention of C. P. Huntington, who bought it for a song and built the Mexican International Railroad through a long stretch of desert to tap the deposit. He never

carried out his plans for the establishment of a steel plant at Durango, and other interests took up the project to build a furnace with 100 tons daily capacity and 50 tons of bar steel capacity. The Steel Corporation has been losing business in Mexico since the establishment of the \$10,000,000 Monterey plant, and may establish a plant to meet the demands in the Southwest and Mexico.

### Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER IV.

Written by ARTHUR C. SPENCER.

Without the above proof that the diorite is intrusive in the greenstone, several general considerations would lead to the probability of this relation. In the region at large the dioritic rocks invariably cut the bedded greenstone, and in Sheep creek they are even later than the gabbro dikes which follow the structure of the enclosing rocks approximately. None of

intrusions, while the greenstone exhibits no features which necessarily require an intrusive origin. The diorite bodies change in shape from place to place, branch irregularly, crosscut the stratification locally, and include masses of slate. The greenstone is a single layer or bed which continues along the same horizon for at least 6 miles, showing but slight variations in thickness. It does not crosscut the slates, so far as observed, and it contains no slate inclusions. Under the circumstances it is strongly believed that the greenstone is not intrusive, but that it originated as a lava flow similar to many others in the same general series of alternating sediments and igneous rocks, while the diorite seems to have been intruded at a much later date.

**THE BLACK SLATES.**—The black slates, which constitute the main country around the Treadwell mines, belong to the third sub-zone of the slate-greenstone band already described. Together with the hanging wall greenstone, they constitute all of the sub-zone which appears on the southern half of Douglas island, the remaining portion being beneath Gastineau channel. They are highly metamorphosed, carbonaceous

impossible to secure entirely unaltered material. Dr. Becker, who first studied it with care, gave it the designation "sodium syenite," to distinguish it from the ordinary syenites which contain potassium as their alkali constituent. However, since the soda feldspar albite, which is the characteristic mineral of the rock, belongs to the plagioclase series, and these feldspars are the distinguishing feature of dioritic rocks, he suggested the alternative name "albite diorite," which is here employed because it serves to indicate the known relationship of the Treadwell rock with the dioritic intrusives of the adjacent Coast range.

The rock varies in mineralogical composition from place to place, but it is always very much changed from its original condition. Most of it shows little or no ferro-magnesian minerals, either because they were never present or because they have been decomposed and carried away by the mineralizing solutions which have permeated the rock. Specimens were collected, however, which contained hornblende in apparently original prisms, and biotite is sometimes observed. Secondarily crystallized mica and green hornblende are somewhat common, and with them a considerable amount of epidote is ordinarily found. Feldspar is present in two conditions, original and secondary. The primary feldspars of the magma were albite oligoclase, occurring in phenocrysts now always clouded by decomposition products, and microperthite with some pure albite, forming a granular ground mass of distinctly later crystallization. The composition of the phenocrysts is inferred in general from the presence of epidote as one of the minerals formed by the alteration of the feldspars, but this has been checked by the optical characteristics of relatively fresh material occurring in several specimens. The secondary feldspar is always albite and is usually quite free from decomposition, and when it occurs in sufficient amounts it gives the rock a very fresh appearance. It seems to have been formed mainly at the expense of the original microperthite, which it replaces in part.

Quartz seems not to have been an original mineral in the albite diorite, and it is never observed in the body of the rock associated with the secondary albite, but is confined to the veinlets which intersect the dikes. Calcite is common both in the veins and distributed through the rock itself along with the albite of the second generation.

Original accessory minerals noted are: Apatite, titanite, rutile and magnetite. The secondary minerals which have been noted are: Uralite (secondary hornblende), green mica, chlorite, epidote, zoisite, calcite, quartz, sericite, rutile, pyrite, pyrrhotite and stibnite, with other sulphides occurring exceptionally. Some of the magnetite seems also to have originated from the breaking up of former iron-bearing minerals, where it surrounds cubes of pyrite it has apparently been deposited from the mineral solutions.

In the vicinity of the mines albite diorite occurs in the black slates as dikes distributed throughout a zone about 3000 feet in width and extending along the strike for a distance of 3 miles. Only bodies near the hanging wall of this zone have been mined up to the present time, though several others are strongly mineralized. The dimensions of the different dikes are extremely variable, the larger ones having a maximum observed width of over 200 feet in surface exposure and in the mine workings. From this, all sizes occur down to the width of one's hand, and toward the ends of the intrusive area only small dikes occur, as may be observed along the bed of Bullion creek. The sketch map (Fig. 6) indicates the general distribution of observed dikes. Undoubtedly a still larger number, principally of small dikes, are hidden by gravel beds and by the deep mat of decaying vegetation which covers much of the ground. In many cases, and this is particularly to be noted in the dikes which have been mined, the individual intrusions are made up of a series of lenses formed by alternate bulging and pinching of the intrusive mass. In places the structure of the slate follows these irregularities, while elsewhere there is local cross-cutting or even faulting. Pinching and swelling of the diorite is shown in both vertical and horizontal cross sections of the dikes, though in general it is to be noted that the variations are more frequent and the changes take place within shorter distances upon the dip than upon the strike. These features are illustrated in Figs. 10 and 11, which, with the addition of a few details, have been selected from the working maps and slope sections of the different mines.

The greater frequency of the variations on the dip, which has been mentioned, may be due to faulting, for in the west end of the Glory Hole at the Treadwell mine and in two other cases underground, where observations have been less readily made, the ore bodies are offset by movement along surfaces which strike nearly parallel to the veins, but dip at a lower angle. A series of such faults would produce the effect of alternate swelling and pinching (Fig. 9).

Outside of the ground which has been worked, the details of the various diorite masses are unknown, but their general distribution is shown upon the geological map, and the generalized cross section through the workings of the Treadwell mine indicates the relative number and size of the dikes which outcrop (Figs. 5 and 6). Considerable work was done

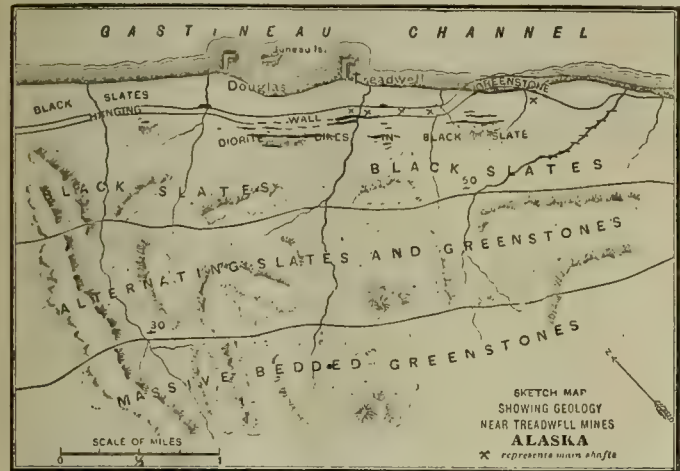

Fig. 6.

Fig. 9—Faulting of Dike, Treadwell Mine.

Fig. 5—Cross Section Through Alaska-Treadwell Mine, Douglas Island.

Figs. 10 and 11—Plan and Transverse Section Treadwell Mine, Douglas Island, Alaska.

the basic intrusives which are evidently later than the Coast Range diorites show any tendency to follow the structural trend of the region, but, like the small basalt dikes in the Treadwell mine, they characteristically hold to transverse courses. The way in which the greenstone limits the zone of diorite dikes, and the marked coherence of individual dikes to its lower surface, both point to the hanging wall stratum as a controlling feature in the distribution of the diorite, and therefore suggest its earlier existence. The probability of this connection is well brought out by the detailed map and cross-section (Figs. 5 and 6). Again, if the attitudes of the diorite dikes and the greenstone in reference to the slate country are compared, it is found that the diorite shows all the ordinary structural characteristics of

and calcareous shales, of fairly uniform texture. Their stratification is usually determinable from variations in color and from slight changes in the character of material, and in so far as observed the bedding and principal slaty cleavage are always in accord.

The cleavage of the slates is regarded as having been produced before the syenite intrusions, the direction of which it largely controls. In this respect the secondary structure corresponds with that of the sedimentary rocks of the general region, all of which were tilted and metamorphosed before the diorites of the Coast Range were intruded. The slates do not appear to have been altered by contact metamorphism next to the intrusive dikes of syenite.

**THE ALBITE DIORITE.**—Classification of the Treadwell rock is somewhat difficult, because it has been

\* Abstract Am. Inst. Min. Engs.

several years ago in prospecting adjacent bodies of diorite, many of which are as thoroughly impregnated with pyrite as the developed ore bodies. So far as known the gold values are mostly very low, and while mines may yet be discovered, explorations have not thus far resulted in important discoveries.

The occurrence of the sulphide-bearing diorite which forms the Treadwell ore deposit has been described by Dr. G. M. Dawson, who visited the mine in 1889. This geologist states his impression that the deposit represents the upper portion or "feather edge" of a granitic intrusion, probably contemporaneous and connected with the granites of the neighboring Coast range. The structural relations presented by this view are entirely in accord with present observations, for, while the rock cannot be strictly classed as granite, neither can a large part of the rocks which form the core of the Coast range be so classed, since their composition is usually dioritic. The diorite of the Douglas Island mines doubtless belongs to the Coast range period of intrusion, and if the small dikes of basalt which are found from place to place throughout the region be excepted, it is the youngest of the bedrock formations in the vicinity. At the time of its intrusion the rocks which now appear at the surface occupied a position deep within the shell of the earth (lithosphere), and while many masses of the Coast range diorite were forced through to the surface, it is doubtful whether any of these particular dikes ever extended as far as the surface which then existed. Taken together they represent intrusive material which was arrested en route, while larger masses of related rocks in the region are regarded as the once deep-seated portions of intrusions which probably had actual surface exit. In the underground workings the blind endings of certain of the dikes show that some of them do not extend even to the present surface. How much farther the larger ones may have penetrated the slates now removed by erosion cannot be estimated.

**BASALT DIKES.**—In several places in the mine workings basalt dikes, which cut all the other rocks, have been encountered. They are narrow, usually from a few inches up to 3 feet in width, and have sharply defined walls. Locally, the dikes occur in pairs and in several places are seen to divide, particularly when they occur in the zones of sheeted rock. The fissures in which they occur are transverse to the strike of the rocks and trend from N. 10° W. to about north and south, true meridian, with a rather steep dip toward the west. As a rule, they are not mineralized to any important extent, though a small amount of pyrite sometimes appears, and occasionally they contain a considerable amount of this mineral. In several places veinlets of calcite occur along the selvage, but these are readily determinable as of later origin than the greater part of the quartz and calcite which form a reticulation throughout the mass of the ore material.

(TO BE CONTINUED.)

## THE PROSPECTOR.

The rock samples from the Kingston range, San Bernardino county, Cal., are classified as follows: No. 1. Hornblende andesite. No. 2 is also apparently an andesite, somewhat altered. No. 3 is trachyte, showing large zonal feldspars. No. 4 is also trachyte, much decayed. No. 5 is rhyolite of glassy variety (pearlite). No. 6 is andesite; it is somewhat altered and shows considerable epidote in the form of yellowish crystals and spots. No. 7 is mica (biotite) andesite, in which the biotite predominates over the hornblende. No. 8 is a basic rock of the basalt family, but is of unusual type. No. 9 is trachyte. No. 10 is diabase, in which much silica has been infiltrated. No. 11 is diabase. No. 12 is also diabase. No. 13 is gabbro. No. 14 is a metamorphic rock, probably altered from diabase; the fibrous mineral with radiated structure is a variety of amphibole (tremolite). No. 15 is limestone. No. 16 is limestone, altered partly into silica with the development of magnesian silicates (tremolite, etc.); stains of green copper carbonate are also present in the specimen. No. 17 is limestone, in which occur quartz and iron oxide. No. 18 is an altered granite, consisting chiefly of granules of quartz, partly kaolinized feldspars and secondary mica. No. 19 is also granite, similar to No. 18, but containing iron ore, probably titanite. The twentieth piece is not numbered; it is quartz, on one side of which occurs bright, metallic-appearing specular iron (hematite).

The rock specimens from Orleans, Cal., are: No. 1. Amphibole rock. No. 2. Amphibolite schist. No. 3. Diabase. No. 2 may result from the alteration of such rocks as either No. 1 or No. 2.

The rock specimens from Custer City, S. D., are: 1. Apatite (calcium phosphate). 2. Black tourmaline. 3. Orthoclase (potash feldspar). 4. Biotite (black mica). 5. Rose quartz. None of these minerals has more than nominal value.

The greenish granular mineral from Denver, Colo., is glauconite, an iron silicate. Nickel silicate has a brighter color.

## Copper in El Dorado County, Cal.

Beside numerous gold mines in El Dorado county, California, there are a number of promising copper mines and prospects, and near Latrobe a quicksilver mine, though the latter has been idle for some years. Near Diamond Springs and about 2 miles east of the Union gold mine is a copper prospect—a vein 4 feet wide producing a good grade of copper sulphide ore. In that vicinity are also several other prospects of copper and gold. Near the Cosumnes river is a copper mine known as the Cosumnes copper mine. It

amount of development, including the sinking of a three-compartment shaft. One of the accompanying illustrations shows the tunnel entrance to the Contraband claim of this company, and the other shows an open cut on one of the veins from which considerable ore has been removed.

There are other prospects in the vicinity of Georgetown where drifts and shafts have been cut on large veins showing copper, gold and silver. The fact that these mines generally are several miles from transportation and are mostly in the hands of men who are inexperienced in the metallurgy of cop-

Open Cut on Gold Property of the El Dorado Copper Co. at Georgetown, El Dorado County, Cal.

per and usually lack the means to properly equip them probably accounts in some degree for their not being producers at the present time.

About 7 miles east of Newcastle (Placer county) and in El Dorado county is a heavy gossan which can be traced at intervals for several thousand feet. One property, the Alabaster Cave mine, has been superficially developed, and is in places 30 feet wide. The ore contains 3% or 4% copper, beside gold and silver. Native copper, in sheets, is also found near the walls. The Cambrian mine, 10 miles northwest of Placerville, was originally worked for gold, but as the sulphide zone was entered copper made its appearance, and now forms an important portion of the values.

Near Georgetown, the El Dorado Copper Mining Co. owns a number of claims, including the old Contraband and Ford mines. They have done a large

per and usually lack the means to properly equip them probably accounts in some degree for their not being producers at the present time.

## A Valuable Bibliography and Index.

In compiling a "Bibliography and Index of North American Geology, Paleontology, Petrology, and Mineralogy for the Year 1903," F. B. Weeks, of the United States Geological Survey, has done work that will be of value to the student who desires to keep pace with the progress of science. It will serve him as a guide to the latest knowledge of the subjects which it covers.

The bibliography consists of full titles of separate papers, arranged alphabetically by authors' names, an abbreviated reference to the publication in which

the paper is printed, and brief description of the contents. Each paper is numbered for index reference.

The index is preceded by a classified key, in which are shown the subject headings, their subdivisions and arrangement. Reference is made in each entry by author's name and number of article in the bibliography.

This is the latest of a series of annual bibliographies prepared solely from publications received by the library of the United States Geological Survey. On January 1, 1903, Mr. Weeks was placed in charge of the Survey library and began to make an effort to procure the publications which were not noticed in bibliographies of previous years. Many of these are noted in the current bibliography, which is listed among the Survey's publications as Bulletin No. 240. J. M. Nickles assisted Mr. Weeks in the compilation of the work. It is published for gratuitous distribution, and may be obtained on applying to the Director of the United States Geological Survey, Washington, D. C.

### Wilfley Concentrator.

The Wilfley concentrating table, which has been on the market for the past eight years, has been greatly improved. Herewith is illustrated the table as it appears to-day; also is portrayed the deck and riffles of the table. Bulletin No. 6 issued by the Mine & Smelter Supply Co., Denver, Colo., says: "It is absolutely essential that a perfect concentrat-

the Mine & Smelter Supply Co., Denver, Colo., and each of their branch houses at Salt Lake City, Utah; El Paso, Texas, and 139 Liberty street, New York City, and the Mexico Mine & Smelter Supply Co., City of Mexico, Mexico.

### Observations on Gold Milling.\*

Written by J. G. McNULTY.

Beginning with the self-feeders back of the mortars, it is a good plan to have the adjusting parts to come on the left hand side, or opposite the belt side. This permits the millman to work with more freedom.

A plate iron lining is of benefit in the throat of the mortar, for, besides protecting the throat from wear, it serves as an apron to catch any ore dropping from the feeders. The iron plate rests on the throat of the mortar, comes up over the back part, and is turned over and out some 5 or 6 inches.

As it is frequently necessary to open and close the battery feed water supply, and several minutes are wasted in again securing the proper working flow, it will be found convenient to have a globe valve on the pipe leading from the main water supply pipe to the feed water pipe with two or more "bibs" at the top of the mortar. The globe valve is always set right for the amount of water required. In hanging

phurets.

Various methods are to be found in our mills for attaching the screen to its frame. The following will be found efficient and convenient: The screen frame is made of 2-inch seasoned hard wood, framed, and provided with ten  $\frac{1}{4}$ -inch stud bolts, four along the upper and four along the lower sides of the opening, with one on either end. The screen is punched from a template to fit over these studs, and is held in place by an iron frame made of  $\frac{3}{16}$ -inch thick flat iron, 1 inch wide, bored to fit over the studs. The screen frame opening is 5x50 inches. With a suitable socket wrench the stud bolt taps are readily removed, and the screen taken out. One side of the screen frame is made wider than the other, so that by reversing, the depth of discharge may in a measure be compensated for. Intermediate posts are eliminated, thus admitting an uninterrupted flow of pulp along the entire length of the screen.

A convenient method for handling a roll of screen is to place it on a spool or reel, unroll the length desired on a table which has a slot running through the center its entire length, then with a stout knife, guided by the slot, the amalgamator readily cuts off the size desired. Low sides hold the screen fair on the table. This simple device keeps the roll of screen intact, and will be found quite a saving of time, especially in large mills.

There is a growing tendency in milling to utilize the stamp mill more as a pulverizer, and depend less upon the mortar as a means of saving the gold—that is, endeavoring to make a combination machine of the battery. The idea, I am aware, is quite at variance with the general mill practice of the province. Some months ago I made a series of special test runs, in a large mill then under my management, and the results convinced me that there was no practical gain in maintaining lip plates, chuck-block plates and the various other forms of plates interposed between the discharge and the apron plates, unless it might be that they offer a slight gain in plate area, but additional trouble in cleaning up. There is very little danger in having too much apron plate area. The coarse gold that may be present in a given ore will naturally find its way down between the dies, if conditions be favorable, while the apron plates will take care of the finer gold passing the screen as amalgam.

To maintain the plates up to a high standard of efficiency, they require constant care and attention on the part of the amalgamator. The promiscuous use of chemicals, particularly potassium cyanide, as a means of attaining this end should be condemned. Hard, persistent rubbing is by far the most efficient, and, indeed, the only method of keeping the plates in the condition they should be to do effective work. Rather than use cloths in dressing and working up the plates, a stout piece of rubber  $\frac{1}{4}$ -inch thick, cut to a desirable size—say 6x3 inches—will be found far more effective.

By having the apron plates in sections of say 3 $\frac{1}{2}$  feet in length, they admit of rotation, or having their relative positions changed in the series, ultimately making a plate equally sensitive and uniform throughout its entire length. The plates are arranged so

The Wilfley Concentrator.

ing machine should run at a uniform speed and without jar, as the effect of the motion in combination with riffled and plain surfaces is to form a stratification of the various products which may be in part de-

up the stamps the two "bibs" can be quickly shut off, and when opened again the flow of water is of desired volume.

I have made extended tests with the front water

Deck and Riffles of Wilfley Concentrator.

stroyed by excessive external vibration. The No. 5 table is supported upon a timber girder, which makes a much lighter support than the former tables had, and at the same time making the most rigid form of mounting possible. The girder frame we are now building is absolutely rigid and self-contained. Under this girder frame three timber feet are securely bolted. The No. 5 movement has some valuable improvements. The entire movement, including the elevator, is self-contained and mounted upon a well designed and strongly ribbed base made of close-grained cast iron. This frame is bolted rigidly to the girder support, making the whole as rigid as if it were one piece. The top surface is covered with linoleum upon which are a series of riffles ending along a diagonal line, forming a combination of a riffled portion and a plain surface."

These machines are on exhibition and for sale by

feed versus the top water feed, and have found the former an advantage, especially with ores carrying a considerable per cent. of sulphurets or clayey gangues. The crushing capacity is considerably increased, less slimes produced, and the sulphurets in better condition for concentration.

The water supply for the various purposes about a large mill should, so far as is consistent with the conditions, be independent, and the supply drawn from head boxes, which will give a uniform pressure. In case wood be used for fuel, it is a good idea to construct a large wooden hopper with a filter bottom, near the boiler room, as a receptacle for the ashes. The "leach" from the ashes, fed to mortars by drip cocks, will be found beneficial in keeping the mercury active, especially in the presence of considerable sul-

phurets. that succeeding plates average  $\frac{1}{4}$  inch, with about the same drop between plates. In construction, the plate taken should be substantial, readily adjusted, preferably by slot wedges at the lower end, and rest on supports independent of the batting or mill floor system, so as to reduce the vibration to a minimum. It is advisable to pass the discharge from aprons over a cross screen, which is nailed to a light frame and set into the launder at the foot of the table, before it enters the trap or passes to the concentrator, as coarse grains of pulp are apt to find their way on to the plates in changing screens, etc., and become a source of annoyance on the concentrator.

In order that the amalgamator may have the screens in full view at all times, special curtains in front of the screens should be discarded when possible.

In setting up concentrators with a view of securing

\*Abstract Trans. Min. Soc. of Nova Scotia.

the greatest efficiency, one can not observe too much care in providing a substantial foundation. A common method is to set the carrying frame for the concentrators on the mill floor and depend upon a few nails to hold it in position. In setting up tables of the Wilfley type, I have found it good practice to construct two rough walls of masonry, with anchor bolts to hold down a 6x8-inch frame, on to which the carrying frame of the concentrator is substantially bolted. This arrangement adds a very little to the cost of installation, insures the possibility of getting the best duty out of the machine, and materially reduces the cost for duplicate parts.

It has occurred to me that even though the amount of sulphurets in a given ore be not sufficient to justify concentration, it might be advisable to convey the pulp after amalgamation over a concentrator, having previously passed it through a "reduction" box, a large Spitzkasten, in order to sufficiently reduce volume of the pulp coming from the mill. The arrangement would certainly make a very efficient trap, producing a product which might be treated from time to time in a clean-up barrel.

In cleaning up I use a clean-up barrel and find it convenient for other purposes than the actual clean-up, in the way of working over the sweepings and workings of the mill floor, iron removed in cleaning amalgam, trash collected from behind the battery screens, etc.

The barrel is placed so as to admit of easy changing from the plate floor, with ample fall below for the installation of a sluice and head box to receive the discharge from the barrel. In discharging the barrel, the pulp passes over a small grizzly or coarse screen, within the head box, so as to separate any large pieces of material that may be present, to be afterwards hand sorted. The material passing the grizzly goes direct to the sluice, which is approximately 12 feet in length by 18 inches in width. The bottom of the sluice is laid with ordinary rubber door mats, butting ends, and held in place by cleats. This arrangement is simple and effective for collecting the mercury and amalgam. The mats are readily removed with their charge to the clean-up room. As a precautionary measure, the pulp from the sluice is run over a 3-tray rocker.

The mill flooring should be double and with sufficient slope to carry all washings into a launder extending along the entire length of the mill and discharging into a sump.

The provision for ample room and light are too often neglected in the average mill structure. Both are important factors in expediting the routine work and repairs.

In submitting these brief observations, I feel that while nothing verging on the original has been advanced, they may, in a measure, refresh ideas in connection with the subject.

### Button Balance.

Style "H" button balance, as illustrated herewith, has agate edges and bearings, star wheel ad-

justment, double-jointed skeleton hangers, fall away pan rests, thermometer and other improvements. This balance, although not classed as a portable, when provided with leather-covered carrying case, can be used for such purposes. The beam-locking device is applied to this balance. It has a sensitivity of  $\frac{1}{200}$  —  $\frac{1}{100}$  mg. 4-inch beam; dimensions of the balance are, 14"x12"x8"—35x32x20 centimeters. These balances are manufactured by the Denver Balance Co., 3000 Larimer street, Denver, Colo.

As an index of the present condition of the mining industry on the Witwatersrand, S. A., the following gives an approximate idea. During a single month of the past summer nearly 800,000 tons of ore were hoisted from the mines. This required 1,100,000 pounds of explosive and 670,000 shots were fired. Of course all of the rock broken was not ore, but the amount of ore broken and raised was equal to about 1.2 ton of ore to each hole. There are at the mines 1684 machine drills, 90% of which were in actual use. These figures indicate in a measure the activity in that single gold-producing district of South Africa.

### Exhibit at Louisiana Purchase Exposition.

The A. Leschen & Sons Rope Co. are extensively represented at the Louisiana Purchase Exposition in the Machinery Hall and also in the mining gulch. In the exhibit in the Machinery Hall is shown the classes of cable which they furnish and manufacture, besides aerial wire rope tramways, suspension bridge, haulage outfits and other equipments involving the use of wire rope.

The exhibit, as herewith shown, consists of an elaborate pavilion artistically arranged and built entirely of wire rope and wire rope fittings which they manufacture and supply.

East of this pavilion is a representation of mountain scenery with an operating tramway model 16 feet in length, built to a scale of 2 inches to the foot, showing the detail of the Leschen Co.'s automatic tramway built over a rugged contour representing a typical mountain scene.

A complete model of a wire rope suspension bridge is also shown in connection with the scenic effect, spanning a wide stream over an extensive waterfall.

A. Leschen & Sons Rope Co.'s Exhibit in Machinery Hall at the St. Louis Exposition.

Other tramways are also shown, carrying ore from different points to the millsites in the gulch below.

An aerial wire rope tramway of the Leschen Co.'s automatic system is shown in actual size in the mining gulch, with a length of 1250 feet. It is supported by two wooden intermediate towers and two steel towers. The track ropes on this tramway are  $1\frac{1}{2}$  inch and 1 inch, respectively, in diameter, made of flattened strand triangular crucible steel. The buckets hold 650 pounds of ore.

In the Leschen Co.'s automatic tramway the traction rope is guided by sheaves on the tower located at the same distance as the grip is placed below the track cable, so that the track rope is not lifted when a bucket passes a tower, and as a result no strain is developed.

One of the longest lines built was constructed for the North American Copper Co. recently at Encampment, Wyo., which was the Leschen Co.'s automatic type of machine, having a length of 16 miles and a capacity of sixty tons per hour.

A. Leschen & Sons Rope Co. have branch offices at New York City, Chicago, Denver and San Francisco. Their headquarters are at 920 and 922 North First street, St. Louis, Mo.

### Tin in the Transvaal.

While tin ore, up to now, was only known to occur in Swaziland and such parts of the Transvaal immediately adjoining the former, a new discovery of tin ore was made in May last in the center of the Transvaal, about 40 miles northeast of Pretoria. In Swaziland tin is found in pegmatite lodes, the occurrence in the Bushveld representing essentially different features. A large area of the center of the Transvaal is occupied by a red, coarse-grained granite, in which mica occurs in association with hornblende. In the parts where the new finds have been made there exists a broken zone striking north-south, along which a younger granite is found. The broken zone has been traced for 18 miles. This younger granite is red and contains scarcely any mica; it differs, however, from the old granite, as it is fine grained and richer in silica, being a variety of aplite. The fine-grained granite protrudes from the older granite in some parts in the shape of kopjes several hundred meters in diameter. The younger granite is the ore carrier. It will have to be proved by extensive prospecting work whether the occurrence of ore in the fine-grained granite will pay to be worked, or whether the narrow contraction fissures will concentrate locally so as to form workable zones.

Another occurrence of tin ore may be observed on the farm Enkeldoorn, where several prospecting shafts down to 30 feet in depth have been sunk on parallel quartz veins. These veins show a strike to the northeast (magnetic) and a steep dip to the east. The principal veins vary between 20 and 70 centimeters in width. On both sides of the quartz veins there are decomposed zones of the coarser-grained granite which are impregnated with tin stone.

A. Leschen & Sons Rope Co.'s Aerial Wire Tramway in Mining Gulch at St. Louis Exposition.

## Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 18, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINERAL OR ORE WASHING JIG.—No. 771,909; C. J. Hodge, Houghton, Mich.

Combination of driving shaft, pair of eccentrics through which shaft passes and which are adjustable transversely of shaft, flywheel mounted on shaft between eccentrics and crank connection between flywheel and each of eccentrics.

PNEUMATIC HYDRAULIC SEPARATOR.—No. 771,874; W. R. Grant, Denver, Colo.

Apparatus for separating and classifying material comprising casing for holding liquid and having outlet at top for fine material and lower outlet for coarser material and means for introducing air to rise upwardly in casing, air introducing means being interposed axially between upper and lower outlets and at intermediate height in casing and diffusing air throughout entire cross sectional area of casing and leaving passages throughout cross sectional area for free fall therethrough of coarser material.

CRUSHING ROLLS.—No. 771,949; J. A. Thomas, Los Angeles, Cal.

Combination with journal boxes, of movable shafts rotatably mounted therein, rolls fixed on shafts, shafts provided with slots, means operating through slots upon boxes, shafts provided at ends with seats, wear plugs within seats provided with threaded bearings, adjusting screws threaded into bearings and adapted to operate upon means, means locking wear plugs in seats, and lock nuts upon adjusting screws.

DUMP CAR ELEVATOR.—No. 771,899; E. O. Fehr, Orangeville, Ill.

Inclined track having pivotally movable drop portion and connecting means underneath portion for moving and supporting latter with relation to former.

ORE DRAINAGE AND LEACHING TANK.—No. 772,389; J. F. Webb, Denver, Colo.

In metallurgic filter, outer imperforate tank separated by annular space from inner drainage and leaching tank with perforated sides and bottom covered with suitable filters, and having within circumference perforated lower end of hollow compartment or standpipe through which liquids or compressed air may be introduced into tank and forced by pressure to pass outwardly through filters and perforations thereof, and having pipes through which flow of such liquids or compressed air may be reversed from hollow compartment or standpipe into said annular space and be forced by pressure to pass inwardly through perforations and filters of tank.

AUTOMATIC COUNTERBALANCING SYSTEM FOR INCLINED RAILWAYS.—No. 772,733; E. C. Morgan, Chicago, Ill.

In counterbalancing system for railway trains, combination with locomotive and train of cars, of counterweight, counterweight proportioned to counterbalance weight of locomotive and cars and portion of load, and connections between counterweight and train.

CONCENTRATOR.—No. 772,540; C. A. Smith, Los Angeles, Cal.

Concentrator table elevated in longitudinal center thereof, and having ports in longitudinal center; riffling on top of table leading downwardly from sides thereof to point adjacent to center; riffling being low at outer end and high at inner end; and means to regulate openings in center for discharge there-through of concentrates from table as they are separated from gangue, and means to give longitudinal swinging motion to table.

PIPE LINE FOR HYDRAULIC DREDGERS.—No. 772,330; L. W. Bates, New York, N. Y.

In combination with series of pontoons, pipe section carried by each pontoon; flexible joint between adjacent ends of pipe sections; pair of rods arranged upon opposite sides of pipe sections and pivotally connected to pontoons; and means for limiting movement of rods relatively to pontoons.

BLAST FURNACE.—No. 772,723; A. Latto and J. C. Callan, Braddock, Pa.

Combination with blast furnace of conduit communicating with blast furnace near top thereof, and dust collector composed of curved elbow, downwardly extending tube, angularly disposed plates arranged in elbow and having spaces between plates communicating with open air.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The United States Geological Survey reports the lead content of ores smelted by works in the United States for 1903:

Source of Ore.	Tons.
Colorado.....	45,554
Idaho.....	99,590
Utah.....	51,129
Montana.....	3,303
New Mexico.....	6,9
Nevada.....	2,237
Arizona.....	1,493
California.....	55
Washington.....	538
Oregon, Alaska, South Dakota, Texas, Missouri, Kansas, Wisconsin, Illinois, Iowa, Virginia, Kentucky.....	1,765
	86,597

Total lead content U. S. ores smelted.....292,674  
Content miscellaneous or unknown.....2,831

Production of soft lead was 83,444 tons, being the lead obtained directly by smelting non-argentiferous ores in the works of Kansas, Missouri, Illinois and Iowa. As a whole, the year 1903 was a prosperous one for the lead mining and smelting interests of the United States. The principal increase in production was in southeastern Missouri, "though the rapid development of the Cœur d'Alene mines in Idaho has more than compensated for the steady decline in the lead product of Colorado. Utah has held its own."

## ALASKA.

In the Kayak oil fields, near Kayak, the English company has sunk eleven holes this summer and reports having struck oil in each. In one well they have obtained forty-five barrels by pumping. This is used as fuel by two rigs in operation. It is said the main body of oil sand has not yet been tapped. One hole is 800 feet in depth and another 400 feet. The Lippy Co. is down 400 feet in one hole and has struck gas and oil. The Kayak oil fields are 150 miles long by 40 miles wide and the surface of the land shows numerous oil seepages. The oil is of high gravity.

The gold output at Nome for the season of 1904, now closing, will reach \$3,000,000, reports the Nome Nugget. The spring cleanup is not included in these figures. A strike has been made on Little creek. Pans are running \$100. The streak is both deep and wide. Since June 13th last, \$3,251,665.40 in gold dust and bullion has been entered at the Nome custom-house for shipment, probably \$100,000 was sent outside through the postoffice prior to the order of the Postoffice Department, which virtually shut off the shipment of considerable amounts of dust through the postoffice.

## ARIZONA.

### Cochise County.

Work on the Gold Treasure (the San Jose) mine at Naco has begun and grading for the mill site is under way. The equipment of the mill will be twenty stamps and four concentrating tables. A 7250-foot tramway will be built from the mine to the mill. The ore carries \$12 per ton, gold, and six ounces silver. Development work aggregates 700 feet in drifts and tunnels.

### Gila County.

Manager Chittenden, of the Saddle Mountain M. Co., is refitting the copper smelter at the San Carlos group, near San Carlos. It is a 40-ton water jacket. The smelter will be started next month.

### Maricopa County.

(Special Correspondence).—J. D. Marlar is sinking a shaft on copper property which he has bought near Rogers Springs. —E. Howard reports that he will put men to work on his gold mines in the Cave Creek district. —J. Maddox is working a promising gold property in the White Tank mountains.

The Arizona Bismuth Co. will install a leaching plant at its bismuth mines.

A. W. Gregg and S. Christy have incorporated the Phoenix Slate Co. They propose to quarry slate from a property north of Phoenix which they have bought. Phoenix, Oct. 23.

### Mohave County.

It is reported the Keystone mine, near Kingman, will put on men and the main shaft will be sunk to 600 feet. The shaft is down 400 feet. The ore is largely copper.

### Yavapai County.

W. McDermott, mine superintendent of the United Verde M. Co. at Jerome, says he has 450 men under his direct supervision, although there are 1000 men working in and about the mine and works at Jerome. Many improvements are being made at the United Verde. They are making connection with the new flue dust chamber, and the smelter is closed down for a few days pending the connection. There are two shafts on the property,

one to 700 feet and the other 900 feet. C. W. Clark is general manager of the United Verde mines, smelters and railroad.

The Colorado F. & I. Co. of Pueblo, Colo., is developing a group of iron mines 16 miles south of Seligman. The mines were located over a year ago. Average of tests is said to show 50% iron. A shaft 200 feet in depth has been sunk and several other shafts were carried to a depth of from 50 to 70 feet. Fifty men are at work and a diamond drill is being used to explore the ore body below the 200-foot level. The vein is 100 feet wide and is near the north end of the Juniper mountains. The ore is said to also carry from \$3 to \$4 per ton in gold. The company will build a railroad from Seligman to the mines. Limestone and other materials for fluxing the ores are found near by. Coke can be had from New Mexico or Colorado, the company being a producer of both coal and coke.

## CALIFORNIA.

### Calaveras County.

Work on the properties of the San Andreas Blue Gravel M. Co. at San Andreas is reported progressing. The hoist is being reset and pump, motors and other machinery are being put in. —Manager Nelson has started work for the winter's run at his mines at Calaveritas. His company is hampered by the break of the Emery dam last summer and much water has gone to waste and time lost. The pipe line will have to be cleaned of rocks and debris that filled it during recent rains.

### El Dorado County.

A 10-stamp mill has been put in at the Monte mine, in Gold Hill mining district, near Placerville. The company has been using a 2-stamp, triple-discharge mill to test the milling qualities of the ore taken out. They are working on a 7-foot ledge. They will run both mills by water power.

### Nevada County.

In Willow valley, near Nevada City, the Lecompton mine has been making improvements and has sunk its shaft 100 feet deeper, says Manager W. H. Dunlap. At the Federal Loan mine Superintendent L. A. Sutherland has put in a new pipe line and has unwatered the shaft. The Posey mine has its mill running again.

The directors of the Blue Ledge mine in Willow valley, near Nevada City, will put in a larger pumping plant, says President P. L. Bliss. It is intended to resume work.

Indications at the Spanish Ridge mine, near Washington, are reported improving. Sacramento men, including E. W. Hale, F. Adams and Egan Brothers, are owners. There are ten stamps running. Ten stamps more will be placed. The millwright is framing timbers for the addition. The company has been driving a tunnel and at 180 feet a ledge 17 feet wide was found, assaying \$6 in gold.

The Pine Hill Con. M. Co. has been incorporated, with principal office at Wilmington, Del. Incorporators are J. F. Mase, J. Rosenthal and J. G. Gregg, all of New York City. The company is operating near Wolf, south of Grass Valley.

The New York-Grass Valley mine, near Grass Valley, is putting in a slimes plant. Ore is being taken out and development increased. Ample water power is available. Forty men are on the company's payroll.

### Plumas County.

G. H. Goodhue, manager, says the mill and reduction works of the Five Bears M. Co., near Genesee, has been put in operation. Electricity is used as power.

C. L. Adams of Taylorsville, superintendent of the Regal mine, reports he will equip the mine with gasoline engine, hoist and pump, after which a 10-stamp mill is to be put in, the plant to include concentrating tables. Power drills will be put in at the mine, and electrical apparatus and hydraulic piping.

### San Bernardino County.

(Special Correspondence).—At the Seal of Gold M. Co.'s property here the mill is built at the shaft and the ore dumped directly into the mill over a 10-foot grizzly into a 120-ton bin; from there it passes into automatic feeders, and then two 5-stamp batteries, 850-pound stamps, 105 drops per minute; from there it goes over 10-foot amalgamating plates, then into an hydraulic separator, where the slimes are separated from the coarse sands; the slimes are treated by two agitators and the results are satisfactory. The coarse sand passes to six leaching tanks of 45 tons capacity each, and is treated for five days with good results. They extract about 40% on the plates and a little over 50% in the cyanide treatment, the ore averaging \$15 per ton. The operating expenses are high on account of the long haul from the railroad and the expensive fuel (distillate). The motive power is two 35 H. P. gasoline engines, one 15 H. P.

and one 8 H. P. gasoline engine, and two 15 H. P. engines.

Dale, Oct. 25.

### San Diego County.

J. A. Wauchope, manager of the Noble gold mines near Descanso, says the company has been reorganized and J. H. Thring of London, England, is principal owner. Manager Wauchope will put in a 100-ton mill at the mines and expects to have it set up by Dec. 1. Development will be increased.

### Siskiyou County.

J. W. Martin, president and superintendent of the Pacific M. Co. at Sciad, near Etna, has completed a flume and ditch. He will start his giants. Men are clearing the ground, making roads and preparing pipe line. —H. Wood is fitting up the Portuguese Flat hydraulic mine, below Sciad, and expects to be ready to mine by the time water comes this fall. He will open up additional ground which prospects well. —The Van Brunt mine, below Happy Camp, operated by the Oregon G. M. Co., is being put in shape to operate this season. Two bedrock tunnels are being driven to a back channel. They will be used to handle the gravel. They have cut lumber for building a higher ditch and flume, to furnish pressure for giants on the high benches of ground.

### Tuolumne County.

The John Royal mine on Knownothing gulch, near Columbia, having reverted to the owner, W. S. Blakeley, will start up again. —Under management of M. Page the Old Tuolumne mine at Wet gulch is being retimbered. —Supply of water being assured for winter operations will start at the Star mine, near Columbia, says Superintendent Olson. A compressor has been ordered and work at the mill will be resumed.

Water having been pumped out at the Jumper shaft at Stent, the contractor is sinking 100 feet additional below the fourteenth level, says the Mother Lode Magnet. Twenty stamps are dropping in the 100-stamp mill. Eighty men are at work under Manager M. B. Kerr.

The M. McCormick Co. has bought the Sirius, Belle Italia, Minot, Indiana, Fortuna and Comet quartz mines, near Italian bar, near Columbia. —The Santa Ysabel shaft, near Stent, is continuing sinking under Superintendent Loftus.

Superintendent O. J. Olsen of the Star mine, near Columbia, has resumed work. There is now plenty of water.

D. Nagle will resume operations at the Pennsylvania mine, near Carters. —Work will be resumed on the Faxon mine on Bald mountain, near Sonora, by Munroe and Lauener. A hoist is being set up.

## COLORADO.

(Special Correspondence). — Suit has been started by J. D. Babcock against the Union Pacific Railway for a tract of land near Evergreen, Jefferson county. Should the land prove more valuable as mineral land than as agricultural, he may win his suit. He has produced some high-grade lead ore.

The suit of the State of Kansas against the State of Colorado for diverting water from the Arkansas river for irrigating purposes is on trial. This is a case where the one State claims that the other has no right to use the water from the river and asks an injunction against Colorado users.

A branch road has been extended from the Colorado & Northwestern Railroad into Sugar Loaf district, above Boulder. This will do away with the long haul by wagon to Boulder and will be much cheaper and will enable the mines in this particular district to mine at a profit. The C. & N. is laying rails on its extension from Sunset to Eldora and expects to be in operation by Dec. 15 of this year. Denver, Oct. 26.

### Boulder County.

The White Crow G. M. Co. has sold its property in Boulder county to E. S. Brockman of Pittsburg, Pa., and J. S. Miller of Colorado Springs. Owing to litigation the mines were closed down about twelve years ago. It is intended by Brockman & Miller to start work next month and to re-equip the mine.

### Chaffee County.

The Tiger Lily M. & M. Co. has started men to work on its mines, 2 miles down the river below Granite.

The Woods G. M. & M. Co. of Buena Vista is operating at Pieplant, in Taylor park. The company is hauling machinery into the park for cyanide mill. J. C. Woods is part owner.

### Clear Creek County.

Near Idaho Springs the Two Brothers tunnel, in Virginia canyon, which is being driven to open the Specie Payment vein, will cut that lode within the next 150 feet. The breast of the tunnel is in 1500 feet. Superintendent Johnson has charge of operations. The completion of the Two

Brothers tunnel to the Specie Payment vein will mean the diverting of the tonnage of ore now going to the Black Hawk mills and depot to the Idaho Springs mills and shipping point, says the Times. A wire rope tramway will be built at the tunnel mouth down the canyon. The greater part of the product is taken out by lessees, and the company will continue the leasing system after the vein is reached.

Lead-covered, moisture-proof telephones have been put in at each of the fourteen levels in the Gem shaft and raise at Idaho Springs, and a lead-covered, multiple-wire cable for the signal and telephone wires has been placed in the shaft. The variation in temperatures at the mouth of the Newhouse tunnel and at the Gem shaft causes changes in ventilation. Some days the air current is down the shaft and out the tunnel mouth, and other days the reverse. —J. & E. Edwards, leasing on the fifth level in the Comstock mine, report shipping ore which nets \$60 per ton. They have milling ore in addition to the smelting ore.

Repairs have been made at the Waltham mill, near Idaho Springs, and foundations laid for ten more stamps. The Elspass mill is working. The mill will be equipped with electric power. It is running on ore from the first level of the Ward mine. The vein at surface is 27 feet wide. The smelting streak in the hanging wall at the 60-foot level runs \$40 to the ton, being 8 inches wide. Unwatering of the lower levels will be started this week. Two drifts have been driven from the 145-foot level, one on each side of the shaft.

The Lincoln Mountain M., T. & T. Co. has started operations on a group of gold and silver-bearing lodes owned by it on Lincoln mountain, near Empire. The properties of the company (formerly the Duchess group) consist of fourteen lode claims and a tunnel site, the principal one of which is the Virginia City lode. It is developed to depth of 520 feet by a shaft, but difficulty of handling water has prevented profitable operation. The company will drive a tunnel to cut the vein below the bottom of the shaft, thus draining and opening additional ground. In driving to reach the shaft the other veins of the company will be opened. The directors of the company are F. A. Maxwell of Empire, W. C. Hood of Georgetown, M. J. Spaulding, W. C. Loughbom and W. P. Herrick of Denver.

Near Idaho Springs, the Allen mill, on Chicago creek, has resumed operations under management of T. B. Crow. Changes and additions have been made. The Allen mill is equipped with water and steam power, and has daily capacity for treating fifty tons. A number of mines which are closed down for lack of milling facilities will resume operations.

Near Georgetown, machinery is set up at the Sidney tunnel, owned by the East Argentine M. Co., and progress will be made in driving the tunnel. Power is furnished from a dam 2000 feet above the power building, having a fall of 225 feet. Manager Sidney says development shows bodies of high-grade ore. —A shaft is being sunk on the Kitty Owsley vein by the Manhattan Union Co. It is down 220 feet, the bottom showing 30 inches of galena. Drifts will be started both ways from the shaft.

### Custer County.

The owners of the Terrible mine at Ilse will replace the milling plant that burned a year ago. The mine produces cerussite (carbonate of lead).

The August Kappe smelter in Custer district has been sold to the Wolcott G. M. Co., operating the P. & O. mine, near the Bassick mine, at Querida. The plant will be overhauled and remodeled.

### Eagle County.

The Black Iron mine at Bell's Camp, near Red Cliff, has a contract from the Colorado F. & I. Co. for 8000 tons of iron ore and has completed a similar contract for 2000 tons for the Pueblo plant. The new contract will be filled at the rate of 500 tons per week.

### Fremont County.

Florence reports say improvements are being made at the Page mill. Foundations are made for a boiler that will add to capacity of the mill. For the present only the tailing dumps of El Paso and National mills are treated, but arrangements are under way for a supply of ore from Cripple Creek district. —The Great Western Coal Co., which has bought the Cuckoo mine, west of Florence, is building additional houses at the mine for the coal miners, and more men will be put on. —The Howells Oil Co. has been formed at Florence with T. M. Howells as president. It owns 160 acres of land south of the city. Work of drilling the first well will be started.

### Gunnison County.

Near Pitkin, the Gold Bar mine (formerly the Old Homestake lode), 800 feet

east of the Chloride, is owned by W. Scott, who has sunk a shaft and run a drift north for 100 feet, which is showing ore. —The Hilltop group, consisting of five claims, is owned by T. Stanley and G. Adams. Work has been going on in a tunnel. A shaft, also, is on the group. The owners will put up a hoist to sink the shaft deeper.

At Ohio City the Sharpe & Stevenson group of seven claims has been sold to the Raymond Con. M. Co. for \$10,000. The property is near the Raymond tunnel, which is showing 25 feet of gold ore. It is reported high-grade gold ore has been opened in the lower levels of the Maple Leaf mine. The vein is 4 feet wide, says Manager E. M. Lamont.

#### Lake County.

The Cloud City mine at Leadville is shipping 100 tons of manganese ore a month, and could be increased to 500 tons a month, says the Times. The last returns gave 18% iron and 35% manganese. This ore is taken from the lower levels, 504 feet. Drill holes have been sunk from the bottom of the shaft and it is expected the shaft will be sunk this fall to the lower zone. The territory is drained by the Coronado and Penrose mines' shafts.

At Leadville, the electric plant of the Yak Tunnel Co. includes a power house, an electric tramway extending over 3 miles of track underground, electric hoists and a lighting plant for all the properties entered or traversed by the Yak tunnel. The tunnel enters from California gulch under Iron hill and into Breece and Johnny hills. Both in its main line and its branches it passes through several important producers of mineral. The tunnel was first driven as far as the Silver Cord mine and then extended to Ibex No. 4 shaft, 2 miles from the mouth. Branches have been driven in several directions. There are three miles of tunneling completed. Up to the present, the power used in the operation of the drills and hoists in the Yak and other properties reached by the tunnel has been compressed air. The compressor plant is at the mouth of the tunnel. Ore was dropped into the cars through chutes coming down from the stopes and drifts to the main tunnel and its branches. Mules were used to haul the ore cars out of the tunnel. One mule would haul eight to ten cars at a trip and would make seven trips a day. About fourteen tons of ore or other material was thus hauled out by the mule at each trip. In the electrical installation the greatest difficulty to be overcome was the water. A heavy stream flowed through the tunnel. Superintendent J. E. Champion put the drainage ditch under the track. There were places in the tunnel where the cars had to be hauled through water which flowed over the bed of the tunnel to a depth of 8 to 14 inches. After the ditch had been placed the track was made dry with exception of a short distance where the water sometimes attains depth of 4 or 5 inches. The electric locomotive put in is 32 inches wide, double type, and arranged to run in 5 inches of water. It weighs five tons. It hauls twenty cars at a trip and makes fifteen trips a day (thirty-five tons a trip). The surface plant consists of two dynamos of 75 kilowatts each (about 100 H. P. each); 14,300 feet of trolley wire have been strung through the tunnel and its branches, 2 miles of it being the main tunnel, where it extends above the Peoria about 500 feet, or within 1500 feet of the Ibex No. 4 shaft. The voltage used is 250. Hitherto hoisting from the Cord mine has been done by means of compressed air. Compressed air has been used also in operation of the drills. The hoists and pumps operated with compressed air have been replaced by electric hoists and pumps. The compressor is now used only for driving of the drills and more drills will be put in. This increase in facilities of the tunnel company will lead to more liberal concessions in hauling waste from other properties reached through the tunnel, says Superintendent Champion. It will also enable the operation of properties farther in the tunnel than are being worked at present. There has been but little work done east of the Bob Ingersoll. It is expected the Golden Eagle and Ibex No. 4 will be put in operation. The Roe leases, which have been shut down because of former expense of operation, will be opened on the Sierra Nevada. An electric hoist will be put in. The Tankerstown and Bob Ingersoll, in which a body of mineral has been opened up, will be further developed. Ore is being shipped from the Silver Cord, the Tankerstown and the stopes in the Ruby and other properties reached through the Silver Cord.

Contractor T. Raney, sinking the shaft on the Bessie Wilgus claim on Rock hill, near the Reindeer mine, at Leadville, in twenty days after ground was broken for the shaft had the bottom down 209 feet from the collar, says the Carbonate

Chronicle. The shaft is still in the glacial wash and will enter solid formations in another week. The shaft is dry. The Reindeer, on the adjacent property, is a dry mine. This change from the conditions which prevailed in that region fifteen years ago when the Sequin shaft was sunk is said to be due to drainage of the pumps in the downtown district near Rock hill and to the drainage through the Yak tunnel. T. B. Wilgus is owner of the Bessie Wilgus.

The Iron-Silver M. Co., working on the Tucson shaft at Leadville, is making improvements in the surface equipment and in developing underground. The shaft is of two compartments, says Manager J. F. Walsh. A larger galloways frame has been built. Work is being carried on at the Moyer and North Moyer shafts, and from those two mines output of 11,000 tons a month is being taken. The Dome shaft is being sunk by the Iron-Silver Co. on Rock hill near the Reindeer mine.

At Twin Lakes machinery consisting of a 50 H. P. boiler and engine, a two drill air compressor, 2½-inch drills, pipe line, etc., are being put in by the Manhattan M. & P. Co. A tunnel is being driven to cut fourteen veins.

The Empire Tunnel Co., operating at Empire and Georgetown, in Clear Creek county, has started work on the Cloud City mine at Leadville and will sink the shaft additional 200 feet—to 700-foot level. The Cloud City group adjoins the Midas M. Co.'s mines. The Empire T. Co., which has its headquarters at Georgetown, proposes building a smelting plant and treating its own ores, and expects to develop fluxing ores from the Cloud City mine, says C. Jarbeau, secretary. W. S. Jones is manager of the Cloud City.

#### Ourray County.

The Ourray Plaidealer says the Camp Bird mine, at Camp Bird, has been bought by an English company. J. H. Hammond, who represents the English buyers, last week made final payments. Approximately \$7,000,000 has all been paid.

#### Pueblo County.

The capacity of the Philadelphia smelter at Pueblo will be doubled, says President S. Guggenheim. He states that all the smelters at Pueblo are to be operated in full.

#### San Juan County.

The Adelia M. Co., that has been erecting buildings and putting in machinery on the Waldron group near Mineral Point, near Silverton, is unwatering the 100-foot shaft. Coal and provisions are being put in for the winter. Twenty men are working.

#### Sao Miguel County.

The mines of the Tomboy G. M. Co., Ltd., in Savage basin, 5 miles from Telluride, report progress. J. Herron, manager, says the principal vein from which they have been extracting ore is 14 to 18 feet in width. The Tomboy vein is being worked by lessees. The lessees' ore is treated at the old mill, which has a capacity of 225 tons daily. The company is working the Argentine vein.

The Butterfly-Terrill G. M. Co., near Telluride, reports progress this season. The 30-stamp mill, connected with the principal workings of the mine by a wire tramway 1500 feet in length, has been operating steadily. The ore is free milling, and values obtained by amalgamation have run \$6000 to \$10,000 per month since January, 1904. It is intended, says Manager Bullock, to start work on a tunnel whose portal will be within a few feet of the milling plant. The tunnel will be from 2000 to 4000 feet in length, and will cut the Alta vein 750 feet below the present workings.

#### Summit County.

Manager J. S. Strickler of the Monte Cristo mine, near Breckenridge, says his company will build an addition to the mill and increase capacity to 100 tons output per twenty-four hours. The machinery will consist of tables, jigs and a crusher. —Ground has been broken for the mill of the Old Union Co. The mill will use zinc-separating process. —On the Montgomery shaft sinking is suspended and the shaft is being lined. A cage and other machinery are going in.

#### Teller County.

(Special Correspondence). —El Paso Con. G. M. Co., on Beacon hill, produced in August \$158,000. Beginning with October this company doubled its dividends from 1 cent to 2 cents per share. A large reserve fund is being put by for future use.

Elkton, Oct. 22.

(Special Correspondence). —The Santa Rita is being unwatered and put in shape for producing by A. C. Denslow. He is taking out ore in the stopes in the upper levels. A cyanide plant is under consideration by Manager Denslow.

Victor, Oct. 22.

(Special Correspondence). —A shoot of high-grade free gold and sylvanite ore

was struck in the Rose-Maud mine this week. The extent of the strike is not yet known.

Hedrick, Smith & Stowell are leasing on Block 11 of the Work M. & M. Co. They report opening high-grade ore. The shaft is down 314 feet, but all the work is being done from the 75-foot level.

The Anaconda and Colorado Moss mines are being operated by lessees. The Peggy is producing. The Morning Glory on Raven hill is operated by the Doctor-Jack Pot Co. and shipping 500 tons per month. Work is carried on from the 700-foot level up.

Anaconda, Oct. 22.

(Special Correspondence). —Twenty-five hundred tons per month is the shipping record of the Elkton Con. G. M. Co. on company account, not including lessees. About 140 men are on the payroll, working two shifts. Work is being done between the fifth and eighth levels, inclusive. The eighth level is being extended north and south from the shaft. On the seventh they are drifting south, also drifting south on the sixth, and on the fifth level drifting both ways from the shaft. A Crane washer has been put in. They also have a new sampling plant and all the ore is sampled before shipping. The ninth level of the mine has been drained by the El Paso drainage tunnel. E. M. DeLaveargne is manager and R. P. Windsor superintendent.

Elkton, Oct. 23.

(Special Correspondence). —Mining generally is in good condition throughout the district and more properties are being started daily. Everyone seems to be well pleased with the manner in which things have settled down. There are but few idle men in the district. Everyone is working who cares to. Rich strikes are being made daily and new bodies of ore opened up.

Cripple Creek, Oct. 23.

The City of Cripple Creek G. M. Co. has been incorporated by E. A. Norton, C. E. Miesse and B. W. Coleman. —J. A. McClurg has a lease on the Colorado & Cripple Creek property (the Rittenhouse) on Gold hill.

At the two-compartment shaft being sunk on the Pueblo claim of the Free Coinage mine, near Cripple Creek, Lessee A. C. Carper & Co. will put in a plant of machinery. —The Hull City placer, in Independence, closed six months ago by an injunction, has resumed operations. —The Vindicator company is pumping 300 gallons of water per minute, which enables the company to operate in the tenth level.

Shipments of 100 tons of ore daily are being made by the Stratton's Independence mine at Battle mountain, at Independence, giving average of \$50 to the ton. There are nine levels under operation, with 250 men employed by twenty-seven sets of lessees. Besides this the company has fifty men, divided into two shifts. When the mine was operated entirely by the company the average returns for ore were from \$20 to \$25 per ton. While there is now being from 100 to 150 tons of ore shipped daily, average \$50 per ton, when the property was being worked on company account the daily tonnage was 400 tons per day, and while the company was breaking the same ore shoot that is being mined by lessees they were breaking wider than at present. Lessee Merrifield and associates are washing the dumps of the Independence.

C. R. Burch says he will build a cyanide mill on the property of the Little Giant M. & M. Co. in Pony gulch, near Cripple Creek. It will be a 50-ton plant.

The District G. Extraction Co. has been incorporated and has started work on a lease of the Little May claim of the Magna Charta ground on Ironclad hill, Cripple Creek. The company expects to build a cyanide mill of 35 tons capacity. F. J. Buck, in charge, claims tests have shown \$4 per ton in gold. Besides working through the tunnel where a 7-foot vein is opened up, the company expects to sink a shaft on which a plant of machinery will be placed. A. M. Story is president and F. J. Brooke secretary.

The Olive Branch G. M. Co. has sold its property to A. C. Mackey. The Olive Branch Co. owned sixteen acres of ground on Ironclad hill, Cripple Creek, adjoining the Jerry Johnson group.

#### IDAHO.

##### Bingham County.

The mines owned by the Carriboo G. & C. Co. on northwest side of Carriboo mountain, near Carriboo, are showing values, says D. H. Swinehart of Pocatello, part owner. They will sink the shaft deeper to open up a body of the gold and copper ore. The company has six full claims and a fraction. There is plenty of water and timber accessible. The property is 42 miles from Soda Springs and 65 miles southeast of Idaho Falls, with a good wagon road all the way. —T. D.

Coder of Idaho Falls, operating in Spring Mountain mining district, 100 miles northwest of Idaho Falls, says the principal ores are lead, copper, silver and gold. Assays for gold carry from \$8 to \$20 per ton. The camp is 75 miles from a railroad, and it costs \$8 to \$10 a ton to haul to the railroad. Ore has been shipped to points East. J. Reed et al. of Curd d'Alene have bought mines in the camp and have bonded other property, and have men at work. They are shipping ore. The principal mines are the Winnie, Gilmore and Nichols. The Winnie has a shaft sunk 200 feet and has a 6-foot vein of galena. The Gilmore has a shaft of 150 feet and has a vein of galena containing gold. The Nichols has a shaft of 100 feet, principally lead, gold and silver. This mine is going to put in a 1000-foot tunnel this winter. At present this district is working 125 men.

##### Boise County.

At the Friday group, at Pearl, the mine and mill will be lighted by electricity. Power will be furnished by the Payette Power Co.

##### Idaho County.

G. L. Hedges of Lewiston has the Gold Seal group of four claims, in Four Mile district, 8 miles northwest of the Hogan property, near Elk City, and work is started. The Gold Seal M. & M. Co. has been incorporated by G. S. Bailey, G. L. Hedges, F. Nelson, J. Nelson and R. V. Kuhn. Hedges will also start work on the Missouri & Idaho mines and the 1-stamp mill will be run. The two properties are adjoining.

##### Kootenai County.

H. M. Williams, manager of the Panhandle S. & R. Co., reports work progressing. The buildings and flumes for the smelter near Sandpoint, on Lake Pend d'Oreille, are completed. The company expects to have machinery set up by Jan. 1st.

##### Shoshone County.

W. H. Smiley of Spokane, Wash., and Detroit, Mich., men have closed a deal for the Red Cloud group of nineteen claims, 8 miles southeast of Pierce City, for \$50,000. They have bought a stamp mill of the Pioneer group, 45 miles away, and are moving it to the Red Cloud.

The Idaho G. M. Co. has been incorporated by J. F. Stevens, F. Watson, W. Stevens, H. C. Belt and W. J. Thayer, with the principal place of business at Spokane, Wash., to operate near Wallace.

The Rex M. Co. has been incorporated by H. Wick, A. B. Campbell and J. A. Finch of Wallace, C. L. Andrews, D. L. Dutton, L. J. Coleman and M. H. Simons of Augusta, Me. J. C. Feehan of Murray is resident agent of the company.

J. B. Collins of Pierce City, near Greer, reports work increasing there. He has sunk a shaft on the Oxford mine and started crosscutting. He expects to put in machinery for deep working next spring. A 9-foot vein of high-grade copper ore has been opened up. The mine is 18 miles north of Pierce City. —Development work is proceeding on the Wild Rose and the tunnel is opening up a ledge at vertical depth of 110 feet. The ledge is 12 feet wide with mill tests returning \$65 per ton. —The Ozark is working a few men with satisfactory results. The 2-stamp mill is running.

At Mullan, under W. A. Bradley, superintendent, remodeling the Gold Hunter mill has been started. With exception of the jigs, all the machinery is being refitted and replaced. Sixteen concentrators will be put in, ten Wilfleys and six vanners. When the changes are complete, the capacity will be increased by 100 tons. Present capacity is 150 tons per day. The ore has been difficult to treat. It carries a heavy gangue. The Hunter ore carries 1½ ounce of silver to each 1% of lead. The Morning mine, adjoining, averages ¾ of an ounce of silver to each 1% of lead. The flume is also being entirely rebuilt. It is 4500 feet long. The mine is closed. Ore is blocked out ready to be extracted.

##### Washington County.

The smelter plant of the Ladd Metals Co. at Landore, near Mineral, designed to treat ores of the Seven Devils district, is said to utilize wood instead of coke or charcoal to generate heat for smelting the ore. Gas is made from wood in a furnace, and is fed through jets to the smelter stack. The smelting furnace is a combination stack and reverberatory. The reverberatory furnace system will be extended. No fluxing ore is used, and the product of the smelter is said to be 95% copper.

The Idaho M. Co. has started to work with men on its mines on Camp creek near Landore, near Mineral. C. F. Macey, principal owner, says they will build a wagon road from Landore up Indian creek to connect with the Ford road to Black Lake. A road will be built from Camp creek connecting with this road 2 miles above Landore to haul ores from Camp creek mines to smelter.

**KANSAS.****Wyandotte County.**

Last week fire destroyed three buildings of the plant of the United Zinc & Chemical Co. plant at Argentine, Kan., causing loss estimated at \$100,000.

**MICHIGAN.****Houghton County.**

The second shaft of the Calumet & Hecla mine at Calumet is reported bottomed in the Kearsarge lode. The first Kearsarge shaft of this mine is being lined with cement. Diamond drills are still working west of the mine, but have not yet found the Tomahawk conglomerate.

**MONTANA.****Jefferson County.**

The tunnel being driven into Red mountain by the Inter Ocean M. Co., near Basin, is in 1200 feet.

The Pennsylvania & Montana M. Co., operating the Hattie Ferguson mine in Cataract district, near Basin, is increasing development work. The shaft has been sunk to 150 feet. The company will build a concentrator, the capacity of which will depend upon result of developments on levels below the second. Concentrating tests have been made by means of a jig.

J. P. Porter, W. C. Draper, J. J. Fitzpatrick and D. Salvail of Helena have a bond on the Straumberg claims near Corbin. They are placing machinery and will sink on the vein.

J. McNaught, president, and R. J. McKay of Cleveland, Ohio, secretary, of the Basin & Elliston Railway Co., report it is proposed to build between Basin, on the Great Northern Railway, and Elliston, on the Northern Pacific. It is expected the line from Basin to the smelter of the Cataract Co. at Jack creek, 10 miles from Basin, will be running this fall. The road will be 40 miles long. It is the intention of the company to reopen the Ontario mines.

**Lewis and Clarke County.**

The Mono Metal Production Co., which has been building a dredger to work several hundred acres of the bars in the Missouri river near Canyon Ferry, has its outfit completed and will make a trial run this week.

F. C. Lavigne of Spokane, Wash., has a lease and bond on the London, Seventy-seven and Little Tom copper claims and will start development. The property is north of Meaderville, near the Jesse mine. The bond is for \$60,000.

**Madison County.**

The Moonlight M. Co. has been incorporated by Canol, Martin & F. L. Sizer of Helena and has bought the Moonlight mines in this county.

Removal of the 100 stamps, concentrators and other machinery in the gold mill above Pony, sold by the Mountain M. Co. to Denver, Colo., men, is under way.

**Missoula County.**

The Deep Creek G. M. Co. has been incorporated, with headquarters at Missoula. Directors are: N. B. Graff of Pittsburg, Pa.; A. E. Anderson, M. H. Hoey, J. C. Godfrey, O. T. Hilgendorf and C. E. Geissler of Chicago, Ill., and W. E. Hales of Missoula.

P. J. McGowan, J. S. Davey and A. Thompson have a lease and bond on the Boulder group back of Basin, and they are prospecting and taking out ore. Their lease also includes the stamp mill on Basin Creek mine of the group.

**Park County.**

The washers at the Chico placers having proved too small, the operations of the Con. G. M. Co. at Chico have been suspended for the season, says the Enterprise. Weather would compel a suspension of operations next month. J. Gegan has been in charge. A larger washer will be built, so as to be ready as soon as weather permits of operations next spring. A steam shovel is used.

**Silver Bow County.**

The station 800 feet below surface on the Reins mine, near Meaderville, has been enlarged to put in a heavier pump, and timbering is under way. The column pipe is being placed in position. The company will resume extraction of ore on the 800-foot level, says President Reins.

The United States Supreme Court, on the 24th inst., decided against F. A. Heinze in the case of Heinze vs. the Butte & Boston Con. M. Co. The case involves title to the Snohomish and Tramway mines, near Butte. Heinze claimed a half interest in the Snohomish claim and a third interest in the Tramway.

**NEVADA.****Esmeralda County.**

Weber & Ish have bought the Alhambra and Atlanta claims on Vincicator mountain, near Goldfield. They have also bought the Bonanza, south of Diamondfield, which adjoins the V. E. S. on

the east, and have made the first payment on the Mammoth and Amazon claims, between the Black Buttes and the Brooklyn group.—E. L. Mims & Co. have bought the Daisy, Belcher and Jockey claims, adjoining the Black Buttes at Diamondfield on the east, and have organized the Black Butte Extension M. Co. to operate the same. Men have been put in and development work started.

At Goldfield, Shove, Aldrich & Co. of Colorado Springs, Colo., have made payment of \$40,000 on seventeen claims, including the Lone Star group. On the Lone Star ore has been opened up in several places, and Patrick & Anderson have a lease in which they have 18 inches of ore at depth of 80 feet which averages \$100 per ton. The Lone Star M. Co. of Nevada will be organized. R. W. Griswold is interested.

**Lincoln County.**

At Searchlight, the Pompeii M. Co., says Manager F. J. Spare, will equip the mine with machinery for opening up at least three more levels. A 25 H. P. gasoline hoist and a Cornish pump will be set up. The work in progress consists of drifting both ways on the bottom level. Manager Spare will straighten the shaft.

**NEW MEXICO.****Eddy County.**

C. W. Maxson, T. E. Teegarden, D. L. and D. A. Casselmann of Los Angeles, Cal., with Eastern men, are putting in drilling equipment and will develop their oil lands northwest of Carlsbad, 30 miles, and comprising an area of four townships. L. G. Sarnow of Los Angeles is superintendent.

**Grant County.**

The Comanche M. & S. Co. has bought for \$1,000,000 the Hearst estate mines at Pinos Altos. Two one-third payments have been made. In the sale are included the Gillette mine, surface and underground improvements at and around Pinos Altos, office and store buildings, sixty dwelling houses, a 700-acre ranch and water right, a pipe line 6 miles long and a reservoir at the mines, besides the Thayer, Hearst, Pacific, North Pacific and other shafts. The company has a 200-ton smelter in operation at Silver City.

**Lincoln County.**

The Old Abe mine at White Oaks, which has been operating under a lease, has shut down.—A. Wingfield and J. Spencer, who have been working on the Little Mac mine, near White Oaks, are milling their ore in the Old Abe mill.—W. Watson and W. Hoyle are doing exploration work on the South Homestake mine at White Oaks, on which they have a lease.

**Rio Arriba County.**

Work is reported increasing in the mica mines at Petaca, 15 miles southwest of Tres Piedras. Several carloads of both sheet and scrap mica have been shipped.—Work continues on the Dillon Dev. Co. tunnel in the Bromide district, near Tres Piedras. The tunnel is in 500 feet. The shaft is above the tunnel and is in ore carrying copper, silver and lead. The company has an electric light plant, electric drills and air supply pipes.—The Tampa mine, in Bromide district, is down 450 feet. The company is putting in an 800-foot cable and an air compressor.

**OREGON.****Baker County.**

A strike is reported in the Emma group, Cracker Creek district, near Sumpter, bonded by A. P. Smith, who resumed development work by driving a drift. This when in 30 feet opened an ore body 6 feet wide assaying \$20. Another tunnel has been started below. Buildings are being erected. Ore from the upper tunnel will be sacked and hauled to the smelter.

Sumpter reports say that the Buckeye group, Cracker Creek district, has been sold to W. F. Kippen et al. of Spokane, Wash., for \$65,000. Ore is being taken out and sacked for shipment to the Sumpter smelter.

Baker City reports say fire broke out on the 21st inst. in the lower workings of the Baisley-Elkhorn mine, 20 miles west of there. A mountain stream was turned into the upper workings and after seven hours' work the flames were under control.

The Buckeye group, consisting of four claims, on divide between Bourne and Rock creeks, 20 miles northwest of Baker City, has been bonded to W. F. Kippen of Spokane, Wash., for \$65,000. Kippen also bonded the American, an adjoining claim, for \$20,000.—The double track tunnel to pierce Elkhorn mountain a distance of 3500 feet is in 230 feet. The tunnel is being run by the United Elkhorn M. Co. It will tap the main Elkhorn veins at a depth of 3000 feet. About forty men are working.

**Douglas County.**

It is reported that the Oregon Securities Co. will start to operate its 30-stamp mill at Bohemia by Nov. 10th. Sufficient water is in sight to continue work. Development is progressing.

**Grant County.**

M. A. Butler, secretary of the Consolidated M. Co. of Copperopolis, near Granite, reports work progressing favorably. The number of men at work has been increased and two drills have been put in, operated by compressed air. The ledge is 57 feet wide. Butler says a concentrator is being considered.

At the Red Boy mine, near Granite, 20,000 feet of lumber will be cut to be used in the construction of a flume from Olive lake to the mine. Two routes have been surveyed for the course of the flume, one being 4 miles and the other 6 miles. The flume will furnish water power for an electric power plant for operating a hoist and other machinery.

C. J. Allen, managing owner of the Monumental mine, has eighteen men working at the mine. The Monumental mine is 8 miles from Granite. The reduction plant at the mine is arranged for roasting, dry crushing by stamps, re-roasting and pan amalgamation, will be remodeled and equipment replaced by stamps for wet crushing, plate amalgamation, jig concentrators and cyanidation.

**Lane County.**

G. Waggoner, manager of the Oregon Blue River M. Co., operating on Blue river, east of Eugene, says considerable development work has been done and it is intended to build a 10-stamp mill in the spring.

The Great Northern Development Co., at its mines on Blue river, crosscut at the 100-foot level a body of ore 30 feet wide. Mill machinery is being put in to crush sixty tons of ore per day.

**Jackson County.**

A cinnabar mine has been opened on Palmer creek by J. H. Ray of Medford and A. McKee of Upper Applegate. A retort will be put up in the spring.

**Josephine County.**

Grant's Pass reports say thirty tons of machinery have arrived and is being set up at the power dam of the Golden Drift M. Co., near Grant's Pass. Four turbines have been put in and connections of shafts, pulleys and wheels are being made. Centrifugal pumps of five-step type will be put in. The Golden Drift Co. is preparing its placer diggings in the red clay hills above the dam for increased work this winter.

W. Kramer of Myrtle Creek, owner of the Kramer & Palmer mine, on Whisky creek, near Mount Reuben, says he will put a stamp mill on the property. It is free milling ore. Development work is being done on the Benton mine, owned by J. C. Lewis of Portland.

Grant's Pass reports say the Wilson & Meredith hydraulic mines of the Illinois River district have been leased for the winter by A. K. Anderson. The property includes 200 acres of ground on both sides of the Illinois river, but operations are confined to a bar of forty acres. A 7-mile ditch supplies water, four giants and a grizzly being operated. The sluices are provided with undercurrents for catching the black sand and saving the platinum values.

Samples of high-grade cinnabar are reported taken out of a quicksilver prospect on Pickett creek, north of Grants Pass, by J. M. Farmer. The ledge is said to be a contact between walls of shale and porphyry.

The Lucky Queen quartz mine at Leland is putting up a quartz mill.

The Maid of the Mist mine on Thompson creek, owned by B. Thurston of Applegate and White & Armstrong of Grant's Pass, has developed ore by tunnel driving. They will put in a mill and increase operations. They will start with a 3-stamp mill.

**SOUTH DAKOTA.****Lawrence County.**

The Tinton Tin Co. at Tinton last week shipped a sixty-ton lot of tin concentrates and closed down the mill to enlarge it to double its present capacity. There is reported a supply of ore uncovered to keep the enlarged mill running. The mill has paid expenses from shipments of concentrates, says Superintendent M. Lyon.

The Gilt Edge-Maid mill is enclosed and nearly all of the machinery is in place. It is expected the plant will be running by November 15th. Delays have been experienced in arrival of machinery, etc. The ore is expected to produce a large amount of slimes, and vats are being set up to handle that product. The machinery will be driven by electric motors. The transmission line from Pluma is completed. Several motors will be put in the mill for driving separate parts. The mill will contain a jaw crusher, the ore then

passing to a pair of roughing rolls and crushed to 1 inch. From there it will be elevated to a bin above the grinding mill, which will crush in cyanide solution to 20-mesh, equipped with silver-plated copper plates for saving the free gold, of which the ore contains a small amount. From that the pulp will be elevated to the separating department where it will pass through two 8-foot cones. The underflow from each of these cones will drop to two 54-inch cones for final classification, the overflow in all cases going to the slime vats and the coarser to the sand vats. The sand vats are three in number, 27 feet in diameter and 10 feet deep, having capacity of 200 tons. The slime vats are 20 feet in diameter by 20 feet depth, four in number. Below the leaching room is the precipitating room, in which are iron precipitating barrels and underneath are two sumps. Below the precipitating room will be pumps. On lower end of mill is the assay office and melting room. On the hill in the rear of the mill are the mine openings from which the ore supply will be drawn. The ore occurs in a porphyry dike, and the values are \$5 to \$6 per ton. The ore is oxidized, carrying but a small amount of pyrite. G. A. Duncan is manager, with offices at Galena.

**UTAH.****Beaver County.**

The Majestic C. Co. at Milford is shipping ore from the Old Hickory mine containing copper values. Product of the Harrington & Hickory lead-silver mine is also being shipped.

M. Cullen at Salt Lake City has put men at work on the Wild Bill and Burning Moscow mines in South Star district, near Milford.

From Frisco to Newhouse, distance 7 miles, the descent is 1200 feet. Camp Newhouse is near the edge of Wah Wah valley, 2 miles down from the mouth of the Cactus mine tunnel, which, when completed, will be over 1 mile in length. It is expected connection will be made in the tunnel by Jan. 1, 1905. About 200 men are employed in mine and tunnel, erection of concentrating mill, etc. The 700-ton mill will occupy a ground space of 96x250 feet. The iron smokestack, now completed, is 165 feet high. Superintendent of Construction J. Deidrich says he is handicapped on account of slow delivery of material. Grading of the railroad from the depot to the mouth of the tunnel, about 3 miles, is being done. The grade is 4½%. The ore will be brought down to the concentrator by gravity.

**Grand County.**

A company of Salt Lake City men is being organized by Manager W. R. Wheat of the Grouse Mountain Co. to operate at head of Miners' basin, near Basin, the coming winter. The company intends to tunnel into Mineral mountain from south side in Corsair gulch, and expects by spring to have ground opened sufficiently to warrant building a cyanide plant. Work is progressing on the Grouse Mountain plant, says Manager Wheat.

**Juab County.**

The Utah mine of Fish Springs has bonded the holdings of the Galena M. Co., operating at the same place. It is the intention of the Utah Co. to sink its shaft deeper. Before sinking is started more power will be provided and the boilers at the Galena will be moved to the Utah plant.

**Salt Lake County.**

(Special Correspondence).—The Queen mill of Butterfield canyon, Bingham, of which F. B. Whitmore is superintendent, is equipped with a Blake crusher, one 16x36-inch set of rolls, four three-compartment jigs, one single-compartment jig, one double and one single-compartment Michigan jig, two Wilfley tables, one 6-foot and two 4-foot vanners, ten stamps and three trommels. From the crusher the ore goes to No. 1 trommel, which is a 2-mesh, the oversize going to the rolls. The 2-mesh and under goes to No. 2 trommel, which has a 4-mesh and a 3-mesh screen. From 4 to 3 goes to No. 2 jig and the oversize (2-mesh) goes to No. 1 jig. The undersize of 4-mesh goes to No. 3 trommel, which has a 1½ m.m. and 3 m.m. punched screen. From 4-mesh to 3 m.m. goes to No. 3 jig, undersize from 3 m.m. to Michigan jig, undersize from 1½ m.m. to launder classifier, the coarse going to No. 4 jig, the fines to the Wilfleys and the overflow to 6-foot vanner. The two 4-foot vanners are used to handle slimes from the water that is pumped back. Having only twenty-five gallons of water per minute, it has to be settled and used over again. The ore runs about 9% lead and tailings assays show only a trace of lead. The middlings are elevated to the battery bins, where they are stamped to 14 mesh and run over No. 6 jig and tables. Owing to the small amount of middlings, it is necessary to run the stamps only about one day a week. The

mill is running one shift daily at present and handling about twenty-five tons per day.

Bingham, Oct. 24.

B. Sewall, vice-president of the American S. & R. Co., says his company proposes making extensive improvements at its plants at Bingham during the next year.

The management of the United Bingham mine of Bingham has leased the Heaton mill and will reduce its second-class ore to concentrates there, says the Deseret News.

The Utah C. Co., operating in the copper-bearing zone of Bingham, says Manager D. C. Jackling, has its concentrator in full operation at Copperton, in lower Bingham canyon. Development of the mining ground, 2 miles farther up the canyon, is under direction of Mine Superintendent McDonald. The first unit of the plant was placed in operation several months ago and the second unit has been completed. The plant is reducing to concentrates 600 tons of ore per day and is making a product which yields the company \$75,000 a month, says Manager Jackling. With the equipment provided, 1000 tons of concentrates are produced monthly which carry values of 35% copper, associated with it being values of gold and silver. The basis of concentration is twenty tons into one.

The 1200-foot tunnel contract awarded by the Great Western G. & C. Co. in Big Cottonwood mining district, near Alta, a year ago, has been completed. The tunnel is 1620 feet long, but is expected to take 400 feet more to cut the mineral zone. The work is to be continued through the winter. The Great Western adjoins the Daly-Judge group on the west. It is west of Park City. D. Evans is manager.

#### Summit County.

Manager G. D. Turner of the South Quincy M. Co., at Park City, says the pumps have cleared the underground workings of water and work of cutting out a station at 600-foot level, for a compound condensing pump is in progress. The pump has capacity of raising 300 gallons per minute from a depth of 1000 feet.

The Glencoe mine at Park City has ten men working under Superintendent G. R. Hancock. The mine is being put in shape for winter work. Sinking has already begun in the winze where ore was struck.

#### Tooele County.

J. Kirk, superintendent of the Con. Mercur mines and mill at Mercur, says he is putting through the mill 730 tons of ore daily and that the rock is maintaining payable average.—The roaster at the Sacramento Co.'s Mercur plant is again in operation.

The Ophir Tunnel Co. has been incorporated with A. B. Herrmann, president, B. J. Stewart and J. A. Butchart. The company owns mining claims in Ophir mining district.

W. L. Wiswall of Salt Lake City, manager of the Greene Reduction Co., which has a lease on the mill and tailings dump at the Geyser-Marion mine in Mercur, says the mill is handling an average of 150 tons of ore per day. The company has thirteen men on its payroll.

### WASHINGTON.

#### Ferry County.

Republic reports say the Midnight M. Co., which controls the Mountain Boy group at Park City, on the Colville reservation south of Republic, has men taking out ore. An assaying laboratory has been put up. C. E. Varrill, in charge, says for the present ore will be packed to Republic, but later, when the wagon road into the camp is completed, the ore will be shipped by wagon.

Work has been resumed in the Lucille Dreyfus mine, near Danville, and next week the lessees expect to begin shipping to the Grand Forks, B. C., smelter.

#### Stevens County.

Machinery for another 50-ton concentrator is being set up at the Portland-Velvet mine, on Sofia mountain, 15 miles west of Northport, on Big Sheep creek. This machinery will double the capacity of the plant, says Manager W. Thompson. Profit is being realized on \$8 ore from the dump. Concentration costs 75 cents a ton and Thompson says they save 85% of the values. The concentrates for the present are shipped to the railroad at Frontier, 9 miles distant.

A sufficient amount of coke having arrived, the smelter of the Le Roi C. Co. at Northport has resumed operations by starting furnaces No. 4 and No. 6. These furnaces have a side feed and greater capacity than the two end-feed furnaces recently closed down. The same number of men is working as before.

Near Northport, L. P. Larsen, who bought the Last Chance, on Deep creek, has made another payment of \$14,000. The mine is reported improving.—In same section, W. Brown of Seattle, of the

Collins Taylor M. Co., reports work being done on the Texas, Gray Copper and Telitha mines on Big Strap creek.

#### Snohomish County.

The Golden Chord mine, near Everett, is shipping 150 tons of ore per week. The tram, which will have a capacity of 100 tons a day, will be ready for operation Nov. 1st. The lower terminal is at the railroad switchback and the upper terminal is at the portal of the crosscut. The ore bins at terminals have a capacity of 100 tons each. The Irma vein has been opened up by the Golden Chord crosscut. The Golden Chord and Irma are on the north slope of Wilmans peak and owned by the Justice M. Co., Wilmans Bros. managers and principal stockholders.

### WYOMING.

#### Carbon County.

The Batchelder mine, 1 mile west of Dillon, is increasing development. In a drift from a shaft 100 feet below surface copper sulphide is being taken out.

### FOREIGN.

#### BRITISH COLUMBIA.

#### Boundary District.

The Granby M. S. & P. Co., operating mines at Phoenix and smelter at Grand Forks, reports for the year ended June 30, 1904:

Production amounted to 16,024,415 lbs. fine copper; 275,990 ozs. silver; 54,231 ozs. gold, for which was received total of.....\$2,948,551.73

This represents net proceeds at Granby works, freight to New York, refining and other charges being deducted from gross receipts:

Costs—	
Working expenses at mines and smelter.....	\$1,814,213.38
Foreign ore purchased.....	14,073.18
Foreign matte purchased.....	727,546.69
Dividend paid December, 1903.....	133,630.30
	\$2,689,463.55

There has been expended in new construction at the mines and smelter during the year, \$97,247.48. All development work and renewals and repairs have been charged to working expenses:

Mine development, lineal feet.....	5,698
Granby ore shipped to smelter, dry tons.....	514,387
Granby ore smelted, dry tons.....	516,059
Foreign ore smelted, dry tons.....	36,182
Foreign matte treated, tons.....	4,290

President S. H. C. Miner reports at the smelting plant two more furnaces with machinery to operate them and two new locomotives with slag cars have been added. The furnace building was enlarged to accommodate the same. Total operating costs have been reduced 44 cents per ton during the fiscal year and with improvements being completed they expect them to be reduced still further. The mines and smelter are in better condition than at any time during the past year, and the company is practically free from debt. The Victoria, Vancouver & Eastern Railway Co., controlled by the Great Northern, is building into Phoenix, and up to the smelter from Grand Forks, which will give the Granby company railway facilities with two transcontinental systems, the Canadian Pacific and the Great Northern.

D. McIntosh and North Dakota mine have bought the E. P. U. mines at Providence.—D. McGillis, M. Carvian and L. M. Knowles have leased and bonded the Combination mine in Providence camp. The Combination is on Boundary creek, above the Elkhorn mine.—Forest fires have destroyed the shaft house, boiler and pump at the Golden Eagle mine, on the North fork, entailing a loss of \$2500. The owners are W. H. Fox and S. M. Barrett.

Phoenix reports say the deal pending for a bond on the Skylark claim, 2 miles for Phoenix, has been put through, and development started by O. B. Smith, Jr., A. B. W. Hodges, W. S. Macy, R. B. Boucher and H. A. Wright of Phoenix. The amount is understood to be \$30,000. A pump has been set up to empty the shaft.

#### Cassiar District.

In the Skeena section, on Maple bay, Portland canal, near Port Simpson, is a group of fourteen claims, including the Blue Bell and Queen of Sheba group, and is owned by the Portland Con. M. Co. The vein is 6 feet wide and well defined, and the ore is pyritic, with chalcopryite predominating. Assays run in gold, silver and copper. It is near tide water. Development is being increased.—Port Simpson men are owners of the Bonanza group on Mineral creek, which flows into Goose bay, Observatory inlet. The ore is similar to that found in the Maple Bay group. The formation is said to be diorite with hornblende schist. The ore assays \$40 and is refractory. On the Bonanza group there are 800 feet of tunnel and crosscutting, and considerable ore exposed.—On Observatory inlet are nine claims in the Hidden Creek group,

1½ mile from Goose bay. This is a copper-gold proposition.

C. M. Hamshaw, managing director of the Amalgamated McKee Creek M. Co. at Atlin, says his company controls all the hydraulic claims on McKee creek. This has entailed consolidation of the McKee Creek Con. M. Co. and the Amalgamated McKee Creek M. Co. Next year operations on a larger scale will be carried out. Hamshaw states that the past season has been a successful one at Atlin.

Altin reports say the mining season is closed, most of the hydraulic plants having shut down owing to scarcity of water. Snow still remains in the mountains, as they have had a cool summer; in fact, there was never at any time sufficient warm weather to cause a flood. The fore part of the season furnished good supply of water, but the latter part was cool and the water was cut short. The Sunrise and Pine Creek Power Cos. have made final cleanup and report the year's operations satisfactory. The Societe Miniere on Boulder has shut down and its manager says the company's ground averaged \$6.50 per square yard of bedrock. S. Black in his deep diggings on same creek has struck payable gravel and has taken out 200 ounces of gold a week for the past month. The Otter Creek Co. operations were closed down early in the summer on account of shortage of water.—The Columbia Hydraulic and Upper Spruce has been hydraulic all summer on its upper gravel which carries fine gold, but as bedrock could not be reached except on the rim, small results were realized. A shaft was sunk 22 feet in the bed of the creek, but no bedrock found.—The Spruce Creek Power Co., on lower Spruce, reports good work for the season and opened up the Old Blue Lead. This ground, where drifted, is said to run \$10 per cubic yard. The owners are Blaine & Denny.—The British-American Dredging Co. started work in the spring and has been running its dredger steadily. The company is using a center bucket dredger of capacity of 1000 cubic yards per day. It is said the gravel handled so far has averaged \$2 per cubic yard.—The McKee Con. Hydraulic, Ltd., on Upper McKee creek, has spent the entire season putting in a bedrock flume to reach its deep channel. It is not on bedrock yet, although the face shows 40 feet of heavy wash.

The Amalgamated McKee Creek M. Co., Ltd., at Atlin, has taken out this season and paid royalty to the Government on \$52,000. The mine is operated by two hydraulics under 250-foot head, using 4 and 6-inch nozzles. The sluices have a heavy grade and all boulders up to 36 inches in diameter are passed through the boxes.

#### East Kootenay District.

The coke oven contract at Michel for the Crow's Nest Pass Coal Co. was completed last week. Michel has now 462 ovens.—Development work has been done by the Canadian Pacific Railroad on its coal claims on Fording river during the summer. An engineering party has been on the ground taking measurements and sixteen men, it is reported, are still doing development work. The work will continue during the winter.

The Bull River Falls P. & L. Co. has a site for its plant near Port Steele. Two miles of flume will be constructed, and during several months in the year the flume will be able to carry all the water in Bull river, leaving the bed dry and accessible to mining.

U. S. Consular Agent Pollock, at Fernie, writes the total output of the Crow's Nest Pass Coal Co., Ltd., during the year ended June 30, 1904, was 769,419 tons, of which 360,462 tons were converted into coke. The shipments of coke to the United States during the year amounted to 62,478 tons, valued at \$252,992, and the shipments of coal to 156,727 tons, valued at \$315,096. The three coal companies operating at Frank, Blairmore and Coleman, in Alberta, have been producing an average of 600 tons a day during the year. The entire product has been used in Canada.—New coal fields are being opened up on Elk river about 50 miles north of Fernie, but it will be necessary to build 35 miles of railway to place those fields in touch with the market.—Quartz mining in the district has not been very active during the year, but is showing improvement. The St. Eugene M. Co. (silver-lead), at Moyie, is working 300 men, and the Sullivan M. Co. (silver-lead), at Marysville, is working seventy men. These two mines have been closed down for nearly two years, but the bounty allowed by the Canadian government on lead has once more placed them among the shippers of East Kootenay. The output of the St. Eugene mine is shipped to Belgium. The Sullivan M. Co. is building a smelter at Marysville, and, when completed, it is expected to place other properties in the district on the producing list, as shipments of low-grade ores will not

have to be made to outside points. A smelter will be built by C. Fernau et al. in Fernie for handling zinc ores from West Kootenay. The ground has been secured for the plant and work started. The smelter will cost \$100,000 when completed and give employment to about seventy-five men.—The Great Northern R. R. Co. is extending its road from Morrissey to Fernie, a distance of 11 miles, and will be in operation about Dec. 1st. The main object of building this road is to have a direct haul from the coal mines at Fernie without transferring over the Canadian Pacific line between Fernie and Morrissey, as at present.

#### Roseland District.

The Caribou mine, near Roseland, adjoining the Jumbo mine, has been bonded to M. R. Galusha, J. C. Eden and R. C. Morgan, said to be for \$30,000. The Caribou mine is on Jumbo mountain. It is surrounded by the Gold King, Copper King and the Victor. The Caribou is crown granted, and developed by several short tunnels and open cuts. The principal showings are on the Jumbo vein, with a width of 50 feet. There is a second showing of quartz about 25 feet wide. Both veins carry gold values.

Two of the four units of the Elmore oil plant at the White Bear mill at Roseland have been tested and put in operation, says Manager Claudet.

#### Vancouver Island.

(Special Correspondence).—The Tyee Copper Co., Ltd., at Duncan Station, reports for September: Smelter ran twenty-four days; 4681 tons of Tyee ore smelted, giving a return after deduction of freight and refining charges of \$52,033. Duncan Station, Oct. 22.

#### Vernon District.

(Special Correspondence).—The Cherry Creek G. M. Co. is operating the McPhail and Morgan mines, near Vernon. The development consists of 1000 feet of tunnels, shafts and raises on the veins. The McPhail is equipped with buildings and has a 2-stamp experimental mill. The directors will confine development work to driving ahead No. 3 tunnel on the McPhail vein. In the spring the capacity of the mill will be increased to fifty tons per day. The officers of the company are G. H. McRae president, J. McClure vice-president, C. P. Nash secretary, G. R. Hibbe treasurer, A. H. Elftman consulting engineer. Vernon, Oct. 23.

### MALAY PENINSULA.

The output of tin and ore in the Federated Malay States during the seven months of 1904 ended Aug. 1st has not increased, compared with the corresponding period of the previous year, says the Far Eastern Review. Only in Negri Sembilan has there been an increase in export of tin, the amount being 3598 piculs, or 214 tons; and that State and Pahang show a decrease in output of tin ore. Jointly the decrease amounts to 5384 piculs, or 320 tons. In the four States, decrease in output of the metal, calculated at 68% of the gross weight, amounts to 3289 piculs (190 tons); and there is a corresponding decrease in the amount of duty collected by the Government, viz., \$1,108,486.10, the low price of tin being responsible; but the Government has realized \$467,626.39 more than estimated from this source of revenue. The district of Batang Pahang exported from Telok Anson 574.33 piculs of wolfram, and 54.88 piculs were exported from Seremban.

### MEXICO.

#### Chihuahua.

La Compania Metalurgica de Torreon is increasing development work on the San Diego mine at Santa Barbara. It is equipped with three gasoline hoists and one steam hoist. Plans are under way for a concentrating plant.

Dale Bros. & McDonald have twenty men working the Americano mine at Terazas. They are taking out ore above water level and some of it is being shipped.

F. F. Hagaman of New York, A. C. McNulty and E. G. Lindsley will operate the Sunset M. Co. group at Maguarichic, with S. L. Pearce, resident manager.

The Grub Stake M. Co. of Lawton, Oklahoma, has bought a group of mines at Santa Eulalia. J. A. Beam and C. A. Ramsower, at Chihuahua, are interested.

#### Durango.

M. C. Parke, developing a gold-bearing mine near Inde, says he will build a mill.

#### Jalisco.

The San Vicente mines, 18 miles south of Ameca, are being worked by the Philadelphia C. & G. M. Co. The tunnels and shafts within the 76 pertenencias of mineral land held by the company aggregate 6000 feet and ore is blocked out. The ore carries values in gold, silver and copper, and equipment for treating it consists of a 35-ton Chilean mill, a set of concentrating tables and an amalgamating outfit.

The company is shipping bullion. A. F. Hall is manager, with offices in Philadelphia, Pa.; J. A. Hall is superintendent at the mines.

M. D. Watson and J. R. Brickerdike of the company organized to work the Rosa Amarilla copper mines, southwest of Guadalajara, have applied to the Federal authorities for a concession to build an electric railway to connect the mines with the Pacific port of Navidad. The road will be about 40 miles long and cost about \$1,000,000. Electricity for operating the system and working the mines will be derived from power plants to be built on two rivers in the same section of the State.

#### Mexico.

A report covering the operations of the smelting plant of the American S. & R. Co., near Mexico City, for fiscal year 1903-1904 has been issued, showing 343,218,647 kilograms (or about 323,000 tons) of ore received during the twelve months. This was an increase of 39,750,640 kilograms over the preceding fiscal year. Average force employed in the smelter during the year was 1637 against 1564 in the preceding year, and the wages paid amounted to \$670,811, an increase of \$59,923. In construction of two more furnaces and in other improvements to the plant the company spent \$500,000.

#### Michoacan.

The Agostitlan Coal Co., Ltd., the successor of the Michoacan Coal Co., is building a narrow gauge railroad from Irimco station, on the Maravatio-Zitacuaro branch of the Mexican National Railroad to its coal property at Agostitlan. The road will be 48 kilometers long, of which 13 kilometers are graded. It is said development work is showing merchantable coal.

#### Sonora.

D. Richardson of Los Angeles, Cal., president of La Bufo M. & M. Co., operating at La Bufo, says he will do his freighting to Minaca, Chihuahua, on account of the Yaqui Indians interfering. La Bufo is 160 miles from Minaca and about same distance from Ortiz station, on the Sonora Railroad, the present shipping point. He says the company is smelting with a 30-ton reverberatory copper furnace built on the ground of silica bricks, and using dry oak wood for fuel. His company is putting up another 50-ton plant and the Cieneguita C. Co. is also putting up 50-ton furnaces. The 30-ton plant turns out three tons of 47% to 55% copper matte for every fifteen tons of ore. He uses only one American to a shift. It requires an American cord of dry oak wood to the ton of ore. It is claimed they can run a charge containing as high as 55% silica. The loss by the plant is about 4% of the silver and a small fraction of 1% of the copper. The bricks, which are made on the ground, are composed of non-mineral-bearing quartz, with one-fourth of clay. Air from the compressors is used instead of a blower. The 50-ton furnace being built is similar and is 36 feet long and 12 feet wide. It will cost between \$12,000 and \$13,000 Mexican money, excepting the stack which the company has for the present plant. This stack is 440 feet long, running up a hill, and has four dust chambers. The company has a calcining furnace and is experimenting with a refining furnace.

The Victoria M. Co. has been organized at Hermosillo to take over and operate properties at Minas Prietas, including the Esmeralda, North Esmeralda, Diamante, Denver and Victoria. The officers are: G. B. Underwood, president; L. B. Ramsdell, C. D. Rickey, W. B. Duvall, manager; S. W. Sawyer and A. Monteverde. The mill of the Zubiate M. Co. at La Colorado is running steadily and producing bullion. There is a scarcity of labor, in consequence of which the mill is not worked to full capacity, says G. B. Earnshaw, manager.

W. H. and M. A. Crocker have bonded La Cobreza mine, 6 miles from Huapac, on the Sonora river. They will put in a steam hoist and pump, having struck water at the bottom of the old shafts. The mine has not been worked for fifty years. Pockets of native silver have been found. In cleaning out one of the shafts they report taking outlump of a native silver that weighed twenty pounds.

The annual report of the Greene Con. C. Co., operating at Cananea, has been issued showing net profits of year ending July 31 as \$1,238,578. The total copper production was 55,000,000 pounds, and \$1,202,000 was spent for improvements during the year. The company expects with completion of the new concentrator to increase production to 6,000,000 pounds of copper per month. In the Capote mines, an additional 100 feet have been sunk, and the copper ore struck is said to average 11%. The company has from 20 to 25 miles of underground workings, and the copper so far produced has been largely from development work, says President Greene.

#### Zacatecas.

B. C. Wheeler, manager, says he will build a cyanide plant of fifty tons daily capacity at the La Mora mine, near Zacatecas.

### Personal.

T. B. CROW is superintendent of the Allen mill at Idaho Springs, Colo.

S. L. PEARCE is manager of the Sunset M. Co. at Maguarichic, Chihuahua, Mex.

E. D. BOYLE has assumed charge of the Schwab properties at Goldfield, Nevada.

S. A. KNAPP of Tonopah, Nev., has resigned as manager of the Ohio-Tonopah M. Co.

B. RICHARDS is superintendent of the New Albany mine for Bunting & Co., near Carters, Cal.

W. S. JONES is manager of the Cloud City mine at Leadville, Colo., for the Empire Tunnel Co.

W. B. MCKINLAY has resigned as manager of the Delta and Northern G. M. Cos. at Delta, Idaho.

D. R. WILLIAMS has resigned as superintendent of the Butler-Liberal mines at Bingham, Utah.

D. KEVANE has resigned as superintendent of the Chris Anderson mine, near San Andreas, Cal.

W. L. WATTS has returned to Los Angeles, Cal., after ten months' examination of mines in Mexico.

PRESCOTT ELY is manager of the Ohio-Tonopah M. Co. at Tonopah, Nev., vice S. A. Knapp, resigned.

P. WISEMAN has resigned as superintendent of the Fletcher M. Co. at Stockton hill, near Kingman, Ariz.

BARTON SEWELL, EDW. BUSH and A. EILERS, of the American Smelting & Refining Co., are visiting Puget Sound.

F. J. BUCK is superintendent of the District Gold Extraction Co., operating on the Little May mine, Cripple Creek, Colo.

CHARLES C. JONES is in southern Idaho looking after his mining interests and developing his phosphate discoveries.

A. W. JENKS having resigned from the staff of the White Knob C. Co. at Mackay, Idaho, is in Salt Lake City, Utah.

J. M. CARTER is superintendent of the Fletcher M. Co. at Stockton hill, near Kingman, Ariz., vice P. Wiseman, resigned.

E. R. CARY, C. E., of Troy, N. Y., has been appointed professor of geodesy and railroad engineering in Rensselaer Polytechnic Institute.

SUPERINTENDENT HEGGERTY is in charge of operations at the Chris Anderson mine, near San Andreas, Cal., vice D. Kevane, resigned.

C. C. GREENE, a mining engineer, recently of Middlebrough-on-Tees, England, has a position with the Yellow Aster M. Co. at Randsburg, Cal.

F. LYON, chief engineer of the United States M. Co., is in charge of the Mammoth mine being opened up by the company near Kennett, Cal.

A. F. HOLDEN, managing director of the United States M. Co., has returned to Salt Lake City, Utah, from the Mammoth mine in Shasta Co., Cal.

H. E. CLIFFORD is acting professor of electrical engineering at the Massachusetts Institute of Technology, Boston, Mass., vice L. Duncan, resigned.

A. H. ELFTMAN has returned to Minneapolis from a professional visit to Vernon, B. C. He will be in Utah next week inspecting properties at Park City.

G. Z. EDWARDS, formerly general superintendent of the Con. Mercur mines at Mercur, Utah, has a similar position with the Lincoln M. Co. at Pearl, Idaho.

E. J. EMMONS of Bakersfield, Cal., is president of the Wagram O. & M. Co., which has absorbed the Soyopa M. Co., operating copper mines in Sonora, Mex.

C. E. VARRILL is assayer and superintendent of the Mountain Boy mines of the Midnight M. Co. at Park City on the Colville reservation, south of Republic, Wash.

B. M. CORNISH, manager of the Pioche-Nevada Con. M. Co., returned to Salt Lake City, Utah, last week from London, and is at the company's mines in Lincoln county, Nev.

R. NICOLL has resigned as manager at the Radiant mine, at Radiant, near Florence, Colo., and will take charge of the

mine of the Great Western Co., near Chandler, Colo.

D. FERGUSON, recently superintendent of the New York-Bonanza mine at Park City, Utah, is superintendent of the Butler-Liberal mines at Bingham, Utah, vice D. R. Williams, resigned.

GEO. HARDING has resigned as chemist and superintendent of the Bismarck-Nugget Gulch M. Co., Sheridan, Mont., and goes to Coeur d'Alene City, Idaho, as manager of the water company and electric power plants.

LOUIS DUNCAN, PH.D., has resigned as professor of electrical engineering at the Massachusetts Institute of Technology, Boston, Mass., to devote his time to duties of electrical engineer for the New York Rapid Transit Commission and several railroad and telephone companies.

THE following appointments have been made to the teaching force of the Michigan College of Mines, Houghton, Michigan: A. A. Koch, instructor in chemistry; C. F. Bowen and E. T. Hancock, instructors in geology and mineralogy; C. H. Hoyt, instructor in civil and mining engineering; D. Copeland, instructor in metallurgy and ore dressing.

### Obituary.

W. GARLICK, president of the Colorado & Connecticut M. Co., died at Meriden, Conn., on the 10th inst.

H. J. STEMPPEL, a mine owner and pioneer of California, died at Iowa Hill, Placer county, Cal., on the 16th inst.

WM. JOHNS, a mine owner and superintendent of California, died at Alameda, Cal., on the 23rd inst. He formerly was in charge of the holdings of the London Exploration Co. Deceased was a native of England, aged 80 years.

M. D. RYAN, aged 47, a Colorado mining man, died at Cripple Creek, Colo., on the 19th inst. Deceased went to Leadville, Colo., in 1879, where he was foreman of the Maid of Erin mine. He then moved to Aspen, where he had charge of the Mollie Gibson and A. J. mines for twelve years, then going to Cripple Creek. He has been in charge of the Hamlin lease on Stratton's Independence.

### Books Received.

"The Black Hills of South Dakota," being the papers read before the Black Hills Mining Men's Association, and including a number of important contributions on mining and metallurgy in that region. These papers may be had, bound in paper, by application to the secretary of the Black Hills Mining Men's Association, Deadwood, S. D.; 135 pages, profusely illustrated. Price, 25 cents.

Under title of "Mineral Resources of the United States for 1903," the United States Geological Survey has issued: "The Stone Industry," "The Manufacture of Coke," "Occurrence of Sulphur and Pyrite and Their Production," "Production of Aluminum and Bauxite," "Production of Magnesite," "Statistics of the Clay Working Industries," with a paper on "The Sand-Lime Brick Industry."

"The Geology of Miller County, Mo.," by S. H. Ball and A. F. Smith, and "The Quarrying Industry of Missouri," by E. R. Buckley and H. A. Buehler, published by the Missouri Bureau of Geology and Mines, give the results of careful and systematic geological investigation in Missouri. These form important contributions to a series of reports on the geological conditions of Missouri. The first three chapters of the report on quarrying discuss the demands and uses of stone, the properties of building stones, and the methods of determining the value of stone for different uses. Following are descriptions of the various quarries and stone products of the State, including results of physical tests especially valuable to architects and builders. They are well printed and illustrated and give a good impression, not only of the authors, but also of the subject.

"Elements of Mechanical Drawing," by Pierce Jamison; 8vo, xii+226 pages, \$2.50; John Wiley & Sons, New York. The first part of the book is devoted to an exposition of the fundamentals of drawing, and the remainder to furnishing copies and directions for an exhaustive course in the laying out and execution of drawings. The chapters on lettering, projection and reproducing are good. The subjects of gearing and of patent-office

drawings are practically treated. While not originally written as a "self-help," but as a basis for class instruction, yet by following the explicit directions given, a conscientious student could attain such knowledge as would prepare him to pursue a course in engineering and such practice in drawing as would qualify him to do ordinary commercial draughting. This book will be sent postpaid, by the MINING AND SCIENTIFIC PRESS, on receipt of the price.

"Rock Excavation—Methods and Costs," by H. P. Gillette, is a practical treatise on a much neglected subject. The author treats on quarrying, open cut work, trenching, tunneling and underground excavation, giving much data whereby an inexperienced man might predicate the cost of rock work with some accuracy, and the experienced manager find how and where savings in the cost of production may be effected. The work is comprehensive, yet specific in its treatment and timely. While considerable of its contents is not of immediate application to mining, yet it puts widely scattered data into compact form. The book contains little that is new or original, being compiled from material most of which has already been published. The author opposes the "crater theory" of blasting, but gives nothing in its place, his idea seeming to be that little value can be obtained from merely theorizing. Published by M. C. Clark, 13 Park Row, New York. Sent postpaid from this office. Price, \$3, cloth; 5x7½ inches; 384 pages, illustrated.

"Untechnical Addresses on Technical Subjects," by James Douglas, LL.D.; 12mo, v+84 pages; cloth, \$1. Contents.—The Characteristics and Conditions of the Technical Progress of the Nineteenth Century. The Development of American Mining and Metallurgy and the Equipments of a Training School. Wastes in Mining and Metallurgy. John Wiley & Sons, 43-45 East Nineteenth street, New York City. The benefits derived from the modern spirit of voluntary interchange of thought and experience; the dependence of mining and metallurgy upon machinery and methods produced by American brains; the advantages enjoyed by the American manufacturers and miners over foreign competition—these form the texts for three addresses delivered before different audiences composed of students and members of the American Institute of Mining Engineers. They give a good general idea of the advance made in coal, iron and copper mining by intelligent competition. Statistics are largely drawn upon for comparison; these have been brought up to date and seem reliable. The whole forms an argument for encouragement of progress and may well be read by young men. The treatment is easy and readable. The sterling worth of the author is a sufficient guarantee as to the worth of the book. It will be sent postpaid, by the MINING AND SCIENTIFIC PRESS, upon receipt of price.

"Australian Mining and Metallurgy," by D. C. Clark, is a comprehensive and exhaustive review and commentary upon mining methods and metallurgical practices employed throughout Australia. The important mines of Western Australia, Tasmania, Queensland, Victoria and New South Wales are specifically treated, the geological conformation, the general resources and the possibilities for further development seem to be impartially and intelligently portrayed. Refractory ore, scarcity of water and wood, and other discouraging circumstances have been successfully overcome in Australia, but in the contest almost every known metallurgical process has been tried. This volume furnishes a valuable record of these, not only of their successes, but also of their failures, the latter of which are often the more valuable to the practical metallurgist. On the extraction, not only of gold, but also of silver, lead, tin and copper, methods are contrasted, treatment examined and appliances reviewed. The illustrations are numerous, but, judged by American standards, are deficient in quality. The value of the work would be greatly enhanced by a general map of Australia and of the districts described. A treatise of this character naturally contains much that has appeared elsewhere, but what does appear is presented in compact form and has been brought up to date. Its appearance suggests that a number of similar volumes treating on metallurgical practices of other countries would make valuable additions to this and that of Richards on "American Ore Dressing." With these as a basis, and a current mining periodical as a supplement to chronicle new processes and improvements, one would possess an invaluable record of what methods will give the best results under different sets of circumstances. The book contains 620 royal octavo pages, and is published by C. Parker, Melbourne,

Australia.. It will be sent postpaid by the MINING AND SCIENTIFIC PRESS upon receipt of \$6.

Commercial Paragraphs.

THE Roessler & Hasslacher Chemical Co. of New York have been awarded a grand prize at the Louisiana Purchase Exposition.

THE Salt Lake, Utah, Hardware Co. is advised that the Keller assay scales was awarded first prize at the St. Louis Exposition.

THE Ohio Steam Shovel Co., Toledo, O., are giving special attention at present to the installation of their shovels for irrigation purposes in Wisconsin, Michigan and Ohio.

THE Snoqualmie Falls & White River Power Co. of Seattle and Tacoma, Wash., by amended articles of incorporation, has changed its name to Seattle-Tacoma Power Co., and has increased its capitalization.

THE business of manufacturing the Boulder brand muffles and other shapes in fire brick, conducted at 1617-1627 North Street, Philadelphia, Pa., for sixty-nine years, has been incorporated under the title of the Boulder Manufacturing Co., Inc., and will be continued at the same address.

THE Brown Corliss Engine Co., Corliss, Wis., have received orders for one 20x42-inch heavy duty Corliss engine for the Grand Rapids Desk Co., Muskegon, Mich; one 16 & 26x16-inch vertical compound non-condensing high-speed engine; one 13 & 22x12-inch vertical compound non-condensing high-speed automatic engine, both D. C. for electric lighting service, and one 9x9-inch single cylinder high-speed automatic engine for Columbia, Mo.

COLORADO IRON WORKS CO., Denver, Colo., report the sales of twelve single bowl slag trucks to the Cananea Copper Co., a carload of Bartlett concentrating tables to the Pittsburgh-San Jose R. & R. Co., and four impact screens to the Avino Mines, Ltd., all in Mexico. All the machinery for the concentrating mill of the Ruby Basin M. & D. Co. has been shipped and when finished this plant will be one of the most complete in Colorado.

R. SPRADO has resigned the management of the Lake Shore Engine Works, Marquette, Michigan, and goes with Chalmers & Williams, Railway Exchange, Chicago, as their consulting engineer. Messrs. Chalmers & Williams, while dealing in machinery and supplies for mine, mill and smelter, will make as one of their specialties, the Sederholm boiler, adopted by the Pennsylvania Railroad, Homestead mine, and other large concerns. The exclusive manufacturing rights to this boiler have been bought by Chalmers & Williams from E. T. Sederholm.

THE Blaisdell Co., Los Angeles, Cal., have completed at the Cleveland works of Wellman-Seaver-Morgan Co., a 22x9-foot 6-inch class "A" excavator and have under construction at the same plant a 40x6-foot class "A" excavator and 40-foot class "Z" distributor. This equipment goes to the El Oro Mining & Railway Co., Ltd., El Oro, Estado de Mexico, Mexico, where it will be in operation about March, 1905, to automatically fill and empty the sand vats of the cyanide plant more economically than is possible with Mexican labor at 25 cents gold per day.

Trade Treatises.

The good qualities of Smooth-On iron cements for repairing leaks or making connections in steam or hydraulic work is finely set forth in a 100-page booklet issued by the Smooth-On Manufacturing Co., 572-574 Communipaw avenue, Jersey City, N. J.

"Hydraulic Turbines and Governors" is the subject treated in "Publication 112" of the Allis-Chalmers Co., who have become the sole licensees in North America for the manufacture and sale of the hydraulic machinery of Escher, Wyss & Co., of Zurich, Switzerland, and announce the fact in their usual sumptuous style.

"Graphite for the Motor," from the Joseph Dixon Crucible Co., Jersey City, N. J., devotes twenty-four handsome pages to the subject of graphite lubrication for automobiles. Copies of the brochure will be freely sent to all interested in the operation of motor cars and motor boats. It is 5x7 1/2 inches and handsomely illustrated.

Latest Market Reports.

SAN FRANCISCO, October 28, 1904.

METALS.

SILVER.—Per oz., Troy: London, 26 1/2 d (standard ounce, 925 fine); New York, bar silver, 58 1/2 c, refined (1000 fine); San Francisco, 58 1/2 c; Mexican dollars, 47c San Francisco, 46 1/2 c New York.

COPPER.—New York: Standard, \$13.25; Lake, 1 to 3 casks, \$13.37 1/2; Electrolytic, 1 to 3 casks, \$13.37 1/2; Casting, 1 to 3 casks, \$13.12 1/2; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £60 17s 6d spot per ton.

LEAD.—New York, \$4.42; Salt Lake City, \$3.50; St. Louis, \$4.12; San Francisco, \$4.50, carload lots, 4 1/2 c 1000 to 4000 lbs.; pipe 6 1/2, sheet 7, bar 5 1/2 c; pig, \$4.85. London: £12 7s 6d long ton.

SPELTHER.—New York, \$5.35; St. Louis, \$5.00; London, £24 10s 3/4 ton; San Francisco, ton lots, 6 1/2 c; 100-lb. lots, 7c.

TIN.—New York, pig, \$28.50@28.62 1/2; San Francisco, ton lots, 29c; 500 lbs., 29 1/2 c; 200 lbs., 30c; less, 31c; bar tin, \$ b., 32 1/2 @ 35c. London, £131 10s spot.

PLATINUM.—San Francisco, crude, \$18.50 @ oz.; New York, ingot, \$19.00 @ Troy oz. Platinum ware, 75 @ 82c @ gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 @ flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBIT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6 1/2 c; extra, 17 1/2 c; genuine, 31 1/2 c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100 lb. lots, 16c.

ZINC.—Metallic, chemically pure, \$ b., 50c; dust, \$ b., 10c; sulphate, \$ b., .04c.

NICKEL.—New York, 40@47c @ \$ b.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$12.85 @13.10; gray forge, \$12.00; San Francisco, bar, 3c @ \$ b., 3 1/2 c in small quantities.

STEEL.—Bessemer billets, Pittsburgh, \$23.00@23.00; open hearth billets, \$23.00 @23.00; San Francisco, bar, 7c to 12c @ \$ b.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6 1/2 c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 1 1/2 c @ \$ b. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 1c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6 1/2 c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city @ bbl.

CEMENT.—Imported, \$2.15@2.65 @ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 @ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6 1/2 c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8 1/2 c; 100-lb. lots, 10 1/2 c. POWDER.—F. o. b. San Francisco: No.

1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2 c; less than one ton, 17 1/2 c. No. 1\*, 60%, carload lots, 13 1/2 c; less than one ton, 15 1/2 c. No. 1\*\* 50%, carload lots, 11 1/2 c; less than one ton, 13 1/2 c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9c; less than one ton, 11c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11 1/2 c @ set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Walsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c @ \$ b.; carloads, 23@24c; in tins, 30c; soda ash, \$2.00 @ \$ b. 100 lbs.; hyposulphite of soda, 3@3 1/2 c per lb.; caustic soda, in drums, 3@3 1/2 c @ \$ b.; Cal. a. soda, bbls., \$1.20@1.40 @ \$ b. 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2 1/2 @2 3/4 c; powdered sulphur, 2@3c; flour sulphur, French, 3@3 1/2 c; alum, \$2.00@2.25; California refined, 1 1/2 @2c; sulphide of iron, 8c @ \$ b.; copper sulphate, 5 1/2 @5 3/4 c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66 1/2 B, 1 1/2 @2c @ \$ b.; nitric acid, carboys, 8c @ \$ b.

OILS.—Linsed, boiled, bbl., 53c; cs., 58c; raw, bbl., 51c; cs., 56c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19 1/2 c; Astral, 19 1/2 c; Star, 19 1/2 c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26 1/2 c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22 1/2 c; 88° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19 1/2 c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c @ \$ b.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburgh. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburgh.

BORAX.—Concentrated, 6@7c @ \$ b.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c @ \$ b., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, \$ b., 7c; less than 500 lbs., 7 1/2 c. LITHARGE.—Pure, in 25-lb. bags, 8@9c @ \$ b.

MOLYBDENUM.—Best, \$2.75 @ \$ b.

CHROMIUM.—90% and over, \$ b., 80c.

PHOSPHORUS.—American, \$ b., 70c.

SILVER.—Chloride, \$ oz., 90c@91.00; nitrate, 55c.

MERCURY.—Bichloride, \$ b., 77c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—\$ b., \$2.75.

SODIUM.—Metal, \$ b., 50c.

BISMUTH.—Subnitrate, \$ b., \$2.10.

URANIUM.—Oxide, \$ b., \$3.50.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CORK EXTRACTOR.—No. 772,888 Oct. 18, 1904. Joseph Kaiser, San Francisco, Cal. The object of this invention is to provide a simple, inexpensive, compact means accompanying every bottle for removing the cork entire. The device takes up no room, is inserted into the bottle is sealed, preserves the cork by leaving it entire and enables the cork to be reused. The top projecting portion of the extractor becomes a combined cap to protect the cork and a means for extracting the cork.

SAW FILING MACHINE.—No. 772,538. Oct. 18, 1904. M. P. Schell, San Francisco, Cal. Assigned to Folkers Saw Filing Machine Co. of same place—a corporation. This invention relates to improvements in machines for sharpening saws, and particularly in machines of the type employing power-driven helical file members. The object of the present invention is to lessen the cost of manufacture of the file members, provide means in conjunction with the file members for the proper en-

trance of the latter into and their departure from the teeth, and further to provide a simple, convenient and adjustable means for supporting the saw relative to the file members, whereby the original locus of the teeth points may be maintained.

ENGINE VALVE GEAR.—No. 772,535. Oct. 18, 1904.

E. A. Rix, San Francisco, Cal. This invention relates to a new and improved valve motion for use in reciprocating engines that compress or expand an elastic fluid. It consists of one or more circular valve seats having ports at opposite sides of the center connecting with opposite ends of a cylinder and a rotatable guided valve fitting each seat and having inlet and outlet ports which are successively brought to register with the ports of the valve seat and which ports remain fully open the longest possible time. Supply and exhaust passages connect with the ports controlled by the valve.

VEHICLE WHEELS.—No. 772,573. Oct. 18, 1904.

Wm. Morck, Oakland, Cal. One-half assigned to James H. Drake of Morcan Park, Ill. This invention relates to improvements in vehicle wheels, and is especially designed to provide a substantially elastic wheel which will relieve the jar and shock to the vehicle in travelling over the ground. The object of the invention is to provide a substantially indestructible wheel which is especially valuable for use upon automobiles and like carriages, and may also be employed for bicycles, and for other similar and equivalent purposes.

WIPE STRETCHER.—No. 772,556. Oct. 18, 1901.

Emil Denison, San Francisco, Cal. This invention relates to improvements in stretchers or grippers for use by linemen and others in stringing wires, cables and the like. The object of the invention is to provide a gripper and stretcher or tightener which is simple in construction, powerful and durable, which is adapted to take either a fine wire or a cable an inch or more in diameter, which will not kink a wire, which may be run out any distance in mid-air on the wire and then engaged, and which can be made to release its grip automatically on the wire at any time and at any point.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING OCTOBER 18, 1904.

772,866.—INCUBATOR.—H. A. Brooks, Los Angeles, Cal.
772,556.—WIPE STRETCHER.—E. Denison, S. F.
772,791.—CARBURETER.—E. L. Dow, Oakland, Cal.
772,558.—STOVES.—K. A. Duff, S. F.
772,880.—PUMP.—M. M. Fulton, Pomona, Cal.
772,888.—CORK EXTRACTOR.—J. Kaiser, S. F.
772,618.—TRAP NETS.—T. E. P. Keegan, Tacoma, Wash.
772,565.—SHINGLING GAGE.—J. J. Knox, Los Angeles, Cal.
772,839.—SPLIT PULLEY.—G. F. McLynn, Cottage-grove, Or.
772,728.—OIL WELL PACKER.—J. E. Merritt, Bakersfield, Cal.
772,573.—VEHICLE WHEEL.—W. Morck, Oakland, Cal.
772,744.—BRACKET.—J. E. Packard, Los Angeles, Cal.
772,746.—FIREARM.—E. E. Redfield, Glendale, Or.
772,535.—VALVE GEAR.—E. A. Rix, S. F.
772,679.—FIRE LADDER.—O. A. Sarvela, Rockley, Cal.
772,538.—SAW FILING MACHINE.—M. P. Schell, S. F.
772,540.—CONCENTRATOR.—C. A. Smith, Los Angeles, Cal.
772,594.—GAS BURNER.—R. H. Walter, Los Angeles, Cal.
772,546.—OIL BURNER.—H. H. Watts, Bakersfield, Cal.
772,854.—SHOE LACE.—P. Wilehart, Oregon City, Or.
772,487.—LOCK.—G. W. Winckfield, Oakland, Cal.
772,488.—VAPOR GENERATOR.—G. E. Witt, S. F.

ASSIGNMENT NOTICES.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of October, 1904, an assessment (\$2.40 of ten (10) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 207 Battery street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of December, 1904, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of December, 1904, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
CHAS. BOYDNE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

DELINQUENT SALE NOTICE.

ORLEANS CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 6th day of August, 1904, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certs.	Shares.	Amt.
Geo. P. Thurston, Trustee.....	233	1000	\$75 00
J. C. Diamond .....	475	50	3 75
J. C. Diamond .....	475	53	3 97 1/2
D. F. Bell .....	206	75	5 70
J. F. Lang .....	209	16	1 12 1/2
John Jose .....	219	2 1/4	19

And in accordance with law and an order from the Board of Directors, made on the 6th day of August, 1904, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company at San Francisco, California, on MONDAY, the 31st day of October, 1904, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. H. SMITH, Secretary.  
Office—Room 10, No. 324 Pine street, San Francisco, California.

JUST A MOMENT is required to order the **BURT EXHAUST HEAD.** Severe and thorough tests have proven it is **THE WORLD'S STANDARD.**

It is the safest, most reliable, durable and economical Head made. It allows only absolutely dry steam to escape from the exhaust pipe. Sent anywhere on approval.

"The Burt Exhaust Head gives entire satisfaction."—Edison Storage Battery Co., Glen Ridge, N. J.

**THE BURT MFG. CO.,**  
Largest Manufacturers of Oil Filters in the World,  
221 Main St., Akron, Ohio, U. S. A.  
Supplied also by Engine Builders,  
Dealers and Power Contractors.

### The Powell "READY" LEVER THROTTLE VALVE.

A first-class Valve—reliable, durable, no undue labor or friction in its operation. Always "Ready" for use; you will be surprised with its efficiency. Is easily operated, and when closed is absolutely tight; no sticking or jamming. Why waste your time with inferior makes? Try the "Ready" and you will use no other. 827-Pacific Coast Jobbers.

MANUFACTURED BY  
**THE WM. POWELL CO.,**  
Dept. "H" 2525 Spring Grove Ave.,  
CINCINNATI, OHIO.

## The Promoter and His Commission.

One of the most important matters in the promotion of a new mining enterprise, from the standpoint of the promoter, is the amount of commission there is in it for himself, and next to this consideration is the finding of those who will be willing to put up the amount of money called for regardless of the actual showing made by the property.

"The laborer is worthy of his hire," and it is only just and proper that the promoter should be paid—and well paid—for his services in engineering the financing of a mining proposition, as much so as he who undertakes a similar office for any other industrial enterprise; but the commission demanded by the mine promoter is often so disproportionate to the sum paid the owner, or put into the development and equipment of the property, as to seem absurd. These commissions are not, as a rule, characterized by their relative diminutiveness, but, on the contrary, are generally proportionately munificent. Sometimes to such an extent is this the case that the promoter and his assistants get practically "all there is in it,"

(See Page 313.)

Ten-Stamp Mill Granite Hill Mine, Grant's Pass, Or.

(See Page 309.)

and another failure goes of record. Not infrequently good mining property comes into the hands of some one of these professional organizers of capital and the commission demanded, though perhaps a large amount, is not greatly excessive as related to the entire sum involved in the transaction.

The promoter accepts a report made for the owner, presumably by a competent engineer, and if the deal is a large one he takes the necessary precaution to verify the report if possible, for the promoter with a good following cannot afford to offer any proposition to his clients that will not bear examination. He is put to considerable expense of time and trouble, and as there is usually a time limit to his contract with the owner, and he may continue development under a bond, he assumes a certain risk.

In some instances the promoter has to deal with those who pertinently inquire, "Where do we come in?" And this class of men are sometimes inclined to secure the property as cheaply as possible, and to that end set about ascertaining the limitation of the promoter's agreement and the amount of commission he is to receive. The result of these investigations often leads to an attempt to "do business" without the aid of the promoter. The would-be investor

procrastinates, and still does not refuse to buy, his object being to keep the promoter "on the string" while killing time. At almost the last moment they will sometimes offer to take the property at a price somewhat in advance of the owner's figures as stated in the bond, but cutting heavily into the promoter's commission, who must accept or let the property revert to the owner. There are important instances known wherein the promoter refused emphatically to accept such terms, and lost the sale and further opportunity to sell the property as well, but the scheming capitalists and their agents failed to get the mine, for the reason that the owner at once advanced the price of the property to a figure considerably beyond the demand of the promoter. The mine had developed and was worth all the promoter asked, and more, but the would-be investors were unwilling he should make so large a commission, and not only defeated the promoter, but themselves as well.

In other cases people of this class ignore the promoter entirely and undertake to negotiate with the owner directly. In some cases the attempt is successful, but in others, as in the case above referred to, they fail to get any advantage.

## Estimating Mining Costs.

Many mining reports contain what purport to be carefully prepared estimates of the cost of equipment, development and the operation of the property upon which the report is made, and it is found subsequently that these estimates often fall far short of the amount actually required to accomplish what it was designed to do. Occasionally the careful engineer will overestimate the amount of capital required; but rarely is this the case, whether the report be for the seller of the property or for the buyer. The reason for these discrepancies may be found in the fact that often the one making the report fails to anticipate the conditions which present themselves upon a further development of the mine. The estimated figures of installing hoisting and metallurgical plants are usually near the proper amount, as these may be readily approximately arrived at or may be done by contract; but it is in the unseen portions of the mine that errors of judgment are more likely to be made. The character of the ground may change to such an extent as to greatly increase the cost of development; the veins or ore bodies may contract, rendering estimates of capacity and cost of mining too low; water may be found in much greater volume than was anticipated, requiring increased capacity to handle it—in some instances requiring the enlargement of a shaft or the sinking of a new one in order that mine drainage may not interfere with mining operations. There is, however, apparently an ever present temptation to underestimate or understate operating costs. The man who reports for the seller is led to do this to make the property show to the best advantage, and he who reports to the buyer adopts the idea, possibly, to "set the pace" for the superintendent or manager to whose lot it may fall to attempt to live up to these estimates. Each engineer probably figures as closely as the information available will admit, and then discounts them if others are to have the handling of the mine, or adds to them, as a factor for safety, if he is to undertake the work himself.

## Corporate and Practical Mine Management.

Not infrequently mines which appear to have the elements of success in the volume and value of the ore available, yet which fail as commercial propositions under corporate management, when directed by practical men at once sustain the previously good opinion entertained of them. A case in point is that of a gold mine in Shasta county, Cal. This property was operated by an Eastern company under bond, and although the ore was considered abundant enough and good enough to afford a substantial profit to the operators, the management appeared to be unable to "make ends meet," and found the income insufficient to meet obligations. The Eastern investors, who had gone into the enterprise in the belief that it would prove a profitable proposition, refused, or, at least, failed to put up the necessary money, and the miners employed asked to be allowed to work the property on their own account with the object of paying themselves from the proceeds of their efforts.

This arrangement was accordingly made and the workmen soon found themselves in funds sufficient to settle the indebtedness. They then took a lease on the property and now continue to work it with good advantage to themselves.

This is an object lesson from which many may derive profit, as it shows clearly the important difference between corporate and practical management. The corporate management may be experienced and also as economical as conditions will admit, but in the very nature of things, under a corporate management there are always extraneous expenses, which are usually grouped under the term "general expenses." Among these are the maintenance of a city office with its clerical force—a manager, often an assistant manager, and a superintendent (when the latter should alone be sufficient to direct operations and attend to the business). There are traveling expenses for manager and directors, long telegrams and many other items which in the aggregate amount to a considerable sum—in some instances the extraordinary expenses are as heavy as the actual operating cost of the mine.

That this was the case in the instance here cited it is not claimed, but the fact that the miners have made the mine pay under their co-operative plan justifies the belief that it was the extraneous expenses which caused the mine to fail under corporate management. In seeking for the reason for this difference, it must be understood that the miners have the benefit of all the development work previously performed, and also the use of the machinery installed at the mine. The tools and the entire paraphernalia are at their disposal, and neither the cost of these nor their deterioration are figured in the working costs. Moreover, there is a certain personal equation which cannot be overlooked. The miners, working for themselves, realize that their success depends largely upon their individual efforts, and will work more faithfully. No laggard is permitted to share in the operation. Every man will do his best without urging, and all who have had experience with men when working by the day, and with the same men when working on a profitable contract, realize that the personal equation is a large one.

The lessee divests the cost sheet of every unnecessary item. No expense is permitted that is not absolutely necessary. All engaged in the work are practical and experienced men, and the combination of energy and experience, with large salaries, heavy office expenses and other miscellaneous charges peculiar to corporate management eliminated, makes success possible, where failure before resulted. The Cripple Creek district of Colorado is another exemplification of this principle, demonstrated in a great many mines. In that district a number of the mines which were profitably operated under corporate management are now wholly, or in large part, in the hands of lessees, who divide good profits, and, in instances, very large ones from their work.

It would seem that corporations might learn much to their advantage in the manner of handling mining and metallurgical operations from lessees. There are a great many large and successful mining propositions which are run upon a narrow margin of profit—such, for instance, as the Homestake mines of

South Dakota, where it requires a production of about \$5 to pay \$1 in dividends. The Treadwell mines of Alaska are also run upon a very narrow margin of profit, but these enterprises, though conducted on a large scale, are nevertheless run on the lines of the strictest economy. It does not follow that because a mine produces gold, or silver, or copper, that it can be run extravagantly and still prove profitable. The day of spectacular mining has passed, and the mine of to-day, whether high or low grade, must be operated with due regard to business principles and with experienced and wise management in which neither extravagance nor parsimony have a place.

## Experimental Mining.

There are few branches of industry which offer better opportunities for experimentation than mining, and it may be said with truth that it requires a good mine to survive a period of experimental operation, particularly if the experiments are conducted by inexperienced and incompetent persons. There are many mines which possess the elements of success, but which do not achieve fame or even moderate success, because their resources are wasted in ill-advised experiment. There are, however, times when experiment is not only justifiable, but absolutely necessary, and it is important that these trials be made by one experienced in the business and competent to judge of their relative efficiency and cost, and the results obtained. It has been said any one can successfully run a rich mine, which is doubtless true, but the best managers are those whose experience has been gained where the cost had to be carefully considered and where extravagance was an impossible factor in the road to success.

The manager of a large mine was advised to install a plant consisting of rolls, trommels, jigs, sizers and concentrators, to handle a particular portion of the output of his mine. He declared, however, that he had experimented long enough, and knew that the plant suggested would not prove suitable. Instead he installed, at double the cost, a stamp battery, which gave a capacity of less than one-half that which would have resulted from the rolls, and with a saving in operation considerably below that which might have been realized with proper equipment. When this manager said he had experimented sufficiently he believed himself in the right, as he had done nothing but experiment through his entire career at the mine in question, but had never had an opportunity to gain experience elsewhere, and moreover, as he was not a reader of technical and practical papers, from which he might have obtained much useful knowledge, his experience was limited to this one spot, and the devices largely of his own creation. Still he thought there was little about mining and metallurgy he did not know. He was a constant experimenter, but his endeavors were mostly misdirected, because of his lack of knowledge of what others were doing.

The manager of another large and successful mine was wont to content himself with the statement: "I permit my neighbors to do the experimenting, and when they evolve something superior to that which I already have, I am ready to adopt it." This man represented directly the opposite extreme. He was experienced in his own work, and believed he was doing the best that could be done, and was so self-satisfied that he even declined to admit the possible advantage of experimenting to see if any additional saving could be made. Here were two extremists—the one continually experimenting, though not intelligently, the other refusing to experiment. Both were wrong; but however desirable and necessary experimenting may be, let it be done by those whose knowledge and experience fits them for the important work.

THE Klondike district of the Yukon Territory presents an interesting phase of the gold dredging industry in the instance of a dredger, built at great expense to operate on a large concession in that district, abandoning the dredging for gold in its own territory and accepting contract work on the Klondike river on a 50% royalty basis. The natural inference is that the managers of the company owning the river have discovered that their lease is likely to prove much more profitable than their own concession.

## CONCENTRATES.

ONE horse power may be safely transmitted by a belt 1 inch wide running 1000 feet per minute.

THE freight on the concentrator from Denver, Colo., to Livingston, Mont., would be \$2 per 100 pounds; on the ore crusher, \$1.72 per 100 pounds.

THE commercial efficiency of a dynamo is the ratio of the useful energy, or output, to the power actually absorbed by the machine in being driven.

DIVIDENDS are paid only on the issued capitalization. Treasury stock does not participate in dividends; it belongs to the company and is retained to be sold as occasion requires.

THE magnetic needle of a transit or compass should not be clamped if within the influence of strong electric currents. The instrument should not be brought near dynamos or motors.

To clean platinum of impurities and to polish without much loss, rub the surface with moist sea sand. The cleansing is made easier by first fusing bisulphate of potash or borax in or around the dish.

THE standard of boiler horse power adopted by the A. S. M. E. is the hourly evaporation of thirty pounds of feed water at 100° F. into steam at seventy pounds gauge pressure. This corresponds with the delivery of 33,305 B. T. U. per hour.

IT is more expensive to operate an air compressor at a high altitude than at sea level, for while it will take less power to run the same compressor, yet the capacity will also be less at the higher level. At 9500 feet the extra expense amounts to about 20%.

WHERE a vein occurs wholly without the lines of a placer claim but the surface boundaries take in a portion of the placer, the lode claimant may renounce any claim upon the included placer ground, or the placer claimant may adverse the lode claimant.

A MINING LEASE AND BOND or other similar instrument expiring in ninety days, and dated July 22, 1904, will expire on the 20th day of October, 1904. Any other transaction which reached a final conclusion in ninety days after July 22 would expire on October 20.

NUMEROUS trials by various means have been made to measure the temperature of the electric arc. All of these experiments indicate that the temperature is not lower than 3600° C., while it is considered probable that the absolute temperature is from 3900° to 4000° C.

THE owner of a placer claim may proceed to patent, and any vein discovered in the bedrock of the placer subsequent to the issuance of the patent becomes the property of the owner of the placer, and he may work all that portion of the vein lying within the boundaries of his claim, but he is entitled to no extralateral right.

TO SET a belt on a quarter twist on a concentrator, find the central point on the face of each pulley at the extremity of the horizontal diameter where the belt will leave the pulley; then set that point on the driven pulley plumb over the corresponding point on the driver. This will cause the belt to run squarely on each pulley.

IN British Columbia the mining laws permit any person over the age of eighteen years, or any joint stock company, to obtain a free miners' certificate by paying the required fee, which for an individual is \$5 per year and to a joint stock company having a capital stock of \$100,000 or less \$50 for one year. If capitalized for more than this sum the fee is \$100 per year.

COPPER PYRITES (chalcopyrite) is believed to contain the copper in the form of cuprous sulphide (according to Bloxam), its true formula being  $\text{Cu}_2\text{S}$ ,  $\text{Fe}_2\text{S}_3$ , for if copper be present as cupric sulphide ( $\text{CuS}$ ), the iron must be present as ferrous sulphide, and the mineral would then have the formula  $\text{CuS}$ ,  $\text{FeS}$ . Ferrous sulphide ( $\text{FeS}$ ) is easily attacked by dilute sulphuric or by hydrochloric acid, which is not the case with copper pyrites, though nitric acid attacks it violently.

THE apex of a vein which is buried beneath a later lava flow, a bed of gravel, a land slide, talus, or other superficial covering, has all the legal force and is entitled to all the rights and privileges incidental to an outcrop or apex occurring at the surface. If a shaft is sunk through a rock stratum or a layer of any material and a vein is discovered beneath, the discovery is equivalent to one made on the existing surface, and such a vein is entitled to the extralateral right as much as any other discovery.

CHROME IRON is found in a number of counties of California. The deposits known to "Concentrates," nearest Los Angeles, are in San Luis Obispo county, in the Santa Lucia mountains in the northwestern part of the county. Chromic iron also occurs in Fresno county, 6

miles southwest of Tollhouse. But little chrome is produced at present in California, owing to the small profit to be derived from mining and concentrating the ore. There are deposits near Livermore, Alameda county, and also in Tehama, Shasta and Trinity counties.

IT is generally cheaper and usually more satisfactory to allow the cyanide solution to dissolve the metallics than to try acid for that purpose. Metallics are usually removed because they tend to choke the boxes, coagulate into lumps and prevent the even flow of solution through the zinc sponge. If necessary, the metallics might first be cleared by dilute acid, then dipped into a solution of mercury, when, after retorting, they would be in the form of fine powder, eminently suitable for rapid solution in the acid.

IN every installation where petroleum oil is used as fuel there should be provision made to remove the water from the bottom of the supply tank, as even a small amount of water pumped to the burners will interfere with the efficient and proper work of the installation. It has been demonstrated that the evaporative efficiency of refined and crude oil is essentially the same, regardless of the locality from which the oil may come, but the danger is much greater with crude oil. Great benefits are derived from heating the air blown into the burner with the oil.

PRODUCTION of aluminum in the United States increased from 83 pounds in 1883 to 7,500,000 pounds in 1903. The Pittsburg Reduction Co. is the sole producer of aluminum in the United States, with two plants at Niagara Falls, and one each at Massena Falls, N. Y., and Shawanegan Falls, Quebec, Canada. There are four companies in Europe producing this metal: At Foyers, Scotland; Le Praz and St. Michel, France; Neuhausen, Switzerland; Rheinfelden, Germany; Lend Gastein, near Salzburg, Austria, the last three plants being owned by a single company.

IN measuring the depth of workings on a vein, it depends upon the purpose for which such measurements are made. If figuring ore in sight, then the measurement should be made on the vein, either perpendicular to its strike or on the trend of the ore shoot, if that be known. It is more common, however, to measure on a line normal to the strike of the lode—that is, along its true dip. If the measurement is to ascertain to what depth a vertical shaft must be sunk to reach a given point on the vein, the measurement must be made vertically. Some mines that are opened to a depth of 2000 to 3000 feet on the dip of the veins are in their lowest workings only a few hundred feet below the surface.

A PROSPECTOR cannot enter a placer location claimed by another for the purpose of searching for an unknown lode, by excavation or otherwise. In the event of a lode being discovered in the working of a placer claim, the owner should claim it as a lode, at once, or failing to do so, any other person may locate the lode. The occurrence of the lode outside of the placer, the outcrop of which does not extend directly up to the line of the placer cannot be assumed as sufficient evidence that the vein also exists in the placer, for it may not be presumed that the vein extends a foot farther than it can actually be traced. If the lode is opened directly up to the placer line the fact that it extends into the placer is demonstrated and the lode may be claimed within the placer location.

BAUXITE is a hydrous oxide of aluminum, essentially  $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$ , and when pure contains 39.2% Al. It is the principal ore of aluminum and is produced in commercial quantities in Georgia, Alabama and Arkansas, the total for the year 1903 being 48,087 long tons, valued at \$171,306. Bauxite from France can be laid down at New York, Philadelphia or Baltimore, including the import duty of \$1 per ton, cheaper than the ore can be delivered by freight from the mines of the South or West. The French ores contain iron oxide, making it unsuitable for manufacture of aluminum sulphate, but are used to obtain aluminum hydrate, utilized in manufacture of the metal. Most of the bauxite consumed in the United States is for production of the metal, but over 25% is used in manufacture of chemical salts of aluminum. There were 14,889 long tons of bauxite, value \$49,684, imported during 1903.

WHERE the apex of a vein occurs on an agricultural patent, within a placer or on patented railroad land, the vein on its dip passes beyond the side line of such land, and the miner may sink a shaft and may locate a claim predicated upon the discovery of a vein in his shaft. This point of discovery may be properly considered a legal apex, and without doubt the discoverer may take 1500 feet along the strike of a vein so located, and he may pursue it on its dip to the full width allowed by law—300 feet from the center of the lode—but that he is entitled to take the extralateral right has not been determined by law. This is a matter upon which there has been no specific legislation, and, as the Supreme Court of the United States has never passed upon it, it still remains an open question. Such a discovery as above contemplated is not that of an apex in fact but is a discovery upon an arbitrary line on the lode some distance below the real apex.

IN the case of the claims located in Nevada, where A's claim was located across the lode and B's claim subse-

quently located along the lode, abutting upon A's west side line, B's claim would hold in law, as he has done sufficient work upon it in 1904, but it would be well for B to make an amended location, stating the facts in the location notice. The Nevada State law provides that "if at any time the locator of any mining claim shall apprehend that his original certificate was defective, erroneous, or that the requirements of the law had not been complied with before filing, or shall be desirous of changing his boundaries or of taking in any part of an overlapping claim which has been abandoned \* \* \* such locator, or his assigns, may file an additional certificate, provided that such relocation does not interfere with the existing rights of others at the time of such relocation, and no such relocation or the record thereof shall preclude the claimant or claimants from proving any such titles as he or they have held under the previous location."

THE direction of air currents in the natural ventilation of a mine is determined by the relative weight of two columns of air. One may be in a shaft, the other outside, or there may be two shafts connected below, their mouths having different elevations. During the day the air in the shaft and level, being colder than the outside air, has a tendency to fall and the deeper shaft becomes a "down cast." At night the outside air may become cooler than that in the mine, and the shorter shaft becomes a "down cast." At a time when the mine air and that outside have about the same temperature and density the ventilation of the workings becomes poor, as the air currents are almost at a standstill. It is for this reason that the smoke often hangs in mine workings when shots are fired in the early evening, or about sunrise in the morning, when the air currents are sluggish. Shots fired at midnight or at noon in the same workings will usually clear away rapidly, except on days when the atmospheric conditions render the temperature in the mine and outside about equal.

ALL forest reserves (not national park reserves) are subject to the operation of the mineral land laws; an owner of a valid and subsisting mining location in a forest reserve has the right to fence such claim, to carry on mining and agricultural pursuits on such claim, and to cut the timber thereon for actual mining purposes. In creating the forest reserves it was not the purpose of the government to antagonize the mining industry, but to protect the forest timber from destructive fires and other waste, that it might be used for mining and agriculture. Mineral claimants in forest reserves are also permitted to use water thereon. They may also take stone and timber from the general unoccupied reserve for use on the claim when the supply on the claim itself is inadequate. This privilege does not extend to corporations. Forest reserves are open for all proper and lawful purposes, including that of prospecting, locating and developing the mineral resources thereof, provided that such persons comply with the rules and regulations covering such forest reservations.

THE fact is well established that no rights can be initiated or acquired on the public domain by forcible entry when another is in possession. One can not hold public lands by mere occupancy, not complying with the requirements of the law. A location must be made according to law. The court decisions lead to the conclusion that if a person goes upon the unclaimed mineral lands of the United States and makes settlement thereon without complying with the requirements of the mining laws, and relies wholly upon the fact of possession and work performed, a second party may enter said lands and make a valid location, provided he does so peacefully and complies with all the requirements of the mining laws, and he is entitled to the possession of such mineral lands, to the extent of his claim, as against the prior occupant, who is from the time the second party has perfected his location and complied with the law a trespasser. The peaceable entry of the locator and the perfection of his location by compliance with the law, operates in law as an ouster of the prior occupant.

THE bessemerizing of copper matte in converters was suggested by the success of the Bessemer process in steel making. It is accomplished by blowing air into the molten matte, which has been drawn from the smelting furnace into the converter. The attempt was first made in steel converters, but when the copper began to separate from the slag, the tuyeres became clogged. Steel converters were eventually lined, after many experiments, with magnesite and other refractory substances, but with these materials the outside of the converter became too hot, due to the high conductivity of the lining, while the interior became too cold. It was finally found that the best lining consisted of crushed quartz— $\frac{1}{2}$ -inch to fine, all mixed together—with clay. These linings have constantly to be replaced, as in the combustion of the matte the formation of ferrous oxide occurs and this unites with the silica of the lining, rapidly destroying it. Numerous attempts have been made to introduce silica into the matte, to satisfy this demand of the ferrous oxide, but without success. Early in the experiments in this direction fine quartz sand was blown into the matte with the air blast, but the silica at once rose through the charge to the surface where it floated about in lumps, an infusible mass. The lining of converters is work requiring skill and experience. The converter lining at the Parrott works at Butte, Mont., weighs 9600 pounds for each converter.

## Quicksilver in Pan Amalgamation.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS.

Some few weeks ago the writer was asked the causes of the flouing of quicksilver in pan amalgamation, but without specifying any local conditions. The question covered such a wide scope that it was thought advisable to take the subject up and try to explain all the causes for this condition.

In order to bring this matter clearly before the reader, not only must the condition and handling of the mercury be considered, but also the character of the ore, the method of operation and the personnel of the operative.

The difference in amalgamation between the process in pans and that on plates is so great that it is rarely that a man eminently successful in using the first will become proficient in battery amalgamation, while if plate amalgamation is thoroughly understood it will not be found so difficult to change the method to suit the new conditions.

The repeated failures of silver millmen to handle successfully any but the richest grades of gold ores are principally due to the employment of the quicksilver. Any good gold amalgamator will be as chary of adding the quicksilver to the ore beyond what the actual gold contents call for as a shipwrecked mariner of the contents of his small fresh water cask. He will watch the consistency of the amalgam on the plates and will add traps and other saving devices to his plant; will save all the dust from the floors, the iron scraps and screens from the mortars, and pan out the amalgam and mercury from them. He will keep everything clean (from grease particularly) and will periodically dress the plates, and always keep the quicksilver in the best possible condition. In spite of all this care, on the semi-monthly or monthly weighing it is always found that there has been an appreciable loss, so that it is a common saying that quicksilver disappears even from looking at it, while it is a well-known fact that the flow of clear water into a bowl of mercury will flour and carry away an appreciable amount, even though it can not be detected by the eye. When such a man takes charge of a silver mill, his watchfulness having become second nature, he stops every possible leak, because in gold work where quicksilver is lost so also is gold, and, though silver is of less value, the same logic must hold true. The gold man will probably fall into one error at first, but if he enjoys only a modicum of common sense he will rectify this in a very short time—i. e., where he formerly used a globule he must now employ flasks, and at first he cannot understand the necessity of this and employs far too little in each pan charge.

On the other hand, the silver man is accustomed to using these flasks with each charge, allows it to flow from pan to settler and from settler to straining sack, falling with a "plump" into each iron lid; hits the sack with a club occasionally, then dumps the contents into an iron car or vessel and throws it into the retort with a shovel. He has not time to thin the pulp in the settler between charges and never runs the tailings through traps or other saving devices. Take such a man and put him at battery amalgamation, and he is unique if he is even able to grasp the minute quantity to use, so that in general his plates are sloppy, his loss in quicksilver enormous (considering the quantity used), and in consequence it is found that only the coarse gold is saved, while even the silver of his copper plates has disappeared.

There is shown the personality of the operative, and it is one great factor in the loss of quicksilver in pan amalgamation.

In regard to the character of the ores, such a wide field is opened up that it can only be touched on in this article. Pan amalgamation is essentially a silver process, though the ores frequently carry a greater or less value in gold; but as a process on a gold ore, pure and simple, it is not commercially successful, and in general also not a success metallurgically, as compared with other well-known methods.

Silver ores that are amenable to this treatment can be divided into two general classes—free milling and rebellious. Free milling ores contain the silver either as native, chloride and bromide or sulphide. The ores become refractory when, in addition to the above, they contain arsenical and antimonial compounds, such as proustite, pyrrargyrite, stephanite and tetrahedrite.

In the first case the ore is crushed wet and amalgamated raw, while in the second it is necessary to crush dry and before amalgamating subject it to a chloridizing roast with common salt, so as to eliminate the arsenic and antimony and change the silver to chloride. In either case, even with the simplest ore, carrying only chloride of silver, it is found advantageous to add certain chemicals to the pan charge before adding the quicksilver, and the quantity and variety of these depend largely on the impurities in the ore, as well as the baseness of the silver minerals. These impurities are generally cerussite (the carbonate of lead), pyrolusite, or some other compound of manganese, and in the case of roasted ore the semi-sulphides and chlorides of lead and copper. The success of pan amalgamation depends on the proper use and quantity of these chemicals, which consist of sulphate of copper (bluestone), common salt, sulphate

of iron (copperas) and sulphuric acid. The ore must be studied practically with varying quantities and proportions of the chemicals, till the smallest amount is determined that will give the highest extraction of the precious metals. These chemicals must all be added to the charge and thoroughly incorporated before any quicksilver is used, or not only will the bullion be base, but from that fact quicksilver is floured and lost. Carbonate of lead will largely increase the amount of amalgam and put it in a shape which will prevent any close separation of the free quicksilver, even when strained hot.

## The Mother Lode in Tuolumne County, California.

NUMBER VI.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Southward from the Mazeppa mine, last referred to, the lode is intersected by the canyon of Sullivan creek. The general and characteristic features of the lode are obscure in this section for a distance of over 2 miles. Some superficial prospecting has been done, but thus far no very valuable deposit of gold ore has been developed. Most of the land is held un-

west vein, which latter in some instances is fully 140 feet in width, and divided by a soft clay gouge, showing marked northwest movement from numerous striation marks. (See accompanying sketches.)

The middle vein, as a matter of distinction from the west or boulder vein, also contains sufficient value to be workable, while the west or boulder vein contains very little value.

The ankerite zone appears to be confined to the west vein, but is not as prominent as around the Rawhide mine and at Quartz mountain.

The so-called east vein is confined to the mineralization of the amphibolite schists composing the hanging wall of the middle vein. This mineralized zone is limited in lateral extent to the immense "blow out" of quartz forming the crest of Eagle hill, and owes its origin undoubtedly to fracturing accompanying dynamic occurrences and subsequent mineralization.

The east vein has been a source of considerable profit to the company and has a maximum length of 900 feet and a depth of 600 feet or more, the stopes in some instances being 50 feet wide.

There are no walls defining or confining the mineralization, a gradual feathering out and extended floors being characteristic features.

A continuation of this mineralization has been found by extensive diamond drilling to a depth of 1800 feet below the surface, showing that the fracturing is

der agricultural patent, which may in some measure account for the lack of activity on this portion of the lode.

The most important development next south of that portion of the lode previously described is in the properties of the Eagle-Shawmut Company, about 2 miles southeast of Chinese.

The country rocks are clay slate, amphibolite schist, diabase (intrusive), serpentine and dike rocks of more acid type than the greenstones. The most striking feature in the Eagle-Shawmut mine is the heavy wall-like outcrop of white quartz which forms a prominent object in the landscape.

The superintendent Charles Uren, says of these mines that the Eagle-Shawmut present quite a different geological condition from the mines to the immediate north, inasmuch as we do not work the west or "boulder vein," as it is locally known, operations being confined to what we term locally the middle vein and east vein.

Geologically, this so-called middle vein may be considered the mother lode, as veins are not always simple, following one line of fracture, but composed of a series of parallel veins.

The middle vein seems clearly of secondary origin, resting immediately upon the hanging wall of the

deep seated, yet not extensive, consisting of narrow bands of mineralized schist following closely the strike and dip of the schist.

The geological conditions are illustrated in the accompanying sketch showing surface geology. Fig. 1, a cross-section roughly showing underground conditions. Fig. 2, a longitudinal section for the same purpose.

Fig. 3 shows the surface geology immediately surrounding the shaft and mine proper, and also the open pit, or "glory hole," as it is locally known, which is excavated in the decomposed mineralized schist of the east vein, and is 500 feet in length, 100 feet wide and 100 feet deep, being connected by a series of chutes to the levels below connecting with the shaft.

Fig. 1 shows a cross-section taken through the open pit, and the relative position of each vein and adjoining formations.

Fig. 2 shows geological conditions of importance governing the working of the mine.

The east vein mineralization shows a connection on its strike with the middle vein, forming a continuous shoot in black slate laminated with quartz seams, this latter formation having a distinct northerly trend and extending to the lower levels of the

Old Mill and Plant, Eagle-Shawmut Mine, Tuolumne County, Cal.

mine. Development consists of twelve main work-levels, the lower of which is about 1900 feet below the surface, and operations are carried on at all points from the open pit to the lowest level. Below a point 600 feet from the surface all work is confined to the middle vein, and development shows little change in geological conditions, except, as previously noted, the east vein ceases to be an important factor.

**TREATMENT OF ORE.**—The ore contains about 4% sulphurets, and in milling the proportion of free gold is about 30%, the balance being in concentrates. The 100-stamp mill is operated by water power under a head of 900 feet and there are excellent facilities for crushing and handling the ore cheaply. (See accompanying illustrations.) The ore is crushed so as to pass a No. 2 punched tinned screen and the mill handles on an average 500 tons of ore a day.

Concentration is accomplished by means of forty 6-foot Frue vanners.

A chlorination plant having a maximum capacity of twenty tons per day, consisting of a mechanical and a hand reverberatory furnace, treats the sulphides by the barrel process, using a 10-ton and a 5-ton chlorinating barrel.

Costs of mining and milling, with a liberal depreciation, has been considerably under \$2 per ton for some time.

### The Laws Against Water Pollution.

A review of the laws forbidding the pollution of inland waters in the United States, which may be of practical benefit to the public, has been prepared by E. B. Goodell for the United States Geological Survey. It is published as No. 103 of the series of Water Supply and Irrigation papers.

The purpose has not been to prepare a complete work on water pollution for the use of members of the bench and bar, but rather to put into the hands of public officials, legislators, water companies, miners, manufacturers, farmers, and others interested in the subject, a guide for their action, and to furnish references to the sources from which a more exhaustive knowledge of the subject may be obtained if required.

No attempt has been made to present a detailed statement of the entire law against water pollution as it exists independently of statutes, but the broad legal principles under which anti-pollution statutes become operative are explained and important court decisions are quoted to show authority for various deductions. These principles and decisions have been classified and are presented in three groups:

(1) The rights of riparian owners to pure water as against one another.

(2) The rights of the public (as distinguished from individual owners) to have inland waters kept free from pollution by riparian owners or others.

(3) The conditions under which, and the extent to which, public municipalities may use inland waters in the disposal of sewage matter from public sewers.

The statutes enacted in various States are classified according to their general scope and an opportunity is thus afforded to compare their effectiveness and desirability. In some States there is nothing more than a simple provision making it a crime to poison wells and springs, while in others elaborate provisions have been made to check and, so far as possible, absolutely prevent all pollution of all waters by the refuse products of animal life or the waste of human industry. In citing the statutes, Mr. Goodell has grouped the States together logically to show the stage of growth in sanitary education at which each has arrived.

It is hoped that the publication and distribution of this paper will help to bring about a general apprehension of correct principles upon the important subject of water pollution.

THE Chinese problem in the Rand mines seems to have been solved, in a measure, the principal thing being the obtaining and breaking in of more coolies. On Oct 7 a ship with over 1400 Chinese landed at Durban, and three days later another ship having on board over 2000 more left Tientsin for South Africa. During September the number of laborers employed by the Rand mines was 68,545, of whom 9039 were Chinese. The addition of the 3000 referred to will aid materially in helping along the situation there. At a recent meeting of the Chamber of Mines at Johannesburg it was stated that the Chinese drillers who had commenced the first month of their employment by drilling an average of about 12 inches of hole daily, improved to 15 and 16 inches, and had further increased this rate by the middle of September to 28.1 inches, while many of the more expert men were drilling 3 to 4 feet per day. As among the workmen of all other nations in performing any class of work, the personal equation is a large one. Some of the Chinese drill after two months' practice but 21 inches, and from that there are those who drill as much as 54 inches in a single shift. The mine managers agree that the success of the experiment has exceeded their expectations. It is stated that by January 1, 1905, there will be upward of 40,000 Chinese laborers on the Rand.

## White Horse Copper Camp, Yukon Territory.

Written for the MINING AND SCIENTIFIC PRESS by W. M. BREWER.

Although volumes have been written descriptive of the northern Yukon country, but very little information has been given by the mining journals relative to the southern Yukon, of which the town of White Horse, situated at the head of navigation on the Lewes river, is the metropolis and distributing center.

This portion of the Yukon occupies the unique position of being the only section in that vast territory in which, up to the present time, have been discovered productive metalliferous lode mines.

The first discoveries of copper-bearing ore were made in 1898 by Jack McIntyre, a Klondike prospector. These are situated about 4 miles northwest from the present site of White Horse.

Because of the remoteness of the district at this early date, no systematic development work was attempted, but on the completion of the White Pass & Yukon Railway several prospectors commenced an

Valerie, 50 tons; and from the War Eagle a trial shipment. All of this ore was bornite, except that from the Valerie, which was chalcopryite, and the values obtained varied from 5% in copper, \$3.50 in gold, and five ounces in silver, to 46.6% in copper, \$2.00 in gold, eleven ounces in silver. The bulk of the ore ranged between 19% and 30% in copper.

It is only fair to the district to call attention to some of the difficulties with which these operators of limited means have had to contend. In the first place, all the ore so far hauled out has been transported from the mines to the railway in the winter months on sleighs, and because of the high cost for horse feed, and teamsters' wages, the rate per ton for even a 4-mile haul has necessarily been high, when compared with the prices paid for hauling in those sections to the south. This difficulty, however, can be easily overcome by the construction of surface tramways, the cost of which, owing to the easy grades from the mines to the railway, will be low. In fact, one proposition was submitted to the owners of the Grafton claim, to construct a tramway for horse haulage for \$3800. Of course this meant wooden rails. Another difficulty was the fact that the men working in the mines, even in the dead of winter, would quit work suddenly to stampede to some newly discovered placer camp, no matter how far distant. As the camp becomes more settled

eral contact between limestone and igneous rocks are concerned, this zone or belt practically maintains continuity for its entire length.

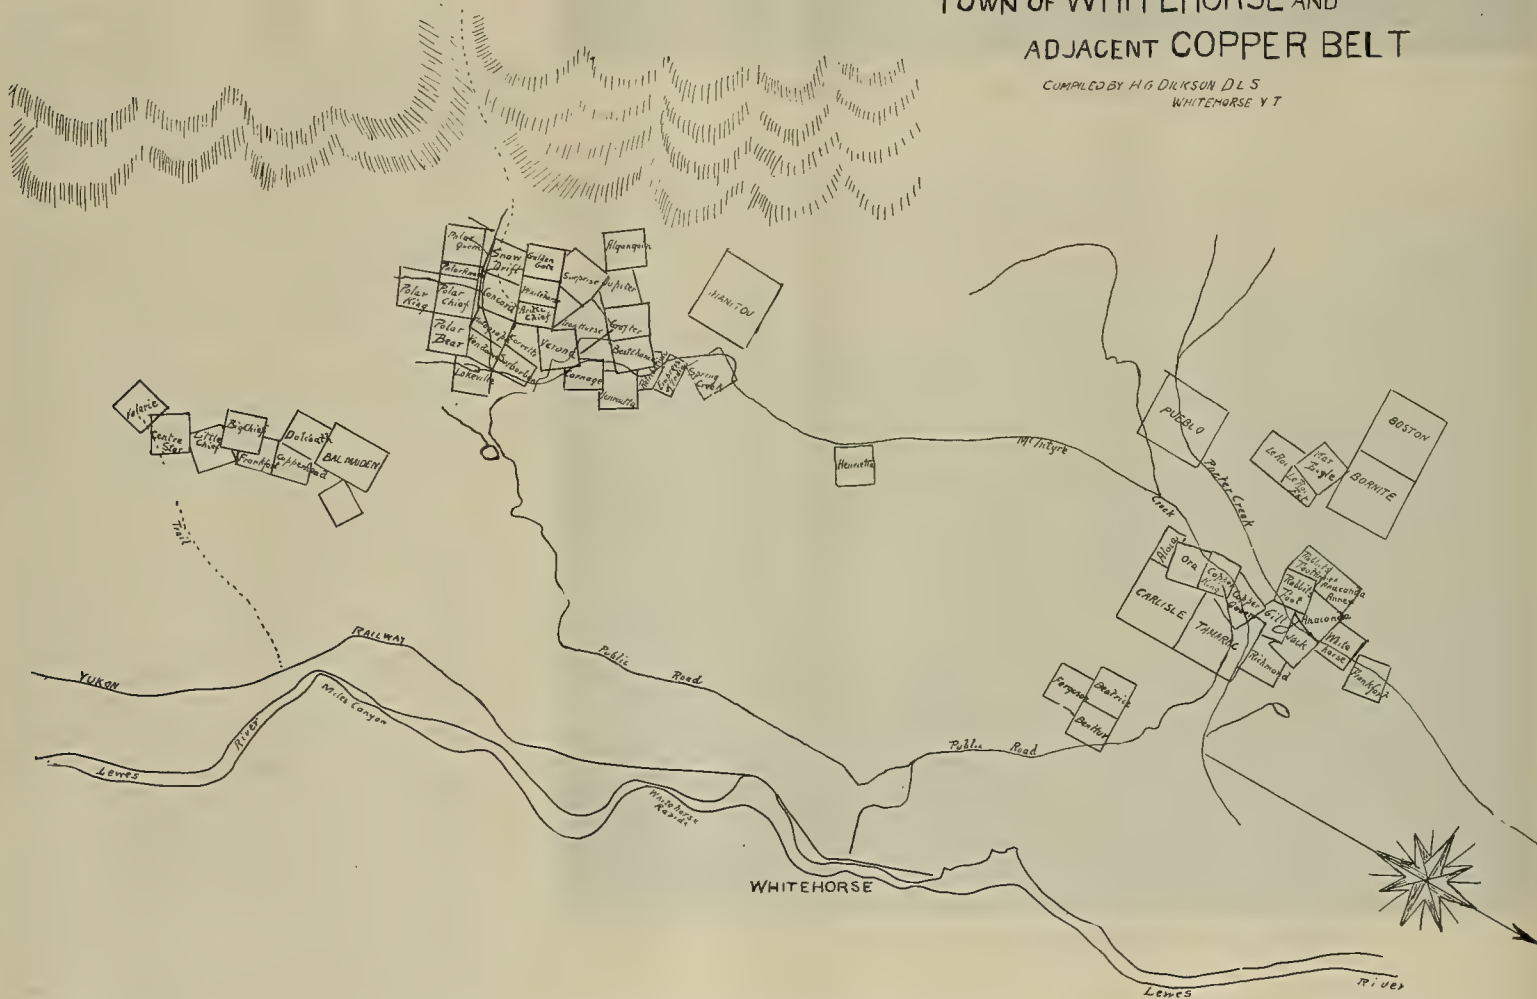

In many places along the Lewes river, especially from Miles canyon to the foot of White Horse rapids, the geology of that portion of the district can be easily studied because of natural exposure, but west from the river, and between it and the copper belt these exposures are seldom met with, consequently any attempt to map the geology in this intervening space, which averages about 3 miles in width, would lack much accuracy in detail.

The topography of that section, including the copper belt and the intervening space between it and the river, is a slightly rolling plateau, with all the indications that at some remote period it formed an inland sea, from which the waters have receded until at the present day such are confined between the banks of the Lewes river.

The rock formations occur in the following series: Basalt, in the vicinity of Moles canyon and other points along the river; west from the basalt, a belt of granite and granitoid rocks, the exact area covered by which it is impossible to estimate, because the natural exposures are few, and because so much of this portion of the country is covered by glacial moraine; next in the series is found a belt of crystalline limestone of variable width, then garnetite and

## TOWN OF WHITEHORSE AND ADJACENT COPPER BELT

COMPILED BY H. G. DICKSON D. L. S.  
WHITEHORSE Y. T.

earnest effort to develop the claims they had staked previous to the building of the railway.

In the fall of 1900 the first sample shipment of ore was sent from the Copper King mineral claim (the discovery claim of the district) to the smelter at Everett, Washington. There were about eight and one-half tons of bornite ore, mined from within 20 feet of the surface, the copper values in which, according to the smelter's certificate, was 46.6%.

For various reasons, however, one of the chief being high freight rates, no further shipments were made from this camp until January, 1903, when a through rate from White Horse to the B. C. smelters was arranged. As a result of the granting of this concession, serious attempts were made to develop the Copper King, Arctic Chief, Grafton, War Eagle and Valerie mineral claims. But as all the capital employed was local, the work was not prosecuted as extensively or as continuously as would have been the case had corporations possessed of large capital been operating the properties. For this reason, every allowance must be made for the comparatively limited extent of the development work, which will be referred to in detail later in this article.

Up to the present time the following shipments have been sent out to B. C. smelters: From the Copper King, about 400 tons; from the Grafton, 150 tons; from the Arctic Chief, 150 tons; from the

though, most of the difficulties which have had to be contended with in the past will disappear. The railroad company and the smelters are to-day co-operating to such an extent that, even in this far distant camp, ore of a uniform value of \$15 per ton can be mined, freighted and treated at a profit, if it is shipped in bulk, and close hand sorting is not found necessary.

**GEOLOGY.**—The White Horse Copper Belt, as the mineralized zone in which the copper ores occur is locally designated, extends in a general direction from south to north for a distance of about 16 miles. It is situated westerly from the Lewes river, having its trend or line of strike nearly parallel with the channel of the river. So far as at present known, the width of this copper ore bearing zone varies from about 1 mile to nearly 3 miles, the maximum width being reached near the northern extremity. (See accompanying map.)

Owing to the fact that in many places along this zone, rock in place is not exposed by nature, but is hidden by glacial moraine and wash gravel, any map of the district will show spaces of variable extent, on which no mineral claims have been staked, but a careful survey along the line of strike of the mineral bearing zone will determine that so far as outcrops of copper ores, or of garnetite associated with iron ore, indicating the presence of copper, and the gen-

felsite (it is at the contact between these two rocks that the copper ores usually occur); to the west of these rocks granite dikes occur as intrusions, and apparently mark the western boundary of the copper belt. Beyond and to the west of the limits of this mineral bearing zone there is a range of hills which, so far as the writer's observations have gone, is made up of a much altered quartzose rock, and beyond this, conglomerates and sandstones of the Cretaceous era in which occur several workable seams of coal.

As the igneous rocks all occur as intrusive dikes and masses, there is necessarily much irregularity with regard to the shape of the ore bodies. These are all lenticular in structure, are of variable extent, and the lines of strike, although having a general trend from south to north, conformable with the trend of the country rock, vary in portions of the belt, sometimes being a few degrees to the east of north, and at other times a few degrees to the west.

A superficial geological survey of the copper belt impresses one that apparently similar conditions prevail with regard to the ore body, as are found on Texada island, situated in the Strait of Georgia, between the mainland of British Columbia and Vancouver island, and also to some extent similar to those found in the Bisbee district of Arizona. So far as magnitude is concerned, sufficient development

work has not yet been done in the White Horse Camp to enable the writer to predict what the conditions in this respect will eventually be determined to be. The high grade of the ore in copper values, as well as the fact that grade holds good from the grass roots down, and is found to be fairly uniform from the foot to the hanging wall side of the various deposits on which serious development work has been attempted, should make the field a very attractive one to operators who are conversant with the geological conditions which prevail.

When the first development was attempted on Texada island that camp was adversely reported on, yet since then, on three different properties situated in close proximity to each other, development has been carried down to a depth of 600 feet, to which depth the ore bodies are found to maintain their continuity, and on that level the showing is such as to warrant the assumption that they are persistent to a much greater depth.

Apparently at some portions of the White Horse Copper Belt the mineral zone has been thrown either to the east or to the west, through faulting, but at the northerly end of the zone a much greater width is shown than towards the south end, there being three parallel zones of an aggregate width of nearly three miles. At some other portions of the belt there are apparently local duplications, because, take for instance on the Grafton mineral claim, crystalline limestone forms the foot wall to the ore body, but on the adjoining claim to the east the limestone is on the hanging wall side. However, there has not yet been a sufficiently close survey of the geology attempted to describe it in detail with any degree of accuracy.

So far as the genesis of the ore deposits is concerned, no attempt has yet been made to determine whether replacement has been the controlling influence, or some other cause. One feature is very noticeable, which is that almost invariably the highest grade ore is found next to the limestone, which is fully crystalline, from metamorphism. Another is that usually the dip of the limestone is variable from about 30° to 70°, owing to the wave lines, caused by its solubility. Another is that, so far, on none of the prospects on which considerable development has been attempted has any well defined hanging wall been exposed; the solid ore usually grades into ore with tremolite, garnetite, or felsite for its matrix; next into garnetite or felsite, in which are found grains, crystals, and masses of ore as impregnations; next we find entirely barren garnetite or felsite, followed by granite or granitoid rocks.

On the Arctic Chief mineral claim the area covered by outcroppings of magnetite, with impregnations of bornite, had not been fully determined by stripping at the time of the writer's last visit in May, 1904, but an open trench had been made about 60 feet in length, and about 10 feet in width, which showed outcroppings to be continuous to that extent.

The development work at that time consisted of about 150 feet of tunneling and 35 feet of sinking below the tunnel level. An ore body had been intersected at about 70 feet from the portal of the main tunnel, and a crosscut started from this point showed a body of solid ore (magnetite and bornite) 22 feet in width. On the supposed foot wall a winze was sunk about 35 feet in ore, but at the bottom the magnetite had given place to garnetite.

During the progress of this development work 400 tons of ore were taken out, but no overhand stoping was done. About 125 tons of ore were shipped during the winter of 1904, but further shipments were suspended owing to the excessive cost for sacking and hauling on sleighs to the railroad.

On the Grafton mineral claim, situated about 1500 feet in a northerly direction from the Arctic Chief, a working shaft has been sunk to a depth of 72 feet, and a level opened at about 60 feet, on which about 200 feet of tunneling has been driven, 150 feet being deadwork paralleling the ore. On this level an ore body was crosscut 12 feet 6 inches in width and drifted on 51 feet. One hundred and twenty-five tons of ore were taken out and shipped, there still remaining about 250 tons on the dump, of which a part is clean, solid ore, and the balance ore mixed with some waste. Active operations were suspended on this mine, notwithstanding that the bottom of the shaft and both faces of the drift were in ore of a grade sufficiently high to pay a profit if transported to the railroad on a tramway.

On the Copper King mineral claim, about 4 miles northerly from the Grafton, the ore body, which is made up of bornite and chalcocite in a matrix of tremolite and felsite, has been followed to a depth of about 200 feet on its dip. A vertical shaft has also been sunk to a depth of about 60 feet on an ore body which is apparently a distinct lens from that on which the incline shaft has been sunk. No indications are apparent other than that the ore bodies are continuous to an undetermined depth below that already reached. From this mineral claim about 400 tons of ore in the aggregate have been shipped.

On the War Eagle claim, situated about 1 mile due west from the Copper King, an ore body has been exposed and sunk on to a depth of about 30 feet, while on the Rabbit's Foot mineral claim, situated between the Copper King and War Eagle, an ore body has also been opened. These occurrences of ore lie almost parallel to each other, and demon-

strate that this portion of the belt is wider than farther towards the south.

About 8 miles in a southeasterly direction from the Copper King mineral claim is located the Valerie, together with several adjacent claims. The ore bodies on these apparently occur in a parallel zone to what may be termed the main zone. There are two features peculiar to the occurrence of ore on the Valerie claim, which indicate that this ore body occurs in a distinct belt from that in which occur the ore bodies on the Arctic Chief, Copper King and other claims. The first of these distinctive features is that all the ore is chalcopyrite instead of bornite, which predominates on the other claims. The second is, that there is apparently no felsite in contact with the crystalline limestone, but instead a pyroxene rock closely resembling diabase. A third is the fact that the occurrences of ore on the Valerie and some of the adjoining claims are found very much nearer to natural exposures of basalt, than is the case in other portions of the White Horse camp.

On these last mentioned mineral claims crystalline limestone forms the hanging wall to the ore bodies instead of the foot wall, as is usual in other portions of the belt.

The White Horse camp is favorably situated as regards transportation facilities all the year round, and mining operations can be and are carried on during the winter months without interruption by reason of extreme cold or snow.

## The Granite Hill Mines of Southern Oregon.\*

[FROM A STAFF CORRESPONDENT.]

The Granite Hill mines of the American Gold Fields Company of Chicago, Ill., are on Louse creek, Siskiyou mountains, 8 miles from Grants Pass, Oregon. Deep sinking and the reduction of ores by improved and up-to-date machinery are rapidly changing the status of affairs in mining in Oregon; gold quartz mines are in demand and mining engineers are investigating for capitalists.

The development of the Granite Hill mine was desultory and unsatisfactory and with frequent change of ownership; but five years ago the property came under the management of C. L. Mangum, who, with a few associates, expended thousands of dollars in development, aided by a 5-stamp mill. Before and at this time three arrastras were in use. The showing made two years ago determined the company to purchase the entire property for the American Gold Fields Company of Chicago, of which W. J. Morphy is general manager.

Since that time development has been constantly pushed; systematic and modern equipment has superseded primitive methods. There are 1200 acres of mineral land in the holdings, upon which there are seven distinct veins, occurring in two formations. The contact passes through the center of the property and has an east and west strike, which is parallel to the strike of the Granite Hill vein. Nearly all of the veins thus far developed strike east and west, with the exception of the Red Jacket and High Tariff, which have a nearly north and south course. On the northeast and lying against the granite is a dike of highly mineralized diorite.

Granite Hill is an almost solid body of granite, surrounded by diorite, with true fissure veins cutting through. The main ledge, upon which are the principal workings and improvements, is from 3 to 6 feet in width, with a dip of about 30°. The ore outcrops at the surface near the mill and can be traced continuously for 1000 feet, and, at intervals, for 2 miles. In development the ore is encountered in shoots of 50 to 100 feet or more. The vertical shaft is of two compartments of equal size, giving sufficient room for the pump and air line in one and ample room for the cage in the other. In sinking the shaft the ledge was cut through at about 160 feet, and a mill run of 100 tons at this depth gave \$9 gold on the plates. The ore of this shoot was heavy in galena, with free-gold quartz in close proximity. At the 207 level a station was cut in the shaft and drifts run 250 feet east and 350 feet west. On the 307 level drifts are run 100 feet west and 50 feet east. On the 107 level the drifts run 200 feet east and 100 feet west. Upraises at different points in shoots of ore connect the different levels, thereby giving good ventilation. The ore treated at the mill has been mostly from development until recently, when stoping began east and west of the upraise in a shoot of ore in the second level.

At a depth of 230 feet in the shaft a water course was cut, which necessitated driving a crosscut 20 feet north of shaft and cutting a sump to hold 10,000 gallons. Beside the No. 9 pump which was first installed, a second No. 9 pump is in position, pumping 150,000 gallons per day, and is capable of doubling that amount. The vein of the Granite Hill is a ribbon quartz, carrying galena, iron and copper sulphides, with considerable free gold, the greater values being next to hanging wall. The average value, as de-

termined at the mill from the combination of the ore of the Red Jacket and Granite Hill mines, is about \$20 to the ton and assays of the tailings give 90 cents to the ton.

To the south of the Granite Hill shaft, 2000 feet, are the workings of the Red Jacket property. The vein is from 18 inches to 3 feet of mixed diorite and quartz, both walls being defined. This is intersected at intervals by cross fractures which form the ore shoots. The ore is free milling, with very little sulphurets. This ore will mill five tons to the stamp daily and is mixed with that of the Granite Hill sulphurets ore. Development consists of a 350-foot tunnel, a 75-foot and a 40-foot upraise, and a winze being sunk to 100 level, a 20 H. P. boiler and a self-dumping skip. At an early date an aerial tram will be placed between the Red Jacket and the mill on the Granite Hill claim. A sawmill is cutting 6000 feet of lumber and mining timber per day. On the 1200 acres is a large amount of timber.

The head-frame and skip shown in one of the illustrations on the front page was erected a few weeks ago at the Red Jacket mine and is giving excellent satisfaction. The head-frame is erected at the collar of an inclined shaft and does service for both prospecting and operative work. The double-compartment shaft is heavily timbered, though only one compartment is thus far used. It is calculated that the head-frame will serve all purposes to a depth of 1000 feet, and even to greater depth, when a more powerful hoisting engine is installed later.

The head-frame is simple and durable. It is built of 10x10-inch squared timbers of tough yellow fir, tied with 3/4-inch iron rods and bolts. The formation of the mountain side at the collar of the shaft is very firm, affording a solid foundation, the hill being graded for the purpose, dispensing with the necessity of a concrete foundation.

The two main posts of the frame, which continue above the collar of the shaft, are at the same angle as the shaft. The posts are set well apart, to give ample room for the skip dump and a wide platform for loading and unloading timbers and other materials.

The entire mechanism is operated by one man, who serves also as engineer and fireman of the hoist engine and boiler. There are two automatic, or self-dumping, arrangements, one each for ore and waste. By a signal from below, the engineer knows whether ore or waste is coming up, and, by throwing in or out the short-hinged section of the skip track on the head-frame platform, the dumping point of the skip is fixed, either for the waste pile or the ore bin.

In addition to their quartz mines, the placer ground of the American Gold Fields Company embraces about 400 acres in a basin between the Granite Hill and Red Jacket workings and may be worked by hydraulic method. To make this deposit available it will be necessary to drive a bedrock tunnel along the bed of an ancient river channel a distance of 1500 feet and this will be done next year. It will tap the basin at its lowest depression and give an outlet to the debris from the hydraulic plant. Test shafts have been put down at various points.

The Greenback mine is also in Josephine county, Or., on Grave creek. In July, 1897, two months after its location, specimen ore was found in a feeder to the main vein and an arrastra was put to work. During the following year the owners took out about \$2000 per month. In the early development the main vein was opened by four levels, the lowest 175 feet below the surface. In 1898 the property was bought for W. H. Brevoort of New York and D. Moffat & E. Smith of Denver, Colo. The whole control and ownership is now vested in Mr. Brevoort. The opening to the vein at the old mill is by a 275-foot crosscut, cutting it at 500 feet on its dip. At the new mill the 9th level tunnel follows the ledge, and by upraises and winzes the several levels to the 1200 will be connected and all ore will be taken to the mill through this tunnel. Sinking is also being vigorously pushed from the 1200 level. This mine has a pay shoot 700 feet long, the values being uniform and comparatively high. It is developed on the 500 and 900 levels. The ground above the 500 level has been stoped out. The quartz is mixed with filling, giving the ore a mottled appearance. The pay ore occurs in a series of lenses, usually on the hanging wall of the fissure. The distance between walls ranges from 3 to 5 feet. The ledge has an east-west strike and is in greenstone. The value of the ore as treated is \$12 to the ton. There are seven veins in various stages of development beside that of the Greenback proper. The walls are from 3 to 6 feet apart, the values being principally in small stringers of high-grade ore, in connection with tellurium. The tendency of the Greenback ledge is to show richness in spots and at the same time carrying values throughout the pay shoot. The 200-foot winze sunk from the mill level gives a total depth on the vein of 1100 feet, and the proportion of gold saved on the plates at this point is as great as on the ore from higher levels. The percentage of sulphurets in the ore does not exceed 1%. The equipment comprises the old mill of 10 stamps, the new mill of 30 stamps, Wilfley concentrating tables and a cyaniding plant of 1000 tons daily capacity. The mine and plant is lighted by electricity, the drilling is done by machinery and ore is blocked out for four years' steady run of the milling plant. C. W. Thompson is superintendent.

## Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER V.

Written by ARTHUR C. SPENCER.

**GENERAL DESCRIPTION.**—The occurrence of the albite-diorite dikes which constitute the Treadwell ore bodies has already been given. The ore consists mainly of rock impregnated with sulphides, principally pyrite, and in part shattered and filled by reticulating veins of calcite and quartz, which also carry sulphides. The ore bearing dikes are considerably mineralized throughout, and often the whole mass can be mined. Locally, however, the values are too low to pay for extraction and portions of the rock must be left.

Three sorts of ore are recognized by the miners—"quartz," "brown ore" and "mixed ore." The so-called quartz ore, which constitutes the bulk of the workable material, is essentially mineralized diorite, but it usually contains calcite and quartz, the former disseminated or in veins, the latter only in veins. As a rule, its color is white or light gray, but in many places it has a greenish cast. The brown ore is derived from a comparatively small amount of productive mineralization occurring in the walls or in the narrow horses of slate, where the presence of gold-bearing sulphides is commonly recognized by a brown color, which leads to the popular designation of this ore. The brown material grades into the ordinary black slate, and its color is apparently due to decarbonization of the carbonaceous rock by percolating sulphide solutions. Impregnation of the slate is by no means always present, and where it occurs it seldom exists for more than 2 or 3 feet from the walls of the main ore mass. The mixed ore, which is more abundant than the brown, is composed of slate intricately intruded by small dikes of very fine-grained diorite, the whole being impregnated with sulphides in the same way as the ordinary ore.

The value of the material mined varies from, say, \$1 to \$5 and even \$10 or more per ton, though in the course of development a great deal of less valuable rock is extracted, and in working the open pits large amounts of worthless slate must be moved, much of which goes with the ore to the stamps. In general the average value of the rock has been a few cents over \$2 for the past two or three years. From 60% to 75% of the gold is free milling, and the concentrates, which the mill records show to be about 2% of the material treated, assay from \$30 to \$50 per ton.

**SHAPE OF THE ORE BODIES.**—The impregnation of the dikes in which the ore occurs is, for the most part, so general, and the presence of at least small amounts of gold is so constant, that it is impossible to recognize any well defined masses which may properly be distinguished as ore shoots. Though the values are by no means uniformly distributed, from the assay plan they do not appear to occur in any regular way, and, indeed, the distinction between ore and rock too lean to pay for extraction is often the matter of only a few cents. The actual differences in gold tenor of several contiguous samples taken from the ore are usually much greater than the difference between the average of any considerable block of ore and the contents of intervening masses of poor rock. In several places mere joints or seams may be noted separating the ore and the poor material, and it frequently happens that blocks of the latter, which show assays from a trace up to \$1, are entirely surrounded by ore averaging \$2 or more. Structural limitations, such as joints, however, are difficult of observation, because the sides of the drifts are everywhere covered with dust.

In general, the best ore is that which contains the greatest number of quartz and calcite veinlets, and though their absence is not an infallible indication of valueless material, it seems that the irregular distribution of the gold has resulted mainly from original differences in the amount of crushing and the consequent varying permeability of the rock. Where the metasomatic replacement of the diorite by secondary albite is absent, the sulphides usually replace such minerals as hornblende or mica, and it is suspected that in these cases the gold content is ordinarily low.

In planning the position of stopes the assay charts often enable locating the pillars in relatively poor material, but as a rule the low-grade rock is not found to persist for the whole distance between two mine levels. The largest masses, which have been left because of their leanness, are on the foot wall side of the south dike in the Treadwell workings, but even here there are great variations in the gold tenor at different places. On the 110-foot level all the rock was minable. On the 220-foot level from 10 to 40 feet of low-grade stuff was left on the foot, excepting for a distance of about 150 feet. On the 330-foot level good values were found up to the slate, excepting for 200 feet along the west end, where 20 feet or so were left, while on the 440-foot level not over half of the rock gave assays over \$1. The relative position of the high-grade and low-grade material is

shown in the plan of the 440-foot level and in section 16 given in Figs. 10 and 11.

**PERSISTENCE IN DEPTH.**—The ore dikes have been developed along the dip for a distance of, approximately, 1000 feet in all three of the mines now operated. The Treadwell workings reach about 700 feet below sea level, the Mexican 600 feet and the Ready Bullion 800 feet. In no case has it been possible to make out any progressive change in the character of the ore as depth was attained. The assay charts show the ore in the lowest levels to be quite as good as in the upper workings, and it is evident that variations along the dip are not greater than those observed from place to place along the strike. It is true that the mine records for a period of years show a gradual decrease in the per ton value of the material which has been treated. This is especially noticeable in the case of the Treadwell mine, which has been the longest in operation, but it is the result of increasing the tonnage by mining low-grade rock, rather than an indication that the average value is decreasing with depth.

It seems fair to assume that the ore will continue to at least a considerably greater depth without important change in average value. There is nothing in the character of the ore to indicate any important secondary concentration of values by oxidizing waters near the surface. On the other hand, the characteristics of the deposits are believed to indicate that it was formed in its present condition by the direct action of ascending waters. If this idea is correct, there can be little doubt that the mineralization and the values will continue to a much greater depth than has been reached, and it may be fairly anticipated that the limit of deep mining will finally depend more upon increased costs attendant upon hoisting and pumping than upon the exhaustion of the ore.

**VEINING IN THE ORE BODIES.**—In almost all parts of the Treadwell deposit reticulating veinlets of calcite and quartz are prominent features of the mineralized dikes. The veinlets are often composed entirely of calcite, but this mineral is usually accompanied by quartz, though the latter seldom, if ever, occurs by itself. The veinlets are rarely more than a few inches in width; many are only a fraction of an inch across, and the microscope shows the presence of minute fracturing between the veins visible to the naked eye. The veins are usually closely spaced, and an estimate based on a study of all the mine workings indicates that infiltrated materials make up nearly one fifth of the mass of the ore.

The boundaries of the veinlets against the enclosing rock are sometimes distinct, but in many cases there is an apparent gradation from the vein matter into the altered diorite. When the amount of introduced minerals is large in proportion to the mass of the matrix, in small specimens it is difficult to distinguish the vein stuff from the rock, though in large fragments or on the stope faces the general extent of the different portions of the ore material is exhibited. The microscope shows that the merging of the interstitial veinlets with the rock which they cut is due to the penetration of the latter by calcite, which is intercrystallized with secondary albite, formed at the expense of the original feldspar.

Veinlets traverse the rock in different directions, but the greater part of the filling occurs in fissure-like openings constituting two well-marked systems. One set of fractures strikes and dips approximately with the structure of the enclosing slates; the other, which is the more prominent, strikes slightly oblique to the structure of the country and dips in the opposite direction—that is, toward the southwest.

In places where the mineralized dikes are narrow, the set of fissures parallel to the country structure usually diminishes in importance, and often only the cross-fractures have been developed. This may be explained upon the supposition that the tendency to motion parallel to the walls of the intrusions was taken up outside of the massive rock in the slates, while the transverse strain affected both the slate

the diorite (Fig. 12). Throughout the mines it is the rule that all transverse gash-veins stop at the walls of the diorite, and while there are a few exceptions the quartz seldom penetrates the country rock to any great distance, and when it does it diminishes rapidly in thickness. However, this is not always due to the non-continuance of the fissures, for they may be frequently observed continuing from the diorite into the slate in the form of well-marked joints.

**GANGUE MINERALS.**—Feldspar, calcite and quartz are the three important non-metallic minerals of the Treadwell ores. Part of the original feldspar of the intrusive diorite remains in the ore, and with a considerable amount of secondary feldspar forms the principal gangue mineral. Other minerals of the unaltered rock were hornblende and mica, but these are present in relatively small amounts, as is also epidote, which has been formed as a product of alteration from them. Calcite and quartz occur in veinlets penetrating the diorite, and make up perhaps one-fifth of the material which is mined. Calcite is also found disseminated irregularly in the more altered parts of the diorite, unaccompanied by quartz. When sulphides and calcite are both present, they are almost invariably in contact with each other, but the secondary feldspar also carries a great deal of pyrite.

The occurrence of ferruginous calcite is common in the superficial workings, where it may have been formed by the action of iron-bearing solutions upon the primary calcite of the deposits. It occurs also in small amounts in deeper parts of the mines, where it is possibly an original mineral. A small amount of pink carbonate, probably a mixture of calcite and rhodochrosite, has been observed in the open pits of the Ready Bullion.

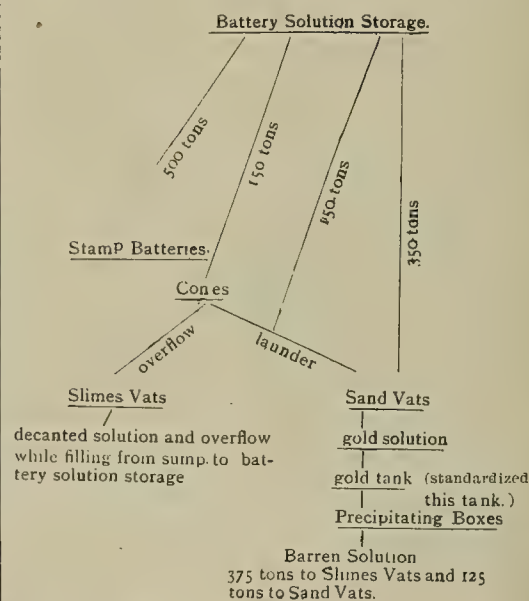

(TO BE CONTINUED.)

## Crushing in Cyanide Solution as Carried on in the Black Hills, S. D.\*

NUMBER VII.—CONCLUDED.

Written by C. H. FULTON.

DISTRIBUTION OF SOLUTIONS AT THE MAITLAND MILL.

**THE PRECIPITATION OF THE VALUES.**—In general no troubles in precipitation are encountered in the form in which the process is employed at the present time. In the earlier practices of the mills, when decanted slimes solution was passed through the zinc boxes with the idea of keeping the battery solution practically free from gold values, trouble was experienced by getting a very bulky and low-grade precipitate on account of the accumulation of fine ore slimes in the boxes, but in the present practice this trouble is avoided as described. At the Dakota and Horseshoe mills precipitation is carried on in barrels. These, at the Horseshoe mill, are 2 feet in diameter and 2 feet high, holding 5 cubic feet of zinc, or 25 pounds. One hundred and twenty of these barrels are in use. The barrels can be readily taken up on a pulley gear running on a trolley and conveyed to the cleanup tank for discharge and cleaning. At the Horseshoe mill, where 225 to 250 tons of ore are treated per day, 1000 tons of solution are precipitated every twenty-four hours. The zinc consumption is 1 pound per ton of ore treated. At the Hidden Fortune and the Maitland mills precipitation is carried on in the usual form of iron zinc boxes. At the Maitland mill, treating 120 tons per day, there are boxes of eight compartments each, the compartment having a capacity of 7 cubic feet of zinc. From 450 to 500 tons of solution are precipitated every day, there being 2.13 tons of solution for each cubic foot of zinc. The solution entering the boxes is kept at 2.5 pounds of cyanide per ton, for a lower tenor

Fig. 12.—Dike of Albite Diorite.

and the intrusive rock, the latter being specially susceptible to cross-fracture because of its small mass and brittle nature. Cross-fractures, filled with vein stuff and limited to a narrow dike in the slates, may be seen to good advantage at the east end of the Ready Bullion pit, near the southernmost outcrop of

\* Abstract Am. Inst. Min. Engs.

\* Bulletin No. 7, South Dakota School of Mines.

causes trouble by copper precipitating, which the solutions carry to a small extent. The zinc consumption is 0.3 of a pound per ton of solution precipitated and 1.33 pound per ton of ore treated.

**TREATMENT OF THE PRECIPITATES.**—The precipitates are refined at all of the mills by the usual sulphuric method into bullion, which is disposed of to the United States assay office at Deadwood. The fineness of bullion varies at the different mills, as the silver contents of the ores vary considerably. However, at most of the mills the bullion produced ranges between 400 and 600 fine in gold. In order to dispose of the bullion to the Government assay office at Deadwood, the bullion must have a minimum fineness of 600 in gold, and at some of the mills in the smelting of the precipitates a matte is purposely formed so that the resulting bullion will be above the minimum limit. The slags from the smelting of the precipitates are disposed of to the smelters at Denver, although at the Horseshoe mill the slags and matte from the smeltings are refined by melting with litharge and cupelling the resultant bullion.

**GENERAL EXTRACTION FIGURES.**—The extraction at the mills varies from 68% to 75%, according to the ores treated. At the Maitland mill, where the extraction is 73.2% and where approximately half the ore is treated as slimes and half as sands, the extraction is distributed as follows: In the batteries and cones, 39%; in the slime treatment, 16.5%, and in the sand treatment, 17%. As a general thing the recovery of bullion is either 2% or 3% higher or the same amount lower than the assays of the ores, tailings and solutions call for.

**THE COST OF TREATMENT.**—The following is the detailed cost of treatment at the Dakota mill during a period in 1902. The average value of the ore was \$4.70 per ton:

	Cents.
Labor	45.3
Superintendence	9.0
Cyanide	21.1
Zinc	3.3
Slime	1.2
Power	22.6
Shoes, dies, etc.	9.5
Repairs	2.7
Refining	3.0
Assay office	4.0
General expense	5.0
Total (\$1.27 per ton)	126.7

The mill during this period treated 100 tons per day. The cost at the Dakota mill, owing to a somewhat increased capacity, has been reduced to \$1.17 per ton.

The cost at the Maitland mill (treating about 125 tons per day, and which is not situated on the railroad, so that the cost of supplies is considerably increased) is \$1.79 per ton. The cost at the other mills ranges between the costs at the two mills given.

**Inexperience in Mine Management.**

**TO THE EDITOR:**—There has appeared from time to time in the columns of your journal protests against the error of appointing men to the management of mining and milling property who are untrained in the necessary branches of science underlying this work, and while perhaps no one hopes to immediately stamp out this fallacy, still all that can be done should be done to lead the investor, whether he be from the East or West, to consider well who is being placed in charge of his property.

The Western investor is a man who is usually familiar with mining, and therefore selects a man

who is experienced, but how is it with the Eastern man? No man who has been long engaged in active mine or metallurgical work has escaped the nephew or son of some president or director in the East who has tried and failed at law or medicine, or has, perhaps, been a postmaster. He comes with the belief that the payment of low wages and purchasing of cheap supplies is the whole matter. The result in most cases is the mine fails to pay. He makes one or two characteristic efforts, such as attempting the concentration of telluride ores, and then our friend goes back to his home in the East and enlarges to his constituents upon the uncertainties of mining. He passes over the field of possibility and does not discover that the mere execution of business is insufficient; that his endeavors involved the principles of pneumatics, hydraulics, mechanics, physics and chemistry. Then out will come some doctor of medicine, whose knowledge of chemistry usually stands in his own light, and a man who believes that the amount of gold in a ton of ore can be increased by some mysterious operation suggested by this or that fakir, and in evidence of his good faith he will spend his people's money, and when the process fails—for want of a little more money for further experimentation—he, too, will fold his tent and retire disappointed, but filled with rare ideas of the possibilities of the industry.

One will find all sorts of absurdity expressed and practiced. A tanner will say that cyanidation is just the same as tanning—the bark is leached in exactly the same manner as the ore. You will be told that in a system of water pipes, under static conditions, the closing of a valve one-half will reduce the pressure one-half in the side opposite the initial pressure. You will be told that the power developed by a water wheel depends upon the size of the wheel—force and volume not considered. You will see a concentrating table drawing a streak of mineral—one-half being saved and the other half being discarded. You will hear that the cheapest power is electricity and that the time is coming when all power will be electric, etc.

It is not my wish to belittle the knowledge of these men; they are as important in the commercial world as the miner; they are men of business ability, but they are not men who will be successful as mine managers until they have learned what is axiomatic, "that to succeed in business one must understand that business, its underlying laws and principles." Mining involves more than the usual business routine. In fact, a great number of natural laws are involved, and it follows that a knowledge of these is essential to successful operations.

Mining is looked upon by many as a gamble, a game of chance, and it ever will be so long as inexperienced men are to direct its operations. Any enterprise is one of chance so long as its governing laws are not understood and observed, and as a corollary it follows that when these laws are understood and observed the operation becomes one of exactness.

We speak of the value of experience, and experience is the final court, but let it be remembered that

men gain experience in proportion to their scientific training.

Mining is a beneficent avocation, for its products are added to the world's wealth. Mining is not a gamble and it should not be so considered, for the number of uncertain factors are no greater than in other lines of industry.

MINE MANAGER.

**Little Giant Drill Sharpener.**

The illustration herewith is that of the Little Giant drill sharpener manufactured by T. H. Proske, 1734 Fifteenth street, Denver, Colo., designed to meet the demand for a one-man drill sharpener, as there are many mines that do not use to exceed 350 drills per day. According to the manufacturer, one blacksmith without a helper can, with this machine, sharpen 350 drills per day.

In this machine the upright hammer and the horizontal hammer are attached to the heavy duty timber frame, which permits of the drills being side set and cross formed in the same die that the upsetting is done in, an auxiliary valve connected to the upright hammer permits the hammer die to be held up while the drill is being entered. A slight shifting of this valve allows the hammer to strike the drill, forging the cross form and at the same time forming the bevel or cutting edge on the face. This portion of the hammer die is so arranged that the taper, or clearance, is formed at the same time that the cross is formed. This leaves only the upsetting and finishing of the drill to be done by the dollie. To do this the drill is placed in the opening to the left of the cross forming part of the die. The upper, or hammer die is then held down on the lower die by means of a further shifting of the auxiliary valve, which permits the air pressure to get above the piston of the upright hammer and hold it down. While this is held in this position the dollie strikes the face of the bit, upsetting it into the die and reducing it to the exact gauge. The dies are so arranged that almost any size drill can be made in them, requiring only the changing of the dollies for whatever size of drill is to be made.

The tail block for taking up the blows of the horizontal hammer is a casting weighing about 425 pounds, provided with steel flanges that act as guides, and slide in guides provided on each side. This is carried back and forth for the different lengths of drills by means of a heavy steel screw which, in turn, is operated by a crank attached to a counter shaft, provided with a bevel gear that meshes into a similar bevel gear on the steel screw. This is placed in a handy place and is easily operated.

It is furnished complete with air hammers, ready for mounting upon timbers, and for attaching the air line to, and can be transported from place to place. The standard machine will sharpen drills up to 9 feet 6 inches in length, and weighs about 3200 pounds. Where longer drills than 9 feet 6 inches are to be sharpened a specially long machine is furnished.

Mouth of Main Tunnel Afterthought Mine, Shasta County, Cal. (See Page 313.)

Little Giant Drill Sharpener.

## Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 25, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINING MACHINE.—No. 773,310; W. O. Wood and J. H. Miller, South Hetton, England.

Mining machine comprising stationary principal frame, sliding frame supported in guides upon principal frame, means for supplying motive power, means for cutting and drill, means and drill being mounted on sliding frame, drill spindle, bearings for drill spindle adapted to swivel and to be adjusted to any position, semicircular guideway and means for clamping bearing in position in guideway and swiveling steadying block upon stationary frame for drill also adapted to be pivotally adjusted to any desired position.

DREDGER.—No. 773,337; R. A. Perry, Oakland, Cal.

Sea going vessel having projecting hydraulic dredging apparatus extending to front thereof, apparatus having Y-shaped ladder, one arm of which extends from junction with vessel in straight line diagonal to longitudinal axis of vessel and other arm extends from opposite side of vessel and intersects first named arm at point between vessel and outer end of arm.

ROCK CRUSHER.—No. 773,107; C. Wallace, Denver, Colo.

Combination with a suitable frame and an operating shaft, of a lever bar connected with the shaft, the latter being connected to impart to the bar an eccentric or crank action, a block pivotally attached to the lower extremity of the lever bar, a breakable safety pin, against which said block bears. Combination with eccentric shaft and suitable frame on which shaft is journaled, of lever bar hung on eccentric of shaft, and provided with crushing jaw, co-operating stationary jaw, abutment forming fulcrum for lever, and yielding means giving cushion support to lever bar during downward movement, means comprising bolts mounted on frame and slid-

able in lugs fast on lever bar on opposite sides, and coil springs located below lugs and surrounding bolts between the lugs and bolt heads.

ROASTING AND SMELTING FURNACE.—No. 772,925; H. Cockell and W. H. Fish, Columbus, Ohio.

In ore roasting and smelting apparatus, furnace, outlet for products of combustion therefrom, ore feeding and roasting chamber located in outlet having separate discharge into furnace, and fuel supply communicating with discharge.

SEPARATOR.—No. 772,860; F. H. Bemis, Bingham Canyon, Utah.

Separator comprising inclined spring-supported screen-carrying frame pivoted at lower or tail end in fixed bearings, means for depressing and suddenly releasing frame, and rigidly secured bumper or contact piece at head end to check upward throw thereof.

MAGNETIC SEPARATOR.—No. 773,246; J. W. Carnoghan, Silver Creek, N. Y.

Combination with downwardly tapering mill hopper, of magnetic separator comprising downwardly tapering funnel seated loosely in mill hopper, and separating magnets supported on funnel at outlet thereof.

AMALGAMATING MACHINE.—No. 773,266; G. C. Scott, Columbus, Ohio.

In amalgamating machine, combination of horizontal tapered mercury-containing casing closed at

larger end and open at smaller end with inlet for larger end, steam jacket for lower portion of casing, and closed amalgamating body carried axially upon shaft, tapered with casing and provided with longitudinal radial blades, means for rotating amalgamating body and inclined tailings discharge chute located adjacent to smaller end of tapered amalgamating body and forming continuation of tapered casing.

ROCK DRILL.—No. 773,112; T. E. Adams, Cleveland, Ohio.

Combination with wagon, drill and arm pivotally connected to wagon and to drill, of engine adjustably mounted on wagon and adjustable means for transmitting motion from engine to drill.

PICK.—No. 773,507; B. H. Laughhunn, Centralia, Ill.

Combination of tool head provided at side faces with recesses and having socket extending upwardly from lower face and terminating short of upper face, handle fitted in socket, combined clamp and brace composed of sections arranged at side faces of head and handle consisting of upper flat portions fitting in recesses and lower approximately semi-tubular portions embracing handle and having side edges fitted together to form continuation of socket, upper ends of semi-tubular portions being fitted against lower face of head, and upper and lower transverse fastening devices piercing upper and lower portions of combined clamp and brace, upper fastening device being located beyond handle and passing through head, and lower fastening device being located beyond head and passing through handle.

## THE PROSPECTOR.

The mineral specimen from Wallace, Idaho, arrived in the form of coarse sand. The material consists of much decayed feldspar and a dark-colored mineral also much decayed, but seemingly originally hornblende or augite. Without doubt the material is a dike which has intersected the vein, and as the distance beneath the surface at which the drift is driven is but 50 feet, it is likely that the width of the dike may be ascertained by an investigation on the surface. Perhaps a few pits may be necessary. It is probable that the ore shoot will be found to continue beyond the dike, but it may not be found directly in line with the portion already opened. If not found there search should be made to the right and left until its continuation is found. The displacement, if any exists, may be small or it may amount to several hundred feet. In the latter case it would be well to take up a new location upon the vein, as some dispute may arise as to its identity and continuity.

The rock samples from Boise, Idaho, are: No. 1, apparently a dike rock, but greatly altered. It contains little or no quartz, and any bisilicates it may have originally contained have been removed by the alteration of the rock. The rock has a porphyritic structure, but the feldspars are so completely altered as to make the identification difficult. No. 2 is aplite, a dike rock of the granite family. It sometimes is very siliceous and occasionally contains gold. It is also frequently found associated with gold-bearing veins.

The ore from Copperopolis, Or., is chalcopryrite in a gangue consisting largely of quartz and tourmaline. This is a somewhat unusual occurrence. The cleavage faces and fracture joints of the tourmaline are plated with the copper sulphide, and, in some instances, it looks as though the tourmaline had actually been replaced by the copper ore.

The rock specimen from Custer, Idaho, is garnet. This mineral is sometimes used as an abrasive. It has a hardness of 6.5 to 7.5, some varieties being harder than quartz, which is 7, in the scale of hardness.

The tallow-like mineral from Acton, Cal., is saponite, a hydrous silicate of magnesium and aluminum. It occurs filling cavities in the lava. The other specimen is foliated talc, or soapstone.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

At Snettisham, on Snettisham bay, the Alaska Snettisham G. M. Co., J. N. Tisdale superintendent, has a 20-stamp mill, with eight Frue vanners. Steam and water power are used and a dynamo furnishes lights for the mill and dwellings. The company also has a sawmill.

Over 3000 tons of copper ore will be shipped from the mines at Ellamar to the Tacoma, Wash., smelter, says the Douglas Island News.

Reports from Copper Mountain state the tram will be enlarged to capacity of 800 tons per day, by the Alaska C. Co., and drifting will begin on the vein in the lower tunnel. This shows sulphide ore. Eighty tons per day of carbonates are being taken out near the top of the New York vein and sent down the mountain by gravity tram. The carbonates and the sulphide ores will be mixed, to make them self-fluxing. The smelter is expected to be in operation by November 15.

## ARIZONA.

### Gila County.

Superintendent Fuller is increasing development work on the Pinto creek mines near Globe, and machinery, including air compressor and air drills, has been received.

### Mohave County.

The Cerbat Mountain M. Co. has been incorporated by St. Louis, Mo., men and is under management of J. Boyle, Jr. The company proposes to take over the Vanderbilt mine at Cerbat. It is intended to put in a hoist and sink a shaft several hundred feet.

J. P. Wallace of the Burro and Telegraph mines, at mouth of Burro creek, near Kingman, reports the lower tunnel has cut the vein at depth of 100 feet below apex and 490 feet in. The ore body shows 6 feet and it is proposed to build milling and cyaniding plants on west side of the mountain.

B. F. Hall, manager of the Golden Gem M. Co., operating near Mohave, says it is intended to put in a plant for making tests of the ores from the Gem mine.

### Pinal County.

Manager A. C. Sieboth of the Lake Superior & Arizona C. Co. at Superior says they were making satisfactory progress in development of the mine. Compressor has been set up. In the shaft they are cutting a station at 300 feet. As there is an overburden above the collar of the shaft of about 400 feet, the 300 level is 700 feet below apex of the hill, says Sieboth.

The Model M. & M. Ex. Co., H. P. McIntosh, president, has an option and lease on the Red Hill group, in Red Hill district, 12 miles east of Florence and 3 miles south of the Gila river. The group consists of fifteen claims showing carbonates, silicates, oxides, carrying gold and silver. A leaching process will be used to extract the values. McIntosh will build a ten-ton plant on the millsite at the river.

Superintendent W. B. Twitchell of the Big Lead M. Co. is increasing development work on the '05 mine at Kelvin. J. Champion Jr., superintendent of the Pinal Con. and Martinez mines, 18 miles northeast of Florence, says those mines are yielding high-grade ore which will be shipped as soon as he repairs the road from the mines to Butte at the smelter site. These properties are producers of lead and silver.

### Yavapai County.

The Arizona Gold Lode M. Co., owned mainly by Prescott men, with R. H. Burmister president, is operating in Cherry Creek district. On the Gold Lode, Leghorn and Red Cloud claims of the group there have been sunk three shafts of 60 feet each, all in ore, while on the Bugler there is a tunnel 260 feet long. On the Todd-King a shaft has been put down. They propose to build a 6-stamp mill. They are putting in a double-cylinder hoist and a boiler.

W. H. Ferguson has started work on the Aztec G. & C. Co. mines, 8 miles from Mayer.

Manager Heslet of the Yavapai Oil & Dev. Co. will start to bore for oil near Del Rio, near Prescott.

The power house of the Oriental M. Co. on its Postmaster mine last week was destroyed by fire. It contained a boiler, air compressor, engine to run a blower, receiving tanks and a blacksmith shop. It will be replaced. The mine is in Bigbug district, 1 mile below Poland.

## ARKANSAS.

### Boone County.

The Mammoth Spring M. & Dev. Co. of

Washington, D. C., has been incorporated, with J. M. Winder of Mammoth Spring as State agent, to operate near Harrison.

Superintendent G. W. Chase, of the Morning Star mine, reports Rush creek mines are active again—the Silver Hollow is shipping ore and the McIntosh is leased.

## CALIFORNIA.

### Butte County.

The Viloro Syndicate, Ltd., of London, England, which took over the McGee ranch of 400 acres, 2½ miles south of Oroville, expects to have its dredger start working this week. From sixty-three holes drilled the average depth to bedrock was found to be 3½ feet. T. H. Leggett is manager and W. H. James of Oroville superintendent of dredger operations.

The Fogg and the McLaughlin tracts, across the river north of Oroville, have been bonded to E. W. Fogg and C. Holman for gold dredging. The tracts aggregate 240 acres and are covered by orange orchards; five drilling machines are prospecting the ground.

### Calaveras County.

The mill for the Chris Anderson gravel mine at San Andreas is set up to handle the cemented gravels. Fifteen more men have been put on. The mill is expected to be in operation this week. Men have been running gangways below bedrock, through which the cars will travel and be loaded from raises into the deposits.

The West Lake M. Co. has started operations on the New Buffalo gravel mine, in Chile Junction district, near Mokelumne Hill. The hoist and other machinery from the Keystone mine at Railroad Flat are being set up. The Rooney and What Cheer mines, in same district, are producing values.

The Utica M. Co. at Angels last week again started up the electric plant, and as a result the Stickle mill and the Cross shaft hoist are being operated. A. D. Field of Waterbury, Conn., president of the Sultana company, says he will resume work.

### El Dorado County.

D. H. Jackson at Placerville says he will put in machinery and reduction works on the Landecker mine.

### Fresno County.

The pipe line of the Coalinga T. Co. has been given final test under water pressure and has started pumping of oil from Coalinga to tide water at Monterey. The pipe line is said to have cost \$750,000, which includes stations and terminals. The wharf at Monterey, while unfinished, is in condition for service.

### Inyo County.

In the Funeral range, near Ballarat, work is progressing on the Kean Wonder mine which J. R. De Lamar has bonded for \$160,000. Superintendent C. J. Lyser says final payment will be made about January 1st. Ore that runs \$200 per ton is being taken out and there is a ledge that assays \$30. The mine is 5 miles from eastern edge of Death Valley, and there is a wagon road to within a mile of the mine, where are the assay and general offices.

### Nevada County.

Final payment of \$15,000 has been made on the Central Con. group (formerly the Greenhorn and Central mines), near Grass Valley, by C. A. Bailey, O. Coffin, M. P. Stone et al. A mill will be built and is expected to be in operation next spring.

### Santa Clara County.

The Quicksilver M. Co., T. Derby manager, at New Almaden has issued its report for the year ended April 30, 1904, showing: Receipts from quicksilver sales, \$184,803; cost of materials and supplies, \$33,055; payrolls, \$146,455. Quicksilver produced, 4340 flasks (76.5 pounds each), average value \$40.495; sales, 4518 flasks. Average cost per flask of quicksilver produced was:

Payroll	\$33,745
Supplies	7,990
Miscellaneous and taxes	0,957
Total	\$42,692

From this is deducted \$2,605 for rents and miscellaneous and \$1,930 for increase ore at hacienda, leaving net average cost per flask at \$38.157. This compares with cost of \$41.59 per flask for previous year. The output was 405 flasks less than 1902-1903, as 6131 tons less of ore were hoisted, due to idleness of No. 2 furnace, and repairs to No. 9. The ore reduced gave average yield of 0.448% mercury against 0.415% in 1902-1903. Tons of rock mined, 40,398, of which 11,051 tons were from prospecting and deadwork, and 22,347 tons from vein and stopes. This gave 39,062 tons of ore, divided into 5082 tons, "granza" and 33,980 tons, "tierras."

### Shasta County.

(Special Correspondence).—The Great Western G. Co., owner of the Afterthought group of mines (see illustrations front page and page 311), is plac-

ing the group on a producing basis. The company controls 1400 acres at Ingot. W. G. Scott is manager. On the 250-foot level a body of ore is showing up, carrying 10% copper, not heretofore known to exist. The main working tunnel is in 1500 feet, and at that point is being built a chute down which ore will be sent from all the upper workings, a distance of nearly 500 feet. Development to greater depth will be resumed. At the smelter camp the furnace is built and the smoke-stack will be run up the mountain side at rear of the smelter. A three-story sampling mill, machine shop, covered ore bins of 1000 tons capacity, stock house, coke bins, laboratory, general office and other buildings have been put up. There is a 30-inch gauge railroad from the mine to the smelter. The main office of the Great Western G. Co. is at St. Louis, Mo. T. S. Henderson is president, W. G. Scott superintendent of mines and general manager, H. Haas superintendent of reduction works, J. Wolf general foreman. Ingot, Nov. 2.

Keswick reports say the sixth Fielding level in the Iron Mountain copper mine, at Iron Mountain, has been opened up; its development will give work to seventy-five more men.

At French Gulch the Fairview company has its wire cables across the Trinity river, and will lay the 2-foot pipe line over the river to the mine through the ditch to the millsite.

At the Gambrinus mine, near Whiskeytown, near Redding, the bonders having failed to pay the miners, the employees took the property and are working out their wages, operating the mine as lessees, says the Searchlight. The property is owned by Barner & Riebe of Redding. C. Woods, in charge of the mill at the Gambrinus, last week sent out three gold bars valued at \$4000, representing a 20-day run of the 2-stamp mill.

In the Whiskeytown section the Tarantula mine, on Whiskey creek, owned by E. Kiessling, F. P. Primm and H. S. Wilson, reports progress. Five of the ten stamps of the mill will be put in operation.

### Tuolumne County.

The New Albany mine near Carters has been bonded to J. A. Bunting & Co. of San Francisco for \$50,000 and twenty men have been put to work. B. Richards is superintendent. Machinery will be put in and the workings unwatered.

At the Ranch and Clark gravel mines, near Columbia, J. Shaw says he will increase machinery equipment and operate on large scale.

The Garfield-Virginia M. Co. has bought the Garfield extension mine, 2 miles east of the Buchanan mine, near Carters.

On Jackass hill, at Tuttle town, Flink & Erickson have unwatered the Allen shaft and are prospecting in the same. They also have an option on the Atlas mine.

W. P. Huston has bought a third interest in the Toledo (formerly the Labatour) quartz mine, 2 miles west of Tuttle town.—The Star mine, above Columbia, has closed down for lack of water. Grading is in progress for an air compressor.

—The Bell mine, near Tuttle town, of the El Rico M. Co. is closed down, but it is expected to start up again this month.

### Yuba County.

The Dunning farm, in Linda township, 3 miles east of Marysville, has been bonded to Stockton men, who will prospect it by drills for gold deposits. H. C. Meyers, G. H. Harris and F. J. Viebrock are of the company. The land bonded consists of 596 acres, 400 acres of which are bottom land.

W. P. Hammon, of the Yuba River T. Co., states his company intends to establish machine shops in Marysville, to repair and reconstruct the company's gold dredgers operating around Marysville.

## COLORADO.

### Boulder County.

The American Gold Queen M. Co. reports making a strike in its American Star mine, on Lefthand creek, near Boulder, says Superintendent L. R. Johnston. The pay streak is 10 inches to 2 feet in width and has been proved for 100 feet at the bottom of the shaft. The ore runs \$40 and shipments are being made.

The Northwestern M. Co., at Caribou, has bought two properties there and F. Smith of Caribou is in charge of operations. They are erecting shaft buildings and will put in machinery on both shafts.

Woods & Co. of Denver, who are interested in the Graham lease at Nederland, are shipping tungsten ores to Denver from Rollinsville over the Moffat road.

The owners of the Boulder County mine will build an addition to their 10-stamp mill at their tunnel property, and in the addition they will put machinery for handling tungsten ores.—The Wolf-tongue M. Co. has put up shaft building on its tungsten mine, 2 miles north of Nederland, and have set up a steam hoist-

ing engine and boiler. They are shipping tungsten ores to Nederland where they are milled and the concentrates hauled to Boulder for re-shipment to Pittsburgh for treatment. W. Roach of Nederland is in charge.

Boulder reports say the Savannah oil well No. 9, came into oil last week, and is producing at a rate of twenty-five barrels. In connection with the discovery of this well is reported found fullers earth, as a stratum below the oil.

Last week the new line of the Colorado & Northwestern Railroad from Sunset, 13 miles west of Boulder, to Eldora, 20 miles southwest, was opened for freight shipments to Sugar Loaf station. Grading on the line is completed and track laying will be completed by Jan. 1st. The Sugar Loaf mining district has the Logan, Livingston, Golden Age, Great Western Exp. Co. and other producing mines. These mines have been teaming their ore to Boulder. The following rates per ton have been made to Denver and Argo, in connection with the Colorado & Southern Railway: From Salina, Wall Street, value \$14, \$1.25; value \$20, \$1.50; value \$30, \$1.75; value \$50, \$1.75; value \$100, \$2; value over \$100, \$2.50. From Copper Rock, Sunset, Sugar Loaf, value \$14, \$1.50; value \$20, \$1.50; value \$30, \$2; value \$50, \$2.50; value \$100, \$3; value over \$100, \$3.25. From Francis, Ward, value \$14, \$1.50; value \$20, \$1.50; value \$30, \$2.25; value \$50, \$3; value \$100, \$3.50; value over \$100, \$4. The line from Sunset to Eldora will serve Nederland, where tungsten ore is being produced; also Caribou and Cardinal.

### Chaffee County.

Salida reports say the Liberty Bell M. & Dev. Co. of Salida, operating at Maysville, in the Monarch district, has added seven more claims to its holdings, at a cost of \$25,000. D. J. Kramer of Salida is president. They have shipped ore which netted \$40 per ton in gold, silver and lead. The mines are 1½ miles west of Maysville, on the Monarch branch of the Denver & Rio Grande railroad, and are so situated that ore taken from the tunnel is dumped directly into the railroad cars. The main tunnel carries veins running north and south. Plans are being made to build a concentrator on the south branch of Arkansas river and 50 feet from the railroad tracks. Surrounding the properties are timber. A branch of the Arkansas river flows near the mouth of the tunnel.

### Clear Creek County.

Manager F. A. Babcock of the Southern M., M. & D. Co., near Silver Plume, driving the Robert E. Lee tunnel, reports progress. The buildings have been repaired and other preparations for winter made. A cross lode has been cut by the tunnel which carries lead ore and is thought to be an extension of the Stevens vein. The Durango lode will be cut. The company will put in an air compressor operated by electricity.

Machinery at the Stevens mill has been overhauled and additions made, in another set of rolls, screens, elevators, etc., that will increase the capacity to 100 tons per day. It is expected the mill cannot be operated during the winter months on account of lack of water, but it can be run several weeks yet. An air compressor will be put in at the mine, which will also be driven by electricity, and fifty men will be kept at work.

Work is under way on construction of the concentrating mill for the Dives-Pelican & Seven-Thirty M. Co., near Silver Plume, and men are grading for the building, which will be west of portal of Burleigh tunnel. It is expected to have it ready for operation next spring. Foundations are made for the air compressor at entrance of tunnel, and further development work will be carried on, which will include driving the Burleigh tunnel to cut the Pelican and other lodes.

The Colorado D. & I. Co., of which H. A. Reidel of Colorado Springs is president, has a three-year lease and bond on the Kelley group of nine patented claims in Trail Run mining district, near Idaho Springs. The group adjoins the holdings of the company in Banner and Iowa districts, where they have 110 acres, and the Rockford tunnel. The tunnel is in 730 feet and is expected to cut the Coyote claim. By continuing the tunnel, it will reach claims in the Kelley group. The Kelley shaft, 300 feet in depth, will be sunk another 100 feet.—Sinking the shaft at the Ward mine has been stopped until the capacity of the mill has been enlarged. A belt conveyor has been put in under the crusher, which will carry the ore to the bins, from which it is fed automatically to the stamps and Elspass mill. The steel cyanide tanks are being placed, as the foundations of concrete have been completed. The mill is running on ore from the open cut. Electric power for mine and mill will be put in, replacing the steam plant.—The Little Mattie mine is producing low-grade ore for shipment under the new smelter schedule. The com-

pany is taking out twenty-five tons per day from the seventh level, and the water is being lowered in the shaft so that operations may be started on the eighth level. Lessees are also shipping steadily.—G. Taylor, operating the Edward mine in Spring gulch, in sinking the shaft, has opened a streak of ore at depth of 175 feet.

Manager Bonney of the Sun and Moon mine at Idaho Springs has been shipping an average of fifty tons per day. Development work has been increased, and by Dec. 1st production will be increased over 100 tons per day.—Four men, under Contractor W. W. Cannady, have driven the Burns-Moore tunnel 243 feet in three months. It includes the laying of track and the placing of air and ventilating pipe and the waterway.

Near Idaho Springs, the Signal M. & T. Co. has secured control of the Helen group of claims in Virginia canyon, adjoining the Crystal and New Year mines. The Helen is the western extension of the Seaton, Kangaroo and Metropolitan mines. The Helen is developed by a shaft and a tunnel, the mouth of which is level with the Virginia canyon wagon road. The mine has not been worked for twenty-three years. A chamber will be made in the tunnel where it cuts the shaft and a hoisting plant with a capacity of sinking 500 feet will be put in. The shaft will be sunk and additional levels driven, and at same time the tunnel will be driven to reach the Lucy claim.

#### Custer County.

Shipments of high-grade ore are being sent out by J. Gill and F. Gay from a lease near the tunnel of the Bassick mine in Custer district, near Rosita. The ore is a telluride and free gold has been found in the quartz. Milton, Bernard & Co., who have a lease on the 1300-foot level, will start outputting. Another lease has been granted on the 800-foot level to Harris & Duncan, where ore is being exposed.

#### Eagle County.

Red Cliff reports say in the past two months 100 locations have been made by Red Cliff, Minturn, Gilman & Fulford men. The camp is 12 miles from Minturn and has timber and water. The Spread Eagle, owned by New York men, the only producer at present, under Manager J. Pease of Glenwood Springs, last week shipped eight tons of ore, which netted \$3000, principally gold values. The mine also contains low-grade ore—a milling proposition—and a milling plant will be put in when method of treatment is determined.

#### Gilpin County.

The Copper Queen and Fairview claims, in Lump gulch, near Rollinsville, have been leased and bonded by J. Hansen & Co. of Central City, and sinking operations are being carried on at the Copper Queen lode. There is a 10-inch pay streak showing.

A. Skeels of the Orado G. M. Co. has taken up the bond amounting to \$10,000. He is starting operation of that property in Eureka district, near Central City.

#### Lake County.

F. G. Mitchell, president of the Lost Canon D. T., G. M. Co. at Twin Lakes, says development will be increased. Supplies, fuel, etc., are being stored. Erection of the 50-ton mill and concentrator has been postponed till spring. The tunnel is near another vein—the Tunnel View—from which \$23 in gold has been obtained on the surface.

#### Ouray County.

N. R. Bagley is getting in an electrical plant for driving the tunnel on the Frisco mine, near Ouray, which is in 100 feet, having been driven by hand thus far. This tunnel, when completed, will be several thousand feet into Houten mountain, near Animas Forks. It will crosscut the Red Cloud, Big Giant, Yankton, Dakota and other veins. The railroad is running into Animas, which facilitates getting in machinery and supplies.—The crosscut tunnel is in 600 feet on the Bankers' National, in Imogene basin, and a 30 H. P. compressor plant is being set up. Eight veins which show on the surface will be cut by the tunnel. Superintendent J. R. McNeill has charge.—Manager W. J. Hammond of the Treasury T. M. Co. is pushing work on his 20-stamp mill and will have it ready for operation next week. More men will be put into the mine.

#### San Miguel County.

The properties of the Alta M. Co., comprising the Alta group and the Bessie group, on Turkey creek, including the 20-stamp mill, have been leased to J. L. Brown of Telluride. The Alta mine has been developed to a depth of 900 feet. The Bessie group comprises twelve claims.—At the Suffolk-Globe or Silver mountain mines, north of Ophir, the main tunnel will be continued. It has been completed for 1400 feet. It is known as the Badger tunnel and is to cut the Suffolk vein at a depth of 2000 feet below the surface.

#### San Juan County.

The Champion mine, near Silverton, reports shipping three twenty-ton carloads of first-class ore per month. The ore is broken from the northwest drift. No stoping is being done.

The Colorado & Detroit M. Co. is increasing operations on Sultan mountain, near Silverton, since putting in water power system and electric drills. The plant includes a pipe line of 1000 feet, extending from above the Thunder tunnel to the base of the mountain at the river level. The 10 H. P. generated from a 4-foot Pelton wheel is transmitted to the Thunder tunnel and distributed to the electric drills that are operated on the Aletha vein. An air compressor is being set up at the Sunnyside mine.

The Hamlet M. Co., operating near Silverton, says Manager O. Matthews, will build a 50-ton mill near Silverton alongside the Silverton Northern Railroad. Ore has been blocked out in the mine. The last 450 feet on the lower 800-foot tunnel has been run on 3-foot vein of ore, and vertical depth at breast to old workings is 420 feet. G. Robin is superintendent.

The tramway on the Hamlet group of claims on Galena mountain, 5 miles above Silverton, is completed and will be running this week. The property contains bodies of low-grade milling ore. The smelting ore, of \$40 grade, will be shipped at rate of a car per day. The vein averages 8 feet in width. The group consists of seven claims and a millsite.

#### Summit County.

Manager J. S. Strickler, of the Monte Cristo mine, near Breckenridge, says his company will build an addition to the mill and put in machinery to increase the capacity to 100 tons per day. The new machinery will consist of tables, jigs and a crusher.

#### Teller County.

At Cripple Creek, a ton and a half of ore valued at \$85,000 was sorted, sacked and shipped last week from El Paso mine, says President S. S. Bernard. The ore was taken from the C. K. & N. vein between the 300 and 600-foot levels of the mine.

King & Co. have completed a cyanide mill on the Anaconda mine on Gold hill, at Anaconda. The mill has a capacity of 150 tons daily. The mill company has a lease on rock both in the dumps on Gold hill and on the Anaconda main vein. The latter is said to average \$8 per ton.

To provide additional stoping ground, the main shaft of the Trilby mine on west slope of Bull hill will be sunk by the lessees to the 700-foot point. Three cars of ore are being sent out weekly by the Trilby operators. The shoot is said to be an extension of one of the bodies developed in the Gold Sovereign, adjoining.

Plans have been drawn up for a mill and sampler to be built at portal of the Ophelia tunnel, 1 mile south of Cripple Creek, says A. J. Chapin, president of the Pueblo Railway Co., which is owner of the tunnel. The company is reorganized as a common carrier designed to transport the ores of different companies whose properties it traverses from the company's territory to sampler at mouth of tunnel. The proposed mill and railroad company will obviate necessity of companies sampling their ore at great expense and then hauling it down the hill to mill, as the company expects to build railroads to the properties and shafts along the route of the tunnel by means of smaller tunnels connecting with the main tunnel.

The tunnel has been driven 7500 feet from the portal and has a double track. The tunnel will cut the Bull hill section of the camp at a depth of 1600 feet and will also carry a drainage way. A few of the properties which the tunnel will pass closely is the Anaconda, Peggy, Doctor-Jack Pot, Mary McKinney, Logan, American Eagle, War Eagle, Last Dollar, Findley, Shurtloff, Deadwood, Pharmacist and Pueblo and Victor properties.

At Cripple Creek, Engineer Jacquith of the El Paso drainage tunnel, says that there is running through the tunnel 4300 gallons of water per minute, 2000 gallons less per minute than when the tunnel was completed. The flow of water is dropping at rate of sixty gallons per week. He says the same situation that confronted the mine owners on Raven and Beacon hills now confronts the mine owners who own territory on south slope of Bull hill. Mines in that section are having same trouble with water as those on Beacon and Raven hills had two years ago. The best and cheapest mode of draining that section is being discussed, as it will have to be lower than the other. As, for instance, the Vindicator, Golden Cycle and Independence Con. are down over 1200 feet, it has been shown by surveys that the water in all three of those shafts is at a common level and that all the water comes from the same source.

At Cripple Creek, Henley & Co., operating under lease the north end of the Ramona claim, are sending out on an

average five carloads of ore per month, which runs \$40 per ton. Ore is being broken from a 12-foot vein on the 300-foot level. Hines & Co., operating under lease the south end of the same property, are drifting on the 200-foot level for the ore shoot which they opened on the level above.

C. B. Burch, manager of the Little Giant Co., whose mine is west of Cripple Creek, in Pony gulch, has started work on a cyanide plant.

Lessee Peters and associates have a two years' lease on the X-10-U-8 claim of the Little Jane G. M. Co., on Squaw mountain, near Cripple Creek. Ore has been shipped.—The Invincible G. M. Co. has been incorporated by L. E. Kimball, A. T. Pierce and G. Holmes to operate in Teller county.

The Frank Gilpin Leasing Co., operating the Jerry Johnson mine on Ironclad hill, Cripple Creek, expects to double the tonnage being shipped from that mine. A plant of machinery, including a 6-drill air compressor, has been put in. They will ship five cars per week.—C. N. Crowder & Co., on the Banner Gold, have depth of 230 feet in sinking the shaft. They are going to 350 feet before crosscutting for extension of the Lonaconing ore shoot.—Machinery is being set up on the Black Jack of the Anchor Co., and development is progressing.

The gas problem has been overcome in the Conundrum workings of the Anchoria-Leland group on Gold hill, Cripple Creek, says President Howbert. W. Lindgren, of the U. S. Geological Survey, left a barometer there and readings have shown that when the barometer reads 20.4 inches a light burns fairly, but one cannot move around rapidly lest they stir the gas, which snuffs the candle. When the night shifts go off the night watchman keeps "tab" on the barometer, and if between then and 6 o'clock in the morning the indicator of the barometer falls to 20.4 inches, he sends steam down the shaft and through the workings. The result is that the gas is dissolved and absorbed. With the barometer standing above 20.4 inches the air throughout the mine is good, but below that point steam is necessary. So serious a problem is the gas that in one mine a level was tin-lined, but failed to exclude the gases.—The two-compartment shaft being sunk on the Free Coinage estate by J. O. A. Carper of Denver is down 50 feet. A plant of machinery is being put in.—The Vindicator Co. is handling 300 gallons of water per minute, and keeping the water below the level.

The Magnolia mine, which adjoins the Colorado King, on Gold hill, at Cripple Creek, will be started up by the Grandin M. Co. It is intended to sink a shaft and run laterals in several different directions. A vein was cut by former operators at the shaft, which is at the 300-foot point. The Magnolia is between the Anchoria Leland and Abe Lincoln mines.

The Winner G. M. Co. has been incorporated by H. J. Brubaker, A. M. Levy, W. McWhorter, S. A. Wilson and L. H. Rowell, with principal office in Denver. Operations will be carried on in Teller and adjoining counties.

## IDAHO.

#### Boise County.

V. Thorne, at Idaho City, says he has cut a vein 8 feet wide at depth of 225 feet which carries average value of \$12 per ton. It is the third vein since they started sinking, making seven in all, which has been cut. The shaft will go to 600 feet. When this is done it is intended to crosscut and do 2700 feet of work on the seven veins this winter. In the spring a 100-ton mill will be built.

#### Blaine County.

Another tunnel has been started at the Red Elephant group of mines, near Hailey, that will tap the vein at a vertical depth of 800 feet. The tunnel is at the 600-foot level and will afford backs of 800 feet in an undeveloped part of the group.—It is reported that a vein carrying 5 feet of galena has been struck on the 1200-foot level of the Minnie Moore mine.

#### Idaho County.

J. C. Northrop of Palouse City, working the Spokane mine, near Florence, reports the Spokane is held by the Florence Electric M. & M. Co., and has 600 feet of tunnel. They are in 160 feet on a 5-foot ledge with 30-inch paystreak that assays \$60. The company owns a 2-stamp mill, but it is intended to put in a 15-ton grinding mill in the spring. The Bear Track, in charge of H. Moore of Moscow, is running a 2-stamp mill. The Mikado, owned by Dayton, Idaho, men, which was idle for five years, is again active. A mill will be put in this winter. On the Gilt Edge mine too much water has caused a shutdown. The company intends to put in additional pumping machinery and hoists this winter, as well as a 30-ton mill.—On the Last Chance placers for three years

the owners have been developing the ground. They have an open cut 1000 feet long through bedrock to a depth of 15 and 20 feet. Twelve men are working, says D. Greenwalt, manager.

A. S. Johnson of Hump, in the Buffalo Hump district, says there are about 300 men working in the district. On the Buffalo Hump mine, he says, there has been 3000 feet of underground work done. On the Jumbo the 20-stamp mill is in steady operation, turning out from \$20,000 to \$30,000 in gold monthly, the ore averaging \$10 per ton. The Atlas Co. is putting up a 10-stamp mill.

L. Hanagan of Lucile, on Salmon river, interested in the McKinley M. Co., states development work will be continued during the winter. The company will build a stamp mill and it is expected to have a plant in operation next summer. A 5-stamp mill will go in, with concentrating tables. Since the first of the year the company has driven 300 feet of tunnel, 210 of which is on the lead. They are planning to drive a 1200-foot tunnel at a depth of 600 feet below the present workings. The Lucile Con. G. M. Co., composed of Clarkston men, has increased development work during the summer.

At Oro Grande, the Hogan mill is closed for the season and a series of successful runs reported. The closing of the mill is preparatory to putting in a cyanide plant, the ground for which is being surveyed. T. L. Kelly of Lewiston says the Union group will be worked this winter. Hoisting machinery is being put on the Oregon mine.

#### Kootenai County.

The River Queen mining group has been bonded to R. K. Green of Spokane, Wash., for \$10,000. The property is on Prince creek, on the St. Joe river, 20 miles above the head of navigation, near Coeur d'Alene. Work will be started next week. It is a copper proposition and has a 50-foot surface cropping.

#### Owyhee County.

It is reported work will resume on the Sinker tunnel on War Eagle mountain, near Silver City. Work was suspended on the tunnel two years ago.

The mill at the Cumberland mine, near Silver City, will start this week. The company has been putting on additional miners for a month past.

#### Shoshone County.

Wardner reports say low water in south fork of Coeur d'Alene and its tributaries is causing an increased demand for electric power. The Bunker Hill & Sullivan M. Co. is putting in three more motors. One of them, with a capacity of 100 H. P., will operate the compressor, while the other two, each of 50 H. P., will be used in the mill. Heretofore water power has been doing this work. The company has been taking on an average of 150 electrical H. P. This is utilized for furnishing lights for Wardner and Kellogg, and operating the company's electric railway from mill to mine, and its sawmill. At Sweeny, at the Last Chance concentrator, a 350 H. P. motor is being added. Electric power only is used at that mill.

H. L. Gray of Pierce City, near Greer, reports on his placer grounds, of 380 acres, taking in a part of French creek and its tributaries, he is putting in a bedrock flume 1000 feet long. It is half completed. Next summer he will run one stream. The ground has been worked on a small scale. The French Creek M. & Dev. Co., owning thirty-four claims adjoining, is running two stamp mills with satisfactory results. The shaft is down 100 feet on the main workings, with a drift of 140 feet. In addition there are 500 feet of work on the other claims owned by the company. A ledge 3 feet wide, giving average assays of \$11, has been opened.

The Olympia M. Co. has been incorporated, and owns a group of claims near the Mammoth mine at Wallace. The trustees are C. Cunningham of Wallace; E. K. Austin, A. Corbin, J. C. Cunningham, R. L. Ford, R. A. Freese and F. E. Lucas of Spokane, Wash.

Since the Federal M. & S. Co. took charge of the Standard and Mammoth mines at Mace it has been the intention to consolidate and operate them as one property, says the Wallace Press. To this end Mammoth No. 6 tunnel has been driven east and connects with the collar of the Standard shaft by a raise, which will be used as an underground ore bin, and skips have been put in the shaft, with skip pockets and air lifts, so that the ore will be automatically handled. Ore is trammed to No. 6 ore bin (which has been doubled in size and has capacity of 2000 tons of ore) by an electric locomotive, drawing a train, each car of which holds 45 cubic feet of ore. By this means all the ore will come out at No. 6, and eventually all the men and supplies will go into the collar of the shaft by the Campbell tunnel. This work is expected to be completed by Nov. 1st.

Wallace reports say the Golden Chest

M. Co., M. H. Hayman of New York president, has men at work improving and developing the group, ready for winter's work. The 20-stamp mill is overhauled, motive power being both steam and water, and is connected to the Idaho flume by a 1000-foot track, over which they are putting a snow shed. As soon as they have water to run the mill, they will drive the Idaho tunnel to connect with the Klondyke shaft. The United States Geological Survey party, which has been in the Cour d'Alene country for several weeks, consisting of F. L. Ramsome, in charge, F. C. Calkins, E. R. Zalkinski and assistants, has nearly completed its work of examining and marking all geological features, also taking surface and underground photographs.

The Samson M. & Dev. Co. of Wardner has let contracts for a tunnel. A pack trail 3 miles long has been completed, which connects with the main trail up Big creek. The claims are on Big creek, 3 miles above the Western Star mine, and have a silver-lead-bearing ledge, giving returns of 6% lead and eleven ounces of silver from the surface. A shaft is being sunk on a 2-foot vein of carbonate ore. The Paragon Co. is doing development, working two shifts, with J. Carter in charge. They are nearing the 36-foot ledge, for which they are crosscutting. The shaft is down 300 feet and the crosscut in 200 feet. The ledge is expected to be struck at a depth of 700 feet.

## ILLINOIS.

A strike of 800 hoisting engineers in 240 bituminous coal mines in Illinois went into effect Oct. 31. The engineers refuse to accept the  $\frac{3}{4}$ % reduction in wages which the miners agreed to. The strike affects about 50,000 workmen, but the operators expect many of the mines will be running within a few days.

## KANSAS.

### Cherokee County.

Near Galena the Merchants M. Co., of which S. Rhodes is superintendent, at Cave Springs, expects to have its mill in operation this week. They have put in a new pump in connection with the walking beam pump. They have opened up a lead prospect. The Palmetto mill No. 1 is running a double shift. Mooney & Co. have started up on the Page land, southwest of Galena, after a layoff of three weeks and are taking out pay dirt. G. W. Van Pelt has ground on the Bonanza tract, and will sink a shaft.

Shovelers' wages in Galena district have been raised fifty cents per day and operators are looking for men. Not only are experienced miners in demand, but laborers of any kind can get work.

At Baxter Springs E. T. McCarthy, of the Baxter M. Co., has bought the Goodwin interests in the Mission mine and mill, known as the Ford & Troupe mine. A 150-ton mill is on the ground and, as soon as ground is opened up so more men can be put to work, the mill will be run twenty-four hours per day. The Strong Bow M. Co. is sinking a shaft northwest of the Dark Horse mine. The Morea M. Co., which has a lease on ten acres of the Abrams land, west of the Dark Horse, has started a shaft. Ginder & Co. have made a rich strike of zinc ore on their lease of the Charters land.

## MISSOURI.

### Jasper County.

At Zincite, the Lucky Five mine is again in operation, also the Edgar County mine after repairs to machinery. The Big Rubin is operating three-hand jigs and hauling crush rock to mill. The Gibson M. Co., owned by Holmes, Cape & Rogers, is running four-hand jigs and has 30-foot face of ore. The Holiday M. Co. is building a mill on a new strike that shows a 14-foot face of ore. G. E. Ladd will work the pit south of the Catheline mill. He will also pump the Catheline lots, which will start several shafts. D. D. Duncan is superintendent and reports a strike on the point of Radish hollow. The Cold Day mine has started work. The Scranton M. Co. has prepared the jig beds and is producing again. The Harris mines report developing a good face of ore. The Daisy Bell mill is starting to run tailings and they will drain the ground for work.

A company composed of A. M. Wagner, J. Varner, S. Hillet al. of Webb City is drilling on land north of Carthage. The tract adjoins the Sloan-Aylor land where zinc has been struck.

The Three C. M. Co. of Joplin has been incorporated by W. Lockow of Milwaukee, Wis.; P. Hinkelmann, C. T. and J. Tasche, J. A. and O. Junck, J. Geren and F. Monika of Sheboygan, Wis.; E. Webb, C. A. Morsman and W. N. Andrews of Joplin.

The Reliance M. Co. has been incorporated by L. J. Stevenson and W. R. Robertson of Webb City, C. Moore, R. H.

and A. Corbin, R. G. Dodge, L. L. Rogers and L. E. Williams.

The Lula D. mine on the American Cornfield tract at Cartersville has been sold for \$30,000, and includes a lease on fourteen lots and the Lula D. mill. The new shaft has been completed and the mill put in operation. J. O. Craig of Webb City has charge.

O. S. Prince and J. R. Ridd of Carthage have leased six lots at Alba and have begun development work. They will sink a shaft. Webb City men are opening up ground at the mouth of Chitwood hollow. They have shaft down and showing ore. They are following a drill hole which shows ore from 50 feet to 92 feet. The company is composed of D. Craig, T. Hill, L. Mock, R. Morrison, J. Wigg, H. Irelan and J. N. Uttersen.

Stepp & Kaiser, operating on the Guinn land, near Webb City, are putting in additional steam capacity and will increase production. A. D. Hutton of Webb City and G. Wommack of Prosperity have bought the Cissna forty acres and will develop it for its mining values. It is in Joplin. The consideration is \$7000.

J. A. Graham & Co., in cleaning out an old shaft on the L. J. Stevenson lease north of the Gussie K., near Webb City, opened up a 25-foot face of lead-bearing ground.

## MONTANA.

### Jefferson County.

The Butte & Basin M. Co. is operating the King Cole group near Basin. The company is composed of Butte men and has shipped several cars of ore that has given satisfactory results. It is driving a tunnel on the King Cole, which is in 240 feet, and is also crosscutting the vein. The group consists of the King Cole, Tip Top, Time and Tide, Oxide and the Florence. P. J. McGowan, J. S. Davey and A. Thompson have a lease and bond on the Boulder mine, back of Basin, and are taking out ore. The lease also includes the stamp mill on Basin creek, which will be operated.

Work of cleaning out and retimbering the lower tunnel on the Minah mine, near Wickes, is progressing. The tunnel is 3000 feet in length. In addition to the main tunnel there are several hundred feet of crosscutting. The Minah is under bond and lease to J. C. Cory. The property is equipped with machinery, concentrating works, air compressor, etc.

### Lewis and Clarke County.

The Red Bird M. Co., which is developing its Copper Hill mines, near Austin, has completed sinking the shaft another 65 feet, and has crosscut to the vein, which carries iron, copper, gold and silver. The vein shows 17 feet wide. The company also owns the Red Bird mines, 2 miles from the Copper Hill, and the Reliance mine, in High Ore gulch, from which shipments have been made.

The Augusta G. M. Co. has been incorporated, with main office at Great Falls. The directors are H. Tegtmeyer, of Augusta, G. H. Stanton and C. Young of Great Falls. The company's mines are at Augusta.

### Missoula County.

T. C. Marshal of Missoula, of the Amador M. Co., says improvements are being made in the company's mines and equipment, and they have fifty men at work. More machinery will be put in. A railroad will be built from the mines to connect with the Northern Pacific.

### Park County.

At Cooke, C. R. Tuttle, secretary and managing director of the New World S. Co. of Seattle, Wash., and F. C. Byrne of Red Lodge, manager, have put men to work. A ditch will be dug to divert the waters of Clark's Fork from above the upper falls to a point on the New World placer where from the flume will be a fall of 50 feet. At that point the smelter will be built. The company will put in saw and lumbering mills on Lake View creek, near Clark's Fork river. G. L. Tanzer of Seattle, Wash., is president of the company. After June 1 next, the principal branch offices of the company will be in Livingston. The company will build a smelter this winter of 100 tons daily capacity and expects to add another smelter next summer. They have 5,000,000 feet of timber on their locations.

## NEVADA.

### Esmeralda County.

The Baltimore-Goldfield M. Co., which includes in its holdings the Fortune group, has been incorporated by President H. J. McGhan, C. D. Mercer, J. W. Skelton, E. N. Davis, M. Averill, A. L. Hudgens and E. R. Shields. The group consists of four claims in northern Goldfield, north of the Tonopah Club claim and west of the Goldfield-Tonopah M. Co.

### Humboldt County.

J. J. Burke of Salt Lake City, Utah, says he will build a 100-ton combination concentrating and cyanide plant at the

property of the Golden Eagle M. Co. at Golconda.

### Lincoln County.

The Old Roman M. Co., near Searchlight, reports a vein 50 feet in width. On the hanging wall a shaft has been sunk, showing average of \$15 in gold and 50 ounces in silver. On the foot wall there are 7 feet of ore which runs \$10 per ton, but no silver values. Between these two shoots there is low-grade ore, says Superintendent DePuy. He is driving a tunnel. The winze will follow the vein, and at a lower level a drift will be run to come out at the head of a canyon, which has been selected as the site for the mill.

The Caliente G. M. Co., near Caliente, is running a drift on a 4-foot ledge of decomposed free gold ore going \$30 per ton. They have run in 210 feet, crosscutting the ledge at 125 feet. They have run a drift 135 feet. They expect to put in a mill in the spring. C. H. Ross and M. T. Breck of Toronto, Ontario, have bought the Chessman group of gold-silver claims, fourteen in number. The claims are 42 miles northwest of Caliente, and have 1000 feet of work in shafts, tunnels and drifts completed. The ore averages \$32 in gold and 110 ounces in silver per ton. The ledge is 4 feet wide at the surface. G. Barton, half owner of the Princess group of silver claims, northwest of Caliente 52 miles, has bought out his partner. They have 300 tons of \$15 ore on the dump and 420 feet of work completed in two tunnels, both of which crosscut 6-foot ledges. The ore carries silver values.

## NEW MEXICO.

### Dona Ana County.

The concentrator at the Bennett & Stephens mine at Organ is reported in successful operation. Concentrates have been shipped running sixty-five ounces in lead and thirty-two ounces in silver per ton. Teams are hauling coal and supplies to the mines and concentrates to the railroad. Shipments will average three cars per week.

### Lincoln County.

The Vera Cruz M. Co. has its plant up, and has started operations on its mines, near Nogal. The plant has five Huntington mills for crushing the ore and also five concentrating tables. Ore averaging \$4 per ton is on the dump.

### Socorro County.

It is reported the Kelly group of mines of Magdalena district have been sold to J. B. Corliss et al. of Detroit, Mich. The mines are not producers of copper to any great extent, but copper ore is reported to exist, underlying the lead, zinc and sulphide ores which are being shipped.

## OREGON.

### Baker County.

Z. Houser of Sumpter is developing his Dixie group of six claims on Cougar ridge, near Quartzburg. The main working tunnel, a crosscut, is in 530 feet. At 150 feet it cut the vein on the Fraction claim, showing 3 feet, with pay streak 6 inches wide running \$30 per ton. A 5-stamp mill will be built. Other properties are being developed in the Quartzburg district, and the extension of the Sumpter Valley Railway, affording transportation facilities, will be built.

With fourteen men winter operations are started at the Citizens Con. G. M. Co. properties in Cracker Creek district, near Sumpter, and work will be resumed in the cross tunnel. The mine has been equipped with a six-drill compressor and the crosscut is in 220 feet. It cut vein No. 1, showing 3 feet of ore. The next vein expected to be cut is the Gold Coin No. 3, at 500 feet in and at depth of 375 feet. There are said to be four parallel veins in the group, the last two to be reached at 1000 feet. The group comprises thirteen claims and millsite (formerly the Gold Coin and Mountain Monarch groups which are consolidated), owned by Wheeling, W. Va., men, represented by J. R. Murrin. W. Priestly is superintendent.

Thirty stamps are in continuous operation at the North Pole mine, near Sumpter, and eighty men are working in the mine and mill. A larger compressor is being put in.

L. V. Swiggett, secretary and manager of the Orleans G. M. & M. Co., near Sumpter, says they cut the vein with a 100-foot crosscut on the lower level. A rush of water stopped operations until a pump can be placed in position. The Golden Chariot has been consolidated with the Orleans, and the name of the Golconda Extension G. M. Co. changed to the Orleans G. M. & M. Co.

Improvements started at the Columbia mine, near Sumpter, during the summer months are about completed. The Huntington mill is ready for operation in conjunction with the fifteen stamps. The shaft has been sunk 40 feet below the 700 level and a sump made. The pump will

be removed from the 500-foot to the 700-foot level, where a pump station is being out. Ore is stoped from the upper workings.

Excavations for the Maxwell mill, near Sumpter, are completed and the building is going up. The mill is on a site near the ore bins, preventing a repetition of damage by snowslides, which wrecked the mill last winter. For the present five stamps will be put in, but next season the capacity will be enlarged.

J. F. Lane of Sumpter has put men to work developing the Morning mine, in Greenhorn district, and will let a contract for driving the tunnel.

### Curry County.

Work is to be increased this winter by H. E. Matlock et al. of Portland on a copper mine in Curry county, 20 miles north of Crescent City, Cal. In the early days this mine is said to have shipped copper ore to Swansea, Wales, for reduction. Ore from one of the tunnels shows native copper.

### Douglas County.

Pending the erection of a concentrator and a leaching plant, Manager H. Banfield of the Rainbow M., M. & S. Co., near Bohemia, has suspended underground development. Banfield says the development completed on the Rainbow is 5000 feet. This work has been concentrated on one location. Six adit levels 100 feet apart have been established and drifts extended on the Rainbow main ore shoot, blocking out ore. The Rainbow has essentially a copper ore, gold values also being present. The group, consisting of nine claims, is on Drew creek, a tributary of the South Umpqua, both of which afford water power.

Superintendent W. B. Hartley, driving a tunnel on the mine of the Star Con. Co., near Bohemia, says a strike has been made. It is intended to put a 5-stamp mill to work next spring.

### Grant County.

First consignment of dredger machinery for the Crane Flat placers, near Granite, being operated by Burch & Burbridge of Spokane, Wash., has arrived. Excavating for the pond that will float the dredge is completed. Lumber for the hull is being delivered and the plant will be ready for operation in February next.

W. W. Gibbs of Portland, president of the Copperopolis C. M. Co. at Copperopolis, says he has increased tunnel work. Compressed air drills will be used.

### Josephine County.

At the Royal Group placer mines of the Royal Group M. Co., near Galice, they have driven a tunnel into the auriferous gravel deposits, and loaded 8000 pounds of powder, firing it last week. This broke and loosened up the side of the mountain. Hydraulic giants will wash the loosened material into the sluices.

Manager L. B. M. Simons of the Rand M. Co. of Bellingham, Wash., is putting in machinery at the company's mines at Galice. A boiler, engine and machinery equipment for a sawmill are included, and must be hauled over a 14-mile mountain road to the Yank mine. The company is developing the Yank quartz ledge, is operating a placer mine and is installing a sawmill to cut lumber for building and mining purposes. The Yank mine is across the river from the Alameda mine and said to be on same mammoth lode. There are five locations in quartz in the Yank properties and 500 acres of placer ground. The placers are equipped with hydraulic plant and 5 miles of ditches, taking water from Bailey creek. C. A. Chalmers has charge of the placers.

The Layman interests on Canyon creek, near Grant's Pass, including the Clark, Lewis, Iron Clad and Golden Age claims, have been sold to the Lewis & Clark M. Co., and J. L. Layman remains as manager. The ore is said to carry sylvanite.

The Carson & Miller placers, in Oscar Creek district, near Grant's Pass, have been bought by Foster & Gunnell of Grant's Pass for the New York & Western M. Co. for \$7500. This ground will be added to the Oscar creek hydraulic mines and is largely to give additional water rights and more dumping ground for the Oscar creek placers. Foster & Gunnell have also bonded the Jewell & Moore hydraulic mines, which adjoin the Carson & Miller.

The W. J. Palmer interests in the Kramer & Palmer group of quartz claims, comprising the Madrona, Golden Queen, Elwida, Little Granite, Riverside, Oakley and Golden Rule, have been sold to W. Kramer for \$30,000. The Kramer & Palmer mine is on Whisky creek, in Mount Reuben district, near Grant's Pass. The ledge is from 2 to 4 feet in width.

Preparations are made for increased work in the placers of north Josephine county, says J. Winton of the Wolf Creek D. Co., north of Grant's Pass. The company will start as soon as the rains bring

sufficient water to operate the four giants. A drift run into one of the company's claims shows payable gravel above bed-rock in deep ground.

## SOUTH DAKOTA.

### Lawrence County.

An addition to the tank room is being built at the Lundberg, Dorr & Wilson cyanide plant at Terry, in which additional vats will be set. The capacity of the plant will be increased to 100 tons per day, says J. Lundberg.

The Homestake M. Co. of Lead is completing its electric plant at Spearfish, replacing the one destroyed by the flood last June. The new plant is larger and better equipped than the old one, says the Review.

### Pennellington County.

The Black Hills M. Co., owning mineral lands 5 miles west of Rochford—about 1 mile west of Hornblende camp—is taking in from springs 2 miles west of its property a water supply. A trench is being dug and pipes laid. When this is completed they will proceed with sinking. The company has a shaft 800 feet deep sunk on a copper vein and is equipped with a steam plant. J. B. Taylor is manager of the company.—At Hornblende camp, the Black Eagle and Golden West companies are increasing work, the former in sinking its shaft to lower levels and the latter in completing its mill. The Golden West flume for water power from Castle creek is nearing completion, the mill building is completed and part of the machinery set up. An aerial tramway will be built from mine to the mill. It will be 1700 feet long. It is expected the mill will be ready for operation by the time the tram is completed, says President J. H. Fisher.

## UTAH.

### Beaver County.

W. M. White of Salt Lake City has a bond on the Hobson group of four claims adjoining the Majestic company's Harrington-Hickory mines on the west, near Milford. A ledge has been opened up through open cuts and inclined shafts, and shows values in silver, lead and gold. From these mines to the Majestic smelter is 5 miles. It is intended to run another tunnel.

### Jaab County.

Extraction of ore from the Victoria mine in Tintic, near Eureka, has started. Men have been working on the 800-foot level of the Grand Central mine on an ore body headed towards the Victoria. The boundary lines of the latter have been reached. At the dividing line the ore is reported to carry 100 ounces in silver per ton in addition to the other metallic contents. The Victoria mine will be operated through the Grand Central shaft.

The Bug Iron group of twenty-two claims, near Eureka, owned by H. Kruse, is being worked. They are running a tunnel which is in 200 feet, in the center of which are 6 inches of ore, with values in gold, copper, zinc and silver.

Manager H. Joseph of the Carisa mine in Tintic district, near Eureka, says he will begin shipping to the Bingham smelters during this week. Over 2000 tons of low-grade ore has been broken down, said to run from \$10 to \$15 a ton.—Damage resulting from the fire in the shaft of the Uncle Sam mine has been repaired and hoisting resumed.—The capacity of the ore bins in the Grand Central mine has been doubled. Sinking the shaft continues.

### Piute County.

The Gold Dev. Co., associated with the Log Cabin Co. in the Ohio mining district, near Marysville, has started work on eighty-six claims owned by that company. L. Neilson is in charge. The property is on either side of Bullion canyon and a tunnel will be driven. An air compressor plant and power drills will be put in.

### Salt Lake County.

The New England G. & C. Co. of Bingham owns the Nast group. Manager H. M. Adkinson says he has struck a 12-foot vein of lead-copper-gold ore on the tunnel level. During the present year he has placed in operation an experimental mill of fifty tons capacity. The plant will be enlarged. It is intended to put in an air compressor of four-drill capacity.

### Summit County.

At the Silver King Con. mine at Park City three shifts are grading for a hoist. Though the shaft is double compartment all the way down, only one cage is used, so a direct-connected double drum will be put in. Bailing skips will also be used.

Tracks and air pipes have been laid into the face of the Federal tunnel at Park City and three shifts of men working with machine drills are driving towards the Mazeppa ground.

The management of the Brown Eagle mines, in the Elkhorn district near Park City, will continue development work this

winter. A contract has been let for sinking the shaft. The officers of the company are F. D. Aubrey, president; O. F. Johnson, G. Wilson and J. H. Macdonald, manager. A hoisting plant will be put in. Tooele County.

Salt Lake reports say Minnesota and Utah men have bought 520 acres of land covering the extensions and being on the end lines of the Fiske, Ophir Queen, Buckhorn, Ophir Hill and Montana Con. properties, 45 miles southwest of Salt Lake City. J. A. Butchart of Duluth, Minn., is interested. The land has been bought from the Michigan Ore Co. Operations have been begun on the property by the Ophir Tunnel Co., formed last week. It is a tunnel proposition and 500 feet in. The mine is in Ophir gulch. The Clark interests have a road surveyed from St. Johns to within a mile of the mine, and it is expected track will be laid and the line in operation by spring. The company is piling its low-grade ore on the dump and will ship out all high-grade ore. The ore is silver, lead and copper, with gold.

Manager G. Dern of the Con. Mercur mine at Mercur says he will start construction of a sampling mill for that property.

Superintendent Raddatz says connections between the drain tunnel and the main Honerine shaft at Stockton will be made by Dec. 20. The tunnel is being driven at rate of 60 feet per week, and there are 400 feet farther to drive to get under the shaft.

## WASHINGTON.

### Ferry County.

At Republic, Superintendent N. Cochran has arranged with the smelters for the shipment of three carloads of ore a day, and has resumed work in the Mountain Lion mine.—It is said Manager E. L. Tate has contracts for shipping Quilp ore, with a combined transportation and treatment rate of \$4 a ton, and that work will be resumed in the mine this week.—The Pearl Con. M. Co. will resume sinking the shaft on the Lone Pine mine. It is stated that a compressor plant will be put in and driving and sinking in the mine will be done with power drills.

Work will be started at the Manila mine, near Keller, under the management of J. L. Harper. He will drive the lower tunnel ahead to the hanging wall. The vein has been cut for 100 feet on this level.

Work on the dam by the Keller & Indiana Con. S. Co., 1 mile above Keller, is progressing. Penstock and headgate for the flume have been built, and other flume work is being pushed. About 1,500,000 feet of logs have been cut and are being hauled to the mill.

Foreman Trahey has resumed work on the Park-Central mine at Davis camp, near Republic. The intention is to drive both ways on the vein cut in the tunnel.

### Okanogan County.

J. J. Bennett of Columbus, O., in charge of the Douglas Mountain M. Co.'s mines, near Loomis, has development under way. It is intended to run a tunnel in on the ledge.

### Stevens County.

R. K. Green of Spokane has bonded the Silver Queen group, 2 miles south of Kettle Falls, on the east side of the Columbia river, and will start work this week. A shoot on the surface, showing silver ore and gray copper running \$100 a ton, is said to be opened up. It will be developed by a shaft.

J. M. Fish, president of the Columbia River G. M. Co., whose mine is 2 miles east of Meyers Falls, says he will ship copper ore to the smelter.

Among the companies that have started quarrying marble near Northport is the Chewelah Marble Co., whose property consists of 400 acres, 5 miles east of Northport, on Deep creek, under management of A. J. Dunton of Rutland, Vt. Dunton says he has ten men stripping off several acres of timber, brush and soil. He has bought a millsite on Deep creek, where he can get 400 H. P., and will build an electric plant to generate power to run quarries, mills, etc. In case the Great Northern does not run a spur up Deep creek, Dunton says he has right of way for an electric road from the quarry to Northport. By March 1 he expects to have machinery in and open the property on a permanent basis. The Chewelah Marble Co. property is 1300 feet below the Last Chance mine.

### Snohomish County.

H. Bailey, secretary of the Smuggler M. Co., developing its properties in the Monte Cristo district, near Index, says work is progressing and the copper ore is of high value. The number of men have been increased.

At Index work has started on the Index M. Co., under direction of T. McIntyre. It is intended to continue the lower tunnel until the Crown Jewel ledge is

reached. It is expected a concentrator, machine drills and an aerial tramway to the railroad will be put in, says the Index Miner.

W. Cornwall has begun work on the Acme M. Co. (the "47") at Index. Development will be on the lower tunnel. A vein of chalcocite and bornite shows 30 feet in width. It is owned by Ohio parties. Machine drills and a concentrator will be put in next spring.

## WYOMING.

### Carbon County.

It is reported that E. A. Norton, C. E. Miese et al. of Cripple Creek, Colo., have bought the holdings of the North American C. Co., valued at \$5,000,000. The property of the company includes the Rudefeha mine, the Encampment copper smelter, the 16-mile aerial tramway connecting the smelter and the mine, and improvements in the town of Encampment.

Superintendent Putnam of the El Rey gold mine, in Purgatory gulch, near Encampment, for the Con. G., C. & C. Co., reports that the tunnel is in 150 feet and in ore. The average width of the vein is 2 feet. The company will sink a working shaft from the tunnel level. A wagon road will be built from El Rey to the Encampment smelter.

DeF. Richards says he will develop the Osceola and Osceola Jr. copper mines near the Ferris-Haggarty mines near Dillon.

### Fremont County.

At the South Pass mines, at South Pass City, men have been put to work by Manager Spry. Ore is being taken out. The Creaser mine is operating on a small scale. Work is being carried on in the 500-foot level and ore has been blocked out.

### Laramie County.

The Hecla M. Co. has let a contract for sinking 300 feet on its Louise mine, 25 miles west of Cheyenne. The present depth of the shaft is 175 feet and hoisting equipment has capacity of 400 feet. Two and one-half feet of high-grade copper is said to be showing in bottom of shaft. The company proposes to build a smelter at Cheyenne to handle its ores.

## FOREIGN.

### BRITISH COLUMBIA.

#### Boundary District.

At the sixth furnace of the Granby smelter at Grand Forks they are adding an electric charge car. By the conveying of the ore by this method several laborers are dispensed with.

By November 15 they will be shipping 600 tons of ore per day from the Rawhide mine at Phoenix, says Superintendent G. H. Collins of the Montreal & Boston Con. properties. Work is on the quarrying system. The Canadian Pacific Railroad spur to the Rawhide is being built and ore bunkers for the Rawhide will also be erected. On the Brooklyn Collins expects to be raising 300 tons daily from the mine itself. About seventy men are at work there. A skip is being put in.

Grand Forks reports say the Canadian Pacific Railway has closed a deal for the Cascade Power Co.'s holdings at Cascade, 13 miles from Grand Forks, and that the railway company proposes to build a smelter at Cascade.

#### Cariboo District.

The Cariboo Con., owning hydraulic properties near Cariboo, has amalgamated with the Gold Lands Corporation as the Cariboo Con., Ltd.

#### Cassiar District.

W. J. Robinson, head of the British-American Dredging Co. at Atlin, says the results of the season's work have been satisfactory. In the early part of the year, owing to hardpan being struck, the dredge was delayed in reaching bedrock. They are working the dredge on Gold Run in 32 feet of earth, averaging from surface to bedrock \$3 per yard, says Robinson. Timber and part of machinery is on the ground for a second dredger. Construction will be started in the spring. The new dredge has twice the capacity of No. 1. The properties on Spruce creek have been acquired at cost of \$88,000, and those on Tar Flats bought for \$55,000.

#### Nelson District.

P. Paulson of Seattle, Wash., has started work on the Flying Dutchman group of six claims at Hall creek, near Nelson. W. Hutchinson of Northport, Wash., is part owner.

#### Slocan District.

It is reported B. N. White, principal owner of the Slocan Star mine at Sandon, proposes building a zinc concentrator at Nelson.

The Two Friends group on Lemon creek, in the Slocan, reports progress. The property is owned by the Pioneer M. Co., Ltd., which is operating the Two Friends and Black Prince groups, both of

which are on second fork of Lemon creek, 9 miles from Slocan City, says Manager J. W. Moffat. On the Two Friends a showing of high-grade galena has been uncovered, which has been tapped at depth. To reduce cost of transportation and do away with hand-sorting the ore, a road has been built 3 miles.

### Vancouver Island.

The Nahmint mines, near Alberni, having been sold to a Portland, Or., company, Superintendent Cabel has started development work.

At the Britannia mine, at Howe Sound, machinery is being put in for treatment of ore on the ground. The concentrates will be shipped to the Crofton smelter. The intention is to put the works in shape to ship 500 tons of concentrates a day, says Manager Robinson.

## CANADA.

### Ontario.

J. Nash, at Rat Portage, reports discoveries of tin ore in the eastern end of the province. The claims taken up consist of five lots of fifty-two acres each, on which there are veins of tin-bearing quartz 50 feet in width. The property is within 4 miles of the main line of the Canadian Pacific Railway at Hawk lake.

W. E. H. Carter, provincial inspector of mines, says that in the Dryden and Eagle Lake gold belts, near Wabigoon, since opening up the Eagle Lake area, there are four properties working and these are owned by the Northern Light M. Co. and the Grace M. Co. The mines are at the west end of Eagle lake. The Baden Powell mine of the Northern Light Co. will put in operation a 5 stamp mill; El Dorado of the same company has a 2-stamp mill. The Pioneer Island mine is being opened up by the same company, while the Grace is owned by the Grace M. Co. From the latter a mill run has produced \$80 gold per ton.

### Yukon Territory.

The Yukon World of Dawson City gives returns of the gold yield in the Klondike for the current year to the close of September:

January.....	\$ 85,895 55
February.....	107,417 10
March.....	138,740 40
April.....	60 00
May.....	836,606 10
June.....	2,687,508 70
July.....	1,300,250 55
August.....	1,539,518 30
September.....	1,887,616 80
Total.....	\$8,593,733 90

From this it is estimated that the total product of the district for the year 1904 will reach \$10,000,000. During the same period, with the exception of the month of September, export was paid on gold at Forty Mile to the value of \$5385, and at White Horse on \$21,541.30.

## KOREA.

Korea possesses gold mines whose output increased from \$1,158,000 in 1898 to \$2,509,000 in 1903. It has also mines of iron, silver, copper, coal, etc. Most of the gold is exported to Japan. Iron, although present in large quantities, can hardly be said to be exploited. Iron used in Japanese foundries is obtained from China. Coal of medium quality is equally abundant, but little exploited. Copper is extracted in several districts. During the last two years 564,433 pounds of copper, valued at \$51,044, were mined. It is stated in the Seoul Morning Journal that the southern portion of Korea belongs to the Crown, and that it is necessary to have a special authorization to develop it. A request for such a concession should be presented through the diplomatic representative of the country of which the petitioner is a resident. As a rule these requests are denied, owing to the Korean's dislike of foreigners. The principal producing gold mines are in northern Korea, in Wunsan province, where the Oriental Con. M. Co. has a total of 200 stamps operating.

## MEXICO.

### Chihuahua.

The Compania Minera de Zola, S. A., has been incorporated in Parral to exploit the Zola mining claims in district of Naica, 16 miles west of Conchos station, on the Mexican Central Railroad. The officers of the company are: W. T. Swoyer, president; J. M. Guevara, E. Van Dreveldt, J. Perez and D. Garza. The property consists of 40 pertenencias 700 meters north from the San Pedro mine of Compania Minera de Naica. The ores of the Zola and the mines of the Naica district are lead-silver, which, owing to the excess of iron and lime, are said to be desired by the smelters. The company has completed a narrow gauge railroad from Conchos station and is shipping seventy-five tons of ore per day. The mine is said to be netting \$20,000 per month.

C. O'Calahan of Chihuahua City has bought the Nueva Chihuahua mine in Santa Eulalia camp. The property consists of 40 pertenencias and is near the

Santa Rita, El Carmen and Negrita mines. Compania Minera del Saltillo is putting in aerial trams from its Nazarena and other mines in San Pedro Ocampo district to a point where they will connect with a mule tramway to the station of Jazmal, on the Coahuila & Pacific Railway. The Saltillo Co. is owned by men of Saltillo, Coah., and J. M. Rodriguez is manager.

**Jalisco.**  
The smelter of Guadalajara, of which J. S. Diaz is principal owner, is completed and it will be blown in this month. The furnace is designed for lead ores with 100 tons daily capacity.

**Mexico.**  
The company owning the Esperanza mine, in El Oro camp, is putting in electric motors and accessories for 2700 H. P. at a cost of \$60,000. It is the plan to operate the plant with electricity from the plant at Nexaca.

During the fiscal year 1903-04 silver exported by Mexico amounted to \$78,987,891.12 as declared at the custom houses, as follows:

	Value.
In bar silver	\$45,748,106 94
In Mexican coin	18,635,595 00
In other forms	14,594,189 18

Total. \$78,987,891 12  
The total amount of silver coined in the three mints and put into home circulation during the fiscal year was \$22,025,450 in addition to the coinage exported, bringing Mexico's silver production for the year to \$101,013,341.

**Michoacan.**  
(Special Correspondence).—In Arrio district the Carrizal G. M. Co., E. B. Sanderson manager, is adding to its ore reserves in the Bella Vista shaft. Work is progressing in three levels, with stoping on the second. Sufficient ore is blocked out to run the present mill for eighteen months. In the third level pyritic ore is appearing. A steam hoist will replace the 4-horse whim which lately superseded the antigua method of carrying ore to the surface with "zirconas." Owing to the limited mill facilities, work has been suspended on the Fortuna shaft and other surface workings. A grinding mill of fifteen tons capacity will be installed. A cyanide plant is building. The solution, tailings and receiving vats are of rock with cement casing. The four tailings vats have a capacity of fifty tons each. G. H. Green is mine foreman.

Gold-silver-copper ore has been struck on the Filo de las Cortaduras, between the Rancho Concepcion and the Rio de Chuta.—J. Luna is working a few men on his exploration concession in the Barranca Blanca.—South of Los Posos nuggets are being taken out ranging as high as an ounce in weight.  
Gold is found in the black sand on the beach between the deltas of the Rio Balsas and the mouth of the Rio de Chuta, on what is known as the Playa Prieta, but it is not sufficiently concentrated in one place to warrant beach placering.  
Near the iron deposits of the Ferreria natives manufacture their own implements from iron smelted in stone furnaces. The charge consists of a certain amount of iron between three times its bulk each of pine and oak charcoal.  
Carrizal, Oct. 21.

**NEW ZEALAND.**  
Gold returns of New Zealand for month of September are reported at 42,259 ounces, valued at £161,767, compared with 58,542 ounces in September, 1903.

**SIAM.**  
British Consul Beckett at Bangkok reports mineral exports for Siam for 1903 at:

	Value.
Tin	\$6,462
Rubies	9,908
Salt	4,239
Lead	473
Sapphires	366

**Trade Treatises.**  
Catalogue No. 35 from the S. H. Supply Co., Denver, Colo., 8½x11 in., has in its hundred pages considerable of interest in the way of illustrated information concerning all departments of mine equipment, with prices and freight rates thereon.

Mine surveyors will find much of practical interest in the eighth edition of a "Manual of Modern Surveying Instruments," issued by A. Lietz Co., 422 Sacramento street, San Francisco, Cal. In addition to a description of their establishment, methods of manufacture and adjustment, and an illustrated price list of engineering instruments, it also contains a number of professional papers, notably one on "Stadia Surveying," by Otto von Geldern. It is sold for 50 cents.

**Personal.**  
H. C. CALLAHAN has returned from Australia to California.  
P. L. YOUNG has returned from Chile and goes to Mazatlan, Mexico.  
W. C. RALSTON has returned to California from Tonopah, Nevada.  
J. BROOKS is superintendent of the California mill at Park City, Utah.  
H. H. CLARK of Tonopah, Nev., is manager of the Bull Frog M. Co.  
A. I. GOODELL has resigned as manager of the smelter at Takilma, Or.  
A. C. CABEL is superintendent of the Nahmint mines, near Alberni, B. C.  
J. E. BARNES is foreman of the Goldfield Bonanza mine at Goldfield, Nev.  
J. L. HARPER is manager of the Manila mine, near Keller, Ferry county, Wash.  
R. L. POSTLETHWAITE of San Francisco is visiting the St. Louis Exposition.  
JESSE SCOBAY has returned to Hermosillo, Sonora, Mexico, from Denver, Colo.  
C. M. FUELLER of Denver, Colo., has returned there from a professional trip to Utah.  
L. S. JUDD is manager of the Copper Glance M. Co. mines, near Encampment, Wyo.  
H. A. BENNER is manager of the Judith Basin M. Co., near Lewistown, Mont.  
C. B. HORWOOD is assistant engineer with F. Hatch at Johannesburg, South Africa.  
J. D. YOUNG is manager of the Silver Cliff G. & C. M. Co., operating near Wallace, Idaho.  
WILLIS LAWRENCE has been appointed superintendent of the Red Lion group at Goldfield, Nev.  
A. M. YONGE is superintendent of the Tres Amigos gold mines at Abangarez, Costa Rica, C. A.  
GEO. A. TWEEDY of Los Angeles, Cal., is making an examination of Arizona mining properties.  
F. SMITH is superintendent of the mines of the Northwestern M. Co. at Caribou, Boulder county, Colo.  
E. W. WALTER is manager of the Takilma smelter at Takilma, Or., vice A. I. Goodell, resigned.  
A. A. KOCH, Ph. D., is instructor in chemistry at the Michigan College of Mines, Houghton, Mich.  
G. R. HANCOCK of Salt Lake City, Utah, is superintendent of the Curtis mines at Park City, Utah.  
L. NEILSON of Richfield, Utah, is superintendent of the Gold Dev. Co., operating near Marysvale, Utah.  
O. STEIN has resigned as manager of the Oro M. Co., in the Bradshaw mountains, near Crown King, Ariz.  
B. HELLER, president of the Oro M. Co., near Crown King, Ariz., will act as manager, vice O. Stein, resigned.  
C. H. HOYT, C. E., is instructor in civil and mining engineering at the Michigan College of Mines, Houghton, Mich.  
D. COPELAND, B. S., is instructor in metallurgy and ore dressing in the Michigan College of Mines, Houghton, Mich.  
C. F. BOWEN, M. S., and E. T. HANCOCK, B. S., are instructors in geology and mineralogy at the Michigan College of Mines, Houghton, Mich.  
W. J. RULE has resigned as superintendent of the Bell mine of El Rico M. Co. at Tuttle town, Cal., to accept a similar position at Goldfield, Nev.  
F. G. ADAMSON, of the Stephens-Adamson Manufacturing Co., manufacturer of belt conveying machinery at Aurora, Ill., sailed last week for Europe, on business.  
E. HODGE, formerly at the Negaunee, Mich., mines, has returned there from Bisbee, Ariz., where he has been underground superintendent of the Houghton D. Co. for two years.  
A. L. DORENUS, secretary of the Crocker-Wheeler Co., Ampere, N. J., is in Denver, Colo., making arrangements for a local manager at that point, vice L. P. Hammond resigned.  
M. M. GREEN has resigned as professor of mechanical engineering of the University of Colorado, at Boulder, Colo., to take charge of construction work for the

Acheson Graphite Co., Niagara Falls, N. Y.  
STATE ENGINEER WAYNE DARLINGTON at Boise, Idaho, has resigned, to take effect November 15th. Darlington goes to California to take management of the Bagdad Chase M. Co. of Stagg, Cal.

**Obituary.**  
J. McDERMOTT, a pioneer miner and mine owner of Bannack, Alder Gulch and Deer Lodge, Mont., died at Butte, Mont., October 19, aged 74 years.  
B. H. EATON, a pioneer mine owner of Colorado, and Governor of the State in 1885-86, died at Denver, Colo., on October 29th. Deceased was born in Ohio, December, 1833.  
A. J. MALLOY, manager of the Bingham-New Haven M. Co., died at Bingham, Utah, October 25. Deceased was formerly manager of the Dixie mines of the Utah & Eastern C. Co. in Washington county, Utah, and was at one time connected with Stratton's Independence mine of Cripple Creek, Colo.

F. SANDS, for the past seven years engaged in metallurgical and chemical investigations for the Boston & Montana C. Co. at Great Falls, Mont., died at Great Falls October 27. Deceased was born in New York City in 1858, and after studying at the Columbia University was with the New Jersey Z. & I. Co., New Jersey. For several years following 1888 he was assayer and chemist for the Butte Reduction Works and the Original mine at Butte, Mont.

**Commercial Paragraphs.**  
THE Witherill Separating Co., 52 Broadway, New York, was awarded a gold medal at the St. Louis Exposition.  
COLORADO IRON WORKS Co. of Denver, Colo., have an order for five of their improved 1904 model impact screens from the Montana Zinc Co. in Montana.  
A GOLD MEDAL was awarded to Wm. Ainsworth & Sons, Denver, Colo., for their exhibit of assay and analytical balances at the Louisiana Purchase Exposition in St. Louis, Mo.  
THE Broderick & Bascom Rope Co., 805 N. Main street, St. Louis, Mo., write regarding their exposition exhibit "We have captured the grand prize, which is the highest prize made to any one in that line."

THE Stoddard Metal Co. of Chicago, Ill., has been organized by E. B. Stoddard, A. E. Woodbull and others to manufacture babbitt metals, electrolytic metals and all the white alloys. The company's offices are located at 1164 Monadnock Block, Chicago, and its plant, which is entirely new, at 150 So. Homan Ave., Chicago.  
THE Denver Engineering Works, Denver, Colo., have orders for the following: One 150 H. P. double conical drum electric hoist to Montana; one 50 H. P. double drum electric hoist to Sonora, Mexico; one 50 H. P. single drum electric hoist for Oregon; one 30 H. P. double drum electric hoist for Chihuahua, Mexico; one 150 H. P. steam turbine motor for Denver, Colo. This company sold and started the first steam turbine at the Gold King mine, Gladstone, Colo., ever started in Colorado—a 250 H. P. direct-connected turbine dynamo.

MR. ERNST WIENER of the firm of Arthur Koppel, 66-68 Broad St., New York City, has returned from a three months' trip to Europe. He reports that general business conditions in Germany are very good. While abroad he made arrangements which will enable him in future to furnish any of the standard styles of railway materials made by his firm from a stock kept in this country. He also perfected a system whereby orders which call for special manufacture can be shipped promptly. In this way, he states, such difficulties as his firm has had in the past from delays in filling orders will be entirely obviated.

THE Jas. Leffel & Co., Springfield, Ohio, some months ago built a turbine for the Kosaka copper mine, Kosakamura, Rikuchu, Japan, owned by the Fujiti Gumi, F. Kuhara and K. Taketa managers. This was a 38-inch double-discharge, horizontal Samson turbine, to operate under a head of 104 feet and develop 850 H. P., at a speed of 360 r. p. m.; direct coupled to a General Electric Co. 500 K. W. generator. This outfit was shipped

on the steamer Calchas, which was captured by the Russians and taken to Vladivostok. The Jas. Leffel Co. then received a cable order from the Fujiti Gumi to duplicate the turbine, and this week made shipment of the duplicate wheel.

THE Westinghouse Companies, exhibiting at the Louisiana Purchase Exposition, advise us that they have been given awards by the International Jury as follows: Special award in the Department of Machinery for the best, most complete and most attractive installation; twelve grand prizes for alternating current generators and motors, alternating current turbo-generator installation, static transformers and rotary converters, direct-current generators and motors, electric railway motors, alternating current and direct current and control systems for single and multiple unit operation and for mining and industrial locomotives; horizontal gas engines and steam turbines; air brakes and friction draft gears; brakes for electric cars; driver brakes; air and steam couplers; air brakes and accessories; signal system; the development of the mercury vapor arc lamp. In addition, they were awarded eight gold medals for complete switchboards and controlling apparatus and the application of electric motors for mechanical purposes; alternating current, direct current and Bremer arc lamps and arc-lighting systems; electric measuring instruments; Nernst lamps; vapor lamps for photo-engraving; water and gas meters; industrial betterment work; the housing of the working classes. Four silver medals for switches, fuses and wiring appliances; incandescent lamps; electric light fittings; gasoline automobiles. And one bronze medal for electric switches.

**Books Received.**

Under the head of "Mineral Resources of the United States for 1903" the United States Geological Survey has issued "Production of Cement," with "Notes on Portland Cement in Michigan in 1903."

**New Patents.**

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:  
FOR THE WEEK ENDING OCTOBER 25, 1904.  
773,450.—MAKING ALLOYS—R. S. Anderson, Seattle, Wash.  
773,118.—SAW—W. W. Carter, Ballard, Wash.  
773,581.—DOOR OPENER—J. F. Connell, Los Angeles, Cal.  
773,379.—CATTLE GUARD—W. D. Dobler, Sumner, Wash.  
773,315.—PENCIL SHARPENER—R. J. Ellis, S. F.  
773,488.—OIL BURNER—C. B. Elmirt, S. F.  
773,281.—CONTAINER—W. E. Everette, Tacoma, Wash.  
773,203.—BLOWPIPE—E. H. Fosdick, Los Angeles, Cal.  
773,391.—FRUIT GATHERER—F. D. Hendrickson, Ambony, Wash.  
773,283.—FRUIT PICKER—J. B. Marshall, Fresno, Cal.  
773,337.—DREDGER—R. A. Perry, Oakland, Cal.  
773,221.—SLIMES WASHER—L. E. Porter, Camp Rochester, Cal.  
773,232.—SLIMES WASHER—L. E. Porter, Camp Rochester, Cal.  
773,954.—MEAT TENDERER—G. R. Sackett, Fennelon, Nev.  
773,526.—ADVERTISING DEVICE—L. L. M. Salsbury, Fruitvale, Cal.  
773,429.—BRIDLE BIT—H. A. Sievert, Walla Walla, Wash.  
773,976.—CAMERA—A. L. Swartz, Junction City, Or.  
773,497.—LOG TURNER—E. E. Thomas, Tacoma, Wash.

**Notices of Recent Patents.**

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:  
PENCIL SHARPENER.—No. 773,315. Oct. 25, 1904. R. J. Ellis, San Francisco, Cal. This invention consists in the combination with suitable supporting means, of a rotatable pencil support, a gear on said pencil support, a reciprocating knife carriage, and a rotatable part on said carriage provided with gear teeth, engaging said pencil support gear irrespective of the reciprocations of the carriage.  
DREDGER.—No. 773,337. Oct. 25, 1904. R. A. Perry, Oakland, Cal. This invention consists in the combination with vessel, of a frame or ladder extending from one side of the vessel's bow in a line diagonal to the vessel's length and terminating substantially on a prolongation of said central line, a shaft journaled upon the frame, an excavator fixed to the outer end of the shaft, a motor and connections between it and the inner end of the excavator shaft, a suction pipe and a suction pump upon the vessel with which said pipe is connected.

**Dividends.**  
Bunker Hill & Sullivan M. & C. Co., Idaho, dividend No. 85, \$75,000, payable November 4. Total since January 1, 1901, \$663,000, total to date, \$2,196,000.

THE WITHERILL SEPARATING CO., 52 BROADWAY, NEW YORK, WAS AWARDED A GOLD MEDAL AT THE ST. LOUIS EXPOSITION.

**Commercial Paragraphs.**

THE DENVER ENGINEERING WORKS, DENVER, COLO., HAVE ORDERS FOR THE FOLLOWING: ONE 150 H. P. DOUBLE CONICAL DRUM ELECTRIC HOIST TO MONTANA; ONE 50 H. P. DOUBLE DRUM ELECTRIC HOIST TO SONORA, MEXICO; ONE 50 H. P. SINGLE DRUM ELECTRIC HOIST FOR OREGON; ONE 30 H. P. DOUBLE DRUM ELECTRIC HOIST FOR CHIHUAHUA, MEXICO; ONE 150 H. P. STEAM TURBINE MOTOR FOR DENVER, COLO. THIS COMPANY SOLD AND STARTED THE FIRST STEAM TURBINE AT THE GOLD KING MINE, GLADSTONE, COLO., EVER STARTED IN COLORADO—A 250 H. P. DIRECT-CONNECTED TURBINE DYNAMO.

MR. ERNST WIENER OF THE FIRM OF ARTHUR KOPPEL, 66-68 BROAD ST., NEW YORK CITY, HAS RETURNED FROM A THREE MONTHS' TRIP TO EUROPE. HE REPORTS THAT GENERAL BUSINESS CONDITIONS IN GERMANY ARE VERY GOOD. WHILE ABROAD HE MADE ARRANGEMENTS WHICH WILL ENABLE HIM IN FUTURE TO FURNISH ANY OF THE STANDARD STYLES OF RAILWAY MATERIALS MADE BY HIS FIRM FROM A STOCK KEPT IN THIS COUNTRY. HE ALSO PERFECTED A SYSTEM WHEREBY ORDERS WHICH CALL FOR SPECIAL MANUFACTURE CAN BE SHIPPED PROMPTLY. IN THIS WAY, HE STATES, SUCH DIFFICULTIES AS HIS FIRM HAS HAD IN THE PAST FROM DELAYS IN FILLING ORDERS WILL BE ENTIRELY OBTIATED.

THE JAS. LEFFEL & CO., SPRINGFIELD, OHIO, SOME MONTHS AGO BUILT A TURBINE FOR THE KOSAKA COPPER MINE, KOSAKAMURA, RIKUCHU, JAPAN, OWNED BY THE FUJITI GUMI, F. KUHARA AND K. TAKETA MANAGERS. THIS WAS A 38-INCH DOUBLE-DISCHARGE, HORIZONTAL SAMSON TURBINE, TO OPERATE UNDER A HEAD OF 104 FEET AND DEVELOP 850 H. P., AT A SPEED OF 360 R. P. M.; DIRECT COUPLED TO A GENERAL ELECTRIC CO. 500 K. W. GENERATOR. THIS OUTFIT WAS SHIPPED

ON THE STEAMER CALCHAS, WHICH WAS CAPTURED BY THE RUSSIANS AND TAKEN TO VLADIVOSTOK. THE JAS. LEFFEL CO. THEN RECEIVED A CABLE ORDER FROM THE FUJITI GUMI TO DUPLICATE THE TURBINE, AND THIS WEEK MADE SHIPMENT OF THE DUPLICATE WHEEL.

### Latest Market Reports.

SAN FRANCISCO, November 4, 1904.

#### METALS.

**SILVER.**—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47c San Francisco, 48½c New York.

**COPPER.**—New York: Standard, \$13.25; Lake, 1 to 3 casks, \$13.62½@14.00; Electrolytic, 1 to 3 casks, \$13.62½; Casting, 1 to 3 casks, \$13.57½; San Francisco: \$15.00. Mill copper plates, \$17.00; bars, 18@24c. London: £63 10s spot per ton.

Copper shows a further advance over last week's quotations, having advanced as predicted. Lake is now quoted at \$13.62½@14.00, which is a generally satisfactory price, though it may go somewhat higher. It is not the part of wisdom for those who control the copper market to advance the price to a figure which will bring the metal into too active competition with aluminum, though there are many uses for copper in which aluminum cannot be substituted. The largest use of copper is in the electrical field, and here the white metal is an active competitor, and in some instances is preferred, but the choice is usually determined by the relative price of copper and aluminum.

**LEAD.**—New York, \$4.45; Salt Lake City, \$3.50; St. Louis, \$4.12½ San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £12 12s 6d long ton.

**SPELTER.**—New York, \$5.40; St. Louis, \$5.00; London, £23 15s 3d ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

**TIN.**—New York, pig, \$28.87½@29.17½; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, \$32, 32½@35c. London, £131 15s 9d spot.

**PLATINUM.**—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 ½ Troy oz. Platinum ware, 75 @ 82c per gram.

**QUICKSILVER.**—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 ½ flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

**BABBITT METAL.**—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100 lb. lots, 16c.

**ZINC.**—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

**NICKEL.**—New York, 40@47c ½ lb.; ton lots, 40@47c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

#### STRUCTURAL MATERIALS.

**IRON.**—Pittsburg, Bessemer pig, \$12.85 @13.10; gray forge, \$12.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$19.50; open hearth billets, \$19.50; San Francisco, bar, 7c to 12c ½ lb.

**WHITE LEAD.**—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¾c ½ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ¾c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

**LUMBER.**—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

**NAILS.**—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45;

Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

**LIME.**—Santa Cruz, \$1.25 country, \$1.25 city ½ bbl.

**CEMENT.**—Imported, \$2.15@2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

#### GENERAL SUPPLIES.

**ANTIMONY.**—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

**POWDER.**—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

**CAPS.**—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

**FUSE.**—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLES.**—Granite 6s, 16 oz., 40s., 11½c ½ set; 14 oz., 40s., 10c.

**COAL.**—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

**CHEMICALS.**—Cyanide of potassium, 98%-99%, jobbing, 23@24c ½ lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 ½ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ½ lb.; Cal. s. soda, bbls., \$1.20@1.40 ½ 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c ½ lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c ½ lb.; nitric acid, carboys, 8c ½ lb.

**OILS.**—Linseed, boiled, bbl., 53c; cs., 58c; raw, bbl., 51c; cs., 56c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Ecocene, 25c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

**ALUMINUM.**—No. 1, 99%, small lots, 37c ½ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c; Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

**BORAX.**—Concentrated, 6@7c ½ lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

**BONE ASH.**—Extra No. 1, 5@6c ½ lb., No. 1, 4@5c.

**RED LEAD.**—500 lbs. and over at one purchase, ½ lb., 7c; less than 500 lbs., 7½c.

**LITHARGE.**—Pure, in 25-lb. bags, 8@9c ½ lb.

**MOLYBDENUM.**—Best, \$2.75 ½ lb.

**CHROMIUM.**—90% and over, ½ lb., 80c.

**PHOSPHORUS.**—American, ½ lb., 70c.

**SILVER.**—Chloride, ½ oz., 90c@1.00; nitrate, 55c.

**MERCURY.**—Bichloride, ½ lb., 77c.

**MAGNESIUM.**—Pure, N. Y., 60c.

**MANGANESE.**—½ lb., \$2.75.

**SODIUM.**—Metal, ½ lb., 50c.

**BISMUTH.**—Subnitrate, ½ lb., \$2.10.

**URANIUM.**—Oxide, ½ lb., \$3.50.

**FIRE BRICK.**—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

**FIRE CLAY.**—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

**THE CALIFORNIA DEBRIS COMMISSION** having received applications to mine by hydraulic process from J. McGrath, in Red Rock Mine, at Howland Flat, Sierra County, Cal., draining into Slate Creek which reaches Yuba River, and from Douglas S. Cone and Charles L. Reynolds, in Smiths Blue Gravel Mine, near Ono, Shasta County, Cal., draining into Jerusalem Creek which reaches Sacramento River, gives notice that a meeting to receive any protests will be held at Room 96 Flood Building, San Francisco, Cal., Nov. 21, 1904, at 1:30 P. M.

### HELP WANTED.

**MINE OPERATORS, ENGINEERS AND CONTRACTORS** can secure without charge competent engineering help by writing us. **CLEVELAND ENGINEERING AGENCY**, Rose Building, Cleveland, O.

Another view of the Car shown last week.

### THE WATT MINING CAR WHEEL CO.

Barnesville, Ohio.

TRENT ENGINEERING & MACHINERY CO., Salt Lake City.....Utah Representative.  
THE BOUSE CO., 509 Mission St., San Francisco, Cal.....Pacific Coast Representative.

### ARTESIAN WATER WELLS DRILLED.

Water Wells Tested. Water Works Installed.

### PROPERTIES TESTED FOR MINERALS.

Bridge Piers, Foundations, Etc.

PUMPING AND DRILLING MACHINERY FOR RENT.

SHREWSBURY & SMITH (Incorporated), Engineers, Office and Works, SAN MATEO, CAL.

### HEADS SCHOOL OF MINES AND ENGINEERING

24 POST ST., SAN FRANCISCO, CAL.

Full courses in Mining, Electrical, and all kinds of Engineering. Assaying, Cyanide and Mill Processes. Catalogue Free.

### SITUATIONS WANTED.

**A FOREMANSHIP OR SUPERINTENDENCY.** Twelve years' experience, practical mining. Possesses technical knowledge necessary for economical ore extraction. Address Edward W. Ralph, 602 W. Broadway, Butte, Montana.

**BY MACHINIST, STEAM ENGINEER, ASSAYER and cyanide man;** sulphide cyaniding a specialty; 14 years' reference. "J. J. B." this office.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MINE SUPERINTENDENT WANTS POSITION.** Capable miner, mill man, cyanide man and assayer. Address R. P., this office.

**SITUATION WANTED BY THOROUGH, COMPETENT and reliable mining bookkeeper.** Four years' experience with large properties. Best of references. Address Box 52, care of this office.

**WANTED—SITUATION BY MILL MAN;** 12 years' technical and practical experience in dry and wet crushing, stamps, rolls, Chilian and Huntington mills, cyanide, amalgamation and the slime problem. Highest references and testimonials. Address "Mill Man," care of this office.

**WANTED—POSITION AS SUPERINTENDENT** or assistant supt by a practical man; first-class chemist and assayer. Specialty: Reduction work, milling and smelting. Address X, this office.

**WANTED—BY EXPERIENCED MINERAL** Surveyor, position as mine surveyor and draughtsman. References. Address D, this office.

**THE ENGINEERING AGENCY, CHICAGO,** furnishes free to reliable employers information leading to employment of Mining Engineers, Draftsmen, Mine or Mill Superintendents, Assayers, Chemists, Cyanide Men, Electricians, etc. In successful operation eleven years. Let us know your need and competent, high-grade men whose complete professional and personal records have been thoroughly investigated will be referred to you at once.

### Thirty Years of Practical Experience

Lie behind every Car we turn out.

We have paid for all the experimenting. Our customers get the benefit.

WE MAKE CARS IN ALL STYLES FOR ALL MINE PURPOSES.

WE SAVE YOU MONEY AND GIVE YOU THE BEST CAR MADE AT NO GREATER COST THAN AN INFERIOR ARTICLE.

### Easy, Inexpensive Hoisting.

There's one way to move or lift things and be absolutely sure that time, energy or power is not being wasted. That is with the

### "Triplex" Chain Block.

It doesn't require power, and it saves enough in time and energy alone, compared with other types of blocks, to pay for itself in a few months. Try it and see.

## Some Object Lessons.

The recent cutting of the Kearsarge ledge at a depth of over 1000 feet in the workings of the Allouez company in the Lake Superior region is an important event in the history of copper mining in that district. The Allouez mine is about 3 miles north of the Calumet and Hecla and Tamarack group. The ledge was cut by a diamond drill operated from the bottom of the new 1000-foot shaft, the object being to locate the lode exactly in order that the proper curves might be arranged in continuing the shaft (which has been sunk at an angle of  $80^{\circ}$ ) to an intersection with the conglomerate bed which has a dip of about  $40^{\circ}$  at this depth. The shaft will be continued downward on the conglomerate. The Kearsarge lode is not always rich in copper, but at the Allouez it carries pay rock where cut by the diamond drill holes. This lode does not outcrop on the Allouez mine, but is seen on the surface both north and south of the property, which comprises 640 acres on the lode. In the history of mining by the Allouez company they have been much less fortunate than some of their neighbors, having had an unprofitable career. The original mine was opened on the Allouez conglomerate. The copper content of this large lode—30 feet in width—was low,

Dredger at Atlin, B. C., Showing Sluices and Riffles. (See Page 324).

running usually under 1%, and the ore was difficult to treat. After an active period of eight years under corporate management the mine was closed down. It was then operated by leasers, who made it pay, demonstrating the value of practical management divested of unnecessary corporate expenses. Three years later the company resumed operations, which were continued for about five years, but without favorable result. Again the leasers took the property, again making it profitable, thus further accentuating the advantage of the leasing system on a low-grade mine. Following them for the third time the company again operated the property at a loss. In 1898 and later a large amount of money was expended on the Osceola lode in the Allouez ground, but the outcome of this operation was so unpromising as to cause a suspension of work again. Notwithstanding the continued losses of this company they started the Kearsarge shaft in 1903, which is now 1000 feet deep. The outlook for the Allouez mine is now said to be good, and the new development on the Kearsarge lode is expected to recoup all their losses of the past. The career of this mine is an unusually interesting one, for in its operation a very large amount of money has been expended, two different lodes have been extensively developed without financial success, and a third is now to be tried with a more promising prospect than before of success. The fact that on three separate occasions several years apart, leasers took the property immediately following failure on the part of the company, paid a royalty and made a good profit for themselves is worthy of careful consideration. The continued faith of the company in the property, and the determination to investigate its every resource, is also one of the phases of mining that is often lost sight of. It is not the first instance of success crowning persistent effort after repeated failure in the development of a great mine.

THE annual report of the Quicksilver Mining Company of California, recently issued, shows some interesting facts; the most notable of which is that the average grade of ore treated during the year ending April 30, 1904, contained only 0.448%; though in 1902-03 the grade of ore was even lower than this. The report also shows that if it were not for rents, and incomes derived from other extraneous sources, the company would have been only able to meet its expenses. The most important fact, however, is that the low grade of ore treated, less than one-half per cent, is just about sufficient to meet the expense of production when the mine and reduction works are operated on a liberal scale.

IN British Columbia the coal miners' strike of a few months ago has had a reactionary effect, as during that period of non-production users of power installed electric or oil burning plants, and the demand for coal was largely diminished in consequence. When miners contemplate a strike it is always well to weigh seriously not only the probable immediate result, but the possible far-reaching consequences of their action.

THE usual amount of sickness prevalent in new mining camps is reported from Goldfield, Nev. The character of the illness indicates clearly the cause—neglect to care for oneself. Exposure, privation and physical inability to endure the hardships of a pioneer mining camp in a desert country, where water, provisions and fuel are high and nothing is cheap. The same conditions prevailed in Tonopah, and in every other large mining camp in Nevada, and in every other State throughout the West in its early history; but the stamper gives little heed to such matters as these, and words of warning and advice are usually wasted.

SOME of the great mines of Mexico now being worked by American or British capital have had an interesting history. Discovered in the seventeenth century, they have been worked vigorously for a period followed by years of idleness, succeeding which activity again prevailed with usually abundantly satisfactory results. The most noted of these mines have produced a series of bonanza ore bodies, each of which in its turn was discovered and worked out, following which the mine was abandoned for long periods. Usually the Mexican removes his ore as fast as he uncovers it, and there is seldom a large ore reserve in sight under the old regime. Systematic mining and development has to a great extent replaced the old-time methods.

## New Mining Districts of Nevada.

The rich discoveries made in southern Nevada since the first strike at Tonopah, about five years ago, are only what may have been expected, and there is no reason at this time to believe that all the claims worth having have been located. Within the past year in southern Nevada there have sprung into existence several new mining districts and camps—among them Goldfield, Crater, Gold Mountain, Bull Frog, Ray, Lone Mountain and Hannapah. The coming year will no doubt see a number of others—equally good, perhaps—added to the list. In the Great Basin almost every hill and mountain range that rises out of the desert plains contains mineral veins and deposits. This fact was learned many years ago, and as far back as the '60s, the districts of Hiko, Logan, Reveille, Silver Peak, Candelaria and numerous others were known to the mining world. These later discoveries were not made at that time, for the reason that the sections in which they occur are even more forbidding, if possible, than those above mentioned. It required a rich discovery like that made at Tonopah to stimulate the search for new deposits and veins, and they have been quickly found. It is reasonable to expect other important discoveries will be made along a northwest-southeast zone extending through these new mining districts. Each new important find aids in the discovery of others, for the reason that a new base of supplies is promptly established at the latest discovery, and from this point the prospectors branch out in every direction.

Good advice to those who contemplate going into southern Nevada is to go to Goldfield, or one of the other newly established camps, and there outfit, and prospect in a new region in which no discoveries have yet been made; for in the vicinity of the now well-known camps, like Tonopah, Goldfield and Crater, the country has been solidly staked for miles, and it is almost useless to hope to find a vacant piece of ground where there is the slightest prospect of value being discovered. It is in the extension of these fields to the northwest and southeast—and for that matter in any direction—that the opportunity for the prospector now lies. This mineral belt extends southeasterly through the Good Springs, Searchlight, Quartette and El Dorado canyon districts, and, crossing the Colorado river into Arizona, continues through Gold Roads, White Hills and the Cerbat districts, which undoubtedly belong to the same mineral zone. Within this zone the veins may individually have a dip and strike in any direction, but the general trend is as indicated, in a northwest-southeast direction. Beyond Cerbat mountains to the southward the zone of mineralization continues beneath the great lava fields of western Arizona, in the midst of which are the old McCracken mine, the Burro, the Hillside and many others, and beyond this through the mines of central and southeastern Arizona and into Mexico.

At Goldfield at present a peculiar condition obtains. The most important mines have developed very rich ore. It is well known that a great deal of this rich ore is being stolen; numerous cases have been proven. The miners are well organized and the greater part of the work is being done by leasers. With the leasers time is an important factor. Any attempt to search men in change houses is resisted, and, if insisted upon, would precipitate a strike. This means loss of time, and the lessees cannot afford to lose time; as a result, the work goes on rapidly and the leasers are making money—so are the claim owners and all others directly connected with the industry.

THE proposed covering of the walls of a shaft in Tuolumne county, Cal., with cement, to keep out water is an ingenious idea, but it must certainly be viewed in the light of an experiment until its efficacy is proved. The mechanical difficulties and expense may be easily surmounted, no doubt, in the hard granite country of that section, but ordinarily the exposures in shaft work are only relatively a very small portion of those made in mining, and that the application of a coat of cement to the shaft walls will have an important effect on the amount of water coming into the workings is extremely doubtful. Similar attempts have been made previously, but have never proved suc-

cessful. If it were merely the lining of a single opening like a shaft or a tunnel, where when this was completed no further work was contemplated, it might have some effect on the water, but where mining is in progress its benefit is doubtful.

THERE is a growing disposition to substitute, as far as possible, mechanical devices for manual labor in mines. The pick and gad have been replaced by the mechanical coal cutters in the coal mines. Electric or compressed air locomotives, or mechanical haulage, have replaced the old-time trammer, or the horse, in many large mines. Automatic skips have taken the place of cages to a great extent. Aerial tramways have supplanted other methods of transportation on the surface. Drill sharpening machines do the work of a corps of blacksmiths—and now mechanical loaders are successfully performing the work of the muckers. In stopes of low inclination the ore is passed to the cars on the level below by means of shaking chutes or by buckets traveling on a wire in a manner similar to the aerial tramway. In the mills and smelters ores, fluxes and all materials are handled by machinery, and manual labor is being displaced on every side. All of this innovation tends to reduce working costs, and the result is that the mine too low grade to work a few years ago has become the profitable proposition of to-day, giving employment to more men than before. A certain mine in Arizona a few years ago was equipped with a hoist and small smelter. Fifty men were employed and the mine paid handsomely—often \$100 per ton. There were large ore bodies in the property but these were too low grade to pay. Only the smaller rich portions could be successfully worked. To-day this mine has a capacity of 1500 tons daily. Its great stacks are fully equipped with every modern device, electric haulage, etc., and the profit is ten times as great as formerly, and it is the low-grade ore that is doing it all, and over 1000 men now find profitable employment at this mine.

THE zinc industry of the United States has been wonderfully stimulated by the large and constantly increasing demands for that metal for use in the cyanide process and in other industries. In the face of a constantly increasing production the price of zinc has advanced, and this has still further stimulated its output. Throughout the Rocky Mountain region and the Pacific Coast zinc ores occur in greater or less amount in many places, but the larger portion of zinc ores exists as sulphide, and is combined with the sulphides of iron, copper and lead. These ores, where the several sulphides occur in finely disseminated crystals, intimately intermixed, were, up to a short time ago, undesirable, as the zinc was not wanted by the lead smelter, and the lead and iron were not wanted by the zinc smelter. The electromagnetic separator, however, has made a clean separation of these several sulphides possible, and as a result the waste dumps of several districts suddenly became valuable for their zinc, lead and copper contents, besides at once rendering profitable a large volume of ore in place in the mines. Under the new conditions and the stimulus given the output of zinc by the demand for it, that metal has become an important factor in the mineral output of several western mining sections. Colorado and Utah have greatly increased their zinc output, and in British Columbia zinc has become a noted feature of its mineral production. In nearly all cases the zinc ores are shipped hundreds of miles to smelters for treatment, indicating that this class of ores will bear a long-distance transportation charge and a comparatively high reduction charge and still afford a profit.

THE profitable reworking of the old slag dumps and the ground about the site of the old Anaconda smelter at Butte City, Mont., is practical evidence of the improvement in metallurgical methods of the present over the past. The slag dumps of to-day may possibly become a source of profitable revenue to some careful worker in the future, but it seems hardly probable that such will ever be the case. Changes in metallurgical methods at Butte have been frequent in the past and are still being made, the object being to derive every possible value from the ores of the district in a series of continuous operations that nothing may be left for the future.

## CONCENTRATES.

PURE PYRITES—that is, pyrites comparatively free from arsenic—would be necessary in the manufacture of sulphuric acid.

THE dissolution of gold in the application of cyanide solutions is greatly accelerated by heating of the solution. Barium peroxide also has the effect of hastening the dissolution of the gold.

POWER may be taken from any part of a line or countershaft, provided the power desired is available. In order not to disturb existing pulleys and boxing, a split pulley may be employed.

WHEREVER in the West petroleum has been employed as fuel it has been found less expensive than any other fuel, excepting at coal mines and in a few isolated mountain districts, where wood is cheaper.

GOLD was known to exist in the Black Hills of Dakota several years before the discovery which precipitated the stampede in 1875-76. Hayden, Warren and other explorers referred to the occurrence of gold in that region as early as 1859-60.

THERE are few accidents in drifting through rock if the timber is kept sufficiently close to the face, but in order to save expense the face is sometimes allowed to advance too far before timber is put in, and the back falls with disastrous results.

THERE is practically no depreciation in copper wire due to the elements. Cutting and splicing will eventually render it useless. Copper wire as junk will about half replace itself. The life of an iron wire is from three to five years in a smoky district; in the open country from thirteen to fifteen years.

THE term "flux" depends upon what kind of a smelting operation is being carried on. What is a flux in one operation would not be in another operation. A flux is a material added which combines with the impurities and forms a fusible mass, a mass that will fuse at the temperature maintained in the smelting operation.

EUCALYPTUS is used in some portions of Australia for mine timbers and is said to answer the purpose admirably. The blue gums, a variety of eucalyptus grown in California, do not usually endure well when set as posts in the ground, but as far as known to "Concentrates" no attempt has been made to utilize them for mine timbers.

A "BLOWOUT" in miners' phraseology means an outcrop of quartz or ore of large size. It originated in the conception that veins were of eruptive origin. Usually an outcrop of this description is much larger than the normal vein, due to the mineral being of superior hardness, and as it disintegrates spreads over the slopes of the hillsides.

ONE foot of a 1-inch hole can hold five ounces of powder. In the anthracite coal mines a 25-pound keg is consumed for every forty tons mined; the bituminous coal miner can break 300 tons with the same amount. Long wall mining uses up very little powder; for pillar and stall work the powder costs about 18% of the gross cost of mining.

IT is not easy to give a definition of the word "apex" from the standpoint of the extralateral right in United States mining law that would be universally accepted. Probably as likely as any to meet with the minimum of dissent would be that an "apex is the point from the foot wall to the hanging wall at the top of the lode nearest the surface."

THE altitude of Death valley, California, at its lowest part, near Bennetts vells, is stated by the State Mining Bureau of California to be 427 feet below the level of the sea. The water in the wells in the valley contains much mineral in solution. There are a few small springs in the canyons bordering the valley, but none of these springs are perennial.

THE rhyolite sheet, covering the Homestake vein at Lead, South Dakota, and also some of the gold-bearing conglomerate of that district, is not an "overflow" from a crater, but a flat sheet injected between the strata from a dike or neck, and forms a portion of a laccolith. The same may be said of the porphyry overlying the ore-bearing limestones of Leadville, Colo.

THE rare metals, such as scandium, yttrium, lanthanum, erbium, ytterbium, etc., are difficult for the prospector to recognize when present, and, while these metals are valuable for experimental and other purposes, the demand for them is limited to a relatively small amount, and the discovery of a large quantity of any such metals would be of no great value to the discoverer.

In ordinary wire rope, if the wires in the strands are laid from right to left the strands are laid into rope from left to right. But in the "lang way" the wires are laid

into strands and the strands into rope in the same direction. The latter is more flexible than ordinary rope of the same diameter and same number of wires. The endurance of the rope is also increased because longer surfaces of the wire are exposed to wear.

NITRO POWDERS cannot be safely thawed before an open fire or by the direct application of heat from a fire. The practice of warming powder by placing it on top of a hot steam boiler is extremely dangerous and has resulted disastrously on more than one occasion. Powder may be thawed with safety in a can or other covered vessel surrounded by warm water, the heat being applied at moderate temperature and for a considerable period.

WHERE the main line shaft of a stamp mill is placed back of the battery, it is advisable to carry it on a line of timbers or concrete piers at least 30 inches above the floor. This makes the shafting always easy of access, and not difficult to repair. The shaft boxes should be solidly held in place by bolts well anchored, to resist the upward pull of the belts. Light is an important thing in a mill, and provision should be made for ample light in every portion of the building.

MINING CLAIMS located at any time during 1903 should have the assessment work required by law completed by January 1, 1905. There still remain forty-nine days in which to finish all assessment work. In those cases where the work cannot be completed by midnight on December 31, 1904, but is already in progress at the end of the year, the work should be continued daily until completed. In this way a claim which is "behind on assessment work" may be legally held.

THE collar of any shaft should be so built as to insure permanency. Whenever there is any earth at the surface the best plan is to dig a pit to bedrock sufficiently large to admit of building within it a substantial concrete wall, the inside dimensions of which shall be such that the timbers may be placed within the wall and connected with those forming the sets below. It is also an excellent idea to place a perforated pipe around the collar of the shaft through which a spray of water may fall upon the timbers, thus keeping them constantly wet, and greatly prolonging their life. This is applicable to vertical shafts only.

THERE is no essential difference between a fault fissure and a fault plane. Many rich mines occupy the "plane" of a "fault fissure," but all fissures do not contain veins. A vein may occupy a fissure which is not the plane of a fault, but simply a fracture in the earth's surface. A fissure may conform to the strike and dip of the formation in which it occurs, or may cross either or both, or it may be cut across a single stratum being limited in its extent by the mass of the strata lying on either side of the one in which the fissure occurs. Thus, a fissure may cut vertically through a bed of quartzite and be limited above by a stratum of limestone and below by shale.

A FOREIGN CORPORATION can not acquire mining property in Colorado without registering under Colorado State law. Without such registration it can not sue or defend in any Colorado State court; but it can so sue and defend in the Federal courts, for no State legislation can abridge the right given by the Constitution and laws of the United States to all persons to resort to the Federal courts. The Federal Constitution also provides that citizens of any State shall in every other State be entitled to the privileges and immunities of citizens of that State. Hence the Idaho corporation could find suitable recourse to the Federal law in its Colorado relations.

IN turning a vertical shaft to an incline having a departure from the horizontal of about 48°, it has been found that a curve built on a radius of about 80 feet from the bottom wall plate, or the rail, permits of rapid running, with practically no lessening of speed at the curve. In some instances this curve is modified by a transition curve of somewhat longer radius on approaching the tangents at either end. The latter provision is calculated to lessen the shock materially and is advisable. Where running is comparatively slow—under 800 feet per minute—the transition curve may be omitted, and at slower speeds curves of shorter radius are permissible.

THE operation of a pyritic copper blast furnace is unlike that of an iron blast furnace, and the conditions present in one furnace may be entirely absent in the other. For this reason the gases which may be advantageously used at the iron furnace cannot be employed at the copper stack, for the reason that they do not exist in the best practice. A good manager of a copper furnace will not allow the gases to escape from the charge at a higher temperature than the gases of a lead stack when running properly, and therefore the gases cannot be economically employed in heating the blast as in iron smelting. The gases from iron blast furnaces are inflammable. Those from a copper furnace are not.

THERE are three towns on the Homestake belt in the Black Hills of South Dakota. Lead is at the southern end of that portion of the lode exposed at the surface, the outcrop practically ending at the creek known as Gold Run. A mile northwesterly from Lead is Terra-

ville, where are located the Deadwood-Terra and Caledonia mines, and north of this is Central City, the upper end of which is known as Golden Gate, where is located the Father de Smet mine, the most northerly of the Homestake group. The several towns of the Cripple Creek district are Cripple Creek, Victor, Independence, Altman, Goldfield, Midway, Anaconda, Cameron, Elkton and Gillett. There is a postoffice at each of the places enumerated.

WHEN contemplating the treatment of tailings, or an ore, by the cyanide process, laboratory experiments on small amounts should first be made, and if fairly good results are obtained, a small plant which will treat 100 pounds or more of the material should be put in, and exhaustive tests made, before designing a large plant. Although much knowledge has been gained of the cyanide process and its various modifications during the past 12 years, it is evident that there still remains much to be learned. Experienced experimenters are constantly making innovations, and adding new and valuable information to that already gained. Some ores, at present considered to be unsuited to the process, like some others in the past, will be found adaptable to some modification of the process.

A BLAST FURNACE for the reduction of silver-lead ore could well be of the following proportions: Area at tuyeres, 48x144 inches; at feed floor, 7x13 feet; height of jackets, 41 inches to 48 inches; height of shaft from top of jackets to feed floor, 13 feet; height of charge (tuyeres to feed floor), 16 feet to 17 feet; bosh of jackets, 10 inches; volume of crucible, 77 cubic feet; volume enclosed by jackets, 180 cubic feet; volume of shaft from top of jackets to feed floor, 1243 cubic feet; total internal volume of furnace (up to the feed floor), 1500 cubic feet. With a blast of three to four pounds and tuyere openings of 3.5 inches the smelting capacity per twenty-four hours would be 140 to 150 tons ore, exclusive of fuel, limestone and slag, but inclusive of iron flux. The above dimensions give a hearth area (at the tuyeres) of 48 square feet, and an area of 105 to 112 square feet at the top.

THE Kendall system of electrolytic precipitation of gold passes a dilute cyanide solution through a mass of carbon fragments packed around a porous cup and connected as cathode of an electric current passing to an anode inside the porous cup, a voltage of 15 being employed. A carbon plate immersed in caustic soda solution is the anode. When considerable gold is thus precipitated, the compartments are emptied of their solution and a strong solution of cyanide introduced, while the carbon is now used as anode and a silvered plate as cathode inside the porous cell. The gold is dissolved off the fragments and deposited in regular form on the cathode. Professor Christy, Dean of the Mining College of the University of California, had previously pointed out the advantage of this general principle of working, collecting the gold on a small fraction of the surface upon which it is originally deposited.

IN order to do the assessment work for a group of claims upon one of them (patented or unpatented) the claims must be contiguous, so that each claim concerned may be in some manner benefited. The amount expended on this one claim must be at least equivalent to the amount which would be required if each claim were "represented" separately. The work performed or improvements made must manifestly be for the benefit of all the claims included in the group, and the burden of proof is upon the miner to show that the work done or the improvement made does, as a matter of fact, benefit each of the claims of the group. As large properties are usually developed systematically for the purpose of more economical working, the running of levels from a shaft which will eventually extend into adjoining claims may properly be considered as assessment work performed on all the claims, or for the benefit of all. The work may even be performed outside of the boundaries of the claims, or the work may be done on a patented claim for the benefit of adjoining unpatented claims.

THE mine pump should receive the same care and good treatment as is given any other engine if good work and endurance are expected of it. Some pumps will handle more grit than others. It is better to send small rocks up in the bucket than to attempt to raise them out through the pump. Every suction hose should be provided with a screen of strong wire outside the perforated iron to prevent coarse grit going up into the pump. It is this material that causes the valves to wear out so rapidly. Whenever possible suspend the suction from the timbers above the bottom of the shaft, and secure it in such a manner that the vibration of the hose, when the pump is in operation, will not cause the suction hose to come in contact with either rock or timbers, or a hole will be worn through the rubber in a short time. It is a good scheme to wrap the suction hose, or the lower two-thirds of it, with a ½-inch or ¾-inch manilla rope. This keeps the suction from being readily injured in the shaft. When it is desired to blast, the suction should be detached from the pump and hauled up above the shaft by single block and rope placed several sets above the pump for that purpose. The bulkhead is then made tight below the pump, which it may also have been necessary to raise by chain blocks. If these precautions are taken the damage to pump and suction will be greatly diminished from flying rocks.

## Quicksilver in Pan Amalgamation.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS.

The tendency of the lead carbonate to combine with the amalgam may in a great measure be provided against as follows: Do all the grinding in the pan before the chemicals are charged, and after lifting the muller add chemicals, incorporate them, and then add the quicksilver, thus using the pan only as a mixer.

The deleterious influences of manganese compounds are counteracted by the judicious use of chemicals only; while on roasted ore it is generally impossible to prevent the addition of some of the lead and copper to the bullion.

So much for the character of the ores in general, though special remedies are known for particular cases, of only one of which I will speak. That is an ore in which the principal value consists of metallic silver. Here the muller must be kept down with constant grinding during the entire time the charge is in the pan. At Batopilas, Mexico, in 1881, the writer assisted in starting all the machinery of the newly constructed stamp mills, pans and concentrators, and the first charge put through the pans, after twenty-four hours' steady run with the muller raised, after the quicksilver was added, did not amalgamate 5% of the metal. This was done against the writer's advice, and it was only when nothing was accomplished that the metallurgist in charge, and as a last resort, finally agreed to allow this to be done. As a result, every particle of silver was amalgamated within fifteen minutes, and all subsequent charges only required two hours for each batch, instead of the twenty-four hours without the grinding.

We now come to the method of operation and we find that there are two distinct methods in vogue: That employing individual pans charged periodically by hand; and the continuous process, where the crushed ore and proper amount of water steadily pass through a series of pans, and afterwards through a series of settlers, from the last of which the tailings pass to the tailings pond. Though both of these use grinding, chemicals and quicksilver, there is a wide divergence in their operations; so that, though skilled only in the use of one, the operator requires special instruction to manipulate the other successfully. This variation is shown very greatly in the employment of the quicksilver, but to see the cause a short description of each method must be given.

**INDIVIDUAL PANS.**—In this method the ore is crushed and settled in tanks, the overflow of slimes going to a separate tank. When a pan is filled this slime is pumped into the pan, and sufficient of the sand shoveled in to make up the charge. Then either live steam is turned into the pulp, or the pans are heated by steam passing through a false bottom. The consistency of the pulp is made thick and the action of the heat still further thickens the pulp, till it becomes a paste that will hold up a large quantity of quicksilver in the form of globules. When the proper time arrives to charge the quicksilver it is poor policy to scrimp the amount used, and here is where the gold man makes his error. From repeated experiments made by the writer it was definitely determined that the minimum quantity of quicksilver should never be less than 300 pounds for a charge of 1½ tons, and 400 pounds is by no means too much. With a properly thickened pulp, the more quicksilver that is carried the more it will conduce to bring the greater number of metallic particles in contact with it, thereby not only increasing the extraction, but diminishing the time required for each charge. It will also admit of a smaller quantity of chemicals being employed, and in that way increasing the fineness of the resulting bullion. There are generally two pans to each settler, and the time in which the charge can be thinned and settled is dependent on the number of hours it requires to grind and amalgamate in the pan. When the charge is withdrawn a plug is extracted from a spout at the side of the pan, which discharges directly into the settler, and the pan is washed out with clear water and the pulp thinned in the settler. The greater part of the quick and amalgam settles at once and is drawn off through a well in the side of the settler, and falls from there, or is ladled into the straining sacks. The slow moving arms of the settler keep the coarser sand in suspension, but with as little agitation as possible, and the constant addition of water increasingly thins the pulp. The overflow passes through one spout below another to five in number, as time allows or the pulp becomes sufficiently thinned. If the chemicals are rightly added and the quicksilver kept clean and free from grease, the only loss will occur from chemically combined quick, in the form of corrosive sublimate or calomel, and the microscopic globules called "floured" quicksilver.

**THE CONTINUOUS PROCESS.**—In this the pulp, and sufficient water to carry it along, are fed into a pan and ground, and from this through the requisite series of pans and settlers, all of which are set on the same level and connected one with the other by horizontal pipes, the pulp slowly passing to its outlet from the last settler. Sometimes the fine grinding is done by pulverizers, occasionally two pans in the series

are used; but the grinding is completed first. In the succeeding pan the requisite amount of chemicals is constantly and automatically fed to the pulp, and in some instances this is carried on with two pans. Then, into the next succeeding pan or two, the quicksilver is periodically fed, and these pans all have the quicksilver wells on the sides similar to those attached to the settlers in both methods. All the pans are also steam heated to assist the chemical action; but the pulp is kept thinner than in the individual pan process, as otherwise it would not flow from one to the other. This results in a great difference in the quantity of quick to be used. Instead of 300 to 400 pounds to a charge, it is found absolutely necessary never to exceed 125 pounds, and the best results are obtained with 115 pounds. The method of application is to pour in 115 pounds, most of which will immediately escape through the well, and then take 15 pounds of this and pour it back into the pan. If the quicksilver was continuously fed in the quantity required, the danger of flouting and consequent loss would be increased an hundred-fold over the periodic dumping in of a smaller quantity from time to time, a large part of which is incorporated with the pulp and carried even to the tail flume of the last settler. To show the activity, and what might be called the mulish inquisitiveness of quicksilver in apparently opposing every physical law, it is only necessary to state that appreciable quantities of quicksilver will be found to have traveled against the prevailing direction of the current, and lodged in the pans which precede the one into which alone the quicksilver is poured.

The surface of the pulp is kept at a lower level in the settlers and clear water for thinning is continually added.

No account need be taken of the amalgamation of rebellious ores requiring roasting; as, in these later years it has been found better, both commercially and metallurgically, to use other processes. Commercially, on account of the wide distribution of smelters and the network of railroads, giving lower transportation and working charges, as well as quicker returns, and metallurgically because all the values, even of the associated metals, are saved, and to a much higher percentage than was ever attained by amalgamation. With this long, but necessary preamble, we now turn to the handling and condition of the quicksilver.

(TO BE CONTINUED.)

## Costs in Mining.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The most important consideration in mining operations is the net profit that may be made, and the next most important matter is the cost of conducting practical operations, whether the enterprise be profitable or otherwise. The aim of every engineer and manager is to accomplish whatever may be required to be done at as low a cost as possible while doing the work thoroughly, properly and in a manner which will make it enduring. As a matter of course, it can scarcely be expected that the details of operation at any particular mine will be exactly duplicated in any other mine, owing to the many important differences that may and, in fact, always do exist. Nothing exemplifies this more strikingly than the difference in cost in performing practically the same work on different levels of the same mine.

On one level the ground may be comparatively easy, still requiring no timbering worthy of mention; on another the ground may be hard and short and progress accordingly slower and more expensive; on still another level the ground may be much softer and wet. Numerous cross fissures may be met, accompanied by heavy ground, and, though cutting is rapid, timbering must be done with often increased expense. On some levels work must be done not found necessary on other levels, and so from place to place in a mine conditions are found to vary.

The figures below are given with the object of showing the approximate cost of working under the varying conditions in a mine in Amador county, California. The conditions existing on the 400-foot level were unlike those found on the 700 level, and these two instances have been selected to indicate the differences in cost under the varying conditions. When the shaft (an incline) was sunk, prior to my management, it had been carried to the 740-foot point, with stations and levels opened at 200, 300 and 500 feet, but none at either 400, 600 or 700 feet. The 500 level was opened and considerable work was in progress there, also on the 300 level above. It was determined to open a station and level at 400 feet, and to do so, if possible, without interference with the regular working of the mine. Accordingly, experienced men were set to work with hand drills to cut out a station and ore pocket at the 400 level. The ground was of average hardness at first, and stood fairly well, so that the men soon made working room. The shoot openings were located in the shaft and the iron doors placed in position as quickly as expedient. The hanging wall side of the shaft was heavily lagged to reduce as far as possible any damage to the shaft from blasting. All rock broken in the station and in the ore pocket beneath was drawn into the skips after removal of the first few tons by shoveling. The dimensions of the station were:

Length, 40 feet; height, 11 feet at the shaft, 8 feet at the back end. The ore pocket was 35 feet long on the level, 12 feet wide and 20 feet (four sets) deep at the shaft. It was divided into two compartments—one for ore and one for waste. Although the back stood well at first, it soon required heavy timbering. The cost of this station, including the ore pocket (all of which was cut by hand, no machines being at the time available), was \$635.86, which included labor, powder, fuse, caps, candles, all lumber and timbers, supplies of every kind and the iron chute doors with wheels, pinions and racks.

The next 111 feet of the crosscut, immediately back of the station, was also driven by hand. This cutting was 5 to 5½ feet wide and 7 to 8 feet high. It required no timbering. The cost of this work was as follows:

Powder.....	\$ 51 18
Caps.....	4 20
Fuse.....	7 70
Candles.....	12 80
Labor (including track laying).....	1,013 00
Lagging (shoveling floors).....	84
Superintendence (apportioned).....	50 40
Total cost.....	\$1,140 12

The cost per foot (hand work) of 111 feet of crosscut was \$10.27. Upon the completion of this work machine drills were put in the crosscut and the next 262 feet was accomplished at a cost of \$1402.14, or \$5.35 per foot. No. 2 Hercules powder was used (¾-inch for hand holes and 1½-inch for machine holes.) The proportional cost of water power for compressing air to drive drills in cutting the 262 feet by machine was \$120, or 46 cents per foot.

The 700 level was driven from the shaft, being started in much the same manner as that on the 400 level. All holes in the station and ore pocket were drilled by hand. The dimensions of the excavation were practically the same as those on the 400 level. The cost of this station and chute was \$667.52, including timbers, lumber, supplies, chute doors (\$78.56) and other sundries. The cost of putting in the chute doors on the 400 level was about the same as at the 700 station. The next 52 feet were also driven by hand at a cost as follows:

Powder.....	\$ 54 00
Caps.....	3 20
Fuse.....	5 40
Candles.....	7 08
Labor.....	509 50
Superintendence.....	25 00
Total cost.....	\$604 18

The cost per foot was \$11.61, which is \$1.34 more per foot than on the 400 level, due to greater hardness of the ground, which was a "short," dry, hard and tough greenstone schist. In this crosscut 419 feet were driven by machines and cost as follows:

Labor.....	\$2,002 40
Powder.....	306 00
Caps.....	8 50
Fuse.....	17 50
Candles.....	19 00
Superintendence (apportioned).....	12 00
Total cost.....	\$2,425 40

The cost per foot by machines of 419 feet was \$5.79, being 44 cents per foot higher than the same kind of work on the 400 level. The cost of power to drive compressors was estimated at \$190, as there are four or five machines running in other parts of the mine. As the amount of hoisting from the two levels here referred to (400 and 700) only constituted a small part of the total amount of ore and waste and water hoisted from other parts of the mine, this item was omitted from both cost sheets, but it may be estimated at about 8% of the total cost of hoisting of ore, waste and water. This total expense for engineers, fuel, lubricant, etc., skip tenders, trammers and other expense amounted to about \$23 per day, or 7.3 cents per ton of materials hoisted—equal to an average of 22 cents per foot of crosscut on the levels here referred to.

## Production of Precious Stones in 1903.

G. F. Kunz is authority for the statement that interest in the production of precious stones increases in the United States from year to year. In a report recently made to the United States Geological Survey he gives the value of the precious stones produced in the United States in 1903 as \$321,400. This production was a little less valuable than that of 1902, which was rated at \$328,450, but was worth considerably more than that of 1901, which was valued at \$289,050.

The total value of the imports of precious stones in 1903 was \$26,522,523, as against \$24,753,586 in 1902, \$22,815,352 in 1901, and \$13,561,588 in 1900.

Mr. Kunz's report on precious stones is more attractive than usual this year, for it contains a great amount of miscellaneous data about the precious stones of other countries as well as those of the United States. The increased interest in this country in the production of precious stones has resulted in bringing together a splendid exhibit of these beautiful products of nature at the Louisiana Purchase Exposition at St. Louis, where thousands of visitors have seen and studied them.

This valuable report is an extract from the Survey's volume entitled "Mineral Resources of the United States, 1903," but it is also published separately, in pamphlet form, and may be obtained on application to the Director of the United States Geological Survey, Washington, D. C.

## Cinnabar in San Luis Obispo County, Cal.

The several quicksilver mines of San Luis Obispo county, Cal., all occur in the Santa Lucia mountains, in the northwestern part of the county. The ore deposits occur in zones having a certain parallelism,

near the New Almaden mines; but in neither this instance nor in the Santa Lucia mountains do these rhyolite dikes come in contact with the ore deposits. The sandstones are all the result of the consolidation of the detritus of granite (arkose), but by infiltration of silica they present many phases, from loosely coherent sandrock, to dense, highly siliceous rock

tact of sandstone and serpentine, the latter rock forming the footwall. The ore is siliceous and contains iron sulphide, as well as cinnabar. The hanging wall sandrock of this vein forms the foot wall of the second vein, which also carries iron sulphide, cinnabar and also native sulphur, due to decomposition of sulphide minerals. The mine is developed by inclines sunk on the veins from an adit tunnel. One of the accompanying engravings shows the massive outcrop and some of the surface improvements at the mine. An 8-tile fine-ore furnace is built near the mine. It is equipped with fourteen brick condensers. In this district is La Libertad mine, which also occurs at contact of sandstone and serpentine, and in this connection it is an interesting fact that every great quicksilver mine in the world occurs under similar conditions, though many occurrences of cinnabar are known in small quantities under similar as well as under different conditions; but no great quicksilver mines are known that are not directly associated with sandstone and serpentine.

The distribution of ore bodies in La Libertad mine is somewhat erratic. The cinnabar occurs principally in the seams of the rock, though disseminated veins also occur in the quartzitic rock forming the lode. In one portion of the property a zone is found 10 feet wide, in which occurs a vein 6 to 8 inches wide of rich ore, consisting chiefly of cinnabar and the more rare meta-cinnabarite. One of the accompanying engravings is that of La Libertad mine, showing the outcrop and the tunnel entrance. Both of the accompanying engravings are here produced by courtesy of the Sunset Magazine. On one portion of La Libertad mine mercury occurs, which can be obtained by panning the crushed ore. This mine is equipped with a 10-pipe retort for reduction of the richer ores.

Karl Mine, San Luis Obispo County, Cal.

La Libertad Quicksilver Mine, San Luis Obispo County, Cal.

though generally separated by considerable distance. The cinnabar deposits occur almost wholly at contact of sandstones and serpentine, and in the sandstone near the contact with the serpentine.

In the vicinity of the mines are intrusive dikes and masses of rhyolite. A rhyolite dike is also known

(quartzite). Among the later developments in this county is the Karl mine in Adelaide district. In this property are two veins running approximately parallel, but dipping in such a manner as to suggest the probability of the two veins uniting and forming one vein in depth. The most westerly lode lies at con-

## The Production of Magnesite in 1903.

Figures given in a report entitled "The Production of Magnesite in 1903," recently published by the United States Geological Survey, show that the United States furnishes only a small part of the total quantity of magnesite consumed in this country. Most of it, especially of fine quality, comes from the island of Euboea, Greece, although some is furnished by Austria. This mineral is a native carbonate of magnesia. In the crude state, the Grecian magnesite sometimes analyzes as high as 98% magnesium carbonate, but more often it averages between 94% and 96% magnesium carbonate, 0.08% ferric oxide, 0.52% silica and 0.54% water. Calcined at a high temperature for refractory purposes, the mineral analyzes from 82.46% to 96.25% magnesite; 0.85% to 10.92% lime; 0.56% to 3.54% ferric oxide and alumina; 0.73% to 7.98% silica.

In the United States the entire product of magnesite comes from California. During 1903 the quantity reported was 3744 short tons crude, valued at \$10,595, equivalent to 1361 tons calcined, worth \$20,515.

The production of crude magnesite is practically in the hands of one firm at present. The crude product is sent to the manufacturers of carbonic acid gas for calcination, and the calcined product is used by the paper mills. The demand for both crude and calcined magnesite is limited on the Pacific coast. Owing to a freight rate of \$13 to \$15 a ton on shipments to Eastern points, it is not shipped out of California except to the paper mills in Oregon. The production of California could be quadrupled if the demands of consumption warranted the increase.

The principal producing point in California is in the vicinity of Porterville, Tulare county, though small quantities still come from Chiles valley and Pope valley, Napa county. The most extensive deposit in California is in Placer county, but it is in an almost inaccessible mountain region where a very costly road would be necessary to get the product out, and the deposit has therefore not been utilized. Near Sanger, Fresno county, is another deposit which is now being opened. A deposit has been discovered also near Walkers Pass, Kern county, but it has never been developed. There are also unutilized deposits near Morgan Hill, Santa Clara county. The extensive deposits of magnesite on Red mountain, at a point where Stanislaus, Alameda and Santa Clara counties join, are now being opened by the American Magnesite Co. of Chicago, which has obtained control of numerous claims heretofore owned by individuals. Subsidiary companies include the Rose Brick Co., which is to manufacture magnesite brick at Oakland, Cal.; the American Carbonic Acid Gas Co., and the Plastic Construction Co.

In the crude state magnesite is used for the manufacture of carbon dioxide gas; calcined, it is used in the manufacture of paper from wood pulp, and as a refractory material in brick or concrete form for lining furnaces, covering steam pipes, as artificial lumber, as composite stone for lithographing, etc. Magnesium chloride is an excellent bleaching agent.

Calcined magnesite, generally in form of brick, is now universally recognized as the best material for lining open-hearth furnaces, cement kilns, etc. It may be employed to advantage wherever high temperatures and chemical reactions are detrimental to chromite and silica brick. The distinctive characteristics of a magnesite lining are durability, freedom

from moisture and silicic acid, and resistance to corrosion when exposed to the action of basic slags and metallic oxides. These qualities make the lining cheaper than most others in the long run.

The report was prepared by C. G. Yale, and is published in pamphlet form as an extract from the forthcoming volume, "Mineral Resources of the United States, 1903," which the Survey has in press. The pamphlet may be obtained on application to the director of the United States Geological Survey, Washington, D. C.

### Character in Mine Reports.

Among the interesting features of mine investment and promotion are the reports submitted by engineers and pseudo-engineers on mining properties. These are of many kinds. Some of them are elaborate in design, replete with statistics, and indicate a rare combination of engineering education and draughtsman's skill. Handsome photographs form an interesting accompaniment, and nothing, apparently, is omitted to make the report a complete exposition of the subject, and all that appertains to it. Other reports are brief, directly to the point, and conclusive. They are shorn of all unnecessary description and contain only that which the investor or his engineer would probably care to know. Little reference is made to other mines—the engineer making the report evidently having long since realized that in any event each mine must stand on its own merit, and can borrow nothing, at most, but glory from the great records of other mines.

Then there are reports that are crude and unlettered, plainly the attempt of the novice with a small fund of large terms. He usually quickly gets into deep water and flounders about in a sea of technical phrases, from which he escapes with difficulty.

Some reports are picturesque, viewed from almost any standpoint—scientific, statistical, historical, or otherwise. These usually deal in magnificent terms, tremendous veins and great values. A few millions, more or less, is a matter of little moment in reports of this stamp; but of all the reports that come to the notice of the investor the most interesting, perhaps, are those written by men who enjoy the implicit confidence of their friends at home, but whose knowledge of geology and mining is of the home-made type and based on a limited personal experience, though the writer of the report tries assiduously to impress his readers with the profundity of his knowledge of the subject.

Following is a report of this latter type, made by an eminent foreign engineer, whose painstaking observation is evidenced in his unusual phraseology and bungling of technical terms, though withal it contains some good, sound advice:

My DEAR SIR:—Before I start to write a report concerning the mines that belong to your company, I must relate to you events that occurred on my first visit to that country.

When I arrived at your mine at a glance I noticed that the formation was what the miners up there call black slate. The serpentine is further to the west. My first observation was to see if the incline was following the foot wall down—which is the only way to be done—for if a miner were to sink on an incline, leaving part of the vein matter between the track and foot wall, it would be dangerous to life and property, for some of the ledge matter might cave in at any time. So, satisfied that everything was all right—that to my mind that it was the foot wall, we went down the incline shaft, noticing the veins very narrow; no gouge; no clay. I was astonished. We alighted at the first level, which is 100 feet from the surface. Here, looking at the roof of the drift, I began to see the vein here and there. At a point 84 feet from shaft I found the vein almost perfect, showing about 5 feet of good milling ore between walls. Right here I made up my mind the mine was from 5 to 6 feet wide, looking like an ore body or shoot, as the miners call it here, but again I was disappointed—its inclination was to the north. There is no precedent in the Pacific Coast States for such a thing, for in all the mines I saw in the northern hemisphere all the ore bodies pitch to the south; and on the other hand, strange to say, in the southern hemisphere the ore bodies pitch to the north. It seems to me the great attractive power of the sun may have something to do with it, but, be as it may, I have no precedent in this country for such a case. I went down another hundred feet to the lower north drift. They were following the vein with some quartz here and there, and they were going in the right direction to strike the ore shoot. Here again I looked to the foot wall to see if I could find some indications of some gouge of clay—none; but I saw some quartz sticking to the foot wall. That put me out. That propensity appertains to serpentine formation, not to this formation. I said to myself, "look for the cause." I examined everything. I saw there had never been any disturbance in that hill. I looked again to the formation, it was the black slate, very eminent formation—it is primary, very uniform, always making nice walls, with clay gouges. Where is it? I was very much disappointed having no other, and seeing there the propensities of the serpentine, which formation is some distance to the west, and knowing that there is some connection between these two formations, I blamed the daughter for the sins of the mother. When I arrived from my trip I was the most disappointed miner in the country. Now to explain how things look now.

REPORT OF THE X—MINE.—With my companion we took the stage at H— for P—, where the mother

lode passes. They told me the distance was 20 miles; if that is the case, we crossed 20 miles of serpentine formation. Here, about 2 miles from the great lode, you can see very plain the work of that great agent, the metamorphic law, that serpentine, oval in its form, changing to tabular—the form of slate. Now you see the formation standing upright with a pitch toward the east, its trend northwest-southeast, being the direction of the mother lode. Now as we approach it, it already looks like slate, only with the difference that the tabular stratification is too thick yet. Now, if you alight from the stage and break a piece of that slate, you will see that it looks green inside and of fine grain. This tells us that it still retains the propensities of its origin. As we approach the west branch of the mother lode it is pure slate. I call it metamorphic slate, and it is of the primary formation and it has no similarity to the black or blue slate that we have here in several places in this State—for this order is a secondary formation, and sometimes we find there nice little gold mines of the second order. But as all the miners call it black slate, we will do the same hereafter in this report. This black slate follows the mother lode on the west side for an indefinite distance. I saw the same formation in Mariposa county. We are at the mine now.

The X— mine is a location of 1500 feet long and 300 feet on each side of the vein, but, for a distance of 1000 feet, commencing at the north boundary on the east side contains only 100, this will not affect your title in any shape or form, for your mine has the right to trespass in its inclinations your side lines, carrying with it the virtue of the 100 feet, and being the prior location, if it came to be connected with another mine of your neighbor everything belongs to you. You have the prior location, but you are going to need some of that ground for working purposes. The trend of the lode is northwest-southeast. Its inclination or pitch is about 65° to the east. The mineral formation is black slate, very uniform. It is a primary formation. We may call it one of the west branches of the mother lode.

THE PROBLEMS ARE SOLVED.—This time they took me to see the old shaft, and I see where north and a little higher up from our ore shoot they had a nice body of rich ore which gave splendid results in the mill. They took from there over \$25,000. That body of ore was connected with our shoot. That established the fact

work the mine calls for now, for I consider your superintendent as capable as I am, if not better, but anyway, I will give you my opinion:

1. Go ahead with that upper raise, to make connection as soon as possible.
2. To push the two crosscuts ahead, one to the east and the other to the west, to strike the walls.
3. Then after that you may get ready to go down another level.

About putting up a mill, the mine does not call for it yet—not until you have your mine better opened.

And all the ore that comes from the dead work pile it up in the dump and have plenty of reserve in the mine before you start the mill.

The ore that was worked in the mill, I am told, went from \$10 to \$20 per ton in free gold, outside of the sulphurets. The ore will be very good grade.

South of the X— mine comes the C— mine, 1500 feet following the lode to the south, with 300 feet on each side, then comes the L—, a full claim. These two claims are in the same lode as the X—, with the same formation. When developed, they may be as good as the X—.

In conclusion, let me tell you, that when advancing those two crosscuts, strike the walls of the lode, with the clay that I like so much to see there, then you can proclaim to the world that in the X— you have one of the best mines on the mother lode.

### Timber Frame for Tunnel Support.

The construction of most tunnels requires that the roof and sides be supported by either timber frames, or arches of brick, masonry or concrete. In Europe and the Eastern United States masonry and concrete are most commonly employed, but in the West timber is abundant, and therefore much cheaper than either of the other means of support mentioned. In mine work timbers in tunnel sets are usually framed with spreading legs and a single cap reaching from post to post, with lagging resting on the caps. The sides may or may not require lagging also. In some larger tunnels the methods usually adopted in mine tunnels

Details of a Tunnel Set.

that its inclination is to the south. How many headaches it would have saved me if I had seen that place on my first visit, but that was impossible, for it was full of water at that time.

In the first northwest drift all the work consisted of, from shaft to ore shoot, 84 feet, and from ore shoot to connect with the old shaft, 45 feet.

Now let us go down to the second level (the 200 northwest drift) and I will show you where a grand idea of your superintendent, Mr. J—, solved the other problem, by crosscutting the lode to the east and to the west, which established the fact that your mine now is 60 feet wide, and no walls yet on either side; so, you see, I am likely to have my clay yet.

The developments on your north drift, 200-foot level, consists: Length, 234 feet. Ten feet northwest from shaft they ran a crosscut due west of 27 feet. Another crosscut west 30 feet, and about 40 feet further ahead; another 24 feet crosscut to the east—towards the hanging wall—and about 35 feet in the upper raise. In this place they have quite a body of quartz, and I believe it will continue, all the distance they have until connections are made being 65 feet, that will make a nice reserve ready to stop when connection is made. In all the crosscuts and southeast drift native gold can be seen, but in small feeders. Some places quartz stringers or feeders are a foot wide. There is a network of them, coming from everywhere. In the southeast drift they are 24 feet from the shaft.

Now you ask me how wide the mine will be. I don't know. It may be 75 or 100 feet wide—the crosscut will decide that question. Again, you may ask me, "When are you going to strike that compact and large ore shoot?" I will say, "You may strike it in the level," for there is plenty of room now, or you may have to go down another level, but for that there is no time yet, for there is a great deal of work to be done in the present level.

There is no necessity for me to tell you what kind of

are often unsuited to the existing conditions, and the sets are framed in the form of a semi-arch as illustrated in the accompanying sketch, which shows the method adopted at a road tunnel between the counties of Alameda and Contra Costa, California. The sets generally are framed as shown in the lower left-hand figure, the sets at the portal being arranged as shown in the upper left-hand figure. To resist the possible thrust of the overhead weight on the interior sets the portal sets are reinforced by timber angle braces which act as buttresses, as indicated in the right-hand figure. This latter idea may be copied with advantage in the starting of some mine tunnels, particularly where the ground at the entrance to the tunnel is soft and likely to give trouble when wet. The design here shown is simple of construction, and if properly set up is likely to fully meet the requirements for which it is intended.

### Dredging for Gold in British Columbia.\*

In the Atlin mining division of British Columbia dredging for gold has become an important industry, though a large number of men still find employment in drifting, sluicing, etc., on their individual claims. On the larger holdings suited to dredger operations considerable "bore hole" prospecting has been done as preliminary to the installation of dredgers.

A dredger was last season placed on a group of claims on Gold Run creek, and an electric power plant installed on Pine creek near the falls. This plant has

\* See engraving front page.

a capacity of 500 horse power. In addition to this the company owning the dredger, the British-American Dredging Co., constructed a mile and a half of ditch, laid 1800 feet of 30-inch steel pipe, built 400 feet of flume and set up six miles of pole line, and put in other equipment and made improvements at their dredge camp. One of the engravings on the front page shows this company's dredger near Atlin. The other engraving shows the arrangement of the gold-saving tables provided with the various types of riffles. In addition to this enterprise, which it is intended to extend by the building of additional dredgers, there are numerous hydraulic properties at work on Pine creek and on Gold Run. Some companies operate both quartz and placer mines. On Spruce creek the mining is mostly of the smaller kind, and is done by individuals or small associations, who work their gravels in the usual way by sluicing. During the winter months a great many men get out the gravel from the bench claims by drifting, washing the gravel when the spring thaws and rains afford abundance of water for this purpose. On Birch and Boulder creeks in this district are also a number of mines, mostly of the smaller kind. Some of the larger companies have sustained heavy losses by the washing out of their flumes, dams and ditches. In several instances their entire season was lost by the destruction of improvements made the previous summer. Between the damage by spring freshets and falling off of water in the early fall the operating period of many of the large mines working by hydraulic method is reduced to 120 to 130 days. Some of the claims are rich, however, and pay well during the short season when they can be worked.

### The McLaughlin Tractor.

The illustration herewith is a good example of the work performed by a McLaughlin traction engine, the latest addition to the ranks of powerful engines of this class for which California has become famous. Rigid simplicity, perfect proportions, with proper distribution of weight to obtain maximum efficiency at the drawbar, are claimed by the manufacturer. The engine, as illustrated, is pulling a gang of forty plows, cutting 33 feet wide at a speed of 3 miles per hour, at times on a 15% grade, and at a stated cost of 25 cents per acre. The boiler is of the well-known vertical submerged tube type, as specified by the United States Government for boilers of this class, and is tested at 220 pounds hydrostatic pressure, the submerging of the tubes being designed to obviate possibility of leaking from overheating. The engines are duplex; cylinders 8 inches diameter by 11 inches stroke, fitted with balanced piston valves and guides of the Corliss type. The reversing mechanism is designed to afford durability and positive action. The transmission gears are of cast steel throughout, few in number transmitting the power direct from the engine shaft to driving wheels through the medium of only one countershaft. The whole transmission contains only five journal boxes which are provided with self-oilers. Owing to the work to which such machines are subjected, it is necessary to devote similar special attention to the construction of the wheels. The tires consist of two or more rings of Channel steel with the flanges extending inwardly, the abutting flanges riveted together and integral with the rim, maintaining rigidity. The spokes consist of flat steel bars riveted in sockets in the hub, and meeting in trussed form between the hub and rim, bracing the wheel with minimum tensile strain on the spokes. Oil, wood or coal may be used as

The McLaughlin Tractor.

fuel, and the saving in cost for work performed by them as against animals is obvious.

The tractor engine illustrated is built and furnished by the McLaughlin Manufacturing Co., 24-26 First street, San Francisco, Cal.

### Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER VI.

Written by ARTHUR C. SPENCER.

**METALLIC MINERALS.**—As shown by the mill records, the metallic minerals, or sulphides, constitute about 2% of the Treadwell ores. They consist mainly of iron pyrites, and a considerable amount of magnetite is also present.

Pyrite occurs both in the rock and in the veinlets, but the position of the sulphides has no apparent influence on the gold content. In the rock it invariably has the form of minute cubes, from a size scarcely visible to the unaided eye up to about 1 millimeter, rarely larger. It is distributed sparsely through the diorite accompanying the secondary minerals, especially the albite and calcite, though where these are not present it is associated with epidote and uraltic hornblende. In the reticulating veinlets the pyrite occurs either as separate cubes, often several millimeters across, or in bunched aggregates, forming "turkey-egg rock" which usually contains more than average values.

Magnetite occurs only in the form of minute grains outside the veinlets. Part of it appears to have been an original constituent of the diorite, but much of it was deposited secondarily along with the pyrite, perfect cubes of which it sometimes surrounds.

Stibnite occurs in minute needles, and though seldom visible to the naked eye the microscope shows that it is widely distributed in various parts of the mines. As a rule, it occurs imbedded in calcite, but it is sometimes in the secondary albite. Pyrrhotite often accompanies or takes the place of the pyrite and may be readily isolated from the concentrates by means of a magnet. Chalcopyrite, galena and sphalerite occur sporadically, and native arsenic, realgar and orpiment have been noted in small quantities. Assays are said to indicate the arsenical nature of much of the pyrite, though the presence of true arsenopyrite has not been recognized. Molybdenite is frequently noted, though it is irregularly distributed.

**OCCURRENCE OF GOLD.**—Visible gold has been observed in veins of coarsely crystalline calcite enclosed in the ore bodies. This occurrence is, however, rare, and in general even the microscope does not reveal the form in which the precious metal exists. I have not been able to distinguish gold in the thin sections studied under the microscope, but Professor F. D. Adams, who examined the material collected by Dawson in 1887, observed gold mechanically enclosed in crystals of pyrite. It is evident that a considerable amount of gold must be in the metallic condition, because a large proportion is saved by amalgamation, the amount sometimes being as high as 75% of the total assay value.

The gold is perhaps mainly associated with pyrite, but rather coarse crushing is the present mill practice where slot screens equivalent to 18 and 20-mesh wire screens are used, and so much of the pyrite passes the screens in comparatively large grains or unbroken crystals, that it seems open to doubt whether from 60% to 75% of the gold could be free milling if it were all associated with the iron sulphide. The non-amalgamating portion undoubtedly does occur with the pyrites, because the concentrates contain only pyrite and magnetite, with a small amount of pyrrhotite, all the stibnite and molybdenite going into the tailings. The portion which amalgamates readily may occur with the stibnite or with the gangue. Molybdenite can hardly be

values. The values vary with the amount of interstitial vein matter, but the position of the pyrite in the rock or in the quartz and calcite seem to have no influence upon the amount of gold. In some places, where the ore is of average grade, all the metallic minerals seem to be in the rock, and careful search is necessary for the discovery of any sulphide in the quartz or calcite. Elsewhere the sulphides may be almost entirely confined to the veinlets. A limited amount of material is mined which contains practically no stringers of quartz or calcite, the sulphide being disseminated through the mass of the rock, for instance, in the crosscut on the 440-foot level and in stope No. 1 of the 330-foot level in the Treadwell mine. In other places material of similar appearance, containing an equal amount of pyrite, yields only a very small amount of gold.

**METASOMATIC ALTERATION.**—As already stated, the Treadwell ore bodies are dikes of albite-diorite filled with reticulating veinlets of quartz and calcite, and permeated with metallic sulphides carrying small amounts of gold.

From the structure of the deposits, it is evident that the dikes were subjected to pressure which caused fracturing, whereby they became porous, affording channels of easy circulation for underground waters. The minerals in the ores and their mutual relations suggest that carbonated and mineral-bearing solutions found the broken dikes and continued to move through them for a very long period. In transit these waters attacked the minerals of the albite-diorite, decomposing them, and in some cases effecting more or less complete metasomatic replacement. As a rule, the hornblende and mica of the original rock have entirely disappeared, their place being taken by aggregates of secondary minerals, sometimes including metallic sulphides. A few specimens of relatively unaltered material indicate that the original rock characteristically contained two sorts of feldspar—albite-oligoclase and microperthite. The first occurs in phenocrysts of fairly definite form, often showing concentric structure, and always clouded by decomposition products, excepting for clear rims, which are usually narrow. The microperthite, which has the mottled appearance of this minute intercrystallization of albite and orthoclase, is entirely interstitial as regards the albite-oligoclase. It is usually nearly free from decomposition inclusions, and is ordinarily accompanied by some clear albite. When pyrite occurs in such slightly altered material, it lies in or next to decomposed hornblende crystals. Most of the rock has suffered considerably more alteration, and pyrite occurs throughout the interstitial ground mass. Its introduction has apparently been accompanied by breaking down of the microperthite, for this mineral, so abundant in the comparatively fresh rock, is usually entirely absent when the sulphide occurs outside of the decomposed hornblende—that is to say, in the interstitial feldspar. In the most altered rock the place of the microperthite is taken by an aggregate of small albite crystals, and this mineral is regarded as a secondary replacement of the original feldspar. In some cases the replacement has gone so far that the crystals of albite-oligoclase have been attacked. This feature is relied on in part to prove the secondary nature of the albite, for intermediate stages, in which the microperthite is only partially replaced, were not noted during the preliminary study of the thin sections. Still more conclusive evidences that the albite is of secondary origin are its occurrence in veinlets cutting the old feldspar, the fact that it is found intercrystallized with calcite, both in veinlets and throughout the rock itself, and the fact that where albite forms the interstitial material instead of microperthite, pyrite and often stibnite are present, embedded either in the feldspar or in the evidently contemporaneous calcite.

The alteration of the Treadwell diorite is regarded as a phenomenon which accompanied the formation of the veinlets which intersect the rock, and the metasomatic action is attributed to the same solutions as those which deposited the quartz and calcite. The minerals last named appear to have been for the most part introduced, but the albite is believed to have been formed entirely, or nearly so, from the previous minerals of the diorite, because it is not found in the larger vein fillings. It is commonly observed that where both calcite and quartz are present in the fractures, the former usually occurs next to the walls, and it always permeates the rock to a greater or less extent. According to Lindgren, alteration of the sort here described has not been previously recorded, for though albite occurs as a vein mineral in California, it has not been detected among the metasomatic minerals in the wall rocks of veins.

In this connection, however, reference should be made to pseudomorphs of albite after adularia from St. Gotthard. These are described by Bischoff, who gives an extended discussion of the probable chemical reactions involved, and suggests the competence of waters containing sodium chloride to effect the observed replacement of potash feldspar by soda feldspar.

The occurrence of values in the wall rock to such an extent as is observed in the Treadwell ores is also somewhat unusual, though not unique. So far as it was possible to ascertain, the position of the sulphides

\* Abstract Am. Inst. Min. Engs.

in the rock or in the veinlets has no influence upon the gold tenor.

**THE ROLE OF THE BASALT DIKES.**—In his discussion of the genesis of the Treadwell-Mexican ores, Dr. Becker leaves some doubt as to the importance which he desired to assign to the basalt dikes as mineralizers. He says that the genesis of the ores is probably connected with the dikes, but afterwards suggests the relative unimportance of their influence.

In the Treadwell and Seven Hundred Foot mines two narrow dikes of the basalt are observed in a zone of sheeting, which is undoubtedly later than most of the veinlets in the ore mass. A small amount of calcite is found along their selvages, but they contain little or no pyrite. Upon the west or hanging wall side the ore is somewhat richer than it is between and beneath them, but it seems that this variation in gold tenor can not be attributed to the dikes as mineralizers, because the rock between them is not enriched, as might be expected had they been an actual source of gold. It seems likely that a rearrangement of values by relatively recent circulation has been going on, and the course of the currents may well have been controlled by the zone of sheeting in which the dikes occur; but secondary migration of this sort must be distinguished from the original mineralization, the extensive results of which in the neighborhood are entirely beyond comparison with the effects directly or indirectly attributable to a pair of narrow dikes of this sort. It is now believed that they have no connection with the formation of the ore.

Other basaltic dikes occurring in Gold creek are regarded as practically of the same age as those on Douglas island, and these are also unmistakably younger than the gold-bearing quartz veins of that neighborhood.

**ORIGIN OF THE FRACTURES.**—Upon the fracturing of the Treadwell dikes their impregnation with gold-bearing sulphides is evidently dependent. The systematic arrangement of the reticulating veinlets in two main sets standing at right angles to each other and dipping in opposite directions led Becker to the conclusion that the fractures had been produced through compressive shearing stresses. He suggested that these stresses were caused by nearly tangential forces acting in a direction normal to the common strike of the two sets of fractures, which is also approximately the strike of the country rocks. The fact that the fractures are due to compressive thrust need not be questioned, since the theory of the subject has been so ably developed and so fully corroborated by experiment. Some doubt arises, however, as to the direction in which the forces may have been applied, because the geological history of the general region since the diorite intrusions seems to indicate that no widespread lateral compression has taken place. If tangential shortening has been going on, evidences of the fact, independent of the fracturing, has not yet appeared. On the other hand, a study of the wide physiographic features of this portion of North America has shown that a succession of continental uplifts has taken place since the period of the diorite invasion, and it seems necessary to suppose that such radial movements would tend rather toward areal dilation than toward contraction, as in the opposite case of tangential compression.

It is suggested that the general fissuring throughout the Juneau district may have been caused by gravitative adjustment in the rock masses, tending to restore internal equilibrium disturbed during the uplifts which are known to have taken place. The rocks of the district consist of alternating beds of greatly varying physical character, and they possess an eminent cleavage structure parallel with the stratification. Under stress such rocks would yield more readily along the pre-existing structure planes than in other directions. That this old structure has, in fact, taken up most of the internal movement during the later deformation of the rocks is evident from the occurrence of so large a majority of the veins in parallel position with it, and it may be supposed that this control has prevented the formation of a large number of fissures in various directions, which would have resulted in the case of homogeneous or massive rocks deformed under their own weight.

Having been subjected to the same pressures as those which fractured the other rocks of the region, it is only natural that the Treadwell dikes should be broken along lines parallel with the general fissuring, and one of the two sets of veinlets occurring in the ore-bodies practically coincides with the structure of the enclosing slates. The other set, which stands at right angles to the first, is not nearly so well developed in the country slates, probably because these yielded by bending, since they are very flexible when compared with the brittle rock of the dikes.

**SOURCE OF THE VEIN-FORMING WATERS.**—The formation of the Treadwell ores is assigned to the same general cause as the other veins of the region. Both are attributed to circulating waters moving through channels opened by a general fracturing of the rocks.

Ascending waters may be assumed from the nature of the metasomatic changes which they have effected and also from the large amounts of carbon dioxide which they evidently contained. That the waters were hot may also be safely predicated, because the erosional history as well as the present topography

of the region both indicate that the veins now exposed must have been deposited at great depths, certainly from 6000 to 10,000 feet below the former surface, and possibly very much deeper. The occurrence of tourmaline in some of the veins of Gold creek and the occasional presence of fluorite elsewhere suggests a connection with igneous emanations, for these minerals are characteristic of pneumatolytic action as exhibited in the case of tin deposits and in various instances of contact metamorphism.

(TO BE CONTINUED.)

## The Mother Lode in Tuolumne County, California.

NUMBER VII.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Southward from the Eagle-Shawmut mines described in the last paper the Mother Lode continues uninterruptedly nearly to the junction of Moccasin creek with the Tuolumne river, a distance of about three miles. The next important property to the southward is that of the Republican Mining Company. The property comprises a number of claims, the most

level is now being opened. Levels are established at 200, 300, 400 and 500 feet from the surface, and these have developed a pay shoot 15 feet wide, extending from the 500 level to the surface. This vein occurs in amphibolite schist, and little quartz appears on the surface, though the course of the lode is indicated throughout the property by the heavy gouge. The Orcutt claim, above referred to, is also singularly destitute of heavy quartz croppings, though producing considerable coarse gold in pockets. This absence of quartz is in strong contrast to the massive white outcrops on the Eagle-Shawmut, a short distance to the northward. The Republican company claims that that property has paid from the surface down, and has been placed on a paying basis by the original company without having ever shut down. It is equipped with free water power, a 20-stamp mill, hoisting equipment run by water power, with steam auxiliary and electrical auxiliary power at the mill. The ore is worked by amalgamation, the sulphurets concentrated and shipped.

Southward from the Republican property are a number of mines along the course of the lode to the crossing of the Tuolumne river. The most important of these is the Clio, where a vein 4 to 5 feet wide at the surface was developed by a crosscut tunnel and a mill built in 1900. The hanging wall of the Clio vein is slate, the foot wall altered greenstone tuff. It is

Republican Mill, Tuolumne County, Cal.

Republican Hoist, Tuolumne County, Cal.

extensively developed of which are the Republican, Ben Harrison, Live Oak, Democrat, Orcutt and Mammoth. These claims extend along the lode for a distance of a mile. There is a large amount of development work done on the Republican and Mammoth, and considerable on the others of the group. In the early history of these mines the work was mostly confined to superficial cuts and tunnels, and a large amount of gold in the form of pockets was recovered from the workings. The Orcutt, particularly, was worked as a pocket mine for many years.

The center of active operations on this company's property at present is on the Republican mine, in which the main shaft is down 700 feet and the 650-foot

seamed with irregular veins of quartz and calcite, and some of this prospects in gold. The surface mineralization here is several hundred feet wide, and a number of zones of mineralization occur, but none of them have proven to be important.

Southward from the Clio mine to the vein the numerous claims which cover a zone of mineral formation half a mile or more in width have been developed by shallow crosscuts, shafts and open workings, and some machinery of ancient type is still seen about some of the mines, notably at the Willietta, where gold was found in a granitic rock which occurs from place to place along this portion of the lode, becoming more prominent geologically southward. The serpentine in

the Willieta ground is also mineralized in places, and it is reported that a pocket of gold valued at several thousand dollars was found in this serpentine. The occurrence of gold in pockets in serpentine and at contact of serpentine with other rocks is known at several places along the lode, but it cannot be said to be characteristic of it.

Along Moccasin creek for a distance of 3 miles the lode is rather indistinct, though there are several outcrops in this distance. Very little quartz occurs along this portion of the lode, the principal rock formations found here being serpentine, diabase, slate and a dike of acid granitic rock previously referred to. Heavy gouges are of frequent occurrence, but no paying mines have as yet been developed in the section of the lode between the Tuolumne river and Grizzly gulch, at the foot of what is known as Priest's hill. The most interesting development in this section is on the north side of Grizzly gulch, on what is known as the Grant mine, where a broad dike of granitic rock carrying several per cent of iron sulphide, said to be auriferous, has been opened by shaft.

(TO BE CONTINUED.)

### Ore Sampling Plant.

Herewith is illustrated the new works of the Denver Ore Testing & Sampling Co., Bryant street and West Sixteenth avenue, Denver, Colo., a fireproof plant 75x75 feet, and an assay office 25x34 feet, designed for making tests on any quantity of ore, from a few pounds to carload shipments. They have a battery of 800-pound stamps, silver-plated amalgamating tables, and if required can crush the ore in a cyanide solution, having facilities for handling the gold solutions afterwards. The roller mill for wet

and Wild tables are used, as well as the Wilfley, Sperry and Wild slimmers. Officers of the company are: N. C. Bonnevie, president; E. A. Lee, secretary and treasurer; C. A. Hoyt, chemist and metallurgist. Their uptown office is 527 Seventeenth street.

PLACER miners, like others in other branches of mining, have their troubles. Often the gold distributed in the gravel is insufficient to make mining profitable; or if containing a fair amount of gold, the ground may be frozen as in Alaska, or the water may

### Gas and Oil Engine Exhibit.

The exhibit of the Mietz & Weiss gas and oil engines, manufactured by August Mietz, 128-138 Mott street and 67-69 Elizabeth street, New York, N. Y., in block 41, Machinery Hall, World's Fair, St. Louis, Mo., is one of the most complete working exhibits at the Exposition. It shows the various units from 1 to 30 H. P., connected up and in operation. These units are of the standard horizontal stationary type and the single and multi-cylinder vertical type for marine purposes.

In this exhibit are also shown a number of units direct connected to generators for electric lighting purposes, centrifugal pumps for irrigating and dredging purposes, triplex and simplex pumps for farm and residence use, also engines direct-gearred to air compressors for operating water storage systems, and direct-gearred hoists for mining and elevator service, of which this firm makes a specialty.

They are showing in operation a 1 H. P. universal pumping engine, a 2 H. P. standard stationary engine, a 2 H. P. engine and direct-connected triplex pump, a 2 H. P. engine direct connected to a 1½ K. W. generator, a 4 H. P. engine and direct-gearred air compressor, a 4 H. P. engine and direct-gearred hoist, a 6 H. P. engine and direct-connected centrifugal pump, a 6 H. P. engine direct connected to a 3 K. W. generator, the electric current from which they use to operate their signs and arc lamps, also to operate a 2 H. P. electric motor driving a centrifugal pump, a 30 H. P. stationary engine and a 3½, 5 and 15 H. P. marine engine.

These engines are of the two-cycle type and have no valves, cams, gears or electric sparking devices, the charge of oil being fired automatically from the compression. These engines are made in sizes from 1 to 80 H. P. and are operated with common kerosene oil, fuel oil, distillate and crude oil as low as 28 gravity.

There is also shown a two-cycle gas engine of 7 H. P., which this firm makes in sizes from 1 to 20 H. P.

These engines have been awarded the gold medal and a special diploma by the examining jury of the Louisiana Purchase Exposition Co.

The exhibit is in charge of Jas. H. Fischer, direct from the factory.

### Relative Economies.

A prominent engineer of the Power & Mining Machinery Co. makes the following statement concerning the relative economies of gas generating plants and steam plants:

The yearly records of 11 electric power stations, each serving a population of 5000 or less, and of 45 stations, each serving 5000 or more, show:

The average B. H. P. developed .....	1235
The average coal consumption per B. H. P. hour (lbs.) ..	5.5
The average cost of coal per ton .....	\$4.30

Cost of fuel in steam plant (operating ten hours per day):	
33.96 tons coal at \$4.30 .....	\$146.02

Cost of fuel with gas engines and producers:	
7.72 tons coal at \$4.30 .....	33.19

Saving per day .....	\$112.83
Annual saving (365 days at \$112.83) .....	\$41,182.95

THE striking hoisting engineers of the Union of Illinois wisely concluded to submit the question to its members. The committees having had the matter in charge called the strike, but the referendum vote showed that the rank and file of the organization did not favor a contest in which there was apparently every reason to anticipate ultimate defeat. In many instances if the proposition to strike were left to the mass of the members, instead of to a few composing a committee or executive board, the vote would be overwhelmingly against a strike, as it was in this case.

grinding prior to amalgamation or concentration has a capacity of fifty tons per twenty-four hours. The ore after leaving the stamp battery or roller mill will be classified, if desired, before reaching the concentrating tables, and the middlings from same can be reground in a 3½-foot Huntington mill and re-treated. In the concentrating mill the Wilfley, Card

be in such volume as to be beyond control with the limited means at hand. In many instances some other heavy substance renders the work of separating the gold from the alluvial difficult. At Leadville, Colo., it was carbonate of lead; at Virginia City, Nev., it was black sulphide of silver, and in some parts of the Black Hills of South Dakota it was tin stone.

### Dry Blowing Gold-Bearing Gravel.

In the desert regions of America and Australia there are many places where gold-bearing gravel is found, but no water is at hand to treat the gravel by sluicing, rocking or even panning. In such cases dry washing is resorted to where the gold-bearing mate-

causes it either to be blown out or to descend over the riffles.

The residue in the riffle box is thrown into a prospecting dish, then wind-blown by tossing or by pouring from one dish to another. The heavy particles—too heavy to be thus removed—are taken out by a quick motion of the hand after settling the gold at the bottom of the dish, and the gold is finally cleaned

A Dry Blower Mounted on a Barrow.

rial is of a character which will admit of its being treated in this manner. The essentials to this method of treatment are a loose material readily sifted and screened, and containing sufficient gold to make the work profitable. Often these desert gravels are found cemented by clay, calcium carbonate or iron, forming a compact material. This cannot be successfully treated by the dry process without crushing. All free material, however, may be handled with little difficulty, the chief factor being the quantity that may be treated daily, and the ratio of expense per ton for treatment to the gold content that may be saved. In California, Nevada and Arizona dry washing machines of many kinds and sizes have been successfully employed in treating gold gravels in districts where water was unobtainable. In Australia these machines have been used extensively. The accompanying illustration is of a dry washer used in Australia, and is described by the Queensland Mining Journal as follows:

The hopper and hopper screen on top of the machine, and the wind chest, zinc perforated screen and riffle box below are all fixed to the long board forming the top of the double bellows, and as the handle attached to the bellows is raised or lowered to make

by blowing with the mouth. The task of separating the gold by dry washing seems to require considerable skill, but the miners get accustomed to it, and to them it becomes a simple, rapid and mechanical operation. With fine gold there is not much loss through want of skill or from carelessness, but generally from the gold adhering to the particles of stone or clay.

The capacity of the machine is about four or five yards a day, under normal conditions.

### A Large Weighing Scale.

It has been decided to establish a national mint at Peking, to take the place of the old mint at Tien-Tsien. The contract for the balances to be used in the Peking mint was given to H. Troemner of Philadelphia, Pa. It involved the manufacture of nineteen special balances, one of which, the largest, is shown in the accompanying illustration, being 10 feet in height, 9 feet in length, 3 feet in width; the entire machine weighs more than a ton.

The capacity of this weighing machine is 10,000 troy ounces. The beam is made of a special alloy

American Scales for Weighing Gold.

the blast, so the hopper, riffle box and wind chest are rocked from side to side with a seesaw motion, the fulcrum being the block of wood separating the two bellows. The hopper screen and its riffles are not removable, and only require to be looked at occasionally for coarse gold, but the riffle box, to which is attached the zinc screen, has to be taken out frequently. The riffle box has two sides tapering towards the front, so that it may be firmly wedged into a number of metal fastenings and set perfectly airtight on the top of the wind chest.

In operating the machine the coarse material comes over the front of the hopper, the finer portion being delivered onto the top of the riffle box, where the seesaw motion and the pulsating blast together

of aluminum. It is 6 feet long, weighs 68 pounds, and has withstood a test of 42,000 pounds pressure. It is protected by a glass case, supported by the column and beam rests. The column is of iron, planed and finished, square in shape, and into its four sides are fitted glass sashes. It is utilized as a case in which the spear, or indicator, attached to the beam, works. The ivory index across which the point of the indicator travels from right to left, is also fitted in the column.

The platform, or base, is of iron, is planed to a perfect level, and polished. The plates and arches are of hammered brass, the pan is made of fine tempered steel, by hand, out of one piece.

"The great feature of these immense balances,"

says the manufacturer, "is their sensibility. So delicately are they adjusted that if bullion to the amount of 10,000 troy ounces be placed in one scale, and balanced exactly by an equal weight in the other, either scale can be made to descend by adding a piece of aluminum whose calculated weight is the one hundredth part of an ounce."

### How the Grand Prize Looks.

The accompanying half-tone gives a good repre-

sentation of the grand prize given at the St. Louis Exposition. This particular one was awarded to the Broderick & Bascom Rope Co., St. Louis, Mo., for the beauty of their wire rope display.

### THE PROSPECTOR.

The rock specimens from Bodie, Cal., are determined as follows: No. 1 is a dike rock with a small fragment of vein quartz attached; no mineral can be seen in either the quartz or dike rock; a few small plagioclase feldspars can be seen in the specimen. No. 2 is from a vein and shows foliated vein material, with veinlets of quartz; a little iron sulphide can be seen in the specimen; it is probable that this rock is gold bearing. No. 3 is opal, and may be opalized wood, although it shows none of the woody structure commonly observed in specimens of that material. No. 4 is aplite, a variety of dike granite. No. 5 is a specimen of carbonized and mineralized wood; numerous specimens of this material have been observed in the mine workings of Bodie district and also in the andesite at Virginia City, Nev., where it is supposed to represent the carbonized and mineralized remains of portions of trees which grew on the surface of older andesite flows; as these carbonized specimens are usually found at the contact of different flows of the volcanic rock, it is presumed that a sufficient interval elapsed between each flow for large trees and other vegetation to grow on the lava surface.

The rock specimens from Kelvin, Ariz., are rhyolite. The rock has been subjected to metamorphism and has been silicified somewhat. The black color is due to manganese and iron. Rhyolite is an acid rock and occurs either as dikes, necks or intruded sheets. It is distinguished from quartz-porphyry by the frequent occurrence of sanidine, a variety of feldspar. The older acid eruptives of fine texture have been called quartz-porphyry and the later rhyolite. The latter, however, is really a quartz-bearing trachyte. The difference between rhyolite and quartz-porphyry is often indistinguishable without the aid of the microscope.

Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 1, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

EARTH AND ROCK AUGER.—No. 773,562; E. Gerry, Whatcom, Wash.

In apparatus of class described, combination of drill tube, drill head secured to drill tube and having shoulder spaced from lower end of same and forming with lower end of drill tube a ball race, a series of antifriction balls arranged in ball race and projecting horizontally beyond drill tube and drill head and adapted to engage well casing, and drill carried by drill head.

SEPARATOR.—No. 713,928; C. W. Colvin, Scranton, Pa.

In coal separator, upper or receiving slide, device arranged transversely of slide at short horizontal distance from its lower end, thus providing vertical gap or opening between device and slide, device being arranged to obstruct flight of coal passing from slide and cause coal to drop downward through gap, and slate separating slide or partition arranged in plane below its receiving slide and having its upper end extending beneath device and into position to divide stream of material passing through gap.

MINE VENTILATOR.—No. 773,936; G. Himrod, Lockport, Ill.

In mine ventilator, combination of ventilator shaft, chamber surrounding mouth of shaft, heater within

chamber comprising annular wall forming air passage registering with shaft, second wall surrounding first named wall and forming therewith firepot, each wall provided with multiplicity of perforations, and draft chimney communicating with chamber and having bore registering with annular space.

DRILL AND UNDERREAMER.—No. 773,962; E. McCray and F. A. Wiser, Los Angeles, Cal.

Flattened drill body having drill bit at end in line with working axis, extension along one side of body provided at lower end with underreamer bit, above but in proximity to drill bit, reamer bit, above but in proximity to drill bit, drill bit having edge in direction of width of drill body, and drill body having incline on end of drill bit opposite underreamer, and drill body being channeled on each side.

STAMP MILL.—No. 773,732; A. P. Granger, Denver, Colo.

Combination with stamp, of counter shaft, cam shaft intermediate counter shaft and stamp, arm mounted to swing on counter shaft, and provided with collar through which stamp stem passes, stem having stop engaged by collar of arm, cam mounted on cam shaft, roller tappet mounted on arm and lying in path of cam, and pawl supported by swinging arm and actuated by tappet to rotate the stamp, stem of latter being provided with ratchet which pawl engages.

AUTOMATIC CAGE LOADER.—No. 774,047; W. H. Davis and J. M. Wood, Cambridge, Ohio.

In apparatus for loading mine cages or elevators, combination of trackway, cage, tilting platform be-

tween one portion of trackway and base of shaft in which cage descends, platform having portion adapted to be engaged by cage and effect tilting thereof, stop devices to engage cars of cage and platform to hold same from movement, means for automatically retracting stop device of platform when latter is tilted, lever connected to stop device of cage, third stop device, and lever having trip member adapted to be operated by car to retract stop device of cage and adapted to be manually adjusted to protect third stop device to prevent movement of car on tilted platform when first named stop device thereof is retracted.

BUDDLE.—No. 774,048; C. W. Denison, Denver, Colo.

In buddle, combination with vertical shaft, and means for rotating same; of similar tables of different sizes secured to and revoluble with shaft, each table comprising hub, circular rim, spokes connecting rim and hub, V-shaped strips of canvas secured upon spokes, grain of canvas forming pockets for reception of flour gold, stationary circular trough under edge of each table and having oppositely disposed outlets, partitions within troughs at opposite sides of one of outlets, bottom of trough being inclined downward from partitions to outlet farthest removed therefrom, means for supplying material to center of upper table, chute extending from one of outlets of each trough to waste receiver, chute extending from other outlet of upper trough to center of lower table, outlet spout depending from other outlet of lower trough, independently adjustable spray pipes suspended above tables for cleaning same, and adjustable spray pipe above each table and alining with trough outlet located adjacent partitions within trough, pipe being adapted to direct flour gold from tables and between partitions.

EXCAVATOR.—No. 774,102; C. L. Payne, Salem, Ind.

Excavator comprising wheel mounted main frame, plurality of frames carried by main frame and reciprocating independently of each other, ground breaking devices carried by reciprocating frames, one set of breaking devices operating to break ground during downward movement, while another set is moving upward free from ground, and means for causing movements of reciprocating frames.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The United States Geological Survey reports the value of the mineral production of the United States for the calendar year 1903, compared with 1902, divided as follows:

	1902.	1903.
Metallic.....	\$ 642,258,584	\$ 624,318,008
Non metallic.....	617,251,154	793,435,579
Unspecified.....	1,000,000	1,000,000
Totals.....	\$1,260,509,738	\$1,418,753,587

## ALASKA.

J. E. Burton, president of the United States Alaskan T. M. Co. of Milwaukee, Wis., after an inspection of the company's tin holdings near Cape Prince of Wales, reports a shaft has been sunk to 65 feet and a vein 6 feet wide found carrying tin ore. Another tunnel will be run 800 feet farther down the mountain side. The ore will run average of 10% tin. Next season development will be increased.

C. E. Nason of Chicago, Ill., manager of the Alaska Marble Co., says at the marble quarry at Marble creek, near Shakan, near Wrangell, he has put on more men, and taken in supplies, and will increase development.

## ARIZONA.

### Cochise County.

T. F. Cole and D. E. Woodbridge of Duluth, Minn., and J. Hoatson of Calumet, Mich., of the Calumet & Arizona mine and associated enterprises in Bisbee district, report the company's mines are developing satisfactorily. Among these are the Lake Superior & Pittsburg, the Pittsburg & Duluth, and the Calumet & Pittsburg companies. The Junction is being operated by the same men. They have cut ore with a drift. There are deep shafts on these properties, and in the Pittsburg & Duluth ore carrying native copper has been found at depth of 1500 feet. On the Lake Superior & Pittsburg they are opening up ore bodies from depth of 900 to 1100 feet. The Calumet & Pittsburg is a pumping proposition. It is down 1000 feet and 4,000,000 gallons of water is raised daily. The Calumet & Pittsburg has five compartments in its shaft.

H. E. Armitage of Prescott, part owner of the Old Terrible mine in Cochise county, says the mine is improving. He has a shaft down 150 feet and cut a blind ledge 4 feet thick that with the adjacent strata carries gold values.

### Maricopa County.

(Special Correspondence).—The Gila Gold Lode Co. will resume work on its mines in the White Tank mountains this month.—G. Hamlin reports the Relief mine looking well. The mill has made a trial run.—The Mormon Girl mill at Cave Creek is in operation.—J. E. Mad-dox reports his property in the White Tank mountains improving.

Phoenix, Nov. 6.

### Mohave County.

The Kingman Volcanic Tufa Co. has been organized in Los Angeles, Cal., with office in Kingman, to utilize the material from the Metcalfe quarry west of Kingman for building and other purposes. It is said it has been found adaptable, when ground and mixed with oil, for waterproof paint for cement work and masonry.

J. Boyle has started up work on the Vanderbilt mine at Cerbat. Machinery is being set up and sinking a shaft will be started.

It is reported work is showing up ore bodies in the Azalia mine at Weaver.—J. H. Johnson has opened up a body of ore on the Bryan mine at Stockton Hill. The ore carries values in gold, silver and copper.—Lead ore is being taken from the Star Spangled Banner mine at Stockton Hill. The work at depth is showing values in gold and silver.

S. C. Bagg, manager of the New Comstock M. Co., operating at Pyramid, near Kingman, reports H. C. Howard et al. of San Francisco, Cal., have a bond on the New Comstock properties and will begin operations this week. A shaft will be sunk to 300 feet. Pending sinking the shaft drifts will be run off from the 200-foot level and the ore milled to test its value.

Heavy machinery and 4-inch water pipes are being hauled to the Gold Road mill, near Acme. The increased output of the mine has made necessary additions to the reduction plant.—The Infalible and Star Spangled Banner mines, near Kingman, being worked by the Fletcher M. Co., are shipping twenty-five tons of high-grade lead ore daily. In the lower drift of the Banner ore that runs \$30 in gold and silver and 40% lead is being ex-

tracted. Last month 1000 tons of ore were shipped from these mines to the company's smelter at Needles, Cal.

The Eldorado mine in Gold basin, near Kingman, is showing up a body of high-grade gold ore on the 300-foot level.—Miners have been put to work on the Golden Gem mine, says Manager Hall.

G. W. Jonas of the Standard G. M. Co., operating mines at Mohave Wash, near Kingman, says it is intended to put in machinery on the mines and sink several hundred feet.

C. Schader, manager of the German-American M. Co., says he will sink the shaft 100 feet more on Pioneer mine of the German-American group. The shaft is down 110 feet. It is intended to put in a mill and begin reduction of ores from the other mines. The mines are in San Francisco district, near Acme.

Compressor plant for the Samoan mine at Chloride is being set up, says L. Hoffman, superintendent. It is proposed to begin deep work preparing for a large output as soon as the railroad is again in operation. The machinery consists of a 30 H. P. gas engine and compressor, with three hammer air drills.

### Pinal County.

(Special Correspondence).—The Silver Belle mine, under Manager Champion, is again a producer. The road from mine to Cochran station, on the Phoenix & Eastern R. R., is repaired and teams are hauling ore for shipment.—The McCormack and Eyrich mines, on the north side of Gila river from Cochran, under recent development work, show bodies of iron with gold values.—At the Aboriginal group, on south side of the river, development shows large bodies of low-grade copper ore with gold and silver values.—The Copper Butte Co. will start operations this week.

Florence, Nov. 6.

### Santa Cruz County.

The Oro Blanco M. Co. has been organized to develop mines in Santa Cruz county by C. F. Slack of Tucson, J. W. O'Neill, S. W. Gilman and other Eastern men, with main office at Tucson.

### Yavapai County.

It is reported that the Copper Chief group of claims will be sold for \$3,000,000 to T. F. Cole, J. Hoatson and D. E. Woodbridge of the Calumet & Hecla Co. at Calumet, Mich. The Copper Chief is near Jerome. Cole is president of the Calumet & Arizona M. Co., with mines at Bisbee.

The Poland-American M. Co. has completed building a 120-ton reduction plant on its mines at Poland. Machinery for the mill is going in. The mill set in operation by the F. M. Murphy interests is running steadily. The Poland-American Co. is working the Vassar, Fitzhugh Lee and Joe Wheeler claims.

Foreman J. Phillips of the Rincon M. Co. has thirty men at work developing the Dixie ledge near Martinez. Machinery, including 85 H. P. gasoline engine and an air compressor, is in operation. G. West is metallurgist for the company.

### Yuma County.

The Bonanza & Golden Eagle M. Co. has been organized, with H. D. Hauge and J. B. Martin of Harrisburg president and manager respectively, and A. Martin, and has bought the Harqua Hala mines at Harqua Hala mountain, in Ellsworth district. The group is equipped with 40-stamp mill, cyanide plant, and pumping plant and pipe line.

Superintendent Beemer of the Amalgamated G. M. Co. has put on additional teams in transportation of the company's machinery, supplies and lumber to its mines at Quartzsite. Work will begin on building the 120-stamp mill.

## CALIFORNIA.

### Amador County.

At Defender, a new shaft is being sunk at the Defender mine in Pioneer district. At depth of about 300 feet the pay ore pinched in the old shaft. A new shaft was started on the ledge at 500 feet from the old works. This is reported in payable ore.

At Jackson, at the Kennedy mine the enlarged chlorination works are in working order. The additional forty stamps to the mill will be ready to start up Dec. 1. The sinking of the east shaft is progressing.—At the Zeila mine excavating for a larger hoist has started. The building will be in front of the present hoist. Sinking operations are progressing in the shaft.

### Butte County.

At Hurlston, Burke et al. are putting in a quartz mill at their mine.—The Blue Lead mine, near Bangor, containing a deposit of gold-bearing "blue" gravel, is reported sold to Eastern men, L. Rose and H. R. Jacobs of Oroville and R. M. Green of San Francisco retaining an interest, with L. Rose as superintendent. The ground will be worked by hydraulic elevator process.

S. K. Thornton has bought an interest

in the Elliott mine, near Oleta, and is starting development work.

### Calaveras County.

(Special Correspondence).—The Mountain King G. M. Co. owns eight claims on the extension of the vein of the Royal Consolidated mines at Hodson. The main shaft has been sunk 500 feet and at that depth the ledge between greenstone hanging and the black slate foot wall is 70 feet in width, with 9 feet of white and blue quartz with heavy percentage of sulphurets. The other 61 feet is of black slate impregnated with white quartz. Drifting north and south at 100, 150 and 200-foot levels shows same grade of ore. The first-class ore averages \$10 and the low-grade \$3 per ton. From the 300-foot level 100 tons milled netted \$5.15 per ton. Foundations have been laid and a 10-stamp mill with two Union concentrators and two Standard tables is going in. C. O. Womble, R. B. Parks and W. R. Womble constitute the company.

Hodson, Nov. 8.

(Special Correspondence).—The Big Tree M. Co. bought or secured by contract 480 acres patented land in Tuolumne county, 480 acres of patented land in Calaveras county, 227 acres patented land north of Murphys and 40 acres of land comprising the north part of the Murphy townsite. The two larger tracts embrace land covered with timber, supplied with water and containing deposits of limestone, iron and metal-bearing veins. The office and assay laboratory of the company is at Murphys. The purpose of the company is to construct and operate a reduction and smelter plant at or near Murphys. Stockton men are interested in the project, the officers being G. O. Pearce, president and manager, and C. M. Webber, secretary and treasurer.

Murphys, Nov. 8.

The Utica M. Co. at Angels is putting in a compressor of 20-drill capacity, besides furnishing air for the men in the Cross & Stickle shafts. The flywheel is 16 feet in diameter, with a 40-inch face. Power will be furnished by a motor of 400 H. P. The compressor is at the Stickle mill.

In Chili gulch mining district, near Mokelumne Hill, the Rooney mill is crushing \$3 per ton gravel. Twenty-five men are employed and the mine is reported improving as development progresses. W. H. Curnow is superintendent.—The What Cheer mill is running steadily with twenty men at work. The mine is managed by H. Birch.—The New Buffalo, adjoining the Rooney mine, has been brought by Squires & Hawes, and is under management of J. Oneta of Sutter Creek. The shaft has been enlarged, grading for the mill and hoist is completed and machinery and pipe for the 3000-foot line is arriving. Fifteen men are working.—The Old Buffalo is at present only pumping water, but it is said operations will be resumed. These properties are contiguous on the Deep Blue Lead.—In the midst of this gravel mining is the Hamby mine, opened up by a series of tunnels showing a lead 8 feet wide of fair grade milling ore. J. E. King has a working bond and has started to develop the mine. A three-compartment vertical shaft is being sunk in hanging wall to cut the vein at a depth of 500 feet. Grading is complete for hoist and men are grading for a 20-stamp mill. Boarding and lodging houses are completed, also blacksmith shop and other buildings. There are twenty-five men at work. The shaft will be sunk 1000 feet.

### El Dorado County.

A pump and other machinery for El Dorado C. M. Co., including two 60 H. P. boilers, are being put in on the Eureka mine at Georgetown. The triple-compartment shaft which is down 180 feet will work the Eureka and Woodside gold quartz mines. When the 300-foot level in the shaft is reached a station will be cut and drifting started, says Superintendent Everson.

### Fresno County.

The Limited Oil Co. well No. 19 at Coal-inga in the first twenty-four hours produced 2300 barrels, and its average production is 1200 barrels a day of 24° gravity oil. A pipe line to connect this well with Ora is under way. The company is building a rig for well No. 23.

### Kern County.

J. A. Waltman, superintendent of the Sunset Diamond, at Sunset, reports a producing well has been opened on the Adeline land. The depth is 700 feet, the first oil sand having been struck at depth of 662 feet. The well is flowing 250 barrels a day through the casing. It is operated by Barlow & Hill.

Bakersfield reports say the Standard Oil Co. will again buy Kern river oil at 15 cents a barrel of 14° gravity and over. About two months ago the company cut prices to 11½ cents and then stopped all purchase, with the result that the inde-

pendent producers have organized to market their own oil.

### Nevada County.

W. Bawden and J. Vivian have bought the Midnight mine at Nevada City. There are two tunnels, through which the mine has been worked and ore extracted.

Peer, Hopkins & Co., who had a bond on El Oro mine (the Yuba) at Magnet and spent \$30,000 making improvements in overhauling machinery and putting up a tramway and buildings, have given up the bond. Superintendent Kahler and the other owners expect to start operations in the first level this month.

At Washington at the Sixteen-to-One mine it is reported another ledge has been opened up 30 feet wide and contains milling ore. The 10-stamp mill is pounding ore steadily and another 10-stamp mill is being hauled in. The ore is said to run \$3 to \$6 a ton and is free milling.

P. Dunn, owner of the Julia quartz mine on Deer creek, below Nevada City and adjoining the Mountaineer mine on the east, reports work resuming under S. A. Gilmore for the Con. Nevada G. M. Co. Gilmore has put men at work retimbering the drain tunnel which is in 400 feet and will be extended.

At Grass Valley the Sultana M. Co. has bought south half of claim of Sebastopol G. M. Co. The mine is near Osborn hill. The Orleans M. Co. owns north half of the mine. The Sultana Co. is operating the Green Mountain mine (the Electric), in Grass Valley district. The owners are San Francisco men—J. E. and E. Green, J. J. and J. M. O'Brien, M. E. Wilson and E. B. Lillis.

### Placer County.

The Blakegrave-Meeke quartz mine in Canada Hill district, near Westville, is taking out ore and the 2-stamp mill is running steadily.—Men are at work on the Tadpole mine, in the same district, under the supervision of J. L. Sparhawk.—It is reported that the Ex Ray mine at Sailor Canyon will be started up again.

—A 10-stamp mill is operating at the Salvation mine, near Canada Hill.—The Santa Fe mine will be started up as soon as the water supply is sufficient.—The Golden West mine at Canada Hill has closed down for the winter, but will resume in the spring.

### San Bernardino County.

The Bagdad M. & M. Co., operating mines at Bagdad, Cal., is shipping four cars of ore daily to its 50-stamp mill at Barstow. The ore is said to net the company \$80,000 per month.

### Santa Barbara County.

The Graciosa Oil Co. well No. 3 near Santa Maria was finished last week, producing 816 barrels per twenty-four hours. No. 2, adjoining this well, started off about eight months ago at 396 barrels and is now yielding 430 barrels daily.

### Shasta County.

W. F. Snyder of Salt Lake City, Utah, manager of the Western Exploration Co., has made arrangements for building a smelter at the Balaklala mines, near Kennett. The plant is to have a capacity for treating 1000 tons of ore daily. At 110 feet from the raise in the main working tunnel a body of high-grade copper ore has been opened up.

### Slack County.

At Rollin, Reed & Ball are increasing work on their mines. They have winter supplies in and will start milling ore when the rains start the water supply. They have struck high-grade ore.

The Rader group of quartz mines on Crater creek, East Fork of Scott river, near Callahans, has been sold to the Crater Creek M. & Dev. Co. The mines will be opened on a larger scale. With the successful operation of the Crater Creek group, it is said the section on the headwaters of Scott river, above Callahans, will be worked. J. B. Scott is operating his quartz mine and mill on Indian creek, near Fort Jones, known as the New York mine, with thirty-five men. The mill is run by electric power and the hoisting apparatus by steam.—A. C. Brokaw is pushing work in developing the Golden Eagle quartz mine on Indian creek.—Placer and hydraulic miners are preparing for winter storms.

### Sonoma County.

Explosion of natural gas in the Great Eastern quicksilver mine at Guerneville on the 8th inst. resulted in death of one miner and three injured. A. Abbey is superintendent of the mine.

### Tuolumne County.

(Special Correspondence).—The Carlotta Con. G. M. Co., with D. Neagle manager, has resumed work on the Pennsylvania and Carlotta mines, 2 miles north from Tuolumne. Associated with him is J. T. Thompson of Calaveras county, and prospecting and development work will be pushed. The water has been pumped from the shafts and drifts and the air compressor will be removed from

the Carlotta and placed on the Pennsylvania. The 200-foot shaft will be sunk to 400 feet and new levels started. There are six distinct veins in a width of 800 feet. The pay streak of the two principal ledges are each about 12 inches in width, carrying sulphurets, and plating \$20 per ton in gold. The property is equipped with an air compressor, seven stamps, two Willey tables and two Frue vanners. Hardeocg air hammer drills will be added when full operations begin.

Tuolumne, Nov. 8.

(Special Correspondence).—The Soulsby M. Co., organized last spring, took over the south extension of the Soulsby mine. The mine had a shaft 300 feet in depth, with three levels and over 2000 feet of drift; also, a 10-stamp mill and a canvas plant. Since then, under the superintendency of H. L. Huston, there has been added a new steam plant, consisting of a 55 H. P. boiler, 62 H. P. engine, an air compressor with five drills and an additional battery of five stamps. The shaft has been sunk to 430 feet, with drifting 450 feet north and south at the 400-foot level. The stoping of ore is going on on that and other levels. The shaft is being sunk another 100 feet, with ten stamps crushing ore. The ore is white quartz, with sulphurets, and is in granite. Values over the plates average about \$20 per ton. There was no closing down this season on account of scarcity of water.

The Black Hawk mine, comprising a ranch of sixty acres or three mining claims, near Soulsbyville, is owned by Irish & Chandler of Los Angeles. Superintendent R. H. Barnes sunk the 30-foot shaft to 90 feet and drifted 40 feet, proving up a 12-inch streak of sulphurets bearing quartz enclosed in granite and diorite walls. Two shafts of 30 feet each were sunk and the surface prospected for 650 feet, showing ore outcroppings. When the gasoline hoist and air compressor are in position they will use air drills, sink the double-compartment shaft 200 feet farther, drift 200 feet, cement the walls exposed to prevent influx of water and then sink from 100 to 500 feet additional, as development may determine. A mill will be built.

Improvements have been made the past summer at the Black Oak mine, near Soulsbyville. The rock crusher has been moved to the hoist and the system of cyaniding changed so as to work the sulphurets. The 1100-foot shaft is being sunk another 150 feet and the forty stamps and Frue vanners are handling sixty tons of ore daily. There are sixty men on the payroll, with W. G. Scott superintendent. Soulsbyville, Nov. 9.

Near Jupiter the Stockton Gravel M. Co. has started work on its shaft, near Rose creek, after putting in an engine with which to pump the water and to hoist.—Hauselt & Bros. of Angels and Murphys have bonded the Snell quartz mine for \$35,000. They have the mine cleaned out and are retimbering the shaft, also putting up buildings.—The Bourbon mine is bonded to Howell, Pollar & Co.—The Star M. Co. will put in a larger air compressor, says Superintendent E. J. Olsen.

The Pennsylvania mine, near Carters, is being unwatered by D. Neagle and J. T. Thompson.—Bunting & Co. of San Francisco are increasing work at the New Albany mine, near Carters. The New Albany road has been cleaned out and graded and mining machinery is being taken onto the property, says Superintendent Chandler.

## COLORADO.

### Boulder County.

The Lincoln G. M. Co. has been incorporated by Kansas men and will operate the Lincoln and Blue Bell mines at Sugar Loaf. C. Hughes is president.

### ChasSee County.

Turret reports say the Vivandiere mine and mill are being overhauled to start up again. Shut-down was caused by consolidation of the Turret Mountain M. Co. and the Twin City Dev. Co. into the Vivandiere Con. M. & S. Co., which took the holdings of the two other companies, including the Vivandiere concentrator. The new company will put in additional machinery for the mill and will increase capacity of the mill. The Vivandiere is equipped with air compressor and drills. The shaft, an incline, has reached 600 feet, with levels driven east and west at the 400, 500 and 600-foot stations, showing ore.

At Sherrod the Sunlight G. M. Co. has been organized. The officers are: President, S. Cohen; J. M. Herbert, W. M. Bacon. The company owns the Sunlight group of six claims on Bacon hill, in Sherrod district. Operations have begun. The company is driving a tunnel into Bacon mountain that will cut the main veins at depth. The tunnel entrance is 200 feet from the Colorado & Southern main line and a spur will be built to the mines. Some of the leads on the surface

show values in gold. The Sunlight tunnel will be used as a transportation tunnel for several properties on Bacon mountain. Salda reports say a strike has been made on Chipeta mountain, in the Monarch district. Herzinger & Matthews of Salda struck a 4-foot vein in the Deer Trail lode, giving assays of \$20 in gold.

### Clear Creek County.

At the Newhouse tunnel, at Idaho Springs, is an automatic mucker or car-loading device, facilitating loading of dirt into cars, says the Idaho Springs Gazette. The loader was built by Superintendent Knowles. It consists of belt conveyor for elevating the rock and dumping it into the cars. At the front is a pointed steel plate nose to be crowded into the dirt pile along the plate, thus bringing the dirt upon the belt, which elevates it to the cars. Under the belt at the rear is a small engine geared to high power, which operates the belt and all machinery. The conveyor is drawn into the dirt pile by cables wound on spools connected with the engine. The cables to be used are anchored at the breast before the blast and allowed to be covered by the rock. The loose ends are attached to the spools when the loader is brought up for work, and the engine revolving the spools forces the nose under the dirt. At its first trial the machine loaded fourteen cars at rate of four minutes to the car. In the Gunnison tunnel the contract will require each heading be driven fourteen feet per day, 12 by 12 feet in the clear, which necessitates removal of 2016 cubic feet of rock, or 3000 feet of broken rock, each twenty-four hours.

Georgetown reports say a compressor and machine drills are going in for the Stevens side of the mountain to meet the Argentine or main tunnel from the east side. The Stevens tunnel is in 2200 feet and the Argentine 3400 feet, leaving 4000 feet to be driven to bring the tunnels together. After a temporary suspension for connecting up with electric machinery and adjusting ore crusher, rolls and screens, work has again started at the Stevens concentrator. The power is furnished by electricity and the capacity of the mill doubled.—G. Anderson, who owns a group of four claims on Kelso mountain, will work them during the winter. A tunnel is being driven. Ore on surface is said to mill 700 ounces in silver, \$15 in gold and 12% in lead.—J. Schuler & Co., on the Bismarck mine, have been doing dead work for the past month.—Under Manager Maxton the number of men on the Lebanon has been increased.

W. Schaner is increasing work on the Ramsdale group, near Georgetown, and has crossed the junction of several veins. The ore carries gold, some of the mill returns showing six ounces in gold per ton, with lead and silver values. There is an accumulation of ore on the dump, which will necessitate building a concentrating mill for treatment in the spring.

### Fremont County.

The coal vein, found by W. Ash of Florence, in the Sangre de Cristo range, and which carried 10% yellow copper ore, is being developed. Ash says the copper is carrying small gold values. The coal vein is 22 feet thick. A road is being graded to the mine from the valley, but shipments will not be made before spring.

Florence reports say the Great Western Coal Co., operating the Cuckoo mine, under President F. D. Heath, will increase development and improvements. The Victor Fuel Co. will take its entire output of coal at the prevailing market price. A town is being built about its coal plant. Twenty houses are up, says Superintendent Nichols. A brick boiler and engine house is also being constructed and plans are ready for a blacksmith and repair shop. A water works system is being put in by the company. At the mine the capacity of the main shaft is being increased. A 10-drill air compressor and a 175 H. P. boiler are being put in. An electric plant is under way for lighting the mine and cottages. A spur of the Denver & Rio Grande is being laid from the Chandler mine to the Cuckoo.

### Gilpin County.

The Otto Shatz M., L. & Dev. Co. has been incorporated by O. Shatz, R. Hastie, R. Keenick and E. Beyer to operate in Gilpin county, with main office in Denver.

At the Lynn shaft of the Eldorado M. Co. at Russell Gulch, a shaft building is in course of construction and a steam hoisting plant will be put in. The plant will consist of a 40 H. P. hoist and a 50 H. P. boiler. The company will sink the shaft an additional 200 feet, says Superintendent S. T. Harris. At their Eldorado mine a shaft building will also be put up, and it is intended to put in a gasoline hoisting plant. Operations are progressing underground and milling ores are being hoisted from the 100-foot workings.

The Benzie I. Co. of Denver has a lease and bond on the Eureka mine in Prosser

gulch, near Central City, and operations will be under W. Ballantyne. The main shaft is down 600 feet, being worked by lessees, the milling ores yielding 24 ounces gold per cord, the smelting ores \$50 per ton net. The Benzie company will unwater the mine below the 400-foot workings, those above the 300-foot point to be still operated by lessees. In the 330-foot stopes the vein is 4 feet in width.

During the past month shipments of smelting and milling ores, tailings and concentrates from Black Hawk depot to smelters and to outside points, were 276 cars, or 5775 tons, being the heaviest shipping month of the year, exceeding that of September by 125 tons. The increased shipments the past two months, says the Register-Call, are attributed to the opening of the Golden smelter and to reduction on treatment of ores by the American S. & R. Co.

The Electric Spark G. M. Co., operating the Hall mine at Russell Gulch, Colo., under lease and bond, is making shipments to the smelter, and amalgamating ores to the Polar Star mill on North Clear creek. These ores are being hoisted from the 130-foot level drifts, where Superintendent G. N. Rogers reports they have three feet of vein matter. He will sink the shaft another 100 feet. The company has put in machinery and made improvements to the buildings, besides cleaning out the shaft and retimbering. Nebraska men compose the company.

The Alps G. M. Co. has been incorporated by H. M. Teller, H. Sayre and H. M. Orahoud, of Denver, to operate in Gilpin Co.—Denver and Eastern parties are interested in the Hampton Con. M. Co., operating the Hampton group, near Russell Gulch. They will put in a hoisting plant at the mine, which produces enargite. The company will ship its product.—F. M. Young et al. of Denver have a lease and bond on the Vanderbilt, Summit, Mountain and Pool lodes, in Central City and Lake districts. The lessees have started operations on the Mountain shaft and are taking out milling ores.

J. R. Anderson, manager of the Gold Dirt mines at Perigo, will build a reduction mill for treatment of the low grade ores exposed. The main shaft has been deepened 100 feet and the 600-foot level opened, which has been driven east 500 feet and west 600 feet, both levels opening up ore, containing \$5 to \$20 per ton.

The Reward G. M. & R. Co., owning and operating a group of mines in Enterprise district, north of Central City, will increase development. New York and Pennsylvania men are interested, with W. P. Volgamore of Buffalo, N. Y., secretary and manager. The company owns a group of seventeen lode claims and two tunnel sites. It is a low-grade proposition and is being opened up through tunnels Nos. 1 and 2, which also serve as drainage for the entire group. The main or No. 1 tunnel has been driven 500 feet, gaining a vertical depth of 450 feet and cutting five veins. That tunnel will be extended during the winter and drifting started. They are building bins on the North Clear Creek road, below the tunnel workings. The ores carry values in gold, silver and lead. The company is also building a road to the property.

### Jefferson County.

The National Dredging Co., which has been building two boats to recover the gold in the bed of Clear creek, near Golden, has put its first boat, Eleanor I., in operation. The second boat is nearly completed and will be ready for operation next week.

### Lake County.

Litigation on the Martha lode, at Twin Lakes, has been settled in favor of J. King, J. Kindregan, O. P. DeFord and S. Wilson, and operations have been resumed. The adjoining Washington claim is on the same vein.

The output from Leadville district for October is reported at 72,000 tons. The increase is due to shipments from the Reindeer, Sunday, Yak tunnel and lessees on the Ibex. In November the Coronado will add several hundred tons a day from the new ore body in the lower zone, the Yak tunnel with new electric haulage will add a heavy tonnage, and the Sunday will ship 100 tons daily. Should the Tuscan shaft be completed and the Moyer ore shoot opened in time, that property will be shipping 150 tons a day. The shafts going down on Rock hill, by December 1st are expected to be in ore, and some of them shipping.

### Larimer County.

At Pearl the 50-ton smelter, in course of construction, is expected to be in operation by December 25. A contract has been let for 1200 cords of wood, the winter's supply of fuel. The 10-ton blower has arrived from Laramie, Wyo., having been hauled 80 miles overland by a thirty-horse team.

### Mesa County.

At Debeque in oil well No. 1 of J. S.

Swan et al., a flow of oil was struck last week which runs fifty barrels a day.

### Ourray County.

This week two new mills will be started in Red Mountain section, the Ruby Basin on South Mineral and the Treasury tunnel, near Red Mountain. The former is a 75-ton and the latter a 50-ton plant.

### San Juan County.

The Sultan Mountain M. & M. Co., with properties on Sultan mountain, near Silverton, will be operated with more men. A tunnel started on the Junior Warden vein, now in 300 feet, will cut the workings of the Molus mine 175 feet below the surface in which water prevented further operation. The extensions of the King, Mazeppa and other veins of the Royal M. Co. are owned by the Sultan Mountain M. & M. Co., and it is expected the Junior Warden tunnel will also prospect those veins.

The Sunlight M. Co. is operating its Mastodon gulch mines, near Silverton. With an electric drill one shift of miners are making 2 feet a day in the lower tunnel. The Evening Star and other veins will be cut at depth.

### Summit County.

The Cashier G. M. and R. Co., near Central City, will put in hoisting engine on the Pittsburg shaft. It is a 50 H. P., double-friction hoist. The mine has 40 men on company and leasing account and a regular tonnage is being produced, principally of smelting ores.—The Nevada Con. G. M. & M. Co. has cut the Lamberson and Warren vein, after cross-cutting south from the King mine, and drifts are being driven both ways. The vein shows 5 feet of concentrating ore. They will start up the company's mill.

Breckenridge reports say more men are at work underground at present than for several years and ore shipments are increasing.—For next season's placer operations the Iowa placers are being equipped with a storage reservoir and a 2300-foot pipe line by the Summit County Banner P. M. Co., and the placer gold dredging boat in French gulch, a mile from Breckenridge, is being built by the Reliance G. D. Co. The Iowa gulch placers have been worked by ground sluicing chiefly. A 22-inch main will supply hydraulic giants with water, having a head of 210 feet.

The Widmar & Dean lease on the Silver King, on Nigger hill, Breckenridge, is taking out good grade lead carbonate ore at 29 feet from collar of shaft. The vein is 6 feet wide and nearly vertical. Shaft sinking will be resumed. Assays show 60% lead, thirty-four ounces in silver, with \$1.20 per ton in gold.—W. L. Sprague has a lease on ground northeast of the Silver King and is having trenches dug to open up a pay ore shoot on the Last Chance ground.—The 40-stamp and concentrating mill of the Jessie group and the 40-stamp mill of the Cashier mine are running full time and are shipping gold bullion and concentrates.

The 1000-foot projected tunnel of the Senator G. M. Co. in Blue river section, near Breckenridge, is being driven with machine drills. About 9 feet per day is rate of progress. The air compressor plant is at mouth of tunnel. The tunnel is being driven to develop a group of gold lodes in Star mountain.

### Teller County.

(Special Correspondence).—The Exposition M. & L. Co. is operating on the Burns lease at Altman. The property adjoins the Shurtloft mine. The Burns lease is down 225 feet and work has been started to sink another 50 feet. They have been taking out ore from the 175-foot level. The mine is equipped with steam hoist, electrically driven air compressor and air drills. The property is on southern slope of Bull hill. In same locality are the Zenobia, Eagles, Vindicator and Findley mines. A. D. Kenyon is manager.

On Ironclad hill is the 200-ton cyanide mill of the Homestake Cripple Creek Co. This company is putting up a 1000-ton mill for treatment of its ore. A double-compartment shaft is being sunk and a hoisting engine will be installed.

At Midway, on Bull hill, is the cyanide mill of the R. E. A. & A. M. & M. Co. (See front page.) This company has a lease on the dumps and mine of the Wild Horse Co., owned by Woods Investment Co. of Victor. H. F. A. Riebling, manager of the cyanide mill, designed and built the mill, which has a crushing capacity of 200 tons per day and a leaching capacity of 100 tons per day. The plant will be increased in size. The building contains one gyratory crusher, three sets of crushing rolls and four leaching tanks. They also have a complete laboratory in connection with the mill. They also ship one carload of smelting ore from the mine each week. W. C. Abbott is mine manager.

Cripple Creek, Nov. 6.

Development on the Free Coinage mine on Bull hill by lessees is showing a vein

at depth of 250 feet from surface during sinking of the new shaft. During October 2000 tons of ore of smelting grade were shipped from the Vindicator mine on Bull hill. Operations on the property will be increased.

The output of the Cripple Creek district for October exceeded that of September. Value of ore shipped reached \$2,043,900 for 61,850 tons. The small cyanide plants treated a total of 10,600 tons of ore, containing values of \$49,900. The figures obtained from the mill and mine managers and railway authorities, says the Cripple Creek Times, are:

	Tons.	Value.
Smelters.....	12,000	\$ 720,000
U. S. R. & R.....	25,000	775,000
Portland.....	7,750	232,500
Dorcas.....	3,500	123,500
Economic.....	3,000	144,000
Homestake.....	5,600	22,400
Wild Horse.....	2,500	15,000
Florence Cy.....	2,500	12,500
Totals.....	61,850	\$2,043,900

The Cripple Creek Gold Temple M. Co., operating under lease the main workings of the Gold Sovereign Co., on Gold hill, Cripple Creek, has reached the 700-foot point. Contract for 120 feet of drifting to the ore shoot has been let, the contractors to drive 10 feet per day. The leasing company is shipping 50 tons per day. Manager Taber says he will ship 150 tons per day.

A plant of machinery is being set up on the mine of the Flying Cloud company, near Cameron.

Cripple Creek reports say the Sioux Falls & Cripple Creek M. & D. Co. has been declared bankrupt. This company has been operating the old Fluorine mine, on Copper mountain, and treating ore for cyanide process.

Cripple Creek reports say Russell & Co., who have a lease on the International shaft of the Savage Co., have put in three machine drills and will start regular shipments.

## IDAHO.

### Idaho County.

E. L. Abbott, superintendent of the Sunnyside mine at Roosevelt, says the wire cable for the aerial tramway is being stretched. The mill buildings are completed and the machinery is being set up.

### Lemhi County.

The Oregon-Idaho M. Co. has begun mining operations on its group at Singiser, near Salmon City.

### Owyhee County.

The mill at the Cumberland mine at Silver City will be started up next week.

### Shoshone County.

Near Wallace, at the 16 to 1 mine, the electric line of the Washington W. P. Co. has been completed, and the motor is set up. Electric power will operate the machinery at the mill and the compressor at the mine. It will be several months before the mill is in operation. Fourteen men are raising and sinking between the 400-foot and the 200-foot levels. It is expected to require two and a half months to complete the work. It is said there is a body of concentrating ore blocked out.

Wallace reports say the continued low stage of water is causing the large mining companies embarrassment. If the water continues to fall it is expected the concentrators will be forced to close, which would necessitate closing the mines. The Mammoth mill has been closed partially for several days while a 50 H. P. engine is being put in. This concentrator, and the Standard adjoining, have heretofore been operated by water power, never being connected with the electric power line. It is said never in the history of mining in the Cœur d'Alene have the streams run so low as they are now. This is causing the tailings question to become serious. At the Standard and Mammoth mills all the coarse tailings are being dumped in railway cars and are being hauled away to be used for ballast. Although the stream is relieved of the coarser tailings, it is unable properly to handle the finer ones, and the bed of south fork of Cœur d'Alene river, as it passes through Wallace, is filled to a depth of 4 or 5 feet. During the low stage of water the electric power brought from Spokane has been of benefit. The Bunker Hill & Sullivan M. Co. is equipping its concentrator with more electric power, as is the Federal M. & S. Co. at the Last Chance mill.

## ILLINOIS.

M. Taylor, president of the Hoisting Engineers' Union of Illinois, declared the strike of the hoisting engineers off, in obedience to a referendum vote, which resulted 750 to 315 in favor of returning to work. The engineers return to work at a scale of 5½% less than that received last year.

## KANSAS.

### Cherokee County.

At Baxter Springs the Strong Bow M. Co. is putting down a shaft on the

Abrams land, as is also the Morea M. Co. The Baxter M. Co. has bought controlling interest of the Sunburst and the Post & Co. mine and will put in machinery to develop it. The company has bought three-tenths interest in the Mission mine and the 40-acre lease. Hash & Co. are into ore and are putting in a pump. As soon as the ore face justifies it, they will build a concentrating plant. M. S. Parker and C. W. Craney are owners.

The Merchants' M. Co. mill, northeast of Galena, is running steadily. They have several additional leases and will start prospecting them. The Applejack mine is running steadily.

## MISSOURI.

### Jasper County.

At Webb City the Newport M. Co. has bought the St. Anthony mill and will remove it to its lease. The shaft is being sunk. Five drill holes show 30 feet of ore at a uniform depth. The Thirty-Eight M. Co. has started up its mill after a shut down. M. Wright, F. Stumbo and W. B. Parker of Webb City have developed a prospect of lead ore on the Smith & Stickney lease, 7 miles west of Webb City.

The L. C. S. M. Co., composed of W. C. Stancoff and Montgomery Bros., have found a run of lead on the Allan Hardy ground, 2 miles southwest of Webb City. The ore has been reached in a shaft 115 feet deep. They have a 10-acre lease. A pump was put in last week and development work will be increased.

In Sherwood section of Joplin district on the Creller & Young land the production made since the first of February from the Harry Pears & Co. mine (formerly the Rice M. Co.) has been 2,178,690 pounds of zinc and 22,300 pounds of lead ore, which brought \$42,052.79 at the bins, says the News-Herald. Production was from the ore body under the mill and south to the line of the Excelsior block. This has caused the ground to settle so that it is necessary to move the mill. Then they will resume taking ore from the ore bodies to the east. The Excelsior Z. & L. Co. adjoins this on the south. It has two shafts in operation which are down to the ore zone. They will build a concentrating mill. A. P. Campbell of Joplin has bought twelve lots adjoining the Excelsior on the east. Deposits of ore have been located in shafts and drifts on the block and there is being erected a concentrating plant which will be in operation by December 1. Campbell has also bought twelve lots adjoining the first ones on the north and adjoining the Pears & Co. group on the east. Another mill will be built on these lots.

The sludge mill in Purcell, near Joplin, owned by Joplin men, has started up. The Gundling & Tobias M. Co. of Joplin has been incorporated by E. Tobias, H. and A. Gundling. The Estewena M. Co. in Joplin has been incorporated by W. H. Frickeleton, W. S. Gray, F. C. Ralston, C. M. McCurdy. The Cornucopia L. & M. Co. of Joplin has been incorporated by L. J. Lanphere, E. C. Houk, H. C. Cosgrove. The Lucky Abe M. Co. of Webb City has been incorporated by W. H. and M. C. Smith of Webb City; A. L. and M. Shepard of Chicago, Ill.; S. M. Shepard of St. Joseph, Mo. A company being organized has taken up a lease on the Schiffer-decker 80-acre tract in Chitwood hollow, near the Jackson mine. Three drills have started on the ground and eighteen prospect holes will be put down. A. and R. H. Corbin, C. Moore, L. J. Steverson, A. Onstott and McAntire & Scott are interested. The Joplin Main Street M. Co. of Joplin has been incorporated by G. S. Tarbox and S. R. Duncan of Arcola, Ill.; W. H. Hancock, A. Bragg, A. T. Collison, W. S. and A. J. Smyser, E. E. Kinney and Malachi Kinney, with T. N. Chenoweth, W. L. Owen and J. C. Ammerman of Joplin.

### Newton County.

W. Lambert, J. Woods, O. Pierson, J. Dale, A. Bishop and C. H. Kugel have organized a company and are operating the War Eagle shaft at Granby.

## MONTANA.

### Broadwater County.

A. C. Mason's properties at Hassel, known as the Park and New Era, report strikes in development work. The ore shoot has been opened for 1000 feet, with shipping ore of \$40 per ton. A 1200-foot tunnel will be run and the plant operated by electricity.

### Deer Lodge County.

Anaconda reports say considerable development work is being done at the Gold Coin mine and the mill has been shut down temporarily. The mill will be overhauled and repaired. Ore of high grade has been blocked out. It is intended to enlarge the working force at the mine and mill.

### Jefferson County.

The Amador Con. M. & D. Co. has been

incorporated at Missoula, with the principal places of business at Phoenix, Ariz., and Chicago, Ill., by G. H. Doehr, J. Sherlaw, R. M. Mahler, T. D. Fuller and D. E. McKinnon. W. A. Peck is Montana agent of the company, which owns mines at Iron Mountain, Jefferson county.

### Lewis and Clarke County.

The Inter Ocean tunnel, on Red mountain, at Rimini, has been driven 1200 feet and twenty-two veins are reported tapped, some of which carry values. The best ore is found in the lower workings, where galena is showing.

It is reported that arrangements have been made for the consolidation of the Piegian and Gloster mines, near Marysville. They are on the same vein and adjoin, consisting of twenty-five claims. The Gloster was closed down fifteen years ago. The Piegian Co. acquires the Gloster, whose machinery will be overhauled and repaired. Ore bodies have been blocked out in the Piegian and when the Gloster mill is repaired and refitted work will begin.

Helena reports say M. L. Hewett will put in equipment for the Bullion mine, including a concentrator and sampling works. The company has spent \$200,000 in the erection of its smelter.

The Indian Queen M. Co. is running its smelter on Birch creek, near Helena, twenty days each month.

### Madison County.

R. Knox, manager of the Revenue Co.'s interests at Norris, says the cyanide mill has been put in operation and 100 tons of gold-bearing ore are being received daily. A large tonnage of ore has been blocked out.

Massachusetts and Missouri men have organized the Poor Farm Placer M. Co., which will operate in Madison county. The directors are N. S. Shaler and J. S. Myers of Cambridge, Mass., F. E. Stanley, H. N. Bigelow and P. N. Moore.

### Park County.

Manager Allison of the Cooke City Smelter Co. has put men to work on the site of the proposed plant near Cooke. J. Burke et al. say the Klondike claim is improving and they will build a stamp mill. The Klondike is located near Horse-shoe, Cooke district.

### Silver Bow County.

At Butte the Speculator Co. has resumed operations in its mine, the hoisting engine having been repaired, and 300 men are again at work. The Gagnon mine, closed down for six weeks, is working again. Repairing the shaft has been done. Lessees are again at work on the Ophir claim. They have struck a vein 150 feet east of the main shaft and are taking out ore.

The ground around the Boston & Montana mine, in Meaderville, is reported settling as a result of extensive underground operations.

### Sweet Grass County.

L. E. Tomblin is operating his mine, near Big Timber, where he has a 5-stamp mill, driven by water power. A tramway is being built.

## NEVADA.

### Lincoln County.

Transfer of the Little Mendha group of mines has been made to B. M. Cornish, B. S. Rives, A. P. Gardiner, K. V. Zink of Salt Lake City, Utah, and E. P. Gordon, directors of the Pioche-Nevada Con. Co. Work has been started. A hoist will be put in and buildings erected. Manager Cornish has bonded four claims in Highland district, on the "Yuba dike."

The Salt Lake Route Exploration Co. has been incorporated at Salt Lake City, Utah, by President H. S. Joseph, R. W. Nicol, J. Obendorfer, J. Gauer and H. Hardy. The company owns seven claims in Yellow Pine mining district.

### Nye County.

Ore shipments from Tonopah for last week amounted to 968 tons from the following mines: Tonopah M. Co., bulk 445 tons, sacked 58 tons; Montana-Tonopah, 89 tons; Belmont, 100 tons, bulk; Tonopah Gold Mountain, 9 tons; Klondike mine, Klondike, 21½ tons. Goldfield: Jumbo (McDonald-Fuller lease), 92 tons; Zinn lease, 39½ tons; Florence, 80½ tons; Combination, 18 tons; Quartzite, 16 tons. The freight traffic over the road for month of October amounted to 9000 tons, of which 5000 tons was incoming freight and 4000 tons outgoing (ore). The work of broadening the C. & C. is being rushed, over 200 men being employed.

## NEW MEXICO.

### Grant County.

Work is reported progressing on construction of the smelter of the Comanche M. & S. Co. at Silver City. A foundry and a machine shop have been completed, and the steel frame of the smelter building is going up. S. S. Curry is president of the company.

### Otero County.

G. E. Moffett, manager of the Electric M. & M. Co. at Jarilla (Brice P. O.), says he will put in placer mining machinery and equipment.

## OREGON.

### Baker County.

H. B. Compson, part owner in the Man-of-War group of mines, near Greenhorn, states that work has been progressing on a shaft on the main ore body, but work will soon cease till spring on account of snow.

One hundred and four sacks of ore taken from the Orleans G. M. & M. Co.'s Orleans mine, near Sumpter, netted \$23 per ton, says Superintendent L. V. Swigert. It is expected a 12-stamp mill will be built.

W. Cable is resuming work on the Montezuma group, Cracker Creek district, near Sumpter. The group of four claims—on a vein parallel to the mother lode—is owned by Canadian men and known as the Montezuma Con. G. M. Co. The vein is shown the length of the four claims by a series of trenches and pits, showing an average width and assaying \$10. A tunnel and shaft are also driven. Superintendent Cable will sack ore and ship it to the smelter. In the spring he will put in a concentrating plant.

### Cos County.

Marshfield reports say the flooding of the Beaver Hill mine, which was on fire for a month, was completed last week and the fire extinguished.

### Crook County.

B. F. Allen, of Princeville, states the Oregon King mine, near Ashwood, has closed its workings to put in machinery to reduce the ore. C. M. Cartwright, of Portland, is part owner.

### Douglas County.

The 10-stamp mill at the Vesuvius mine, near Bohemia, was started last week, says Manager Hard.

About 150 feet more of tunnel will be driven in the mine of the Judson Rock M. Co., near Bohemia, says J. B. Keefer of Portland, president of the company. The quartz struck will pay \$30 per ton. The property of the Judson Rock Co. is 2 miles north of Mineral.

### Grant County.

The Iowa-Oregon M. Co. has been organized, with offices in Granite, Or., and Webster City, Ia., by President J. J. Kellher, Pocahontas, Ia., B. F. Keltz, J. J. Hahn, J. E. Thornhill, H. Campbell, H. O. Hyatt, with E. E. & G. Thornburg of Granite. H. O. Hyatt is manager. The Morris mines, near the summit of the Greenhorn mountains, 18 miles from Granite, owned by Thornburg Bros., have been deeded to the company.

The Empire G. D. & M. Co., at John Day, has men at work on its dredger, overhauling and repairing it for the fall run. The company has been defining the pay gravel in the district and securing water rights for development of electrical power for operating the dredgers. Operations are under T. H. Pomeroy.

Operations in dredging are being increased on Canyon creek between John Day and Canyon City by the Empire D. & G. M. Co. For the past three years the company has been operating a dredger near John Day, and the company has bought nearly all the land between the two places for dredging. Manager Carlton of the Pomeroy dredger is investigating the possibilities of Canyon creek and has two steam drills at work prospecting the banks of the stream. It is said two more dredging plants will be built next season.

In Quartzburg district, near Prairie City, the Dixie Meadows G. M. Co. has started up its 80-ton concentrator and is reducing from twenty to thirty tons daily. Ten per cent of the product is free milling. The Equity G. M. Co. reports good work with its 5-stamp mill. The Dixie M. Co., the stockholders being principally Portland men, is doing development work, and it is stated a 5-stamp mill will be put in this fall.

G. W. Wright of Albany reports he has sold his Golden Fleece mine in Quartzburg district to Kissling & Makeing of Portland for \$3000.

### Lane County.

L. Zimmerman, president of the Lucky Boy M. Co., operating at Blue River, reports that owing to scarcity of water in the mountains the Lucky Boy's 40-stamp mill cannot run to full capacity, twenty-five stamps being the limit at present.

### Lincoln County.

It is expected work will begin this month in the black sand beach mines, near Seal Rocks, near Toledo. Several of the miners have been working with small heads of water all summer. B. F. Jones of Toledo says he has 2 miles of the beach sands and will start as soon as there is sufficient water for a sluice head.

**Jackson County.**

A 10-stamp mill is being put in at the Opp mine, near Jacksonville. J. F. Reddy, to whom the mine is bonded, reports progress in development. He reports twenty men at work on the Blueleaf mine, which he also controls.

**Josephine County.**

The New Channel placer is being operated by H. F. Schoenfeld and J. E. Verdin, on south side of Rogue river, 5 miles above Galice. It comprises 120 acres of places ground. The gold is said to be coarse particles. The mine is equipped with hydraulic plant, with No. 2 giant and 1000 feet of 10-inch pipe. A ditch  $\frac{1}{4}$  miles in length has been completed. A 400-foot cable is stretched across Rogue river, fitted with cars for transportation of freight and passengers.

The Oro Pico mine has hauled the 50-ton cyanide plant from Merlin to the mine, 11 miles, and it is being set up. The mine, under Superintendent Chase, has been opened and ore blocked out.

**SOUTH DAKOTA.**

Monthly output, says the Black Hills Review, is being made by the principal mines of the Black Hills as follows:

Name of Mine.	Monthly Output.
Horseshoe	\$54,000
Clover Leaf	30,000
Spearfish	30,000
Homestake	204,000
Wasp No. 2	15,000
Imperial	24,000
Maitland	35,000
Golden Reward cyanide	27,000
Golden Reward smelter shipments	10,000
Miscellaneous	15,000
Dakota	15,000
Hidden Fortune	15,000
Lundberg, Dorr & Wilson	12,000
Black Eagle	2,500
Placer (estimated)	2,600
Total	\$450,500

**Lawrence County.**

Seventy-five stamps are dropping in the Horseshoe cyanide plant near Terry, and it is expected the remaining forty-five stamps in the mill will be added next week. The mill is treating 9000 tons of ore per month, says Manager W. L. McLaughlin. In the mines of the company preparations are being made for winter. The storage bins at the mill are being filled with ore that no delays may result from storms. Ore is being taken out at rate of 400 tons a day. The bins will hold 7000 tons of ore.

The Elliptic Co. is putting in equipment of mining machinery, including two boilers, air compressor and hoisting engine, at the company's shaft east of the Maitland mine at Maitland. The shaft is 170 feet deep, and will be continued to quartzite, which it is expected will be reached at 350 feet.

J. P. Allison of Deadwood of the Hidden Fortune M. Co. says 100 feet of ore is showing in the Bingham tunnel. The company is making regular shipments of ore to its mill below Deadwood and will resume operations in the shaft, where the ore body is shown.

The Gilt Edge-Maid mill, near Galena, has been connected with the electric power line and ore crushing will start next week. The leaching vats are in place.

L. E. Tomblin is doing development work on his mines in Bear Gulch district, west of Lead. Tomblin is also operating in Montana, near Big Timber.—Argentiferous galena is being shipped from the Shamrock mine, in Strawberry gulch, near Deadwood, adjoining the Puritan.

Alterations are being made by the Wasp No. 2 at its mines at Flatiron, near Deadwood. A baby air drill will be used in the open cut for block holing and breaking up boulders to mill size after the heavy blasts. To furnish compressed air for the drill they will put in 1400 feet of pipe line from the mill, where is a small compressor. The company will also put in two adjustable rolls for fine crushing. The crusher will be replaced by a No. 4 Gates. A bar worth \$4500 was shipped from the mill last week, the result of 12½ day's run.

**Pennington County.**

J. N. Wright of Custer, who has a bond on the Oriole mine, near the Golden Slipper, 4 miles northeast of Hill City, has the shaft down 110 feet. The vein shows a width of 3 feet.—At the Dolcode mine, near Hill City, under bond, development is under way with a diamond drill. G. Bain is said to have a contract for four holes, each to be 500 feet in depth.

C. J. and H. Gunderson, A. Lee and M. L. Fox, of Vermillion, S. D., having bought the Holy Terror M. Co. mines at Keystone, will work the Keystone vein by another reduction method. It is said they will sell the present equipment, and buy an entirely new plant of machinery.

**TEXAS.**

**Brewster County.**

Manager H. M. Nesmith of the Dallas M. Co., on Terlingua creek, near Terlingua, is putting in pumping machinery and will increase development work,

**UTAH.**

**Beaver County.**

H. E. Meyer of Salt Lake City, manager of the Federal mine, near Milford, says a hoist is to be put in and work increased.

**Box Elder County.**

The Boston & Terrace C. M. Co. owns a group on west side of Great Salt Lake, near the Lucin cut-off near Terrace, and arrangements will be made to ship ores to the Salt Lake smelters, says President C. T. Burchard. Sinking is still in progress on the vein struck in the main tunnel workings. At the 50-foot point a station will be cut and drifts and crosscuts started.

**Grand County.**

W. R. Wheat, manager of the Grouse Mountain M. & S. Co., with mines in Miners' Basin section of the La Sal mining district, near Basin, says: A carload shipment of rare metals made to the works at Niagara, New York, netted the Welsh-Lofftus Rare Metals Co. \$6200. The ore is said to carry radium, vanadium, uranium and barium, with copper and silver. Manager Lofftus says the returns received from the sale of the uranium, copper and silver paid expenses of mining, transportation and treatment charges. The vanadium brought \$6000 while the radium sold for \$200. Another shipment is being prepared. The product is sacked. The Lofftus Co. has two claims on which work is being done. The vein through which the rare metals are distributed measures 7 feet in width. The Grouse Mountain group is a producer of gold ore. A cyanide mill will be built.

**Juab County.**

F. Sundel of Eureka has bought mining property in Broad canyon, North Tintic district, including a one-fifteenth interest in the Tip Top, the North Star and the Silver King mining claims.

The Wasa M. Co. has bought in North Tintic district the Lucky Boy Nos. 1, 2 and 3, North Star, Tip Top, Red Wing, Silver King, Evening Star and Blue Bird mines.

A 40 H. P. engine, compressor and drills are being added to the Tintic properties of the Scranton M. Co. near Eureka, of which N. Dunyon is manager.

S. Nelson and T. C. Burns have started work on the Home Rule group at Eureka.

At a meeting of the Grand Central and the Victoria directors, vertical lines dividing the two properties were agreed upon which will prevent any future dispute as to the ownership of ore bodies. Arrangements were also made for the Victoria Co. to bring its ore and water to the surface through the workings of the Grand Central and work has started on the Victoria. Mining will begin on the 1500-foot level. The mines are at Eureka.

From the Carlisa mine of Tintic, near Eureka, is being shipped to the valley smelters an average of forty tons of ore daily, this to be increased when the hoist being set up on the 700-foot level goes into commission. In addition to the second-class ore, which maintains average of 5% copper, 7 ounces silver and \$4 gold per ton, the management reports normal tonnage of high-grade ore.

**Plute County.**

H. C. Lawrence, manager, and R. Foster, superintendent, of the Sevier Con. mines of the Gold Mountain district, near Marysvale, report in tunnel No. 3 a body of ore struck and penetrated for 12 feet without reaching the foot wall. The ore averages \$17 in gold per ton. The vein carries a flow of water. The mill is running on eighty tons a day. The company will make enlargements in the spring. The ore being milled comes mostly from tunnel No. 2, where a vein 14 feet in width has been developed.

**Salt Lake County.**

The Copper Belt railway, between the mines of Bingham and the stations on the Rio Grande, forwarded during October 35,000 tons of ore. The heaviest consignments during the month were from the Utah C. Co., also the Boston Con. and the Yampa. The Commercial group of the Bingham Con. system also sent out a heavy tonnage, while Ohio maintained its usual production. The Bingham and New Haven will ship increased tonnage the present month. In addition to ore that passed over the tracks of the Copper Belt railway, there were the tonnages handled by the United States & Utah Con. tramway.

Manager T. Jacobson of the Columbus Con. mine of Alta reports the mill in operation and concentrates will be shipped. S. Bamberger, manager of the Fortuna mine at Bingham, says forty tons of ore are being shipped daily.

Work on the towers of the Continental Alta's tramway at Alta is under way. Manager Crowther says survey for the aerial line has been approved to the first terminal, a distance of 13,317 feet—this to be known as the "angle station."

On the 300-foot level of the Ohio C. M.

Co. at Bingham, Superintendent Cummings says the ledge has opened up 25 feet of copper-bearing ore. Sampling from wall to wall shows average of 6% copper. On the 200-foot level the fissure had a width of 6 feet. Concentrates and ore are being shipped.

**Summit County.**

The roaster at the lead plant of the United States M. Co. at Bingham will be finished this week, says Constructing Engineer G. K. Fischer.

In the Scottish Chief M. Co. mine, near Park City, they have uncovered 20 inches of ore, assaying 700 ounces silver, with \$9 gold, 3% lead, 1% copper. The strike was made on the 250-foot level, says D. B. Hempstead of the company. The ore is largely silver chloride.

Manager J. Hickey of the Comstock mine at Park City says the company will put in an air compressor and use power drills in the mine. The water is now out of the mine, and work is going ahead. The Comstock is in Thayne's canyon.—At the California mine starting of the mill was somewhat delayed by breaking of pump used to pump water to run the mill from the Comstock mine. The mill has been idle for several months. A small dynamo has been placed at the mill to furnish lights for the mill and mine. At the mine, Superintendent Kaas reports conditions improving.

**Tooele County.**

In the drift run on the 900-foot level of the Honoring mine at Stockton the Buhl shoot of ore was broken into last week. This body was opened on several of the upper levels.

The Stockton G. M. Co. mine and mill at Stockton will be lighted by electricity, says Superintendent Galliger. In addition the generator will assist in driving the mill machinery, it being intended to connect the motors with the shaft in the concentrating room. Machinery is being set up and the mill is expected to start next week.

The Sacramento G. M. Co., at Mercur, will make a carload shipment of quicksilver, comprising over 300 flasks.

Manager G. H. Dern of the Con. Mercur at Mercur says at the mill during month of October 2100 tons of ore were treated, the value of which ran \$4 per ton, all of which was saved but 85 cents a ton, which went into the tailings. Manager Dern says headway is being made with construction of the sampling mill.

Shipments from the Buckhorn mine, near Ophir, to the Ophir hill mill, will be started this week. The men at work in the mine has been increased.

**Utah County.**

Lessee Tyng on the Miller hill mines, near American Fork, reports he has opened up ore and has started shipping. The ore nets \$50 per ton. It costs \$5 per ton to haul to American Fork. The Kalamazoo and other claims near the Miller hill mines will also be opened up.

**WASHINGTON.**

**Ferry County.**

Repairs and alterations are in progress at the Northport smelter of the Le Roi C. Co. The buildings have been reroofed and men are making repairs in the mechanical departments. All idle furnaces are being put in shape. The Northport smelter will receive 100 tons of ore daily from the Snowshoe mine at Rossland, B. C., and this, together with custom ores being received with the daily shipments from the Le Roi mine, will increase the working force and place more furnaces in operation, says Manager McMillan.

The First Thought mine, owned by P. Burns & Co., has resumed operations. Approximately 40,000 tons of ore are reported blocked out, ready for shipment. The ore is quartz, running on an average of \$15 per ton. The fall from the mine to the railroad at Orient is 1600 feet, sufficient to operate a gravity tram, which the management will put in. It is intended to increase the number of men at the mine. The smelters at Granby, Greenwood, Boundary, Phoenix, B. C., and Northport have arranged to handle limited quantities of First Thought ore.

**Stevens County.**

Kettle Falls reports say that work on the Silver Queen group of mines has started. The mine is 2 miles south of Kettle Falls and will be developed by R. K. Green of Spokane, who holds a bond. The superintendent is W. W. Warner, of Spokane.

**WYOMING.**

**Laramie County.**

The Amalgamated M. Co., composed of Denver, Colo., mining men, has bought five claims in the Hecla district, west of Cheyenne, making eleven claims owned by the company at Hecla, and increased development will be started. H. Schwartz of Denver, Colo., president of the Hecla M. Co., says he will erect a smelting plant in Cheyenne costing \$50,000. The plant

will be a 50-ton smelter and will handle all of the ore from the mines owned by the Hecla and Amalgamated companies.

**FOREIGN.**

**AFRICA.**

**Rhodesia.**

The Rhodesia Chamber of Mines at Bulawayo reports gold output for month of September at 17,166 ounces for Matabeleland and 8863 ounces for Mashonaland, total of 26,029, compared with 24,669 ounces for August and with 18,741 ounces for September, 1903.

**Transvaal.**

The Transvaal Chamber of Mines at Johannesburg reports the gold output for month of September of Witwatersrand mines at 301,131 fine ounces and of outside districts 11,155 ounces, a total of 312,286 ounces, as compared with 276,197 ounces for September, 1903. The principal producers report the following results:

Cyanide Plants, Ounces.	Tons of Stamp, Cyanided.	Gold Yield, Ounces.	Tons Crushed.	Stamps Dropped.	MINE.
3,084	9,041	3,623	11,665	60	Anglo

**BRITISH COLUMBIA.**

**Boundary District.**

The Senator mine, bonded to the Granby Co. of Phoenix, is being worked under J. Rogers and is making regular shipments to the Granby smelter. The contents of the ore are said to be largely iron, with copper.

Development work in taking out and shipping ore is being done on the Senator group, up North Fork, near Phoenix, under management of J. Rodgers. One car of ore is being shipped daily.

B. Ray, superintendent of the Betts & Hesperus mine, on Hardy mountain, 4 miles from Grand Forks, will increase development work this winter. He has let a contract for building a wagon road from Fourth of July creek to the Betts & Hesperus mine, 1½ miles long. Men are cutting timber for mining purposes.

**East Kootenay District.**

The Southeast Kootenay C. & P. Co., Ltd., has been incorporated at Spokane, Wash., to prospect for coal and petroleum in East Kootenay. The incorporators are G. W. Kerr, Rossland; W. Kelly, Jr., Stewardville, Minn., and W. A. Nelson, Spokane, Wash.

**Nelson District.**

At Ymir a strike is reported made on the Foghorn mine, owned by the Golden Monarch M. & M. Co. of Spokane, Wash. After the mine had been temporarily shut down, two men were left to do surface work. They uncovered apex of one of the veins crosscut in the tunnel, showing 9 feet of ore, says C. Wolfe, superintendent. He has put more men to work. It is also reported in the lower levels ore of good milling grade has been opened, and as soon as the water supply is sufficient the stamps will again be in operation.—The Hunter V. mine is maintaining output of 100 tons a day. This ore, although low grade, is said to be desirable smelter flux. Shipments are being made to the smelters at Northport, Wash., and Granby and Greenwood.

The Belmont group at Waneta has been bonded to R. A. Abrahams of Seattle, Wash. The claims are 1½ mile from the Nelson & Fort Sheppard Railroad and 7 miles from the Northport smelter. The principal values are in silver, assays running 200 ounces.—A strike is reported from the Lucky Boy group at Erie. A shoot of ore averaging, it is said, \$18 a ton, has been uncovered.

**Rossland District.**

At the White Bear mine, at Rossland, unwatering was completed last week and

mining has started with twenty-five men underground. More will be added. They will stop on the 800-foot level. The tonnage hoisted will be rough-sorted, the first-class product going to the smelter, while the balance will be put through the mill.

The Jumbo mine, at Roseland, is making shipments weekly of 500 tons. M. R. Galusha, manager, states a body of ore of shipping grade is being developed between the intermediate and No. 1 level.

A. J. McMillan, managing director of Le Roi mine at Roseland, states the chief idea for the amalgamation of Le Roi, the War Eagle, the Center Star and the Snowshoe mines is to get concentrated management, which will allow a reduction in cost.

#### Slocan District.

A. Ross has a lease on the Young Bear mine, on Slocan lake, near Slocan City. The Idaho mill at Sandon has closed down for repairs to machinery.

#### West Kootenay District.

Development work on the Lucky Boy mine is being increased with fifteen men. As soon as the trail is in shape for raw-hiding shipments will be made of ore assaying \$100.—At the Eva mine at Camborne the miners are driving in No. 1 tunnel and the raise. The raise, which is 225 feet in length, is timbered.

### BRITISH GUIANA.

Georgetown reports show exports from January 1 to October 4:

	GOLD.	Ounces.	Value.
1904.....	60,715	\$1,073,239 17	
1903.....	64,636	1,126,102 36	
	DIAMONDS.	Carats.	Value.
1904.....	8,560	\$67,583 22	
1903.....	6,836 9-16	57,546 39	

### INDIA.

The output of the gold mines of India for month of September is reported at 51,666 ounces—an increase of 149 ounces over August and of 214 ounces over September, 1903.

### MEXICO.

#### Chihuahua.

At San Pedro the Candelaria M. Co. is making improvements in the Leon camp.—L. Bryant of El Paso, Tex., has bought the Smith interest in the San Pedro M. Co. which owns 15 pertenencias in Leon camp. The Isabelita property was sold last week to S. C. Pratt & Co., who own other mines in the camp.

#### Durango.

The American-Mexico M. & Dev. Co. of Chicago, Ill., is preparing to build a 100-ton lead smelter on its mines and also to put in gas engines and hoists. The American-Mexico Co. is planning a 1000-ton smelter at Torreon and another at Velardena. The company will also place contracts for a 5000 H. P. boiler plant.

It is reported the mines of the Santa Rita, the San Nicolas, and the Concordia groups at Nieves, 30 miles west of Canita station, on the Mexican Central railroad, will be reopened. A 100-ton concentrating plant is running on ore from the dumps. The ores are silver-lead.

#### Guanajuato.

The American M. Co., having bought the Valenciana, Cata, Mellado and other mines at Guanajuato, will build a cyanide plant. The old dump will be treated, as well as ore from the mines.—Cyanide equipment is being put in by the Guanajuato Con. M. Co. at the Pastiler mill, to treat tailings from the concentrators.

#### Nuevo Leon.

The Harrison smelter at Cerralvo, 90 miles from Monterey, owned by H. C. Harrison, is reported doing well and working 400 men. This plant is on the Matamoros branch railroad.

#### Oaxaca.

A concession has been granted L. G. Teruel to build a smelter at Ocotlan or at Ejutla.

#### Sonora.

P. E. Murray of Nogales has bought the Jalisco silver-lead mines and will start to operate them next week. Much of the ore is shipped to El Paso, Texas.

It is reported that hoisting machinery will be put in at the Guadalupe mine, near Cananea.

The Sonora M. & M. Co., C. O'Keefe president and manager, will build a 20-stamp mill and cyanide plant on the Juarez mine, near Altar.

#### Zacatecas.

R. C. Gemmell, a mining man of Salt Lake City, Utah, has been granted a title to six pertenencias of mineral land in Parrillas canyon, near Concepcion del Oro. A lead vein, bearing gold and copper values, has been uncovered. Gemmell has named the mine Utah.

### TASMANIA.

The Mount Lyell M. & R. Co. at Mount Lyell report from September 15 to Octo-

ber 12, inclusive, a total quantity of 34,155 tons of ore treated, being 25,142 tons from the Mount Lyell mine and 9013 tons from North Mount Lyell mine. In addition, there were treated 1087 tons of purchased ore and metal bearing fluxes. The converters produced during same period 552 tons of blister copper containing—copper, 545 tons; silver, 49,816 ounces; gold, 1870 ounces. Shortage of metals due to stoppage of converter plant during period, thereby preventing working up of matte containing 101 tons metal into blister copper.

### Commercial Paragraphs.

E. B. WIGGINS has bought the assay office formerly conducted by R. W. Jackson at Phoenix, Ariz.

THE Watt Mining Car Wheel Co., Barnesville, Ohio, received a gold medal for their exhibit at the St. Louis Exposition.

THE Bucyrus Co. of South Milwaukee, Wis., has the contract for five 70-ton steam shovels and for six 95-ton steam shovels for the Isthmian canal commission, bids for which were opened Oct. 6th.

THE Link-Belt Machinery Co. report the sale of two complete tippie equipments to the Victor Fuel Co. The installation was designed by their Western engineers, A. E. Lindrooth, Shubart & Co., and consists of shaking screens, weigh baskets and motors.

COLORADO IRON WORKS Co. of Denver, Colo., report the sale of one large Bretherton hot blast box to the Ladd Metals Co. in Idaho and the shipment of one carload of improved standard wide-faced crushing rolls to the Detroit Copper Co., Morenci, Ariz.

THE Blaisdell Co., Los Angeles, Cal., have a cablegram from A. F. Crank, Johannesburg, S. A., stating that the equipment installed by them at the Robinson Gold Mines, Ltd., is working satisfactorily, and that the 40 feet by 8 inches Class "A" excavator is delivering in good condition 100 tons per hour, on 15 H. P.

The "Connecticut," launched September 29, 1904, at the Brooklyn Navy Yard, is the largest battleship afloat. Length, 450 feet; beam, 76 feet 8 inches; normal draft, 24 feet 6 inches; normal displacement, 16,000; indicated horse power, 16,500; speed, 18 knots; officers and men, 819. She carries the largest electric light and power plant ever installed on a battleship. The plant, which has a capacity of 800 kilowatts, consists of eight Crocker-Wheeler generators direct-connected to Forbes marine-type engines.

THE Borden & Selleck Co., 48-50 Lake street, Chicago, manufacture modern conveying machinery, gas and gasoline engines, coal crushers and screens, etc., and are also contractors and designers of complete plants and docks for storage and handling material. They issue handsome catalogues covering their lines and showing photographic illustrations of many of their installations. This company also issues special catalogues on the Howe gas and gasoline engines, which are combined with pumps, air compressors, hoists and engines.

### Trade Treatises.

Bulletin "A" of international standard metric weights, with grade description, is from Wm. Ainsworth & Sons, 2151 Lawrence St., Denver, Colo.

"The Sullivan Mining Machine for Undercutting Coal in Room and Pillar Mines" is the subject of Bulletin 48-B, from the Sullivan Machinery Co., Chicago.

Catalogue No. 7 of the Raymond Bros. Impact Pulverizer Co., 143 Lafin street, Chicago, Ill., describes the Raymond system of air separation, and their special grinding and separating machinery.

"The Power of the New York Subway" sumptuously sets forth the part played therein by the Allis-Chalmers Co. of Milwaukee, Wis., in the new underground rapid transit system of New York City.

The "Bronco" channeler is the subject of a trade treatise from the Ingersoll-Sergeant Drill Co., 26 Cortlandt St., New York, describing and illustrating the successful operation of a heavy-cutting engine for open quarry work and the development of quarry properties, being an outgrowth and development of the old bar channeler.

### Personal.

S. A. GILMORE is superintendent of the Julia mine at Nevada City, Cal.

E. P. FLEMING is assayer at the Copper Queen smelter at Douglas, Ariz.

C. H. MARKHAM is manager of the Guffey Petroleum Co. at Beaumont, Tex.

W. CABLE is manager of the Montezuma G. M. Co.'s mines, near Sumpter, Or.

A. C. MASSEY is superintendent of the McCabe mine at McCabe, Yavapai county, Ariz.

M. H. FRENCH is manager of the Black Hills & Denver G. M. Co., near Rollinsville, Colo.

C. M. BECKER is manager of the Stratton's Independence, Ltd., at Independence, Colo.

G. WEST is metallurgist for the Rincon M. Co., near Martinez, Yavapai county, Ariz.

F. H. SHEPHERD, C. E., of Victoria, B. C., is inspector of coal mines for British Columbia.

A. R. PARSONS is assistant manager of the Bamberger De Lamar mines at De Lamar, Nev.

J. S. JOHNSON of Houghton, Mich., is superintendent of the cyanide plant at Blanchard, Ariz.

A. C. GARDE, for the past three years manager of the Payne mine at Sandon, B. C., has resigned.

S. J. SPEAK is manager of the Ymir G. M. Co., Ltd., at Ymir, B. C., vice G. H. Barnhart, resigned.

W. W. TRAVELL is assistant manager of the Stratton's Independence mine at Independence, Colo.

P. H. AHIER is manager of the Idaho-Alamo mines at Sandon, B. C., vice W. S. Jenkins, resigned.

W. W. WARNER of Spokane, Wash., is superintendent of the Silver Queen mines, near Kettle Falls, Wash.

H. O. HYATT of Webster City, Iowa, is manager of the Iowa-Oregon M. Co., operating near Granite, Or.

G. F. RANSOM is manager of the Payne mine at Sandon, in Slocan district, B. C., vice A. C. Garde, resigned.

J. D. MCKENZIE of Chihuahua City, Mexico, has gone to the Cerro de Pasco mines at Cerro de Pasco, Peru.

W. S. JENKINS has resigned as manager of the Idaho-Alamo mines at Sandon, B. C., in the Slocan district.

N. F. HEATH is superintendent of the Standard mine at Quartzburg, near Sumpter, Or., vice Z. Houser, resigned.

E. ENDERLEE of New Orleans, La., is at Forest, Idaho, where he is manager of the Idaho Placer & Quartz G. M. Co.

W. FITCH has assumed his duties as manager of the United States M. Co.'s mines and reduction works at Bingham, Utah.

G. W. KEEL, having resigned as manager of the Butterfield mines at Bingham, Utah, has gone to New York and London.

J. FITZSIMMONS has left Cananea, Sonora, Mexico, for Johannesburg, South Africa, to become identified with mining there.

N. B. KNOX, mining engineer, is in San Francisco, Cal., and will leave on Nov. 15th to examine concessions in Japan and Korea.

A. BUCKBEE of Salt Lake City, Utah, part owner of the War Eagle mine, near Silver City, Idaho, will remove to Boise, Idaho.

W. H. CLAY of East Orange, N. J., has been appointed to the engineering staff for the Panama Canal construction, and will be at Colon.

W. Y. WILLIAMS of Spokane, Wash., recently general superintendent of the Granby mines at Phoenix, B. C., has gone to Wales on business.

S. K. THORNTON has resigned as superintendent of the Shenandoah mine at Plymouth, Cal., and is in charge of the Elliott mine at Oleta, Cal.

R. B. GREEN, formerly chemist for the Minnesota Iron Co. and for the United States Steel Co. in Minnesota, is with the Sumpter smelter at Sumpter, Or.

F. TAYLOR, till recently superintendent of the Bingham-New Haven M. Co. mines at Bingham, Utah, is manager of the company, vice A. J. Molloy, deceased.

O. F. LACKEY has resigned as chief en-

gineer of El Cobre mines of Santiago de Cuba, to become assistant engineer in the office of Harbor Engineer, Baltimore, Md.

H. L. MILLER, manager of the Libertad M. & S. Co. of San Antonio de la Huerta, Sonora, Mex., has returned there from three months' visit in the East.

F. O. HARVEY of London, England, consulting engineer to Mason & Barry, Ltd., has been appointed consulting engineer for the San Miguel C. M. Co., Ltd., operating in Spain.

D. M. PHILLIPS, for several years manager of the San Ricardo mines in Sonora, Mexico, has resigned, and is devoting his time to his interests in Ures district, with headquarters at Ures, Sonora, Mexico.

W. L. LOVELAND has been appointed manager of the mining and crushing machinery department of the Allis-Chalmers Co. He assumed his new duties October 18th at the main office of the Allis-Chalmers Co., Chicago.

### Obituary.

WM. DUNN, a mine owner of Arizona, died at Phoenix, Oct. 30. He was interested in mines in the White Tank mountains.

W. H. BUCKETT, a pioneer miner of Nevada county, Cal., died at Grass Valley, Cal., Oct. 31. Deceased was a native of Cornwall, aged 75 years.

G. W. CURRIER, a pioneer mining man of Colorado, died at Denver, Colo., on the 1st inst. Deceased was a native of Newburyport, Mass., born in November, 1839.

J. W. JONES, a pioneer mining man of the San Juan, Colo., died at Kansas City, Mo., Oct. 18th, aged 69 years. Deceased was a native of West Virginia, and went to Colorado in 1872.

G. H. KNOX, a pioneer miner of California, died at Redding, Cal., Oct. 21, aged 74 years. Deceased was a native of Maine, and was part owner of the Bully Choop mine in Shasta county.

A. SHERWIN, a pioneer smelter man of Leadville, Colo., died at St. Louis, Mo., Oct. 21. Deceased was 76 years of age, a native of Vermont. He was manager for several years of the Elgin smelter at Leadville, Colo.

M. J. MCNAMARA, a pioneer of Colorado, a director of the Colorado Mining Exchange, and vice-president of the Colorado Marble & M. Co., died at Denver, Colo., Nov. 5th. Deceased was born in Ireland, May, 1843.

W. W. HOOTON, a pioneer miner of California, Caribou, B. C., Washington, Montana and Idaho, died at Idaho City, Idaho, Oct. 31. Deceased was locator of several mines, among them the Sub Rosa group and the Washington, near Idaho City. He was born in Philadelphia, Pa., 74 years ago.

J. B. BRADLEY, an oil producer of Bolivar, N. Y., and one of the first men to discover petroleum on Oil creek, near Titusville, Pa., died Oct. 30 at Chicago, Ill. Deceased was 78 years old. In 1859, when E. L. Drake sank the first well on Oil creek, Bradley went there and leased property on the banks of the stream. During the forty years he was engaged in oil production he is said to have put down several thousand wells. He also operated at Pithole, Petroleum Center, Oil City, Edenburg, Bradford and Titusville.

### Books Received.

The Journal of the Canadian Mining Institute for 1903, Vol. VI, has been received. It contains the papers and proceedings of the Institute. This volume contains a number of interesting and valuable papers, mostly of a practical nature. Others are of a scientific and theoretical character.

The sixth edition of "Accidents and Emergencies," by Chas. W. Dulles, gives a concise and complete account of the means of relieving injured persons till the arrival of skilled assistance. In addition to its treatment for poisoning, drowning, fits and other common accidents, the procedure in case of electrical and machinery accidents is good. An understanding of the facts set forth would do much to reduce the mortality in our mines if they could be promptly applied. This book is published by P. Blakiston's Son & Co., Philadelphia, Pa. It will be sent by the MINING AND SCIENTIFIC PRESS upon receipt of \$1.

## Tunnel Locations.

Among the oldest form of mineral locations are the "tunnel sites," as they were formerly called. Locations of this character were made even prior to the enactment of the Federal mining laws. The discovery of new mineral districts often resulted in the location of numerous "tunnel sites," sometimes laid on the four slopes of a mountain. As this class of location became popular, legislation was enacted to make the acquisition of mineral veins by this method possible while doing away with the frequent litigation arising from the unorganized acts and rules of the miners.

In some districts where the vein system was complex it was impossible to locate a "tunnel claim" without strife. The first tunnel legislation was unsatisfactory, as this, as well as other mining legislation, was largely based upon the miners' rules and customs, which were often crude, and insufficient to meet the wide range of geological conditions which often had a direct effect upon the provisions of the law. The first laws were amended by the passage of the law of May 10, 1872, which provided that "where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the face (or beginning) of such tunnel, on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnels of lodes or veins, not appearing on the surface, made by other parties after the commencement of such tunnel, and while the same is being prosecuted with due diligence, shall be invalid, but failure to prosecute the work on the tunnel for six months shall be considered an abandonment of the right to all undiscovered veins

on the line of such tunnel." The ambiguity of this statute—the only one on the subject in the Federal mining law—has been the cause of much litigation. Many questions in tunnel litigation have fortunately, however, been settled by the United States Supreme Court.

The Federal law does not prescribe how a tunnel location shall be made, and this matter has come to be regulated by rules prescribed by the General Land Office. By these rules the tunnel locator is required, as

soon as his projected tunnel goes under cover, to give notice at the entrance to the tunnel, by posting the same in a substantial and conspicuous manner the following: Names of the persons, or the company claiming the tunnel right; the proposed actual course of the tunnel; the height and width of the tunnel; the course and distance from the entrance to some permanent well-known objects in the vicinity, by which to fix and determine the locus of the tunnel entrance, as in lode claims.

To mark the "line of the tunnel," it is necessary to set a double line of stakes or monuments 6 feet apart (the width of the tunnel) and extending for 3000 feet to the end of the claim farthest from the mouth of the tunnel.

The United States Supreme Court has definitely determined that the right of a tunnel locator to claim a vein arises from his discovery of the vein in his tunnel, and may be exercised by locating 1500 feet of said vein, and this may be taken as desired, in equal distances from the center of the tunnel or in such proportion thereof on either side as he may desire.

A discovery made in an ordinary tunnel (not a tunnel site claim located under the tunnel laws) requires that the discoverer mark the boundaries of such claim on the surface, the same as if such discovery were made on the surface; but in a tunnel right claim, where the claim has been properly taken, the discovery of a vein in such tunnel does not require the same to be located at the surface. In addition to these several phases of tunnel site law, there are many others not passed upon by the courts.

THE upward advance in the price of copper is having a salutary effect on the industry, and if long continued cannot fail to result in increased production, particularly in the Western United States, where there are many new and idle mines ready to start up. While the demand for copper has increased the past five or six years, the total visible supply has steadily fallen off, being reduced by large sales of stock on hand. In 1899, the total visible supply November 1 was 26,847 tons. The first of each succeeding November since then has seen the visible supply shrink to smaller amounts each year, until on Nov. 1, 1904, it was but 13,505 tons, a comparatively small amount. Contemplated electric installations indicate a demand for copper fully up to the present production, if not exceeding it. A short time since, when copper was but 13 cents, it seemed possible that 15-cent copper would soon be a reality, and now it is within a small fraction of that figure with every indication that it will pass the 15-cent mark. To what figure it may advance it is impossible to say, but it seems not too much to expect, under the existing conditions, a further substantial increase in the present price of the metal, possibly 16 cents, or even more.

AMONG the notable accomplishments of the modern mining industry was the recent unloading in four and one-half hours of 10,000 tons of iron ore from a steamship on Lake Erie at Connaught harbor. In this work eight electrical unloading devices (four each of two types) were employed. The best previous record for ore handling from ship to land for an equal amount was about ten and one-half hours, actual time, although the machines worked off and on for fifteen hours, making four and one-half hours lost time. In the recent example here mentioned only five minutes time was lost. These occurrences show clearly the drift of the tide of human ingenuity, the capabilities of which have not yet been reached.

## The Miner in Rock Studies.

A great deal of attention has been given by students of geology and petrography to the origin and composition of rocks—particularly the igneous rocks. In these studies it has constantly been the aim to find typical examples of the various rocks and to secure them as fresh and unaltered as possible, that their identification might be more certain. Probably no branch of geological science has undergone so much investigation and has caused so great an amount of discussion as that of the character and origin of rocks, unless, indeed, it be the character and origin of ore veins and deposits. The nomenclature and classification of rocks has been changed time and again in the past years, and each new student who comes to be recognized as an authority attempts to create new species, and to make further hair-splitting differentiation among the rock masses, which only serves to still further complicate a classification already seriously involved. It is a well-known fact that from different portions of the same rock mass it is often possible to secure half a dozen or more distinct types of rock—the disappearance or appearance of common and essential minerals at once altering the name and character of the rock, while the chemical analysis still shows that no very material change has taken place. In a single rock mass it is possible to find granite, quartz-porphry, syenite, aplite and several other varieties of the granite magma.

While the exhaustive studies of rocks, their composition and origin, have resulted in a large fund of valuable information on this subject, the metamorphism and alteration to which normal rocks have been subjected by dynamic and meteoric and other agencies, has largely been neglected, but the recent publication by the United States Geological Survey of a monograph on this important subject, written by that careful observer, C. R. Van Hise, will prove a welcome addition to the classics of mining and geological literature. Really from the standpoint of the miner a knowledge of metamorphosed and altered rocks is of far greater importance usually than of normal unchanged rocks, as ore deposits rarely occur in wholly unaltered rocks of any kind. Their most prominent normal constituents are often replaced by strange minerals. Hornblende or mica may be removed in a granite to give place to valuable gold bearing minerals, as at the Independence mine in Cripple Creek district, Colo. The feldspars of diabase may be altered to silica with infiltration of gold and auriferous pyrite as an accompaniment, as in the Mother Lode region of California and elsewhere. Dark, hard and tough rocks are changed to soft talc schist. Granite becomes schist near the vein, and many other changes take place in the rocks, and it is a knowledge of these occurrences that is more valuable and necessary to the miner than the knowledge that the country rock of his vein being granite should consist of orthoclase, quartz and mica. He knows that, for all the text books tell him so, but he constantly finds conditions and combinations of minerals with which he is unfamiliar, because the text books do not treat of these. He finds a fine-grained, light greenish colored siliceous rock. He may believe it to be felsite, but is not sure for the reason that a short distance away the rock is limestone, apparently a portion of the same rock mass, which it really is. It is on these matters that the miner desires information.

## The Hoisting Engineer.

No man about a mine assumes graver responsibilities than the hoisting engineer. He must be not only a competent engineer and a machinist, but he must possess peculiar personal characteristics not necessary to success in other occupations. He must have quick discernment and be able to act promptly. His judgment must be intuitive, and he must almost anticipate the wants of the men far underground, and whose means of communication with the surface is a slender bell cord. Bell systems sometimes become disarranged and signals are not as clear as they should be, but by long familiarity with the ringing of the bells the engineer can almost unerringly tell what is wanted, but under such conditions he assumes grave risks. He becomes accustomed to the different methods of ringing and can thus usually feel certain who the person is giving the signal from below.

He should occasionally make the trip through the shaft, in order that he may become thoroughly familiar with it, particularly if there are changes in its dip or alignment, or dangerous projections in the shaft, such as settled wall plates, chute aprons, pipes or other objects dangerous to the men. When he leaves one place of employment to perform similar duties elsewhere, if the levers, throttles, etc., by means of which the moving skips and cages are controlled operate differently from those to which he has been accustomed, his responsibilities are greatly increased, and if it can be satisfactorily arranged these levers should be changed to suit the runner. Particularly is this the case with steam throttles. Some are drawn toward the engineer to start the engine, others are pushed away, for the same purpose. When a man is accustomed to this operation of a throttle by working at it for months or years, it becomes "second nature" to him to move the throttle in whichever direction the exigencies of the case require. Removing to a new situation, for days and weeks, possibly months, he has to guard carefully against moving the throttle in the wrong direction.

## Risk vs. Economy.

Men who are working mines under lease will ordinarily surround themselves with the necessary precautions to avert, or at any rate, postpone a dangerous condition, but as they have usually no permanent interest in the property they do not make as substantial improvements as are made by owners, either private or corporate. Lessees will assume great risks sometimes to secure a small amount of rich ore. At one time in the Calico district in San Bernardino county, California, miners might have been seen swinging by ropes over a perpendicular cliff in upper Wall Street canyon, where were found small pockets or bunches of rich chloride of silver in vugs and spots in the volcanic rocks. Some mines are worked in so niggardly a manner by owners, as well as lessees, as to leave insufficient support to the walls, and the few pillars left are robbed from time to time by succeeding and more daring workers until the pillars cease to be much of a factor for safety. It is told of the last days of operations in a mine in Sonora, Mexico, some distance east of Hermosillo, that this had been the style of mining practiced, but the company taking up the old mine recovered a large amount of ore from the old workings by scaling from the walls the thin slabs of ore left in the haste incident to mining the rich vein, until all that was left were a few small insecure pillars. These contained rock running into the thousands of dollars per ton. The weight of the walls was beginning to tell on these frail columns which were cracked and splintered by the pressure, and miners feared to touch them with pick or bar. The wealth was aggravatingly in plain sight, but just beyond reach. As an interesting experiment, the expedient of shooting off fragments of the ore by well-directed rifle shots was tried and succeeded so well that several thousand dollars more were recovered in this manner without injury to the workmen. It was then determined to undertake the recovery of a larger amount of lower grade ore by blasting. The result was disastrous. The entire upper works caved, a workman was killed and several others barely escaped with their lives. This mine is to be reopened by a new and expensive vertical shaft sunk in the hanging wall, which will reach the vein far below any of the old workings, and in time it will doubtless again become a producer. The above is only a single example of the risks men will take to recover a small amount of rich ore at a minimum of expense.

IT is not only requisite to have many acres of land, great veins, and heavy machinery to make mining profitable. It is even more essential to have sufficient value in the veins to make profit in mining possible. Low-grade mines of large size are in demand, but there is a limit to the lowness of the grade. Moreover, a grade of ore which will insure dividends at one mine may be wholly inadequate to produce like results at another mine, for many reasons, due to situation, cost of labor, materials, and many other things, and in some instances to the management.

## CONCENTRATES.

CARBON is a non-metallic substance. It is between the two, but has not the properties of a metal, hence by some chemists is styled a metalloid.

It is seldom well to buy an imitation; it is usually better to buy the thing imitated. There is less trouble and better result and less cost in the long run.

IN modern mining practice the tendency is to increase the load hoisted, rather than increase the speed of hoisting. By this means economy and safety are both promoted.

SULPHATE OF ALUMINA 15° B will make timbers fire proof, and if ferric sulphate be added will preserve them from decay. The cost of such impregnation is about \$10 per m. ft. b. m.

THE trend of ore shoots in many important veins is to the right, in looking down the dip of the vein; but this is not universally the case, as there are exceptions equally important.

THE barometric reading in inches multiplied by .4908 equals atmospheric pressure per square inch. The barometer at 23.8 shows a pressure of 11.68 and an approximate altitude of 6420 feet.

THERE is an occurrence of quicksilver (cinnabar) near Santa Ana, in Orange county, Cal., but the mine has never been profitably worked. The development is only superficial. As far as known, no serpentine is present in the vicinity of this cinnabar.

EACH 1% of water or moisture in wood will detract about that much from its fuel value. A pound of oak wood is worth no more than a pound of pine if both are dry; about two and one-fourth pounds dry wood equals one pound soft coal in fuel value.

LITTLE success has attended efforts to extract the gold values from iron sulphide without fine grinding. Experiments made in a number of places indicate that the percentage of extraction bears a strong relation to the degree of fineness of material treated.

SOME of the largest gold mining operations in the world are in progress in New Zealand, in Waihi district. New shaft equipment at the Waihi Co.'s mine have recently been added, which will nearly double the output. A pumping plant has been put in to handle the water to a depth of 3000 feet.

RICH lode gold mines do not always produce rich placers, and rich placers are often known where the lodes do not pay to work. Although millions of dollars have been taken from the telluride ores of the Cambrian strata, near Lead, in South Dakota, these deposits do not produce valuable placers.

THE copper mines of Missouri are in St. Genevieve county, about 11 miles from the Mississippi river. The ore occurs in a series of shoots or lenses lying nearly horizontal in limestone. There are at least two horizons at which these ores occur. The mines have been operated off and on for years. Idle at present.

THE fact that a certain rock formation is of Carboniferous age does not necessarily imply the occurrence of coal in the formation at that place. The Carboniferous rocks in the Western part of the United States rarely, if ever, contain beds of coal, though they are frequently the repositories for rich bodies of ore—copper, lead, silver and gold.

WHERE two machine drills are operated in a single face—drift or shaft, or even in a stope—they may be so set up that a single "chuck-tender" can attend both drills, working a crew of three, instead of four men. If the runners understand their business, the chuck-tender will have an easy time; but an incompetent runner can keep a chuck-tender busy throughout the shift.

THE amount of water being sent out from the Sutro tunnel, on the Comstock Lode, from the Con. Virginia & California mines, which is the point of central drainage below the Sutro tunnel level, is about 1500 gallons per minute. This is in addition to the amount coming in under pressure in the hydraulic elevator. There are many mines which make more water than this, but the water is not hot, as at the Comstock mines.

THE grade of flume which will carry the tailings from a stamp mill depends on the amount of water present in the tailings, the character of the material, size of the flume, and on the temperature. A flume which will discharge perfectly during summer may clog as soon as freezing weather sets in because of insufficient grade. A grade of 2 inches to the foot will usually suffice in any but the coldest countries, where the amount of water is abundant.

WHERE a person legally relocates a mining claim, he also has the right to locate a claim on the ground ad-

joining, if the same be public land and open to location, and this location may be made on the same vein as that first mentioned. Assessment work may be done on either of two contiguous claims for both of them (\$100 worth for each), if it can be shown that this work is for the benefit of both, even if a creek run between the two locations on the surface.

A STEEL INGOT is not a finished product. It is a raw material for a rolling mill. It is a product that is obtained by pouring metal into a mold. An ingot 17 inches square at the small end and 19 inches square at the large end and 5½ feet long would weigh 5500 pounds. In the rolling process the ingot is passed through rolls, reducing its size to bloom, billets and slabs. Anything below a bloom and slabs are billets. A bloom is the largest size. Eight inches square or larger is ordinarily called a bloom; below that it is a billet, until the ½ inch or ¾ inch size is reached, when it becomes a rod. These terms are approximate and lap over.

HYDRAULIC "GIANTS" used in placer mining are of several kinds, and the modern device has been evolved from the experiments of fifty years. Various devices have been employed to prevent the stream from spraying, and two of the most important are the placing of several longitudinal wings, called "rifles" by the inventor, though they are not spirally arranged. The lip of the nozzle is also provided with a small channel (cut by machine). This channel or groove is situated just within the outer edge of the nozzle, and is claimed to reduce the tendency of the stream to spray. The wings are calculated to prevent the stream from assuming a rotary movement, and the groove is claimed to keep the stream from feathering.

REDUCTION of tellurium dioxide and tellurous acid to metallic tellurium by means of sulphur dioxide occurs only when the solution is mixed with from half its bulk to an equal bulk of strong chlorhydric acid, and then only after several hours' heating and passage of the gas, but in the simultaneous presence of sulphur dioxide and iodohydric acid the reduction is immediate and complete, even in the cold. To the solution of about 0.3 gram of tellurium dioxide in sulphuric or chlorhydric acid diluted to 100 c.c., add 1 to 2 grams of potassium iodide, heat to boiling and add about 50 c.c. of a solution of sulphur dioxide. Pass through a weighed filter, wash with water containing sulphur dioxide and finally with alcohol and ether, dry at 100° to 105° C. and weigh.

A CONVENIENT DOOR for ore chutes in shafts, either vertical or inclined, is the plate-iron door supplied with rack and pinion. The chute bottom should have a slope of at least 45° to keep rock from clogging, though the outside extension may be made somewhat flatter than this angle. If desired an apron of plate iron may be secured beneath the chute lip by bolts at the sides, so that it may be folded back when not in use, out of the way of the bucket or skip. For safety some miners also place a board across the chute, secured by cleats about 6 inches outside the door to catch any stray pieces of rock that may escape after attempting to close the door, but the better plan is not to overload the bucket or skip, and not to "ring it away" until all ore has ceased to fall from the chute.

HANGING BOLTS in shafts may be safely removed from those timbers above three sets from the bottom of the shaft, if the ground is hard and the sets have been tightly wedged. If the ground is too soft to firmly sustain the timbers in place, bearers should be put in at least every ten sets until hard solid rock is reached. On these bearers, which extend into the shaft walls at its ends, the entire weight of ten sets must rest, consequently it is important they should have a firm foundation, or rest on a ledge of rock or in hitches cut for them. It is also a good idea, in such cases, to put in permanent hanging bolts to aid in holding the weight and to make the frame as rigid as possible. In shafts where these precautions are necessary the work should be in experienced hands, as mistakes may lead to serious results.

IN designing a quartz mill it should be the object to utilize only sufficient timber, or other material, to make the structure strong and durable, and to distribute it in such manner that it will form the least possible obstructions to the view, and movement of materials from place to place, compatible with strength and durability. In no case should the rock breaker be set in the mill proper if it can be avoided, but if not then the breaker should be set on a timber frame resting upon the bedrock, or other secure foundation and wholly detached from the building, or the great vibration set up by the operation of the crusher will be communicated to the entire structure. The most important feature in mill construction is the foundations, and these must be secure and ample to carry all weight. No timber should be laid upon the earth, either wet or dry, or it will rot in a short time, causing more expense than would have been necessary if the work had been properly done in the first place. Dry walls, as well as masonry walls, are suited to mill work when the walls are carefully made by experienced men.

WHERE two compressors are operated by a single motive power, as by belt between them, and the pipes lead to one main pipe, it is proper to have a valve on

each of the individual pipes, and also one on the main line intermediate between the compressors and the air receiver. By means of this arrangement either of the cylinders may be thrown out of commission while the other is operated, and in the event of the necessity of stopping both sides of the compressor for a few minutes, this may be done by closing the valve on the main pipe, the air under pressure in the receiver then being available as long as the pressure is effective. The safe speed for running a compressor depends wholly upon the make of the machine. Some old style compressors are at top speed with sixty revolutions per minute, and more modern ones are run at much higher speeds. Mine ventilation by means of compressed air is expensive. A large volume of air may be blown into mine workings by means of fans. Compressed air is useful to drive out smoke or gas from a face or in a raise after a blast, but the scheme is of doubtful economy. It is better to provide the necessary fan ventilators.

EIGHT persons may take up 160 acres of placer ground as a consolidated single location or claim. In Idaho the State law requires that within sixty days from date of location the locator shall sink a shaft to the depth of 10 feet and not less than 16 square feet in area. Any excavation which shall have been completed within sixty days from date of location, and which shall measure 160 cubic feet in extent, shall be considered a compliance with this provision of the law. The Federal law requires that \$100 be expended annually upon each claim, and as the 160-acre tract located by the association of eight individuals is a single claim, but \$100 worth of work or improvements is required on this claim annually. Mineral lands must be paid for at the rate of \$5 per acre, in addition to the assessment work or other improvements made, no matter how extensive. The applicant for patent must also pay the fees for publication of "notice of application for patent," which must be published in the newspaper nearest the claim. In the event of the land having been surveyed by the United States, and the lines of the placer conform to these lines of survey, no new survey is necessary.

THE first cement copper was produced in Spain at Rio Tinto in 1752 from heaps of low-grade sulphide ore that had undergone decomposition through natural process. The copper was leached out by water, the metal being precipitated on iron. It was first thought to be merely a coating of copper on the iron, but it was found that if left long enough the replacement became practically complete. At Stadtberge, Germany, copper ores, consisting of the oxides and carbonates of copper, metallic copper and copper glance, are crushed and charged into cemented vats to a depth of 3 feet. A weak solution of sulphuric acid is turned into the vats (the acid being obtained by roasting sulphide copper ores in furnaces). It takes eight to nine days to leach a tank containing sixty-five tons of ore. In the United States a patented process employs the action of sulphurous acid on copper oxides and carbonates, in the presence of water and an excess of the sulphurous acid. The oxidized compounds of copper are attacked by the solvent, the copper going into solution as cuprous sulphite, which, although insoluble in water, is soluble in an excess of the sulphurous acid solution. If the excess of sulphurous acid be driven out by heat, cupric sulphite will be precipitated from the solution in the form of cupro-cupric sulphite, a finely crystalline dark red salt, containing 49.1% copper, which, after drying, may be melted in a crucible, with little or no flux, to a mass of pure copper. There are numerous methods of leaching copper ores, but all of these processes are more or less complicated and involve an extensive knowledge of chemistry, without which only moderate success can be anticipated.

IT is not an uncommon thing to find an accumulation of ore, a pocket, or a bonanza, in a vein where the dip changes from a steep to a flatter indication. This is often found to be the case in pocket mines, in simple fissure veins, and elsewhere. The bonanzas of the Comstock lode, Nevada, mostly occurred under these peculiar conditions, notably those of the Con. Virginia and California. In the development of most pocket mines it is found that the pockets occur with some regularity—that is, like causes appear to produce like effects, and in some mines this systematic occurrence of bonanzas, or pockets, has been studied and the mapping of these several occurrences has shown that the pockets appear in a zone or shoot within defined limits, and that search for pockets beyond these limits is not fruitful of good results. The size of bonanzas, or value of pockets, cannot be anticipated, but often their distribution in the vein or zone can, with a fair degree of certainty. This would indicate that the arrangement is not haphazard, but systematic. These conditions are particularly observable where pockets of gold occur along a fissure which at intervals is intersected by small fissures or veins crossing it in strike and dip. In some instances a third fissure appears, having approximately the same strike as the main fissure, but a different dip, which results in an intersection of these veins, the bonanza, or pocket of gold occurring where the three planes intersect each other. Sometimes one of these planes, instead of being a fissure, is a particular band or stratum of rock (not a vein), as a layer or band of "mineralized" slate, that is, slate heavily impregnated with iron sulphide. In some instances it is a strip of talc schist, probably representing an altered dike.

Native vs. White Labor in Central America.

To THE EDITOR:—In your issue of July 30, under "Concentrates," you give a few paragraphs respecting white labor in Spanish America—outside of Mexico. With respect to the opportunities and remuneration for white miners, it occurred to the writer that, possibly, a few words respecting white labor in Central America might prove acceptable.

Generally speaking, with regard to this and other countries of the Central American republics being suitable as a field of enterprise for skilled white miners, outside of those brought here under contract, I should be inclined to give but scant encouragement.

In the first place, almost all the manual part of mining is done by native labor, which is decidedly cheap, and, as regards its efficiency—for the class of ground that we have here, at least—I should be inclined to place it somewhere in the ratio of two to one in favor of good, skilled white miners. Good native miners are, therefore, fairly efficient and, under contract, they will work long hours (ten) and work hard. Their remuneration, reduced to a gold basis, is very small. Miners in this part of Nicaragua receive \$2.25 paper per day, which, as the rate of exchange is about seven to one, makes their remuneration on a gold basis equal to about 32 cents. Consequently, if my premise is correct in the ratio of two to one, the local remuneration due to a white miner to compete with natives would be about 64 cents gold—a wage that no white miner would dream of accepting. On the other hand, if he cannot turn out a greater proportion of work, it is clearly not the good policy of the mining company to pay him more; and there is very little charity in Central America—any more than in other parts—in solving the equation of cost versus results.

A man's value, manually, is equal to and is, more or less, reckoned at the cost of native labor he is capable of displacing, and this formula applies to all trades.

White miners are utilized as shift bosses and mine foremen; but, again, clearly their numbers are limited, and, besides, on account of the highly unsatisfactory conduct of imported men through taking to "guaro"—a native spirit, peculiarly disastrous in its enervating effects—and other depreciatory digressions, they often become more burdensome than helpful, so that there are many who prefer native foremen, at least for all but the most responsible positions. It must not be forgotten that white men in the States and elsewhere are under a different environment than they are when living in the tropical Central American countries; and to many, if not most, especially those with any pronounced structural weakness, this change of environment induces too readily and perceptibly a change conformable thereto, resembling the condition of the inhabitants of these countries, which, to say the least, is neither desirable nor conducive to the benefit of the individual. The Central Spanish Americas, in the writer's opinion, offer inducements to only those who are qualified to fill responsible positions efficiently and honorably. The requirements call for men of stamina and of a decidedly moral fiber—men who do not need "props," but men who are men and who can stand alone. To such there is undoubtedly a field in the Spanish Americas, but to such men there is usually a position to be filled at home, for these men not only make good miners but good citizens—men whom the world needs everywhere.

As an example of the cheapness of labor, together with its efficiency, herewith is added a statement showing the cost of contract work, which may be taken as about the present average at this mine, and which, I think it will be agreed, it would be impossible to anywhere approximate in any mining district, not only in the States, but also in any country where white labor is exclusively employed. Of course, this result, figured on a gold basis, is mainly due to the depreciation of currency in this country, which may change. In that event, unless wages were correspondingly lowered, the costs must necessarily increase; but most will allow, I imagine, that there is a good margin before—with such economic costs—one must seriously consider cutting wages or its equivalent, the price of contracts.

Finally, I would say with regard to Central America—for I know nothing of South America—that it is most decidedly not the country to which white miners should come, unless under contract at a satisfactory remuneration. This, as stated, is mainly due to the "impossible-to-meet" competition of native labor, giving the costs recorded, and also on account of the moral disintegration that so often happens to those not cast in a sufficiently strong mould.

And, moreover, I would emphasize the potentiality of the remarkably cheap labor that is capable of yielding such results.

That this labor is not without certain serious drawbacks cannot be denied; also, that at times it is somewhat difficult to procure in adequate quantities. But, as an instance of what native labor can achieve in these countries, the writer considers the attached

tabulated statements may prove of interest to many mining men, and also of service in comparison with costs of other cheap native-working countries. Probably it may not be considered a remarkably cheap performance by local experts. The writer rather hopes that this may, indeed, prove the case, as he is humanitarian enough to know when his corporation is getting good and efficient returns and the toiling native some sort of adequate remuneration for his industrious efforts. In this instance, as the wage is \$2.25 per day (paper) it will be seen that all the contractors are making from 50% to 100% over day wages, which, in the writer's opinion, from the strenuous application is richly deserved:

struction at one particular place. Of course there are other ways in which a rope may receive injury while on the drum for an unusual length of time, such as being wound on in very hot weather and remaining until the weather is cold; that was not so in this instance, however, and it is more than likely that the cause was as above suggested.

Gravel Milling in Calaveras County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by M. P. BOAG.

The deep gravel mines of Calaveras county are ancient river beds, which can be traced for miles

The Care of Hoisting Ropes.

In a recent report contributed to his Government on mine accidents, W. Fryar, Inspector of Mines for Queensland, Australia, has the following to say regarding the care of hoisting ropes:

The care of the ropes is of the utmost importance. They should be examined every day, and during that examination they should make the journey up and down the mine before any persons descend.

The French law provides that, where persons ordinarily ride in cages or buckets without safety catches, the ropes must be subject, among others, to the following regulations:

1. Two meters (6 feet 6½ inches) or more shall be cut off once every three months from the end of the rope.
2. Unless tests are made every time the end is cut off, the rope must not be employed for more than a year for winding purposes.
3. If the tests are made upon the end of the rope cut off every three months, the rope may be kept in use so long as its resistance to rupture, or its breaking strain, has not been reduced more than one-third.
4. For regularly lowering or raising persons, it is forbidden to use a wire rope which has been spliced, or one which has been returned on account of having been strained, or one which has not already worked successfully in several trial journeys in winding material.

A remarkable bit of experience was obtained at one of the Gympie mines toward the close of the year touching the care, or want of care, of ropes. Among the vicissitudes of the mining industry is the necessity of obtaining exemption from work for certain periods. Such necessity had arisen, and the ropes were wound on the drums in the engine house, where they rested for a term. The ropes had not done much work, and, to use a common expression, they were "good as new." On resuming work, however, it was soon found that one of them was gone in one of its strands; fortunately, this was discovered before any harm was done; the other strands were easily broken at the same place, and a valuable rope was destroyed. In many cases an occurrence of this kind is "shrouded in mystery;" but the necessity of searching out the hidden mysteries of these and other dangers has been so frequently brought under notice that the cause was sought and apparently discovered. The roof of the engine house had been used before it had attained to that position, and a number of nail-holes were in it; it was corrugated galvanized iron; the holes were not on top of the corrugations, but in such a position that they allowed the rain water to descend on to the rope, and hence its de-

through this and adjoining counties. Their course is not influenced in the least by the mountains and valleys at the present day. The rivers had defined channels in the bedrock. The whole country was then overflowed with lava, covering up the streams. The depth at which these channels are found varies with the locality. The gravel in the channel is from a few feet thick to several hundred. All, or nearly all of this, carries gold. The richest is mostly found on the bedrock, though deposits of rich gravel have been found just under the lava capping. The gravel consists principally of decomposed serpentine, schist, granite, quartzite, slate and quartz. This decomposition, especially of the serpentine, has formed a clayey cement, binding the pebbles and boulders of quartz so hard that milling is necessary to release the values. The usual practice in milling in this neighborhood is to dump the mass as it comes from the mine onto an inclined grizzly. The fine separates and goes directly to the storage bin. The lumps fall onto a horizontal grizzly. The largest of the quartz boulders are sorted out by hand and thrown over the dump. The clayey chunks are broken up with hammers till all will pass through the grizzly into the bin. The bars of both grizzlies are spaced 2 inches apart. It is fed from the storage bin to the stamps by a large Challenge feeder. The screen used has 1/16 of an inch mesh. When fine enough to escape through the screen it passes over wood riffles charged with mercury. The gold usually being bright is easily amalgamated. At one mill a plate is being used with excellent results. An ordinary stamp mill, with 800-pound stamps, will crush one ton per hour per stamp. After being about one month in one of these mills I would offer the following suggestion and experiences. It is, however, distinctly understood that the question of one or more discharges or any other practices usually found in quartz milling are not here discussed. I do not consider the stamp mill best adapted to this kind of work. In my opinion a mill of the revolving cylinder type is better. It is a well-known fact that not less than 80% of the wear and expense of the stamp mill is caused from crushing the quartz pebbles and small boulders which are entirely worthless; whereas, in a cylinder mill they would be useful as a means of pulverizing the cement. If a stamp mill must be used the 2 or 3-stamp mortar is to be preferred. With a 5-stamp battery there is difficulty in preventing the two outside stamps from pounding iron. I tried a 5-inch drop but found it would not work. This material does not scatter well when being crushed. Better results were obtained by giving stamp numbers 1 and 5, 6 inches drop; Nos. 2 and 4, 6½ inches drop; No. 3, 7 inches drop. This mill had been run with back and front discharges. By stopping up the back discharge and using the single discharge only I found the mill worked much better, besides increasing the tonnage crushed. I believe the principal cause of the increased capacity when using only the front discharge was due to the water being more concentrated, and having consequently more moving power, keeping the screens from getting clogged by the clay.

In front of the plate was a distributing box with holes 1 inch from bottom. The discharge from the mortar struck the holes, making the flow very uneven over the plate. By putting in a piece of 1x4, resting on the front of the box and sloping towards the back and 1 inch from the bottom, I found that the flow over the plate was much more even. By adding mercury to this box it was possible to save a high per cent of the values here. By making this box not less than 12 inches wide and putting in slats in the form of a riffle, the greater part, especially of

the coarse gold, can be saved. The plate is a great benefit, especially for the fine gold. The riffles should be used, but only for safety. If a stamp mill is used the feed throat should be not less than 6 inches wide.

### The Homestake Cyanide Plant.\*

The most extensive cyanide plant in America is that of the Homestake Co., in the Black Hills, S. D. The plant is in two sections, one on Gold Run, below the city of Lead, and the other at Gayville, at the mouth of Blacktail gulch, 1½ mile north of Lead. The company mills daily over 4000 tons of ore from its extensive system of mines. The ore is crushed in six mills having a total of 1000 stamps. That from the open cuts and superficial workings is treated in the three mills (containing 360 stamps) on the north

the mortars. The cost of milling and amalgamation in the mills at Lead (two of 200 stamps each and one of 240 stamps) is 40 cents per ton. As the pulp leaves the plates it consists of about ten parts water to one part of solid material (ore), sands and slimes. The tailings are sized, the coarse (remaining on 100-mesh screen), being 22% of the whole; the middles being 100 and 200 mesh) 18%, and the slimes (passing 200 mesh), 60%.

The pulp is passed through several series of classifying cones. From the first series a portion of the water is pumped back for re-use in the mills. Recently a set of sixteen cones, 10 feet in diameter, has been added to the Gold Run plant.

From the lower part of the cones is drawn the pulp, which consists of all the leachable material and a portion of the slimes. The water passing off at the top of the cones contains very little that is of value. That portion separated, which contains the values, is conveyed to the cyanide plant on Gold Run,

the battery has a beneficial effect upon amalgamation. The lime is crushed through a screen having a mesh ½ of a square inch.

There are fourteen vats each 44 feet diameter, 9 feet deep inside, and holding 610 tons of sand. A vat fills in eleven to eleven and one-half hours. The material is given five days contact with solution. The first solution contains 0.14% potassium cyanide. This solution is continued, with frequent intervals of drawing off to admit oxygen, for three days, at the end of that time, the weak solution containing 0.10% cyanide is turned onto the charge and contact maintained for two days, completing the period of leaching. Wash water is then turned on and continued until the effluent solution shows only 0.02% to 0.03% KCy, and from 5 to 7 cents per ton in value. The charge is then sluiced out with a hose.

Precipitation is effected in the large tanks of 300 tons solution capacity, by agitating by means of compressed air, while spraying the agitated solution

The Homestake Mines and Mills, Lead, South Dakota.

end of the property. The leachable portion of these oxidized north-end ores are treated in the plant in Blacktail gulch (see engraving on the front page). The ore from the lower levels is mostly mined at the southern end of the property and crushed in the mills at Lead. This ore is described as a hornblende, garnetiferous schist, which has been infiltrated by silica and auriferous pyrite, the latter constituting 7% to 8% of the entire vein rock.

The ore is crushed in rock breakers at the hoists, from whence it goes to the stamps in three mills comprising a total of 640 stamps. The mortar is narrow and gives a rapid discharge of this ore through the steel needle slot type of No. 8 screen, though the height of discharge averages 10 inches above the top of the die. These conditions with this granular, half schistose ore result in producing an extremely fine pulp—80% passing a 100-mesh screen. The capacity of the batteries is four tons per stamp per day.

To properly handle this amount of crushed rock the quantity of water necessary is fully eight to ten times the weight of ore.

Amalgamation is practiced both inside and outside

(see engraving on front page), where the pulp is subjected to a second classification by passing through another set of settling cones. The overflow from these cones is carried to a large tank and holds in suspension only the finest sediment. This material is little more than clouded water and is employed in sluicing out the leachable material from the cyanide tanks. The material discharged from the bottom of these gravity settling cones is passed through thirty-six hydraulic classifying cones.

The slimes separated from the sands by these several series of classifiers constitutes about 30% of the ore crushed, all of which will pass a 200-mesh screen. The remaining sands form a product which is rapidly and successfully leached by cyanide solutions. The amount of sand treated at this place daily is 1450 tons, the largest in the world.

The leachable pulp (very fine sands), which contains 10% to 15% pyrite, is charged into the vats by means of a rotary distributing device. The normal leaching rate of this material is 3 to 4 inches per hour throughout the treatment. Lime is added to the pulp before it reaches the tanks. The lime was formerly added in the battery, but was found to seriously interfere with amalgamation, whereas, in South Africa it is claimed that the addition of lime to

with an emulsion of zinc powder and water. The entire contents of the tank are then pumped through two large filter presses. The gold, silver and excess of zinc remain in the filter while the barren solution passes through to the weak solution tanks, its value having been reduced from \$2 to 5 or 10 cents per ton. The value of the slimes from Homestake is \$0.80 to \$1.10 per ton, but these are not being treated at present.

This refined and exhaustive treatment of the tailings leaving the Homestake mills, several of which are illustrated in the accompanying engraving, is strongly in contrast to the treatment of tailings in former years. At first the mills were only provided with plates of raw copper, inside and outside the batteries. From time to time experiments were made in the concentration, but these were spasmodic and never wholly satisfactory. For several years, beginning with 1879-80, a rude concentration was attempted in so-called blanket houses. There were two houses, each about 300 feet long, having a grade of 2½ inches or more to the foot from end to end. In these were arranged shallow sluices, 22 inches wide, in which were laid 50-foot strips of Brussels carpet. Over these the tailings were run, the greater portion of the sands passing on with the

\* See illustrations on front page.

water, the heavier particles of pyrite and iron from the mortars settling on the carpets with some sand, forming a dirty and low-grade concentrate. These were recovered by turning off the stream of pulp from one section of the several lines of sluices and removing the carpet, which was washed in a tank, the carpet being replaced in the sluice, and the pulp again run over it when the several strips of carpet in the section had been washed.

These concentrates accumulated in large quantity during the several years that the plant was maintained, and in time the entire lot was sold to the pyritic smelter at Deadwood, where it was used in the smelting of the siliceous telluride ores from the Terry peak region.

### A Concrete Lined Shaft.

Written by FRANCIS DONALDSON.

The United States Coal & Coke Co. at Tug River, W. Va., has just completed two coal shafts which are noteworthy in being elliptical and lined with concrete. Both shafts penetrate two coal seams, the No. 4 seam at a depth of 100 feet, and the No. 3, or Pocahontas seam, at a depth of 175 feet. These shafts are described in the Engineering News as follows:

**AIR SHAFT.**—The air shaft is 14 feet 2 inches by 20 feet in the clear, and is divided into two compartments by a line of 6x8-inch buntons carrying a brattice of tongued and grooved boards. One compartment is for an air passage; the other is to contain a spiral iron stairway. As this shaft is to be used as an upcast, and the rock penetrated is very solid, it was necessary to concrete it only for 45 feet to cut off surface waters. At the point where it was decided to start the lining, bearing timbers were

and except at the surface no timbering was required. The sump and the necessary excavation for the arches at the lower seam were completed before any lining concrete was placed.

A mixing board was built between the shaft and the engine hoist. In the shaft, 4 feet below this level, a platform large enough to hold two shaft buckets side by side was set on the cross braces (Fig. 1). A paddle mixer was set up on the mixing board, with its spout overhanging this platform, and a movable chute was adjusted so that the concrete could be run into either bucket. When a bucket was filled the chute would be thrown over, the bucket would be hoisted enough to swing clear of the platform, lowered into the shaft and dumped. It was thus possible, by filling one bucket while the other was being emptied, to run the mixer continuously.

The sump lining and the arch bench walls for a distance of 10 feet back from the shaft at each opening were completed before the arch centers were set. For filling the arches a platform was set about level with their crown. A horizontal elliptical ring of the shape of the cross-section of the shaft was set to correspond with the shaft lines 2 feet above the crown of the side arches. Vertical lagging was run from this to the arch centers all around and the concrete thus brought to a level. The placing of all this concrete was continuous, making the lining of the shaft bottom monolithic.

The forms for the vertical lining were built in 5-foot rings, each having eight sections. These were constructed of 2x6-inch vertical lagging, nailed to segments or frames at the top and bottom. The bottom frame of each section was fastened to the upper frame of the section below by two 1½-inch oak dowel pins. The tops of the sections were held together by cleats nailed at the joints, and by 6x6-inch braces bolted to the under side of the upper frames. Spaces of 1 inch were left between sections at the side and end joints to facilitate the removal of the

stand rough handling. The cast iron buntun pockets should be either omitted or modified so that it would not be necessary to cut holes through the forms.

The concrete should be placed wet and faced by working a perforated shovel or similar instrument next the forms.

Springs delivering any considerable volume of water should be drained to the shaft by a pipe through the concrete. These pipes, if plugged at all, should not be plugged until the concrete has set hard. The work was done under superintendency of the writer.

### A Ride on an Aerial Tramway

TO THE EDITOR:—One and one-half miles north of Silverton, Colo., is located the Silver Lake mill, on the Animas river. From this mill to the Silver Lake mine and Unity tunnel is an aerial tramway. The line to the Unity tunnel is 6200 feet in length and has a fall of 659 feet and a capacity of eighty tons in ten hours. It is known as the Bleichert system, made by the Trenton Iron Works Co., Trenton, N. J. About half way to the mines from the mill is a station (Midway), where the buckets are switched to and from the main line to the mines.

I secured a pass from the company to ride over this tramway to their mine and return to the mill. I got into the bucket, which is 2 feet 6 inches long, 2 feet wide and 15 inches deep, and holds 5 cubic feet, or about 700 pounds, of ore. I was somewhat nervous, not being pleased with the idea of being suspended in the air anywhere from 20 feet to 600 feet from the ground. But once in the bucket there was no backing out. The tramway man pushed the bucket out to the line and fastened the grip to the running cable and said "Good bye." Before I knew what was happening I was out of the building, going up the line, and found myself grasping the sides of the bucket for fear of falling out. After passing a few towers I soon breathed easier, as I found out it was no use to be frightened—the bucket was going ahead and I was in the bucket and there was no getting out. Several hundred feet up the line from the mill is a "break over" and then a straight line for Midway station. One place just after leaving the break over is a very high tower and quite a long span, and I thought that was the long span I had heard of, and once over that I again breathed with more freedom. I reached the Midway station without mishap and was still grasping the sides of the bucket. As I rode into the station the tramway man at this point asked me if I wanted to go to the Unity. Upon assuring him that I did, he pushed the bucket around to the Unity line, set the grip and said "Good bye." I was again off, up the line. It looked pretty steep, and it was. Some of the towers are over 100 feet high, and in crossing the gulch one span is 500 feet long and something like 600 feet from the ground. At this point I still clung to the bucket. It looked a long distance between towers and seemed to me it was a mile or such matter to the ground. During the trip, which occupied something like thirty-five minutes, it rained several times and the weather was cold. Arriving at the mine I was met by another attendant, who helped me to alight from the bucket, and I was glad to get out.

I immediately went to the blacksmith shop, where there was a fire, and got warmed up. In a short time the foreman of the mine came out of the mine and we went to dinner at the boarding house, which is a part of the mine buildings. After dinner I visited with several of the men until it was time for them to go under ground. The tramway did not run during the noon hour, and shortly after it started up I again seated myself in a bucket and started down the hill for the mill. But a short distance from the mine is located the long span, and it looked higher than ever, and I caught myself gripping the bucket tighter than ever. At several of the towers heavy timbers and rock have been placed to keep the snowslides from tearing out the line. I had been out but a few minutes on the line when another light shower passed over. In making the switch from the Unity line to the main line at Midway my hat was knocked off and it looked as if I would go the remainder of the distance hatless, but, as luck would have it, the attendant caught me before I got out of the building. In a short while I was again at the mill, having made the perilous trip in safety.

In coming down the line I could not help looking at the rope above and the little sheave wheels traveling along on the standing cable, and to notice the grip

Fig. 1.—General Layout of Concrete Plant for Lining Elliptical Shaft.

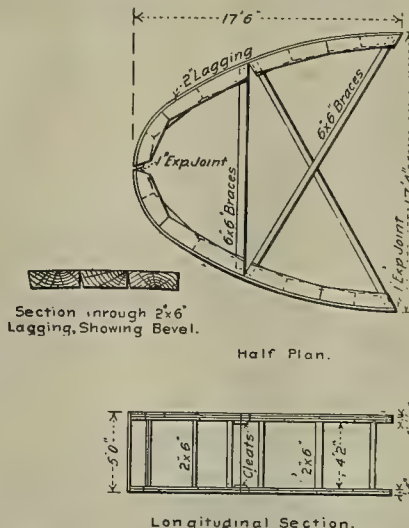

Fig. 2.—Movable Form for Concrete Lining for Elliptical Shaft.

placed, and a foundation ring cut into the rock. A platform was built upon these timbers to support the first set of forms. The concrete was brought up in 5-foot sections, the method being similar to that used in the hoist shaft, which is described below. The plans required the lining to have a thickness of 1 foot. This concrete was hand mixed.

When the surface of the bedrock was reached the overflowing water was led to a point at one side of the shaft, where a small dam was built. A pipe was then placed from this dam so as to lead the water through the inner concrete form to the interior of the shaft. The concrete was tamped around the pipe, and after it had set sufficiently the pipe was plugged, thus completely cutting off the surface water.

**HOIST SHAFT.**—The hoisting shaft is 17 feet 4 inches by 33 feet in the clear, and is concrete lined throughout, with concrete arched entries at both seams. This shaft is divided by three lines of 8x12-inch buntuns into an air way, two hoist ways and a pipe way. At the bottom, under the hoist ways, is a sump 8 feet deep, lined with concrete. Each seam has two 24-foot, three-center concrete arches over the main entries, and a 15-foot arch over the air course. The lower seam has, in addition, an 8-foot entry for pipes at one end of the shaft. The plans for the hoist shaft lining required a thickness of 1 foot at the sides and 1 foot 6 inches at the ends. The buntuns are held by cast iron pockets or boxes imbedded in the concrete lining, so designed that the buntuns may be readily changed.

Both shafts were sunk simultaneously. Compressed air was used for drilling and electricity for lighting. Three eight-hour shifts, six days a week, were employed. The average weekly progress in the hoist shaft was 16 feet, and 20 feet was the best week's work. This shaft was 19 feet 4 inches by 36 feet through the rock, and contained 20.2 cubic yards of rock per lineal foot. The rock penetrated was solid,

forms. The cracks thus left were covered with strips of roofing paper.

Lining was carried on in two shifts, one placing a ring of forms and the other filling it with concrete. A platform was laid on each set of braces for dumping the concrete. As this platform was level with the top of the ring, placing the concrete was not laborious. Little ramming was needed, as the concrete was mixed wet. A smooth surface was obtained by working a long, narrow spade up and down against the forms.

The cast iron boxes for the buntuns were placed in holes cut through the forms, and were lined and held in place by temporary buntuns made of boards.

The arches at the upper seams were put in similarly to those at the lower. The shaft forms below the upper seam were then taken out and used one by one above it. Only ten rings in all were made, and these served for lining the entire shaft. When these ten were all in place again above the upper seam, the lower rings were removed one at a time and used for a third time.

The form shift consisted of an engineer, headman, two carpenters and two helpers, the latter working either inside or out, as might be required. The time required to take a ring out from below and reset it was about the same as that required to set a new ring lowered from above.

The concrete shift consisted of an engineer, headman, about twelve laborers for the mixer and five men in the hole, placing and ramming the concrete. To fill an average ring, containing 30 cubic yards, took ten hours.

The finished lining is generally smooth and water tight, and is a satisfactory job. This work has shown that the most important points which must be observed to make a concrete shaft lining a success are: The forms must be rigid, smooth and practically water tight. They must be built in sections small enough to be readily handled and strong enough to

attached to the running cable. And as I came down I kept thinking to myself, "Suppose that grip should break, where would I be?" I would then argue the question to myself, "Hundreds of men have gone over the line before me and came out all right; guess I will get through all right." M.  
Silverton, Colo.

## Use of Crude Oil for Fire Assaying.\*

Written by F. C. BOWMAN.

The principal fuels used in assaying are coal and coke, while charcoal and wood are used in special cases, and in some portable furnaces gas and gasoline are employed, although it is difficult to obtain the same even heat with the latter as with the coal and coke furnaces. In some portions of the country, however, the high cost of these fuels and the difficulty of obtaining a good quality of such fuel often leads one to adopt the gasoline furnace where the work is light.

It was in view of these facts that I was led to experiment with crude oil, which was comparatively cheap as a fuel, although I was informed by a very prominent manufacturer of gasoline furnaces that others had not been very successful in this line.

A new two-muffle 11"x16"x7" furnace, which was constructed to burn coal, had just been completed, as is shown in the accompanying cross-sectional draw-

ing. The full width of the fire box and the other brick arranged as shown in the section and extending the full width of the fire box. The successful working of the furnace depends largely on the arrangement of this firebrick.

In starting the fire a piece of oil waste is lighted in the fire box just back of the burner nozzle. When this is burning well oil and steam are turned on at the same time until the oil ignites and the oil valve set to give the proper flow of oil, after which it is regulated by the steam valve. Plenty of waste should be used to furnish a blaze until the furnace is hot enough to ignite the oil, otherwise an explosion is liable to take place from the gases formed by the oil in the partially heated furnace.

The valve DV at the end of the steam line is left slightly open to let the water of condensation drain off, which if passed into the furnace will cool it off and is liable to crack the muffles. To obtain the best results the steam should be absolutely dry, and for this reason the steam is passed through a coil around the stack before going to the burner. A small steam coil is placed in the oil tank to heat the oil and make it flow more evenly, and also serves to keep the heavier oils from settling.

About fifteen minutes after the fire is started the muffles are red, and after from thirty to forty-five minutes the crucibles are ready to pour. With this furnace I have run through twenty-five to thirty assays in one and a half to two hours, and from fifty to sixty assays in two and a quarter to three hours, including cupelling. This time is counted from the time the oil is turned on until it is turned off. The amount of oil used varied from 4.2 gallons per hour to 5.3 gallons per hour, varying with different lots of oil and also with the quality of steam furnished. With oil at 8.7 cents per gallon delivered at the burner, the cost per assay was 2.2 to 2.8 cents.

In a coke furnace with a single 11"x16"x7" muffle and using forced draft, the average consumption of coke per hour was thirty-four pounds. The time was counted from the lighting of the fire until the heat was too low to be used for cupellation. With coke costing \$2.25 per cwt. delivered at the furnace, the cost per assay for fuel was 7.1 cents.

In a No. 31 Cary combination gasoline furnace of F. W. Braun & Co.'s make, using a 2-inch Cary burner of the same make, the average consumption of gasoline was 0.65 gallon per hour, the gasoline being delivered to the burner under an average pressure of ten pounds. The time was counted from the time the gasoline was turned on until it was turned off. With gasoline at 40 cents per gallon delivered at the burner, the cost per assay for fuel was 5.2 cents.

In the discussion following C. W. Comstock said: "By way of additional information as to fuel consumption in assay furnaces the following may be of interest: Twenty-three heats aggregating 117.25 hours were made in a coal-burning furnace with one muffle. The muffle was 12"x19"x7½". The grate was 19"x12½", and its upper surface was 17½" below the muffle. Two tons of coal were burned, one ton of Maitland screened nut and one ton run-of-mine from an unknown locality. The grate area was 1.66 square foot. Coal was burned at the rate of thirty-four pounds per hour, or twenty and one-half pounds per square foot of grate surface per hour. No record was kept of the number of assays made during this time. The average time per heat was 5.1 hours, the shortest 3 hours and the longest 8 hours. Fire was started in a cold furnace at the beginning of each heat.

"A No. 37 Cary double muffle furnace made by F. W. Braun & Co. of Los Angeles consumed gasoline as follows: Two heats aggregating four hours and fifty minutes consumed 6.36 gallons, or 1.30 gallon per hour. The air pressure in the gasoline tank was forty pounds. One heat of two hours and twenty-five minutes consumed 2.70 gallons, or 1.12 gallon per hour. The pressure was thirty pounds at the beginning, but owing to a leak ran down to seven pounds at the end. One heat of four hours and twenty minutes consumed 5.95 gallons, or 1.37 gallon per hour. The pressure was thirty-five pounds. One heat of two hours and twenty minutes consumed 2.70 gallons, or 1.14 gallon per hour. The pressure was twenty pounds. The total consumption was 17.71 gallons in fourteen hours, or 1.27 gallon per hour. One of the muffles was 6"x12"x4" and the other was 10"x16"x6½". The burner was a Cary hydrocarbon burner, 2¼" in diameter."

## A Big Contract.

The California Gas & Electric Corporation of San Francisco, Cal., has contracted to supply the United Railroads of San Francisco with all the power necessary to operate its electric lines for twenty years, beginning January 1, 1906. This means that electricity developed by water power in the Sierra Nevada mountains will be transmitted nearly 150 miles at 40,000 volts to operate the street cars of San Francisco. To prevent any interruption of service, a 16,000 H. P. auxiliary plant is to be installed in San Francisco. This will consist of 4000 K. W. dynamos directly connected to gas engines operated by crude oil water gas from a new gas-making plant to be installed. Contracts for the auxiliary plant have been let.

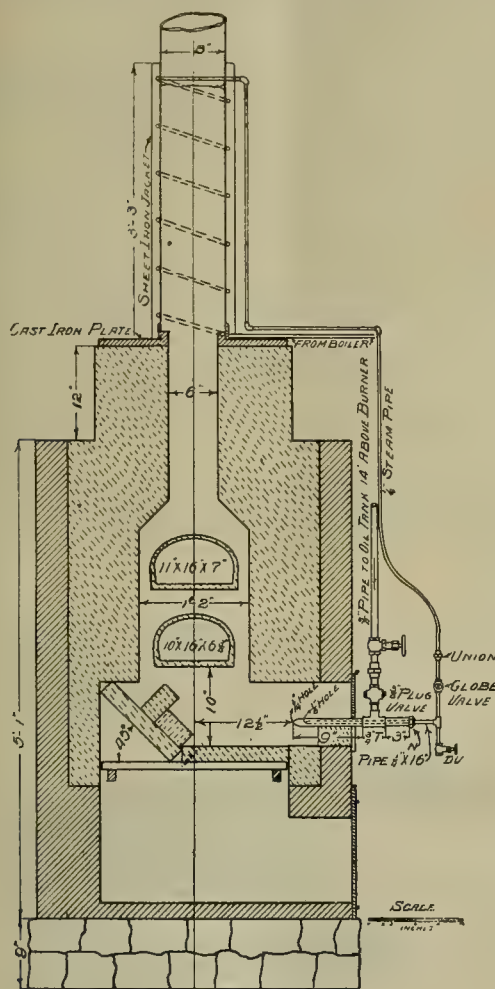

## Quicksilver in Pan Amalgamation.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS.

In the first place, the quicksilver must be in perfect condition before its addition to the pans. It must not be "sickened"—i. e., the globules must quickly become incorporated with the mass and not repel each other. It must be bright and very active. Unless in this condition, one of two methods of regeneration must be employed. Either retort the entire amount very slowly or put it in the clean-up pan with a small amount of potassium cyanide, some copperas and a very small quantity of unslaked lime and grind for at least two hours before drawing off. Even if the loss is heavy, it will be more than balanced by the subsequent saving, not only of the floured quick, but also of an increased amount of the precious metal contents of the ores. In the second place, handle as little as possible, because whenever it is poured from one vessel to another, even into water, there will be a loss of floured quick, besides, at times, a greater loss from the spattering of the big globules. Quicksilver becomes so comminuted that a collection of the particles will look milky and can only be combined by rubbing the globules together for some time, so that it is important to prevent this separation in every possible way. From the first time that the newly purchased flasks are emptied, the quicksilver should pass mechanically through the entire journey, from its entrance to the pans to its deposition below the strainers, except that portion which is mechanically and chemically combined in the amalgam. The tanks below the strainers contain water to break the fall of the quick, which is dripping from the canvas sacks, and from there it is pumped to a tank above the pans, from which it runs automatically, as required. Caution must be exercised that there is no leak in any part of this system, so that the losses can be confined to the time that it is in the pans and settlers and in the handling of the accumulating amalgam. To extract the balance of the quick from the amalgam, don't hit the sack with a club, but raise it in the iron box and drop it smartly on the iron ring, while in scooping out the contents hold a vessel under the scoop till it is over the receiving car. In shoveling into the retort, see that a tight dam of clay is placed at the mouth and a large vessel with water in it underneath to catch the drip. Start the retorting slowly and carry it through till the last drop of mercury has been distilled. In this way the losses can be controlled by conscientious work, except while the quick is with the pulp.

This is where we find flouting and, to a very limited extent, chemical loss. This chemical loss is much less than is generally supposed. If some of the quicksilver is changed to calomel, it is immediately decomposed by the copper sulphate and the iron of the pans or the iron scraps, which are always in the pulp from the wear of the crushing and pulverizing machinery, so that the entire loss in quicksilver can be definitely stated to be mechanical, and under nearly every condition the majority of it can be saved if proper devices are put in, as in gold mills. Take the head of a tailings pond, where the slimes and sand fall from the flume, the accumulation of quicksilver and amalgam in a very short time becomes of monetary importance, showing that no intricate or expensive devices are required. To control the loss in the settlers is very difficult, as the pulp does not remain long enough for this, besides, when a fresh plug is withdrawn, the sudden lowering of the surface will carry off an appreciable quantity, through the increased velocity, until the outflow balances the fresh water added. This loss can be kept to a minimum by always having the wooden shoes on the bottom and only revolving the arms at such a speed as to keep the sand from packing and accumulating on the bottom. This speed must be determined for each individual ore. Either by the continuous process or by individual pans there is a constant flow leaving the mill—i. e., the flume is never dry—so that no trouble is experienced from the choking of traps, which, should it occur, can be remedied by having a stream of water entering the flume outside the mill. Of all the methods to save quicksilver, whether floured or in coarse globules, none are as efficient as those which require the pulp and water to ascend a short distance before overflowing, owing to the specific gravity and the rounded shape of the quicksilver particles, which present the least resistance to the force of gravity. As soon as there is a collection of quicksilver, the saving is increased from the incorporation of the fine globules into a heavy mass. As the intermittent flow from each settler will not admit of placing any saving device in the launders leading from the settlers to the main flume, it is in the latter that an effort must be made to catch the escaping quicksilver and accompanying amalgam, as in the flume there is always a continuous flow of tailings from a mill having several settlers. First put into the flume cross-rifles from ½ inch to 1 inch high or a layer of expanded metal, which can be easily removed. Second, dependent on the fall between the mill and tailing pond, put in several traps, either

Cross Section of Furnace.

ing. It was rather doubtful at first whether this could be adapted to the burning of oil without very radical changes, but comparatively few additions were found necessary.

There are a great many styles of oil burners on the market, all having their special claims, but the general result arrived at is the breaking of the oil into fine particles by the use of steam or compressed air, and at the same time forcing it into the fire box.

The burner which I have adopted, though probably not as efficient as some sold by manufacturers, has proven quite effective and is simple and easily constructed by any one. It is shown in the section of the furnace and consists of a ½-inch pipe connected by a T with the oil line and through which passes a ¼-inch pipe connected with the steam line. This steam pipe passes through a packing nut (N) which allows of the adjustment of the distance between the opening in the nozzle and the opening in the steam pipe, this distance affecting very materially the flow of the oil even when the inlet valves of both steam and oil are set. A slotted hole was first used in the nozzle, but a round one was found to work better in such a small fire box.

The arrangement of the firebrick was only determined by experiment. The grate bars are covered

\*Trans. Colorado Sci. Soc.

made of wood by the carpenter at the mill or of iron, with a taphole in the bottom. These traps should have but one division under which the pulp is forced to flow. Clean these up either monthly or when sufficient has accumulated to warrant its removal. The results will be very satisfactory, and even if the price of quicksilver is so low that a little loss need not be considered, the amalgam saved will so add to the output that it will be of sufficient importance to warrant the expenditure.

Summing up the results, it can be briefly stated:

First.—See that the quicksilver is bright and active and with no repellent globules.

Second.—Grind and add chemicals always before adding the quicksilver.

Third.—Run the settlers at as slow a speed as will prevent packing with the ore under treatment and thin with clear water as long as possible.

Fourth.—Put riffles in flume and traps between sections of same, even if only wooden boxes.

Fifth.—See that no filth or grease from water or machinery gets into pan, settler or flume.

In conclusion, the writer wishes the reader to understand that the above is the result of practical experience; chemical equations and theories are left out, as well as the results of laboratory work. This laboratory work is only useful as a guide, as the small quantity taken allows a closer saving of the quicksilver than could ever be possible in practice.

As there are still many pan mills in operation, it is hoped that the above will prove of benefit, particularly as very little, if any, expense is required to change the existing conditions of the average mill.

### Hydraulicking in the Yukon Region.

Written for the MINING AND SCIENTIFIC PRESS by  
C. R. SETTLEMEIER.

With the practical demonstration that the frozen placers of the Yukon basin can be worked by hydraulic process on an extensive scale, an incalculable range of possibilities in mining in the North is opened. It has been proven with hydraulic plants from Atlin, in northern British Columbia, to Nome, on the Bering coast, within the last five years that hydraulic mining can be pursued profitably over all this vast stretch of territory where gold has been located, and the number of hydraulic plants are being yearly increased at a rapid rate. Ground, which for a long time baffled the early prospector in his simple and primitive manner of operation, is being secured by big companies and made to yield profitable returns to capital invested.

When gold was first discovered in the Yukon it was feared by many that hydraulics never would be prac-

as the sun can thaw it. By the time one end of a claim is washed clean the apparatus can be directed to another end, and thus the work never ceases. Some of the gravels are so dry that the frost troubles the miners but little, and great areas of gravel are washed freely without the sun-thawing precautions being necessary.

In Atlin, at the head of the Yukon basin, the ground contains no permanent frost, but the auriferous deposits there are not as rich as in the Klondike. Atlin has several hydraulic plants that handle great quantities of dirt annually. One company, the Sunset, has a ditch 8 miles long.

The Big Salmon diggings, east of White Horse, are worked successfully by hydraulic, and the Alek diggings, west of White Horse, are said to be admirably adapted to that process of mining.

The Rampart camp, on the lower Yukon, this summer received its first impetus in hydraulic mining. The Pittsburg Gold Hydraulic Co. landed there this summer 170 tons of equipment for a big hydraulic plant for the company's property on Big Minook creek. The plant includes 3 miles of 22-inch wrought iron pipe and giants. The Gold Bug Hydraulic M. Co. had delivered a hydraulic plant at Rampart, late this fall, for its claims on Rhode Island creek. The property in the camp, owned by ex-Governor J. H. McGraw, of the State of Washington, it is understood, is also to be worked by hydraulic.

On American creek, near Eagle City, on the Yukon, the Evergreen Hydraulic Co. has a big plant at work, under the direction of Dr. Cook of San Francisco. In the old Birch creek diggings, back of Circle, hydraulic apparatus, it is said, could be used successfully. Already a steam shovel has been taken into that district.

Nearly all the heavy equipment installed in the Yukon basin placer camps this summer, aside from steam boilers and the winter thawing apparatus, has been hydraulic apparatus. In the aggregate, hundreds of thousands of dollars have been spent on such equipment.

In the Klondike alone—that is, in the rich British Yukon camp, within a radius of 55 miles of Dawson—two or three of the most heavily capitalized companies in the far north have been floated and the preliminary work done toward opening the placer ground on which the new holders will work with aid of gravity water systems and hydraulic giants. Before the beginning of the present year ten or more large hydraulic plants were at work in this camp, and next year more will be under way. The mines, which startled the world when Klondike was discovered in 1896, have yielded in excess of \$125,000,000, and this year, together with the modern equipment, the same mines produced \$9,500,000. This is all from the little area within one day's ride of Dawson. The richer claims have seen their best days, and gradually the ground on bench and creek bottoms is being absorbed

by J. S. Baker of Tacoma and others; the Pacific Coast Mining Co., operating on Cheechaco hill, on Bonanza, and backed by American capital. The Detroit-Yukon Mining Co. has worked extensively this summer with steam dredgers and controls much ground originally intended for hydraulic purposes. For the last year or two the Big Bonanza Co., managed G. T. Coffey, on Fox and American gulches, has been working with hydraulic process at a profit. Other smaller hydraulic operators also are busy throughout the camp. A few of the larger companies have endeavored to hydraulic by lifting their water by steam pumps from the creeks to the hill or bench levels, but it is demonstrated to the satisfaction of nearly all Klondike operators that for profitable hydraulic work in this country it must be done by gravity and the water must be obtained at no expense other than for ditches.

In bringing water to their grounds most of the operators in the Klondike thus far have drawn on the local supply—that is, the supply from the passing creeks and the drainage from the adjoining watershed. But to supply all the camp and wash all the hundreds of thousands of acres of auriferous gravels in the Klondike by this process is impossible. A supply equal to a river would be necessary, and it may be safely said that, were the entire supply of a navigable river available to distribute over the hundreds of gold-carrying streams and their wealth of ancient contiguous gold channels, such a supply would not be sufficient to tear down and wash away all the gold-bearing gravels now known to be auriferous within an area of 50 miles square and lying mostly to the southeast of Dawson.

The Acklen enterprise, which is the most pretentious on the gravity plan in the Klondike, has one ditch 12 miles long, just now being completed and running to the Twelve Mile river. Another ditch is being planned by the same people to run 40 miles across hills and benches and up the Twelve Mile river to near its source in the Rockies.

The North American Transportation & Trading Co., which put part of its new plant into operation on Miller creek this summer, brings its water several miles through ditches. Next year it will have iron piping added to the ditch system and will greatly increase the flow. This plant alone will cost \$250,000 or more.

The thoroughness with which the Bonanza Creek Hydraulic Co. is going at the work is demonstrated by the fact that this winter they will dig 800 feet or more of tunnel to carry off tailings. The company has already spent more than \$100,000. The other companies mentioned nearly all plan to spend \$100,000 at least in early work, and some will spend much more.

One of the biggest mining enterprises ever undertaken in Alaska, or the Yukon basin, has been inaugurated in the old Forty Mile country, on Chicken creek. Six miles of this stream and its principal

Miners Rocking on Forty Mile, Alaska.

Home of a Miner in the Yukon Basin.

tically applied in the country because of the permanent frost which permeates the ground. The frost disappears to the depth of 2 feet every summer, but below that it is permanent. Frost has been followed in shafts in the Klondike to a depth of 210 feet. The frozen gravel is as hard as rock, and in all instances must be thawed before it can be removed. At the depth of 210 feet the limit of the frost line evidently was reached, because, at that depth, with a temperature of 50° or more below zero, running water was found. Scores of other shafts 100 to 150 feet deep have been sunk in the Klondike without getting beyond the frost.

The hydraulic operators in the Klondike overcome the difficulty of frost by letting the sun thaw the first few inches of dirt, and then washing it away. By having a large area it will require the attention of several giants to wash off the exposed surface as fast

by companies which obtain many claims in a group and operate them in the advantageous manner described.

The new hydraulic concerns which go to work this season in the Klondike camp include the Bonanza Creek Hydraulic Co., Ltd., managed by Emil Weinheim, and backed by New York and London capital, and operating on Adams hill and on hills near discovery on Bonanza; the North American Transportation & Trading Co., of which the Cudahys of Chicago and others are chief owners, operating on Miller creek, 50 miles west of Dawson; the Acklen Hydraulic Co., owning groups of hillside properties of many acres, opposite the mouth of Bonanza creek and almost immediately back of Dawson City, and backed by British capital; the Fuller-Lawson-Norwood Co., owning a big group on Bonanza; the White Channel Gold Mining Co., operating on Gold hill and backed

tributaries have been grouped for the purpose of being worked by hydraulic. It is estimated that \$500,000 will be required.

Water will be brought to the creek from the Mosquito fork of the Forty Mile by ditch or pipe line. The supply of water is so easily obtainable and the fall so great that it will be almost like diverting a river to the field of operation.

It is estimated that in the ground on Chicken and the tributary of Myer's fork, which virtually comprise all the ground secured, there is \$10,000,000 in gold.

The Chicken creek proposition is considered by certain Klondikers, who have examined it and are conversant with the place, as more inviting than most big propositions in the heart of the Klondike, or, more properly, in the section within a radius of 50 miles of Dawson, popularly known as the Klondike.

camp. It is considered more inviting for the reason that it can be supplied with an abundance of water by going a comparatively short distance. To get such a volume of water on the richest creeks of the Klondike camp would require running a ditch perhaps 50 to 100 miles. Thus far no such extensive ditches have been finished in the Klondike. The Aeklen ditch, now under way, is the only thing that will approximate such an enterprise, and it will be 40 or more miles long before it can supply all it is planned to carry.

In the Chicken creek enterprise 2500 to 3000 inches of water can be placed on the ground without great difficulty or expense. Perhaps the volume could be greatly increased over that by simply providing a larger conduit or ditch. The head available for hydraulicking will be 200 feet.

Another advantage the Chicken creek proposition has over the Klondike is that on Chicken the gold is found from the surface down through the 18 or 20 feet to bedrock, while in the Klondike most of the streams have no gold save in the layer of 2 to 6 feet of gravel immediately over the bedrock.

Pay has been located on 3½ miles of Chicken and on 1½ miles of Myer's fork. Stonehouse creek, which may also be included in the big group later, likewise has pay located.

Pay has not only been located but is also being taken from the individual claims on Chicken, Myer and Stonehouse. Last winter sixty men worked on Chicken and Myer and took out many thousands of dollars.

On No. 9 below discovery on Chicken, \$38,000 was taken out last winter. On No. 8, \$30,000 was produced during the same time. Other claims and their yield last winter were: No. 8 bench, right limit, \$16,000; No. 6, \$10,000; one claim on Myer's fork, \$10,000; two or three claims on Stonehouse, \$2500. Four or five boilers, weighing two or three tons each, were the only plants of machinery of any consequence which was used on Chicken or tributaries last winter. Other Chicken claims also have produced well.

The benches are shallower than the creek bottoms. Some of the benches are no more than 3 feet deep, and the creek ground averages 16 to 35 feet. The area over which the gold pay streak is traced spreads from 500 to 1300 feet. Bench and creek claims are included in the big group.

The hydraulic improvements planned for the creek, the promoters say, should wash as much gravel as several hundred men could handle. As there are no large boulders, it could be worked by dredger as well as by hydraulicking.

The Forty Mile district is perhaps the greatest grubstake camp in the world. It has afforded grubstakes to miners for twenty years or more, and the most interesting part of it is that the greater number of transient grubstakes have been washed from the river bars with little trouble.

Oftentimes the rockers have yielded from \$4 to \$40 a day when working gold taken simply from river bars. The benches of the Forty Mile country are believed by many to be scarcely touched and now only on the eve of an awakening to operation by modern hydraulic methods, which will mean the annual output of great quantities of gold for many years.

Several attempts were made to group and amalgamate the Chicken creek properties before the efforts became successful. One of the most prominent mining promoters in the North attempted the work last winter, but the plan was then unsuccessful because he did not have the large sum of ready cash which individual claim owners asked him to advance. The work was successfully undertaken this summer by others.

Some express the idea that perhaps in time all the Forty Mile benches may be torn down by hydraulic. The rich deposits on the bars of Forty Mile, miners say, seemed to have been hydraulicked out by nature, the streams crosstcutting the benches.

The hydraulic method is the most promising in the Yukon for the reason that fuel is a mighty factor there, and pumping processes, thawing by steam boilers and steam points, and all such work entailing the consumption of fuel, means a vast consumption of the gold yielded in the getting of the fuel. Coal exists in the Yukon in commercial quantities, but it costs money to mine coal. Wood is to be had, but at a great expense. Any work entailing labor entails expense, and no expense is light in the Yukon. Water, when it can be secured by gravity and applied by gravity, is the great economical force in Yukon mining.

Henry Powers, mining engineer for the North American Trading & Transportation Co., predicts that fifty years hence thousands of men will be mining in Alaska, from Skagway to Nome, and the vastness of the gold deposits, the area they cover and the possibilities in hydraulic work over the new empire verify the belief in the popular and practical mind of the North to-day that, with economical methods, the gold mines of the American and the British Yukon cannot be exhausted in many years.

Dredging has received some attention and promises to receive more, but the dredging areas do not compare with the hydraulic areas. Steam shovels are used in some of the big Klondike works to-day, but they are few compared to the hydraulic plants.

## By-Products in Metallurgy.

In these days nothing goes to waste in mining and metallurgical operations if the management is competent and the waste product can be converted to any useful purpose. The tailings of mills are carefully concentrated by various methods and the waste from the concentration process is cyanided or otherwise treated. Smelting methods have been so far improved that slags are now practically devoid of valuable metallic contents, and in some cases the usually useless slag is converted into paving blocks or bricks for structural purposes, forming a by-product of value. The one thing that causes the smelter the most concern, if not the greatest loss, is the gases escaping into the atmosphere from the stacks of the furnaces, and even these may be commercially and profitably utilized in some localities. Whenever sulphide ores are reduced sulphurous fumes are a necessary result, but by proper arrangement these sulphurous fumes may be conducted to lead-lined chambers where they are absorbed by water forming commercial sulphuric acid, useful in other metallurgical operations. The Broken Hill Proprietary Co. of New South Wales, Aus., within the past year have installed such a plant at Broken Hill. This plant is illustrated in the accompanying engraving. So suc-

Sulphuric Acid Plant of the Broken Hill Proprietary Co., Broken Hill, N. S. W.

cessful has been this innovation at those works that a similar though larger plant is to be added to care for a greater quantity of the sulphurous gases coming from the furnaces. This not only results in the making of a valuable by-product of the smelting operations there, but it prevents to a great extent, if not entirely, the escape of these obnoxious gases into the atmosphere.

In California the Iron Mountain Copper Co., operating in Shasta county, recently determined to put in a sulphuric acid plant constructed and operated on similar lines. The cost of making sulphuric acid as a by-product is not excessive and the acid can always be used, as previously stated, about the works where it is manufactured in other metallurgical operations, or sold to other mines for this purpose. At Broken Hill the acid is employed in connection with the "salt cake" process of separating blende from the other sulphide minerals with which it is naturally associated in those ores. The plant is capable of producing thirty-three tons per week of chamber acid from concentrates and sulphide slimes.

## Radium in American Carnotite.

Recently, before the American Philosophical Society, A. H. Phillips described experiments made by him with ore from Richardson, Utah, containing about 10% carnotite. The radio activity of the product obtained was deemed sufficiently high to indicate that radium could be produced in quantity from carnotite, at least from this locality, as twenty-five pounds of rather lean ore had been used. Had a ton been worked over in the same way it would have yielded a gram of chlorides of 60,000 radio activity as compared to uranium. This specimen was separated in November, 1902, and is as active now as then.

Carnotite is comparatively a new mineral, having been described by Friedel and Cumenge in July, 1899, and for this reason it is not found in most books on mineralogy and is therefore but little known to the general prospector. It was first discovered in the western part of Colorado and occurs in Montrose, San Miguel and Mesa counties of that State and the adjacent counties of Utah. It is a uranyl-potassium vanadate with three molecules of water of crystallization. Carnotite occurs as a light canary-colored powder disseminated through a fine grain sandstone. It is easily soluble in acids and is treated in this way for the commercial production of uranium salts.

## The Mother Lode in Tuolumne County, California.

NUMBER VIII.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Before closing this chapter on the occurrence of mines along the Mother Lode in Tuolumne county, it will be well to refer again to the Clio mine near Jacksonville, more particularly in reference to the recent developments in that property. In this mine there are two distinct zones or veins of mineralization. The workings of this mine are principally on what is locally called the "back" vein—a vein of massive quartz from 4 to 12 feet wide. The shaft has been sunk to the 300-foot level, where the vein in places is 10 feet in width, carrying payable free gold, beside about 2% of auriferous iron sulphide, said to assay \$100 per ton. In the hanging wall of this quartz vein is a zone of amphibolite schist, from 10 to 20 feet wide, as determined by crosscuts driven from the levels on the back vein. The schist is siliceous and impregnated with iron sulphide, as is usual in these zones of mineralization, and the superintendent states that these schists contain from \$2 to \$7 gold per ton.

The mine is in the development stage as yet, but has the prospect of becoming a producing mine, when the surface arrangements are properly adjusted and some cheaper power than steam is provided.

Southward, along Moccasin creek, from the mouth of Grizzly gulch at the foot of Priest's hill, the vein is obscure for about 3 miles, when again occurs one of those characteristic isolated buttes which appear at intervals along the line of the lode. These have been previously remarked, among them being Whisky hill (rather a ridge than a butte), Quartz mountain and Golden Rule hill. This new occurrence is known as McAlpine hill. It is near the line dividing Tuolumne from Mariposa county. About 2 miles to the southward in Mariposa county is a similar, though larger eminence, called Pinon Blanco, and farther south, in the vicinity of Coulterville, are the Margaret hill, Louisa hill, Mary Harrison hill and others, all of similar appearance and geological structure. The central mass is a broad zone of ankerite, in which occurs numerous ramifying veins of quartz, large and small. The associated rocks are serpentine, black clay slate, diabase, diabase tuff, gabbro, diorite, and other less common rocks at intervals.

On McAlpine hill considerable mining has been done, and it is reported that in early days a large amount of gold was taken from this property. Recently the mine has been reopened, but the writer is unfamiliar with the results of these late operations. A striking feature of the McAlpine mine is its bold quartz outcrop. On the east hillside the slope and canyon are strewn with the great boulders of quartz which have rolled down the mountain from the cropings. The vein at the McAlpine is 100 feet wide. The best pay is usually found near the hanging wall, associated with talc schist. Serpentine, slates and graywacke are the most prominent rocks associated with the lode on McAlpine hill.

The occurrence of occasional bunches or pockets of gold along the Mother Lode in this county resulted in forming very rich placer mines in the streams cutting the region tributary to the lode, due to the erosion of millions of tons of gold-bearing rock with a concentration of the gold in the bottoms of the streams, and the harvest reaped by the placer miners in the early fifties was rich indeed. This has also been the case in sections where quartz mining has not proven profitable as yet, although there are some noted and largely profitable quartz mines on the Mother Lode in Tuolumne county.

## Treatment of Silver Sulphides and Gold Ores by Electrolytic Methods.

The practical metallurgist is often apt to belittle the research work of the chemist, not appreciating that many of his own methods were probably worked out by years of patient trial. One of the important offices of the modern university is to furnish means for such investigations. These, when developed in the hands of the practitioner, often solve the successful treatment of ores formerly considered refractory and economically valueless.

Belonging to this latter class are the grayish quartzose ores from Tonopah, Nevada, containing galena, pyrite, calcite, silver sulphide and gold. The silver sulphide is largely stephanite, the black antimonial sulphide of silver, together with argentite and ruby silver.

In a series of investigations in the chemical laboratories of the University of California, M. Vaygouny has found that the values of these ores can be effectively dissolved with a solution of 1% to 2% ferric chloride, 15% to 20% sodium chloride and 1% hydrochloric or sulphuric acid. The ore is first crushed and then leached with this solution, which is electrolyzed as it leaves the vats. By this action the values are deposited on the cathodes, and the ferric chloride—the active solvent agent—is continuously regenerated through the oxidizing influence of the chlorine liberated.

Consequently the main items of expense will be electric power, common salt and acid. The latter might be too great with alkaline ores, as the precipitation must take place from an acid solution. Sulphuric acid is as satisfactory and much cheaper than hydrochloric acid. The chlorine is obtained directly from the latter or by the action of the former on salt.

The time of treatment is three hours, if the mass is kept boiling and continually stirred, and three days if treated cold with an occasional shaking.

The results of a large number of experiments give a silver extraction of 95% to 97% and a gold extraction varying from about 60% to 88%, the success of the latter depending upon the continuous presence of chlorine in the solution and fineness of crushing. The higher gold extraction was obtained by crushing to 120 mesh, showing that the gold is finely disseminated throughout the ore mass.

Mr. Vaygouny states that it is difficult to always get a coherent deposit on the cathode, but suggests the addition of a fraction of a per cent of some mucilaginous substance to the solution, perhaps in conjunction with Tomass's method of revolving cathodes, from which the deposit is quickly removed mechanically. Graphite electrodes are the best as regards duration and cheapness.

He finds that if the solution be warmed and glue added that a firm whitish-gray deposit is formed on platinum electrodes with a current density of .1 ampere per square decimeter and 1.5 to 2 volts.

The practical application of this process on a large scale has not yet been tried, but offers an interesting possibility for the economical extraction of silver and gold from their ores.

## THE PROSPECTOR.

It is more common to begin the development of a prospect by means of a tunnel than by a shaft, and in most cases where either method may be employed, the tunnel is usually preferred, for the reason that it is less expensive and one man may alone accomplish much more than one could alone perform in a shaft, though there are instances of record where prospectors have alone, and entirely unaided, sunk shafts approximating 100 feet in depth. In starting a tunnel prospectors, in their haste to get "under cover," frequently start the tunnel before they have a face in the open cut sufficiently high to give solid ground as a back to their tunnel, being still, in fact, in loose earth and grass roots. This is unprofitable, as a rule, for the reason that it not only requires timbers at once (which may also be the case in rock), but timbers are always short lived when placed in contact with soft earth and particularly in loam full of roots, etc. It is better to have a solid back of at least 3 feet of rock. The first set may project 2 feet or more if the rock shows a disposition to cave. It is also a good plan to cut a drain above the tunnel so that surface water will be carried off to the sides. Some miners make the open approaches to these tunnels wide enough to admit the building of solid rock walls along the sides, employing the rock subsequently taken from the tunnel for this purpose.

The rocks from Marion county, Or., have been determined as follows: No. 1 is a feldspathic rock showing indistinct feldspar crystals and partly altered hornblende; it might properly be termed diorite porphyrite; it also contains some infiltrated iron sulphide. No. 2 is similar to No. 1, but the hornblende has largely been altered to epidote; it also contains iron sulphide in finely disseminated

crystals. No. 3 is similar to Nos. 1 and 2, but is much altered; the porphyritic crystals of feldspar show more plainly owing to their carious condition; the iron sulphide is more abundant than in the other specimens and is in coarser crystals. A few hornblende crystals are still to be seen in this much altered rock. No. 4 is somewhat altered, but is evidently diabase; it shows very little iron sulphide as compared with the specimens previously examined. No. 5 is a typical quartz porphyry, though decayed; it contains considerable iron sulphide, the appearance of which suggests that it may be auriferous.

The metallic mineral in the black sand from Valdez, Alaska, is josephinite, a highly magnetic compound of nickel and iron. The two crystals accompanying the sand are garnet. The black sand consists principally of grains and fragments of magnetic iron oxide, but the josephinite is more highly magnetic than the sand.

The rock from Julian, San Diego county, Cal., is an amphibole schist, in which there is a large amount of quartz and magnetite, but no feldspar. The rock is evidently metamorphic.

## Geology of the Treadwell Ore Deposits, Douglas Island, Alaska.\*

NUMBER VII—CONCLUDED.

Written by ARTHUR C. SPENCER.

The presence of these minerals can not be pushed to the value of evidence, as neither of them have been universally observed in the district, but, even for those who hold the theory that the final source of mineralizing water is mainly meteoric, their occurrence may be admitted as probably significant of at least accessory contributions to the vein-forming solutions from igneous sources.

It is concluded that known facts do not lead to a recognition of the actual source of the solutions which have formed the mineral deposits, and for any present idea of their origin recourse must be taken in the direction of speculation. I am inclined to believe that the very wide occurrence throughout southeastern Alaska of intrusions related to and of practically identical date with the Coast range diorites strongly indicates the possibility of a great buried couche, or reservoir, of igneous rock underlying the whole region. It is evident throughout the field that the veins were formed at a period subsequent to the invasion of the diorite, and they were probably formed long after intrusion had ceased; but it is not a violent supposition to consider that the deep-seated magma, from which the masses now observed at the surface had been given off, remained in a molten condition for a very long time.

A plausible hypothesis for the formation of the veins, based upon the foregoing ideas, is that the unknown forces, which at various times have caused general elevation throughout the region, were transmitted to the other overlying rocks by this great residual magma. In adjusting themselves to the changed conditions of equilibrium the rocks were fractured; then, as the deep-seated magma gradually cooled and crystallized, water and gases expelled from it found their way into the overlying rocks, and, searching out the easiest routes of travel along existing fractures, escaped to the surface.

Undoubtedly waters of this origin might carry in solution all the elements which have been observed in the veins, and they would deposit their mineral contents under various conditions, as from decrease of dissolving power through diminishing pressure and temperature, from precipitation through metasomatic interchange with wall rock materials, or again from precipitation due to mingling with solutions of some other derivation.

**SUMMARY.**—The formations of the mainland of southeastern Alaska are thrown into three lithological groups, which are distributed in parallel zones following the general trend of the coast. Two of these groups—the schists and the slate-greenstone band—are mainly metamorphosed sediments, the greenstone beds, however, representing ancient volcanic flows of andesite and basalt. The third is the great complex of intrusive granular rocks, mostly dioritic, forming the mass of the Coast range. The general structure of the region is monoclinical, strikes being usually northwest and southeast and dips always toward the northeast.

The region is one of very general mineralization which has taken place since the diorite intrusions, and there is a probable correspondence in date with the extensive gold veins of the Pacific States.

The Treadwell deposits appear to have been formed during the general activity of vein-forming solutions throughout the region. The ore bodies consist of mineralized dikes of dioritic rock lying between a greenstone hanging wall and a slate foot wall, with a few detached masses near by in the slate. Hot ascending currents of water are regarded as the source of the minerals which have been introduced into the

dikes, where they fill fractures and also replace the original minerals of the rock. The origin assigned leads to the expectation that the character of mineralization will not change with further depth, and deep mining is more likely to be limited by increasing expense of hoisting ore than by gradual decrease in gold tenor.

Speculation as to the cause of fracturing and the source of vein-forming waters, for the region at large leads to the suggestions that the former have been attendant upon recognized continental uplifts in the region since the invasion of the Coast range diorites, and that the latter emanated from a great reservoir of igneous rock, underlying the whole region at great depth, during its consolidation from a molten condition.

## Short Beam Analytical Balance.

The accompanying illustration shows a new analyti-

Short Beam Analytical Balance.

cal balance just placed upon the market by Wm. Ainsworth & Sons, balance manufacturers, Denver, Colo.

The beam is made of hard-rolled nickel aluminum, the design being to enable it to maintain its adjustment throughout a wide range of temperature and still have ample strength to carry 50% more than its rated load. The rider apparatus is so constructed that the rider arm or carrier can not touch the beam, and, if need be, the rider can be taken off and replaced in the dark without dropping it off the rider carrier or knocking it off the beam. The hangers are of skeleton construction, similar to those used on their button balances, and have a maximum carrying capacity with a minimum amount of weight. Two sensitive levels are set in the metal base in front of the index and in plain view of the operator. The case is of French polished mahogany, with counterpoised sliding door in front and removable sliding door in back. A plate glass sub-base covers the entire top of base. All metal work is gold plated.

In the illustration the counterpoised sliding door has been removed to better illustrate the balance. Full particulars regarding this balance will be furnished by the makers, 2151 Lawrence St., Denver, Colo.

## The Elmore Oil Concentration Plant at Le Roi No. 2 Mine, B. C.

The ore consists of a heavy gabbro (therefore basic) rock, mineralized with pyrrhotite, a little pyrite and chalcopryrite and some free gold. It is crushed and ground to 40 or 60 mesh, and treated first on concentrators, which take out about one-half of the sulphide contents, which contain 45% of the gold value of the ore and considerably less than one-half of the copper value.

The tailings from the tables, diluted at least 10 to 1, with the water usual in grinding and in the table work (all this water has to be heated to a temperature suitable for the subsequent work), is passed through the mixers, thence to the separators, the oil being fed in with the pulp with pumps.

The oil-containing concentrates is collected in a receiver in advance of the separators, the latter acting as storage reservoirs, while the separators work out a charge.

The tailings after passing through a trap pass continuously to the sluice. Two additional trapping tanks, for saving oil, have been put in the line of the sluice since the plant was started. The loss of oil is reported to have been 1.03 gallon per ton of ore treated, and 55% of the gold remaining in the material from the tables is said to be recovered in the oil concentrates. A saving of practically all the copper in the tailings treated is claimed.

The grade of material worked has been about \$5 total assay value in gold, silver and copper, and the cost of treatment has been about \$2.50 per ton—that is, the entire treatment, including crushing and grinding, is covered in cost named.

Crude oil had been costing 30 cents per gallon; but the duty of 5 cents per gallon having been removed, it may now be a little cheaper. A two unit plant treats fifty tons per day.

Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 8, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

COAL HOING AND CUTTING IN MACHINE.—No. 773,882; A. E. Millward, Accrington, England.

Mining machine comprising casing, driven shaft supported therein, and pair of forwardly diverging rotary cutter wheels on shaft, and ore cutters operating between cutter wheels.

ORE WASHING MACHINE.—No. 774,704; G. Seberg, Racine, Wis.

Ore disintegrating and washing machine, comprising suitable receptacle 3 having extension 9 upon one end thereof, receiving and agitating drum mounted within latter receptacle; inclined, spiral sluiceway extending from receptacle 9; chamber 21 located at end of sluiceway, stand pipe extending from chamber upward to top of machine; elevating shaft having suitable elevating devices comprising worm secured near bottom and top of shaft and agitating blades at lower end thereof, located in stand pipe in combination with agitating devices in receptacles 3 and 9 whereby when receptacles, sluiceway, chamber and stand pipe are filled with water devices within stand pipe will induce continuous circulation of water through parts.

ORE GRINDING MILL.—No. 774,273; C. C. Pratt, Portland, Or.

Ore grinding mill comprising main frame having apertured crown bar; bearing block on lower portion of frame, horizontally disposed annular plate fixed in frame at intermediate point in height thereof, annular collar connected to plate and having interior groove, cylinder having exterior rib disposed in groove of collar, and also having interior vertical grooves, shell arranged in cylinder and having vertical ribs disposed in grooves thereof; shell being interiorly tapered from upper end to point adjacent to lower end and gradually enlarged and smooth from point to lower end, upright shaft journaled and movable vertically in crown bar of frame and bearing block and having threaded upper end, hand screw fixed on end above crown bar, cone

fixed on shaft and having vertical grooves, mantle mounted on cone and having ribs disposed in grooves thereof, and also having smooth surface opposed to that at lower end of shell, shaft journaled in main frame and provided with fly wheels, driving connection intermediate of shaft and cylinder, and driving connection intermediate of shaft and cone.

PROCESS OF FILTERING SLIMES.—No. 774,349; H. R. Cassel, New York, N. Y.

Process of filtering slimes, which consists in filtering off liquid from pulp by suction in tank containing filter cells, and simultaneously agitating pulp between cells.

DREDGING DEVICE.—No. 774,280; J. L. Searfoss, Providence, R. I.

In dredging machine, boom supported at one end, bucket supported by poles from opposite end of boom, means whereby outer end of boom is held from rising and means for automatically locking poles.

STAMP STEM AND TAPPET ATTACHMENT.—No. 774,398; W. Reine, Quartz Mountain, Cal.

Device for securing tappets to stamp stems, comprising fixed and movable segments within tappet and embracing one-half of circumference of stamp stem, shoe inclosing and conforming to movable segment and fitting chamber within tappet and movable with relation to one of segments, segment and shoe being tapered in opposite directions and adapted to lock segments upon stamp stem.

HOISTING APPARATUS FOR BLAST FURNACES.—No. 774,387; H. Heffrin, Pittsburg, Pa.

Hoisting mechanism for blast furnaces having in combination skipway, car movable along skipway, means for moving car and automatic means for stopping car shifting mechanism and for preventing operation of such shifting mechanism in same direction without prior operation in reverse direction.

METALLURGICAL PROCESS.—No. 774,304; M. P. Boss, San Francisco, Cal.

Method of reducing ore body and introducing carbon into metal extracted therefrom in sufficient amount to convert it into steel, which consists in subjecting ore body to action of hydrocarbon flame, and metal extracted therefrom to action of highly heated free hydrocarbon vapor.

SAFETY DEVICE FOR MINE SHAFTS.—No. 774,655; Norval W. Dickerson, Derwent, O.

Combination of elevator shaft, elevator car movable in shaft and provided with rails, landing provided with rails arranged to register with those of elevator car, horizontally movable lever fulcrumed at intermediate point of length alongside of one of rails on landing, and having forward arm for preventing passage of car when elevator car is at landing, means for normally holding lever so that its forward arm rests in path of car on landing rails, rock shaft journaled in suitable bearing and having arms at ends; one of arms being arranged to be engaged by elevator, longitudinally disposed lever fulcrumed at intermediate point of length of landing, bar connecting other arm of rock shaft and forward arm of lever, and bar connecting lever and first-mentioned lever.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

O. G. Herning at Seward, manager of the Klondike & Boston Co. M. Co., says the Klondike & Boston Co.'s property is on Willow creek and Grubstake gulch. The company owns thirty-one placer claims. Willow creek runs east and west and these placers are in a small basin 30 miles above its junction with the lower Susitna. The Alaska Central Railway crosses Willow creek near there. These claims are 24 miles from tide water at Knik; the distance is 110 miles. Herning has landed at Knik hydraulic machinery to operate the mines, which will be sledged in this winter. The machinery consists in part of a grizzly and elevator and three giants. Ditches have been run.

## ARKANSAS.

### Marion County.

Hodges Brothers have leased five acres of the Zinc basin holdings on Clabber creek, near Yellville, and will sink a shaft near the two now going down. The ore is on same run as that found in the Beulah mine. The Hodges have also leased twenty acres from the Zinc Basin Co., in Searcy county. This mine is reported having a shaft passing into 10 feet of zinc ore.

## ARIZONA.

### Cochise County.

F. H. King of Boulder, Colo., says he will put in machinery to cut and polish marble at his quarries in the Santa Rita mountains.

### Gila County.

The Old Dominion C. M. & S. Co.'s production of copper at Globe for month of October from its new smelter was 970 tons, or 1,940,000 pounds, made from one furnace in commission the entire month, and a second furnace running half the month. The output on the last of the month was 46 tons of copper. With two furnaces it is expected 2,500,000 pounds of copper can be produced. The third furnace will probably not be started until the concentrator is completed. Then the Old Dominion is expected to produce a minimum of 3,000,000 pounds of copper per month. It is expected to get cost down to 7½ cents per pound laid down in New York, which is said would permit of annual profits of \$2,000,000 on a 13-cent copper market. As the efforts of the management have been directed toward completion of the smelter and other surface improvements, and also sinking the new shaft, underground work has been retarded. The plans call for a large amount of development, which will require a year's time to complete.

### Graham County.

The production of copper by the Shannon C. Co., at Clifton, for October was 1,025,000 pounds, and shipments for same month 1,050,000 pounds of copper.—A hoisting engine for the Copper Center group of claims, controlled by the Standard Con. Co., is being placed on the main shaft. Sinking the shaft will be resumed. Development work on the San Jose group, owned by same company, is reported showing up well.

### Maricopa County.

(Special Correspondence).—Twenty men are working at the Relief mine, 15 miles north of Peoria. Work has been resumed in the west drift and a black diorite carrying free gold is showing in the drift. The mill is in operation and producing bullion.

The Grand Traverse & Arizona Co., operating in Cave Creek district, has increased number of men at work. A road is being built to the property to replace the one washed out last summer.—J. E. Maddox will put men to work on Welch & Dunn's property in the White Tank mountains, west of Phoenix.

Men are at work on the Bismuth property, east of Phoenix. The ore will be sorted and shipped and the lower grades of ore worked by leaching process.—Cleberat & Co. have resumed work on their mines west of Hot Springs Junction.—J. V. Creath will arrastra several tons of ore from the Salt River mountains. He will cyanide the tailings.

Phoenix, Nov. 14.

Phoenix reports say the Cleopatra C. M. Co. is increasing development work on its properties in Deception gulch.—The Jessie M. Co. is planning additions to its equipment. It will build a 50-ton mill with concentrating and cyaniding plant. The water problem has been solved by arrangement to bring water from Agua Fria river at the DeLarge ranch. Tunnels and shafts have been driven and there are 40,000 tons of low-grade ore on the dumps.

### Mohave County.

F. Merrill et al., who have a 2-stamp prospecting mill in Bill Williams Fork section, near Signal, are putting in a gasoline engine to furnish power for the mill.

## CALIFORNIA.

### Calaveras County.

Twenty stamps of the Balliol mill, near Sutter Creek, are being moved to the Lampheer mine in Spring gulch, 2 miles from Mokelumne Hill, where they will be put in operation.

The stockholders of the Big Trees M. Co. of Stockton have authorized a bond issue to build a 200-ton a day capacity smelting plant at Murphys. Part of the money will be used to construct a railroad of 11 miles from Angels Camp or from Valley Springs, by way of San Andreas, as well as develop, open up and work the mining lands of the Big Trees M. Co., near Murphys. G. O. Pearce is president and manager of the Big Trees M. Co. Work will start this winter on the mines. The smelter will be built next year.

D. A. Nuner at Central Hill, near Mokelumne Hill, says he has men clearing out and retimbering the tunnel. Payable gravel has been taken out. The number of men will be increased. A mill will be built as the company has gravel on the dump.

### El Dorado County.

Preparations are being made to resume operations on the Mameluke Hill gold mine, north of Georgetown, by the New Highland G. & C. M. Co. The two 60 H. P. boilers for El Dorado C. M. Co. hoisting works at the Eureka gold quartz mine are being set up.—Work was started last week by the company which has bought the Delwisch gravel mine, near Georgetown.

Development work has been resumed on the Kelsey G. & S. Co. mine. It extends from the American river, above Chili bar, to the Big Sandy mine, near Kelsey. A 3-stamp mill for prospecting purposes has been set up.

### Kern County.

It is reported the old Amalie and the Barbarossa mines at Amalie have been sold to J. J. Mack et al. who will build a mill there.

The Yellow Aster G. M. Co. at Randsburg proposes improvements with additional machinery that will increase capacity of its mills. It expects to put in two rock breakers to reduce the ore to smaller size, enabling them to put more ore through the mills. The breaker at the 30-stamp mill is worn out. A larger breaker will be put in at the 100-stamp mill in addition to the one now in use. E. H. Barton is superintendent.

### Los Angeles County.

(Special Correspondence).—The Lowell & California M. Co. of Los Angeles, operating mines at Shoemaker, has completed its concentrating plant and is operating ten stamps and four tables. An electric light plant has also been added. The ore is low grade and free milling. Large ore bodies have been opened up. At the present time 1000 tons per month are being treated. The company expects to add to the equipment next spring. F. C. Fenner is manager.

Shoemaker, Nov. 16.

### Nevada County.

The Chicago mine, near Nevada City, which has been idle for twelve years, is again being opened up. It is east of the Pittsburg mine. W. P. Martin has charge of the work.

Superintendent C. Graham reports he is making headway in reopening the Canfield (the Grizzly Hill) gravel mine on the South Yuba river, opposite Blue Tent, near Grass Valley. It will be operated by drifting process. The 10-stamp mill in construction will be ready to run about December 1st. The gravel channel that yielded results when hydraulic method of working was in use, shows in the face of the bank, and a bedrock tunnel through which to mine it will be started.—At the Blue Tent gravel mine Superintendent C. Graham is getting out gravel keeping the 20-stamp mill busy. The breasting is being done to the north of the 1550-foot bedrock tunnel.

Pumping machinery for the Union Con. mine at Banner mountain, near Nevada City, is being put in. The three-compartment shaft is down to the drain tunnel which is being reopened.

Manager B. Wilkins reports shipping last week a gold bar, value \$5000, as returns of a clean up from the mill in which is being crushed the debris found under the floor of the mill and around the batteries and in the rock breaker at the Idaho-Maryland mine at Grass Valley. The stamps have been dropping for a month and the work is not yet finished. Improvements at the Idaho-Maryland are progressing. The shaft has been cleaned out and repaired down to 200 feet, the old timbers have been taken out and replaced by new, and now that the remainder of

the shaft is open the work of repairing and retimbering the shaft will be more rapid. The air shaft in the brick building is also being put in repair. The Cornish plunger pump in the main building was started last week and the water in the shaft was lowered 18 feet in the first twenty-four hours.

### Placer County.

(Special Correspondence).—W. H. Cass is secretary T. C. G. M. Co., 628 7th street, Sacramento, Cal. The company will put in an entire new plant next February. The mine is 5 miles from Westville, Placer county. A fine body of ore is now being opened up by tunnel work.

Westville, Nov. 16.

R. A. Davis et al. have contract to sink another 100 feet at the Bouk mine between Auburn and Ophir. Superintendent G. Foster says the company will put up a mill.—They are putting on full number of men at the Southern Cross, near Towle. Superintendent W. R. Tremble has put in a compressor.

The Golden West mine at Canada Hill, near Blue Canon, will resume work, says Superintendent F. P. Armstrong. They will drive the tunnel to open up the ore bodies.

### Sacramento County.

A 5-foot lead of coal is reported struck in a shaft being sunk by D. Finch on the B. F. Biggs ranch, near Folsom, when prospecting for gold.

### Shasta County.

Thirty men are on the payroll of the Marina Mariscano M. Co., operating the Sunny Hill mine, 12 miles west of Igo, and the number will be increased. The cyanide plant is being built.

### Siskiyou County.

Fort Jones reports say the Sheba mine was closed down last week by creditors. The mine was bonded to C. J. Fry & Co., who had sixteen men employed in the tunnels and 10-stamp quartz mill. No notice that the mine would not be responsible for contracted debts was posted about the Sheba, consequently the Denny-Bar Co. and the miners have attached the property, including the mill.

The Mount Vernon quartz mill on the divide between Greenhorn and Cherry creeks, near Yreka, is running steadily on ore taken out during the past summer. The mill is run by electric power and the ledge is 2 feet wide.

### Tuolumne County.

The New Calico Co., operating on the Lucio ranch, ½ mile east of Stent, have men at work with G. H. Gerken, one of the bondees, in charge. A shaft operated by a steam hoist has been sunk 108 feet. At a depth of 80 feet two drifts have been run. The width of the vein is 12 feet. They have free milling ore on the dump.

The Los Angeles G. M. Co., operating the Phillips claims, is working ten men and will increase the number. Buildings are being erected and a flume is being built to bring in water for power. J. S. Kuns is superintendent. Development work and ore extraction are under way, and the mill will be started up. The mines are situated on north fork of Tuolumne river, ½ mile from the Mobican mine, near Tuolumne.

## COLORADO.

### Clear Creek County.

Near Central City, the Onoko G. M. Co. has a lease and bond on the Annex mine in Lake gulch, reported to have the extension of the Chemung-Belmont vein. The main shaft is down 200 feet, and the property is equipped with steam hoisting plant and top buildings. The company will sink the shaft. Smelting ores have been taken out.

Idaho Springs reports say ore shipments from that station during month of October were 244 carloads, or nearly 5000 tons of ore and concentrates. During the same month of 1903 shipments were 116 carloads. Mine operators are being obliged to restrict their output because of inability to get miners, and also because they cannot get their ore hauled or treated at the mills. Several mills are enlarging their capacities. Development work which has been done in the past few years has resulted in opening up many large blocks of ground, and the mines are in a position to make large outputs had they the facilities. The increase in ore shipments recently is attributed to the present low schedule of smelting charges caused by the competition of the Independent smelter at Golden with the American S. & R. Co.

### Fremont County.

Florence reports that the ruins of the burned Metallic reduction works have been leased by the United States R. & R. Co. to a local man. The gold and dust in the ruins are estimated to be worth several thousand dollars.—M. Williams is opening another mine on a 4-foot vein of coal near Williamsburg. It is known as the Rockvale vein.—Another coal mine

is being opened near Coal Creek by the Cowan Co. The mine is being driven on the Old Slope vein, from which coal was hauled by wagon to Denver, across the plains, forty years ago.—The closing down of the United and Independent companies' oil wells, near Florence, for a few days, pending the building of new storage tanks and the repair of the old ones, did not interfere with drilling operations.—D. Goldstein of Denver has bought the scrap iron of the cyanide mill, north of Florence, and is shipping the material to Denver.—The Union mill has started another furnace.—The Florence mill is operating almost exclusively on the sand dump of the burned El Paso mill. There are 30,000 tons of material in the pile.

### Gilpin County.

Central City reports say that during the month of October there were shipped over the Colorado & Southern Railroad to Denver and Golden smelters, and to other points, 276 cars, or 5775 tons. This was the heaviest shipping month in the year, exceeding that of September by 125 tons.—The Otto Shatz M., L. & D. Co. has been organized by R. H. Hastie of Denver, with local parties, and will operate in Lake and Russell districts, starting operations this month.

### Gunnison County.

At Ohio City, near Pitkin, President Brant has begun operations with the Golden Islet mill. It is run by steam power. The Golden Islet mill has ten stamps and is expected to handle thirty tons daily. It has three Wilfley tables and concentrates seven to ten tons of ore into one. Brant states that there are 3000 tons of ore in sight in the workings of the Golden Islet mine and 500 tons in the bins. The lower tunnel is in 900 feet. The mineral is sulphide. Two ore shoots have been cut by the lower tunnel, one at 150 feet, giving 100 feet of stoping ground, and the other at 900 feet, giving 550 feet of stoping ground. The first is 4 feet wide, with a pay streak of 18 inches and the balance milling material. That at 900 feet is 3 feet wide. S. Nathan is in charge of the plant. D. H. Casey is foreman of the mine.

A hoist is being placed on the Gold Cross group, owned by G. Brant et al., near Pitkin, and the shaft will be sunk. Ore shipments will be made. If arrangements can be made with the Colorado & Southern Railroad to have a switch put in, only a short wagon haul will get the ore on the cars.

### Lake County.

Leadville reports say the Midas M. & L. Co. has started hoisting ore from the bodies of lead carbonate opened in the lower levels of the Coronado shaft below the parting quartzite. The Midas Co. prospected its down-town properties with diamond drills which were sent down from the former bottom levels of the Midas, the Coronado and Penrose shafts. The diamond drills passed through the Cambrian quartzite to the granite and the cores showed mineralized strata between the parting quartzite and the Cambrian quartzite. West of the Elk fault the formations were found to be regular and in place. The Coronado shaft, formerly 640 feet deep, has been sunk 200 deeper and at the 805-foot level a drift passing medium-grade sulphide ore struck high-grade lead carbonate ore. The drifts and raises have proven the extent of the carbonate ore body thirty acres. It averages 145 feet thick. It carries fifteen ounces of silver. The accuracy of the diamond drill explorations has been shown. The Midas Co. installed heavier plant of machinery at the Penrose shaft and will continue sinking in that shaft to a level corresponding to that in which the ore was found in the Coronado. The Penrose is several hundred feet south of the Coronado and is expected to show the extent of the ore body in a south and southwesterly direction beyond the present limits of the Coronado drifts.—G. Bassinger, operating in Lake Creek park, reports opening a vein of high-grade ore. He drove a tunnel 600 feet into northern slope of Lake Creek gulch and found a 12-inch vein which carries fifty ounces of silver, 0.2 ounce gold and 10% lead. The owners of the Silver Queen, which adjoins the Bassinger group, report they expect to resume operations.

During the past summer placer operations by the Saguahe Hydraulic M. Co. in the Arkansas valley, near Leadville, are reported producing good results. The company secured ground in Arkansas river valley and in California and Birdseye gulches. This has been prospected and dredging done in two gulches. The main work of the company has been done in the valley and around Granite. The company has an area in the gulches leading from the river toward Twin Lakes from Granite. About 100 men have been worked steadily. California gulch was prospected by the company with churn drills and

preparations made to carry on dredging operations. It is expected the gulch will be dredged during next summer.

The air compressor has been set up and the power house completed on the Manhattan M. & P. Co. group at Twin Lakes and they have resumed work with steam power.—Operations will be continued this winter with increased number of miners in the Ida-May group in Sayer's gulch.

The Iron-Silver M. Co. is sinking a shaft at north end of Moyer placer at Leadville to develop an ore body shown by diamond drill explorations in its Tucson claim. The shaft of the Tucson was down 640 feet and diamond drill holes driven to additional 520 feet. The ore body is said to be 600 feet in length, 200 feet in width and 30 feet thick—assaying 300 ounces silver, with 40% lead. This discovery shows the continuity of the Iron and Rock hill series of ore shoots which are said to pass under the Moyer and Tucson, 1 mile from the outcrop being worked in the Reindeer and Nil Desperandum on Rock hill.

#### Larimer County.

It is said work will be resumed on the Tully mine at Pearl. It is intended to stoop out 300 tons of ore this season. Assays show 22% copper and \$4 in gold. There are twenty tons of this grade ore in the bin. The Tully has 300 feet of sinking, crosscutting and drifting and is equipped with steam plant.

#### Ouray County

The Camp Bird mine at Camp Bird, near Ouray, reports the statement from the mine manager for the month of September, showing that the mill ran thirty days and crushed 5917 tons of ore (dry weight), yielding 8547 ounces of bullion and 326 tons of concentrates. Number of feet of development, 871. Amount received from sales during the month:

Bullion (including cyanide bullion)	\$166,274
Concentrates (375 tons)	38,603
Total	\$204,877
Less expenses (including development, transportation and treatment of product)	\$ 51,560
	\$153,317
Less monthly London expenses (estimated)	3,500
Balance	\$149,817

There was expended on construction \$2827, making a total since May 1, 1904, of \$58,155.

The Ouray Chief M. Co. has struck a 3-foot streak of ore in drift from bottom of shaft. They also have ore in breast of main tunnel, in stopes above main tunnel and in bottom of shaft. In the bottom of the shaft ore runs \$30 in gold and 100 ounces in silver. Stopping from the drift from the shaft and shipping will be started. The shaft will be sunk to the lime contact. Manager Wood says the number of men at work will be increased.

#### Park County.

The mining situation at Alma shows a satisfactory condition at beginning of winter, says the News. The mines are increasing number of men at work. The London mine has about seventy men. It has seven teams hauling ore for shipment, and these are inadequate to relieve the ore bins at the north side, while arrangements are being made to begin shipping from the south side also. The mine is continuing its development, four machines being used in driving drifts. Other working mines of Alma district are the Paris, Hock Hocking, Russia, Moose, Ling Star, Lee Goss, Kentucky Belle, Viking, Montgomery and Dolly. The Lee Goss, a former producer of the Green Mountain group, on North Star mountain, has resumed operation and shipments to Denver, the Leadville Leasing Co. having it in charge. The Russia is being again developed, a tunnel being run to cut under the ore measures. The Paris resumed work the past summer under superintendency of J. P. Isben, of Denver, and has begun to make shipments. Two carloads were shipped last week, and are expected to run \$200 per ton gold values. In the Hock Hocking mine a strike of native silver has been made, and two carloads of the ore taken out for shipment. The ore shows free silver. The vein is 15 inches wide. Development has consisted mainly in prospecting its levels for richer ore measures. The Ling Star mine is being developed by Eastern men. It has shipped occasional cars of ore taken out in course of development, netting \$100 per ton in gold. The Kentucky Belle is in Bucksburg gulch. It is being developed by the Philadelphia M. Co., with offices in Colorado Springs. The Viking and Montgomery properties are at head of Platte river, 8 miles above Alma, and are being developed by tunnel. The offices of these companies are in Denver. The Dolly and Moose are former producers. The placer season recently closed at Alma is reported satisfactory by the operators. A good amount of dust, coarse gold and some large nuggets were secured. The greatest amount of work was done

upon the Snowstorm. A year ago the Alma placer ground was combined with the Snowstorm and its ditches extended to the latter. It is intended by the Snowstorm Hydraulic Co. to improve the Alma placers by laying high-pressure pipes and building a more extensive reservoir higher up the Platte.

#### Pueblo County.

The News says a deficit of \$1,584,857 for the fiscal year ended June 30, 1904, is shown by the annual report of President F. J. Hearne of the Colorado Fuel & Iron Co., with iron furnaces and steel works at Pueblo.

#### San Miguel County.

Telluride reports say notices were posted at the mills of the five principal mines of the Telluride district, on the 14th inst., that in the future the eight-hour day will prevail in the mills. The plants concerned are those of the Smuggler-Union, Liberty Bell, Tom Boy, Nellie and Alta. It was the demand for this concession in the mills of the State that caused the strike in the mills and mines of Colorado. The minimum wage promised under the new arrangement is \$3 a day. At one time the Western Federation of Miners offered to accept \$2.75 for an eight-hour day. It is said that under the new order no discrimination will be made against the employment of union men.

#### San Juan County.

The Eureka Con. M. Co., operating near Silverton, is driving a tunnel at rate of 5½ feet per diem at Eureka into Crown mountain. The tunnel is in 245 feet and within the next 200 feet vein No. 1 of the group of twenty-seven claims, known as the Eagle, will be cut, from which point another 100 feet will cut the Cliff vein. The equipment consists of a 100 H. P. marine boiler with a compressor with capacity to operate eight drills. Until sufficient water can be obtained from the tunnel a well near the power plant is furnishing supply which is raised to the boiler by a pump. Fourteen men are working. S. Davis is superintendent.

The Green Mountain M. & M. Co., near Silverton, will postpone building of the mill until next summer. The 4500-foot pipe line that will convey Cunningham creek water to the mill site for power was completed last week and excavating started for the mill foundation. Development of the mine has progressed and the ore bodies opened up have caused a change in the plans for a larger mill. The raise from the main level on the Ocoela vein to the upper working, 330 feet, is complete, while the Leonard and Ocoela veins are opened so that stoping may be started.

At Gladstone, the original mill of eighty-five stamps and Frue vanner concentrators of the Gold King Con. M. Co. continues in operation. The new auxiliary mill, however, is also running. The process is expected to effect a separation and saving of 95% of the gold and silver values from the tailings and slimes that have escaped from the tables of mill No. 1. The mill is run by electricity. There are two floors, the upper being 16 feet above the lower. The upper floor is divided into two rooms, one for motor, the other for amalgamation, the equipment of the former being two marine boilers of 150 H. P. each, a steam turbine of 250 H. P., direct connected to two electric generators of 75 kilowatts each. A series of eight silvered plates, with sand pumps from below, comprise the equipment of the amalgamating room. The lower floor is equipped with thirty-six Wilfley slimers and four cylinder revolving mills, charged with pebbles, and a drying room. The slimes and tailing product from mill No. 1, reduced in the cylinders, is lifted by sand pumps to the plates above. The total power system comprises fourteen electric motors.

#### Teller County.

Cripple Creek reports say that each month the output of the small cyanide mills in the district is increasing. During October a total of 10,600 tons, containing on an average \$5 per ton, were treated by the few mills of the district, and the amount recovered reached \$50,000. A few years ago it was the general opinion that the low-grade ores of the camp could not be handled at a profit. There are other portions of the district where cyanide mills are under contemplation, in addition to those already in operation or being built.

The Elkton Con. Co. at Cripple Creek is pushing work of development. They are breaking and shipping 100 tons of ore daily, which with the ore shipped by lessees makes a total output from the property of 3000 tons per month.

Extraction of gold has begun at the Gillett mill at Gillett under direction of Manager W. G. Beyerly. The machinery consists of a crusher, three sets of rolls and six leaching tanks of 150 tons capacity each. It is expected that 150 tons of

ore may be treated daily, owing to the length of time each tank is in use, which is about five days between the time of loading, treatment and unloading. They have contracted to handle ore from several properties, principally oxidized ore.

Near Cripple Creek, the shaft that I. O. A. Carper of Denver is sinking on the Free Coinage Co. group is down 50 feet and a steam plant will be put in. It is a three-compartment shaft and is projected to reach 1000 feet before the expiration of the lease, which is for five years. The shaft is within the town of Altman.

The Ajax Co. at Cripple Creek is at work again in its twelfth level. When the water was last measured it was found to be standing between 7 and 8 feet above the bottom level, and it is receding about 4½ feet a month. Since the company adopted the leasing system ore has been opened at a number of places in the territory, and there are six openings through which ore is being hoisted. About 800 tons of ore is being shipped a month, and the showing of both leases and company account is encouraging.—The Tunnel M. & L. Co., operating the Abe Lincoln mine, will start sinking the shaft an additional 100 feet from the 600-foot level. This is an illustration of the effect of the drainage tunnel. Now that that bore has been completed and the water course tapped, the Abe Lincoln shaft can be lowered without pumping. About thirty tons of \$30 ore is being shipped daily.—Taylor & Co. have a lease on the dump of the Porcupine mine, on Bull hill at Victor. The dump was made in the early days of the camp, when one had to ship \$40 ore to make a profit. Taylor will assort and screen the dump rock.

J. S. Osborn, who has a lease on the Dexter mine on Bull hill at Victor, will sink the shaft another 100 feet, it being at 600 feet from surface. The property is a low-grade proposition and is yielding heavy tonnage of ore. A vein of smelting ore has been opened.

Cripple Creek reports say construction work has started on the cyanide mill on the Summit claim of the Michardo Co. on Ironclad hill. The mill will have capacity of thirty-five tons a day to start with. Values have been received of \$4 per ton.

Shipments are being made weekly from over 100 leased properties of the Cripple Creek district, says the Cripple Creek Times. There are 200 shafts through which ore is being hoisted. One hundred cars leave the mines daily.—Production of both low and high-grade mineral is being made from the Los Angeles. One runs \$5 to the ton, the other \$30. The Abe Lincoln and the Moon-Anchor yield two or three cars a week, the former running \$50 and the latter \$20.

At Gillett, Superintendent J. Losbaugh, for a New York company, has started work on a group covering 100 acres of mineral land. A 50-ton cyanide plant will be built to handle ore said to assay \$4 to \$7 at the surface. The territory to be developed by the company is on Sheep mountain, near Midland and north of Gillett.

Development of the Big Twenty M. & M. Co.'s mine, below Beacon hill, Cripple Creek, is progressing. Its ground is being penetrated by a crosscut tunnel, in 1000 feet, which has cut several veins. The main purpose is to reach ore bodies 500 feet ahead. The ore is largely oxidized and it is thought a cyanide plant will be built.

While shipments from the Acacia Co. group on Bull hill, near Altman, are unimportant in quantity, considerable prospecting is being done, says the Times. On the Morning Star claim Hansbrough & Gray have sunk a winze 160 feet below the 400-foot level, following a shoot, and are using an electric hoist to raise waste. On north end of the Burns claim Wyatt & Burns have put in machinery and will develop above the 400-foot level. On south end of the Burns the Exposition L. & M. Co. is sinking to the 250-foot point. Surveys are said to indicate that the body of ore that traverses the Findley and Shurtloff mines will be found in the Burns. Lessee Hawkins is taking out ore from workings near the Burns shaft.

Construction work on the cyanide mill by the Giant M. Co. down Pony gulch, west of Cripple Creek, is started, says D. B. Burch, manager of the company. With this mill in operation, the producing area of the district will be widened 2 miles in that direction, says the Gazette. At Cripple Creek W. H. Sanford, R. A. Kincaid, L. L. Rees, E. Whitley and I. F. Feek have incorporated the Columbine G. & C. M. Co.

F. Burke, who has a bond and lease on the Alpha & Omega mine, near Cripple Creek, will work through the new shaft on the Caledonia mine, which gives him a depth of 250 feet to start with. A drift has been run 200 feet from the shaft, so Burke will drive another 250 feet to reach his ground, where he expects to open up the extension of the Henry Adney ore

shoot.—The R. E. A. & A. Co., operating under lease the Wild Horse mine, on Bull hill, last week made a cleanup. The plant has been treating eighty-five tons a day and the cleanup covers a period of one month, the ore running \$6 per ton. The cleanup returned \$15,000 gross.

The Pharmacist Con. M. Co., whose mines are on Bull hill, at Victor, will lease out its property in blocks. The company will sink the shaft.

Development of the Teutonic mine, on Ironclad hill, at Cripple Creek, which adjoins the Jerry Johnson, is being pushed by Lessees Duncan & Cain, who are sinking the shaft to attain a depth of 300 feet. The shaft is 200 feet in depth. During the sinking the lessees have cut three veins between the surface and the present depth. The first ran 5 ounces in gold and 100 ounces in silver. With the 300-foot point reached they will extend the level.

Cripple Creek reports say the smelters have put a clause in their contracts that is new to the shippers, and is said to be causing dissatisfaction among them. The new clause provides that whenever the shipper and the smelter do not agree on the contents of the ore the settlement will be made at the point nearest the umpire's result, which means that there will be no split, and that will be the basis upon which the shipment is settled for.

The Metallic G. M. Co., leasing on the Bill Nye claim, on Copper mountain, near Cripple Creek, will sink a deep shaft. A road will be completed to the claim. A plant of machinery in the Copper mountain tunnel will be removed to the shaft house.—Shipments are again being made from the Mountain Beauty mine, on Bull hill, at Victor, after an idleness of a year. Lessees have opened a streak of ore in the Ogilvie shaft.

The mining town of Anaconda, in Cripple Creek district, was wiped out by fire on the 12th inst.—Machinery has been put in and a gallows-frame erected at the shaft that J. A. O. Carper is sinking on the southwest section of the Free Coinage Co. ground on Bull hill, at Victor. The shaft is to drop to the 200-foot point. It is of two compartments. Ore is being mined by Lessee Carper at several points in the Free Coinage mine.

## IDAHO.

#### Bear Lake County.

W. Hatfield of Salt Lake City, Utah, part owner of the Bear Lake Copper Co., 5 miles out of Paris, has men at work on the Humming Bird mine. The vein averages 4 feet in thickness and the ore carries 5% copper. A shaft has been sunk.

#### Blaire County.

W. N. Pierce, interested in the Revis placer mines in the Little Smoky section, near Hailey, says he will put in 10-inch riveted pipes, giants and other placer mining machinery, also timber for sluice boxes. A reservoir made this year will conserve a supply of water.

#### Boise County.

W. Green of Boise says that at the Payette group of mines on the State road, near Banner, near Boise, machinery is on the ground. The sawmill will be in operation this week and the quartz mill will be running in December. A road has been graded to the millsite. Work in the mine has progressed. A crosscut tunnel has been driven to cut two ledges. The first shows 42 feet of quartz. The mill will be started on ore from the open cut.

G. Z. Edwards, general superintendent of the Lincoln Co.'s mines at Pearl, says a triple-compartment operating shaft has been started and will be sunk 500 feet. Over 30,000 feet of lumber has been ordered to put into surface improvements. A compressor, pumping machinery and drills will be put in and will derive its initial power from an electric station a few miles distant. The mine is opened through a 300-foot incline shaft. The mill, which has a capacity of 125 tons in twenty-four hours, is operated with one shift only pending surface and underground improvements. Tests are being made to determine if better methods of treating the ores can be devised. It is thought a cyaniding addition will be made to the plant.

—Adjoining the Lincoln on the east is a group of eight claims owned by D. Kennedy. A triple-compartment shaft has been started. They propose to equip the mine and open it up.—Adjoining the Lincoln on the south is the property of the South Lincoln Co., controlled by J. H. Stallings and J. T. Hodson of Salt Lake City, Utah. It has been equipped and a three-compartment shaft is being sunk within 50 feet of the Lincoln lines.

#### Elmore County.

R. P. Chattin, principal owner of the Franklin mine at Neal, 35 miles from Boise, says the drift from the tunnel had reached the ledge. The vein matter at the surface showed sulphurets and panned free gold. The mill on the mine is running regularly and making satisfactory output.

**Idaho County.**

W. J. Mattern of Topeka, Kan., manager of the Old Mexico M. Co., which owns two groups, one of nine and one of four claims, on Big and Logan, near the head of Government creek, in Thunder Mountain district, near Roosevelt, says his company has put in machinery, including a drilling machine. Prospect shafts and tunnels have been driven and bodies of ore opened. Mattern says his company has a power site on the property and he intends to put in a water wheel and electric dynamo. He will also put in an electric air compressor and drills.

The Dewey 10-stamp mill at Roosevelt, Thunder Mountain district, running on second-class ore, during the month of October turned out bullion to the value of \$12,000. The entire cost of operation of mine and mill, including all development work, is \$4500 per month. Supplies cost from 8 to 10 cents per pound more than in other districts. Manager Dewey says the report of Superintendent Haug for the quarter ending October 24 shows as follows: Number of tons crushed, 308.84; average battery value, \$12.85; average value of tailings, \$1.49; percentage saved, 88.4.

C. Crawford et al. are organizing a company to develop and operate the Hawkeye & Badger group of mines on Rapid river, near Warren. Crawford has a one-half interest in the Gold Bullion group, in Thunder Mountain district. Development on the Gold Bullion is working ten men for the winter. It is intended to double the number in the spring and a mill will be built. The tunnel on Monumental creek, which is in 200 feet, will be run 100 feet farther, opening the vein at depth of 700 feet. On Botha creek a tunnel will be run 100 feet this winter.

At Roosevelt, in Thunder Mountain district, E. L. Abbott, superintendent of the Sunnyside mine, says the wire cable for the aerial tramway is on hand and the work of stretching it is under way. The mill buildings are completed and machinery is being set up.—The Lucky Joe group of mining claims, at head of Westfork and Snowslide creeks, 12 miles northwest of Roosevelt, is owned by H. Kinsinger and J. B. Martin. Samples show assay values running from \$6 to \$16.50 per ton in gold. Millmore states the deposit is 40 feet wide.

**Kootenai County.**

It is reported a 6-foot ledge, containing 6 inches of carbonate shipping ore, wire and native silver, has been struck on the Black Jack group, 2 miles north of Lane, and owned by T. Gunyet. Assays give average values of \$100 per ton. The ore was struck in the crosscut tunnel at 210 feet, where a 24-foot winze was sunk, and at a depth of 100 feet. Over fifty tons of ore are on the dump.

An 8-foot face of galena has been opened in No. 3 tunnel on the Continental mine, near Porthill, says W. T. Bailey Jr. of Duluth, Minn., manager. The mine is working thirty-five men, including the crew cutting wood for the compressor. They are driving three tunnels. It is a concentrating ore, with streaks of high-grade galena. The lowest tunnel, the Blue Joe, exposed a 400-foot shoot of ore. H. C. Kelly is in charge.

**Nez Perces County.**

The Pittsburg-Idaho M. & M. Co. has resumed development work on its property, 3 miles below Kamiah, on the Clearwater river. The mine is 2000 feet from the Northern Pacific railroad.—The Hawkeye group, owned by Nez Perces people, 2½ miles below Kamiah, on opposite bank of the river, is also being worked.

**Shoshone County.**

A. M. Mundell, in St. Joe district, has been working his eleven claims. The district is 10 miles south of Wallace and 4 miles west of Slate creek. Mundell uncovered two ledges cutting at right angles. Surface assays show 12% lead, 9 ounces in silver and 30 cents in gold.

The tunnel on the Cathella group, near Wallace, is in 400 feet and stringers of galena are out, says Superintendent J. H. Smith. The ore shoot will be tapped at a depth of 200 feet. G. Cunningham of Wallace is manager.

Silver-lead concentrates are being obtained by Safford Bros. from sluicing Mile creek at Wardner. They have been sluicing from the site of the old Last Chance mill down to where they have a Cornish jig. They have rocked out in two weeks twenty tons of concentrates, running 50% in lead. Coins are found among the concentrates. Among the debris are scrap iron, axes, cartridges, revolvers, hammers, wrenches, bits, several gold rings, etc. For several years the Last Chance mill was at the upper part of Wardner and its slimes and tailings were dumped into Mile creek. Not only the waste from the mill, but the waste from the city, was dumped into the creek.

At Mace the Standard and Mammoth

mines of the Federal M. & S. Co. are being worked as one property. Approximately 1000 tons a day will be brought out through the Mammoth tunnel. The ore bins at the Mammoth have doubled in capacity. The old ones were strengthened and new ones built. For several months the two mines have been worked with machinery at the Standard, as the substation that furnishes electric power is there. Electric haulage is being placed in the lower workings of the property and other improvements made.

**KANSAS.**

Independence reports say there was a slight decrease in oil field operations in October, as compared with September. During October, 427 wells were completed in the combined fields, as compared with 472 in September. In September there were 41 gassers and in October 40. September had 71 dusters while October had but 55. The new production in September was 7387 barrels; in October, 7092 barrels. The average production of the wells drilled in October was 21 barrels, as against 20.5 barrels in September. It is believed the Kansas and Indian Territory fields are now capable of producing 30,000 barrels a day, if all the wells were pumping regularly and all the oil being taken. The following summary is given for October:

District.	Drilled.	Gas.	Dry.	Producing.
Independence.....	31	6	7	264
Drum Creek.....	8	1	2	85
Wayside.....	27	1	1	357

**MICHIGAN.**

Houghton reports show that the copper mines of Michigan have produced 199,580,100 pounds of that metal during the ten months to Nov. 1st of this year. During the entire year 1903 the output was 192,223,855 pounds.

**Houghton County.**

The Centennial management, near Calumet, is increasing work on surface improvements at its Kearsarge shafts. The old stock piles are out of the way and give needed room.—The Champion mine, at Painesdale, is sinking in all shafts. Owing to other work on hand and lack of adequate power for drilling machines, sinking was discontinued for about a year. The Champion now has ample air and can send 2000 tons of rock daily to the mill and do deep work in addition. With the 2-stamp addition to the mill in operation, the Champion will begin crushing 3000 tons daily.

**Keweenaw County.**

Developments at shaft No. 5 of the Mohawk mine, near Allouez, continue to improve. The Mohawk has given smaller returns from its rock than was expected before milling started, notwithstanding which the property is said to be making profit.

**MISSOURI.****Jasper County.**

Near Webb City, W. M. Williams, R. C. Butts et al. have leased ten acres south of the Stevenson & Moore lease and will begin prospecting the same.—J. Scudder, W. Nemrick and G. Parks are opening up the Anderson & Co. mine on the Missouri Zinc Fields. A cave-in stopped operations. The lessees intend to cut a new drift to head of the old drift.—M. Clark, E. L. Flood and W. H. Chew have opened up a lead prospect on the Zinc Fields lease. They are working at 90 feet and think they have extension of the Davey & Co. ore. They are working it with an electric motor hoist and three hand jigs.

E. P. Church, T. Shelton, W. R. Marsh, L. Hamilton and G. Bayless have a three-year lease on the Yale mill and mine on the Old Colony Z. & S. Co. tract, adjoining the Wright M. Co. at Webb City.—A mill is in course of construction at the mine of Forristall & O'Donald of Boston, Mass., northeast of the Mary Louise mill. W. B. Shackelford is superintendent.—The Big Four M. Co. is putting in a 5-inch compound duplex steam pump at its mine. It is expected the pump will drain the ground and open up a run of sheet ore that has been under water for several years. The Star mine will also be effected by the drainage.

The Clover Leaf mine on the Continental tract, near Jasper, has been sold

for \$15,000 to E. H. Mower of the Empire Z. Co. Mower will increase development work and increase the output.

**MONTANA.****Deer Lodge County.**

Anaconda reports say the cave-in at the Southern Cross mine has been repaired and work resumed with full number of men and ore teams. The cave-in did not affect the new workings at the mine. The company has twenty-five ore teams at work.

**Flathead County.**

J. Z. Clark, J. Rouse and H. Hamilton, owning the Selkirk group at head of Cedar creek, 13 miles southwest from Libby, report development work in the shaft is opening up silver ore carrying 300 ounces silver per ton. A tunnel is being driven to cut the ore below the shaft. Ore shipments will be made.

**Jefferson County.**

A. H. S. Bird of Salt Lake City, Utah, is prospecting his mining ground in the Wickes-Corbin district with a diamond drill. The district is between Wickes and Corbin. Surface indications are of deposits of copper. The country rock is granite and porphyry.

**Lewis and Clarke County.**

Work on the properties controlled by A. C. Mason & Co. is being increased. They have properties at Red mountain, near Rimini; at Hassel, Broadwater county, and near Norris, Madison county. The Inter-Ocean tunnel on Red mountain is in 1200 feet and has cut twenty-two veins of ore, all carrying values. It is expected to cut forty producing veins when the tunnel is completed. It is expected to cross the Mammoth vein. Shipments are being made from this vein by lessees west of the tunnel. The best ore is found in the lower workings, where a body of galena is said to run \$50 per ton. Mason's properties in Hassel district are the Park and New Era groups. He is increasing development with sixty men. A concentrator will be built and is expected to be in operation in January. A 1200-foot tunnel will be run and electric power used from water power. The ore shoot has been opened for 1200 feet, with average shipments of \$40 per ton. At the Black Hawk group in Madison, controlled by Mason & Co., a mill is about completed and will be put in operation to handle low-grade ore, the shipping ore running about \$42 per ton.

The Tri-Metal Co., under direction of J. C. Cory, is developing the Telegraph properties on main divide between Rimini and Elliston. There is a porphyry dike, 50 feet wide, carrying values in free gold. The company has men at work and will start up the mill.

The Beatrice M. Co., operating a group in Mike Reinig gulch, 15 miles from Helena, has ore blocked out and will put in a concentrator. The values are in gold, silver and lead.

L. Brown of Helena is working men in development of the Fnebner mines on Red mountain, near Rimini. A concentrator will be placed on the property.

**Madison County.**

L. D. McCall, manager of the Bismark Nugget Gulch Co., operating the Toledo mines near Sheridan, reports a strike of ore at depth of 750 feet in the Toledo No. 1, and the company will start its 150-ton mill this week. For some time past the company has been confining operations to development of its mines.

**Silver Bow County.**

F. W. Link & Co. are building a cyanide plant southwest of the Lexington mill at Butte for treating several thousand tons of tailings from the mill. The plant will be finished this week. It contains eleven 25-ton tanks and other equipment. The tailings from the Lexington contain gold and silver. The plant is said to be the only one of its kind in Silver Bow county. Horses will be used in transporting the material from the gulch to the plant. Chutes have been built from the top of the plant to the vats.

The Montana Zinc Co. has been organized in Butte, as the result of tests made on the zinciferous ores of the Alice M. Co. in Walkerville. The incorporators are: C. W. Leimer, C. B. Wisner, R. H. Crosby, J. E. Fryer and W. A. Moore. Those conducting the tests have been using a portion of the Alice company's 60-stamp mill to crush the ore, but will put in rolls to take the place of the stamps. The Alice mines contain bodies of this class of ore. Besides zinc, it contains values in gold and silver. The output last year aggregated 7316 tons of ore and 1281 tons of tailings. The ore was sold for \$48,684, net earnings of the company being \$4045.

**NEVADA.****Elko County.**

G. L. Moats, of Salt Lake City, Utah, manager of the Latham mine in Spruce Mountain district, south of Wells, says he

will build a dry process concentrating mill at the mine. Some of the equipment for the proposed plant has already been placed. It is expected it will be ready for operation in January. The first unit will have capacity for treatment of 100 tons a day.

G. L. Moats of Salt Lake City, Utah, manager of the Latham M. Co. mines at Spruce mountain, south of Wells, says work will start on the mill with which they are to be equipped.

The mine and stamp mill of the Dexter company at Tuscarora are being operated under lease by P. McKenzie, who is mining from thirty to forty tons of ore daily. Manager S. B. Milner says the company's experiments on treatment of the ore have been successful and the temporary cyanide equipment will be enlarged next spring. It is closed down for the winter. No ore from the mine has been handled, but the slimes ponds were drawn upon to keep the plant supplied. The average of pulp treated was \$6 per ton, one-half the values being in gold. Practically all the gold has been saved and about 70% of the silver.

**Esmeralda County.**

The hoist for the Red Top mine at Goldfield has been set up and sinking the shaft resumed.

The Bullfrog M. Co. has been incorporated at Tonopah by T. L. Oddie, president; G. W. Ladd, L. E. Benson; H. H. Clark, secretary and manager; K. Pittman, R. R. Davis and J. Carter, to develop its twenty-three claims at Bullfrog district, south of Goldfield.

At Goldfield, ten claims and three fractions constitute the Combination group, owned by Winslow, Hubbard et al. of Chicago, Ill., and L. L. Patrick. Development work began Nov. 1, 1903, and the shaft has been sunk 315 feet. Ore to value of \$315,000 has been shipped. There is said to be ore to value of \$250,000, running \$30 to \$100 per ton, on the dump, waiting treatment methods, for which a reduction plant will be built, to consist of ten 1200-pound stamps, plates, concentrators and cyanide tanks of forty tons daily capacity. From the shaft, five levels have been run 150 feet each way. Some stoping was done above 135 feet, but below that the only ore extracted was in development. At that point the ore became sulphides and carried a lesser percentage of free gold. The shaft is equipped with a 14 H. P. gasoline engine, but this will be replaced by a steam hoist. For the use of the mill, water has been developed at Alkali springs, 10 miles west of the mine, and a flow of 75,000 gallons per day secured. Work on the pipe to conduct the water from the spring to the mill will be started next month. The pipe line, with the attendant work, is expected to cost \$33,000. The Combination Co. has been reorganized as the Combinaton Mines Co.

The Nevada Goldfield M. Co. of Reno has bought the mining properties of T. Wilyter, eight in number, in Gold Mountain mining district, Esmeralda county, 40 miles south of Goldfield, 10 miles northwest of Chiatovich's mill and cyanide plant.

The lease of J. X. Jones, L. L. Patrick, Z. Kendall and B. J. Reilly on the January mine at Goldfield expires Jan. 1st, by which time it is estimated the lessees will have taken from the 700 feet of workings opened up \$800,000 in ore. Of this amount one-half will have come from shipments of ore and the balance will come when a reduction process in the district is available to handle the dumps. The January is one of seven claims owned by the Goldfield M. Co. of Nevada. R. L. Johns, president, with M. N. Clark, H. T. Bragdon and A. C. Eisen, are officers. The January is opened up by a vertical shaft to depth of 285 feet. At five levels crosscuts have been run to the levels, of which there are six. The lessees' work on the January has been under superintendency of S. Kemp.

At Columbia in Goldfield district, Hicks & Co.'s sampling mill was put in operation last week. The plant consists of a small crusher, two 100-pound stamps and an 8-foot amalgamating plate. The capacity will be about one ton per day. In addition a rotary grinder has been put in.

The Frisco Gold Field M. Co. has been incorporated by J. H. McGhan, president; E. A. Montgomery, J. W. Skelton, T. E. Edwards and R. B. Wampler, directors. The property of the company consists of five claims, containing ninety-four acres in Goldfield mining district. The Frisco claim adjoins the Cimmeron fraction on the west, the Potlatch M. Co. ground on the north and the Lone Star group on the south. The other four claims of the company compose the Chispa group, in southern part of the district.

The Baltimore G. M. Co. has been incorporated under Arizona laws. The property consists of the Fortune group of four claims and fractions, covering in all

forty acres in Goldfield mining district; and north of the Tonopah Club claim. It also joins the Goldfield Hibernia M. Co. on the north. Its officers are: H. G. McGhan, president; C. D. Mercer, J. W. Skelton, E. N. Davis of Tonopah; M. Averill, A. L. Hudgens and E. R. Shields. Development work will start this week.

C. F. Mau of the Pactolus M. Co., operating 47 miles southwest of Sodaville, reports opening up ore that carries free gold. A 4-foot ledge has been uncovered. He expects to put in additional mining machinery and a mill.

Official announcement has been made that the Taylor & Brunton Sampling Co. of Salt Lake City, Utah, will enter the Goldfield-Tonopah field. It is expected the works will be at the point where the Goldfield railroad is to leave the main line of the Tonopah railway.

At Bullfrog, near Amargosa, south of Goldfield, the Bullfrog M. Co., of which H. H. Clark is manager, is working on the Ladd Mountain, Benson and Indian Springs groups, and sixteen men are employed. On the Ladd Mountain group a shaft is being sunk on the vein, surface assays of which run \$46. The company has three camps with blacksmith shops and other equipment, and is also building an assay office, in charge of W. H. Bryson. At the original Bullfrog mine a shaft is down 10 feet in ore. There are 300 men in the district, most of whom are on location work. At Amargosa, where a postoffice has been established, there are forty tent buildings. At the Goss ranch, 9 miles distant, men are working on the spring, which at a point 300 feet above the townsite, is running from 30 to 50 inches of water, which will be piped to Amargosa. Fuel and mining timbers are obtained 10 miles from the town. Wheeler, Hassel & Lind of Goldfield have bonded the Black Monster, White Monster, Aurora, Wild Cat and Bountiful claims adjoining the Bullfrog mine, and development work will be started this week.

#### Humboldt County.

B. F. Smith, J. P. Fitting and O. C. Black of Colorado Springs, Colo., have bought 200 acres of auriferous mineral land in the Humboldt range, near the Sheba mine, south of Mill City. The group has 4500 feet of surface croppings, and the chief ore vein ranges from 4 to 8 feet in width at 220 feet. A 15-ton stamp mill will be in operation within thirty days.

Superintendent C. D. Morrison of the Sheba mine, south of Mill City, reports the main tunnel completed to 1132 feet, and that the face is in porphyrite. The raise, being made to connect with old workings, is advanced 25 feet per week.

#### Lincoln County.

The Deer Lodge G. M. & M. Co. has been incorporated by President E. D. Trenam, J. J. Trenam and R. G. Andrews at Salt Lake City, Utah. The company owns claims in the Eagle Valley mining district.

#### Nye County.

In the MacNamara mine, at Tonopah, on the 350-foot level a body of high-grade ore has been opened which is being sorted and sacked for shipment. It is 2½ feet wide. On the north dip vein a raise is being put up from the 350 level in milling ore. The group of the Free Gold M. & M. Co., at Gold Reef, is opening up satisfactorily under management of J. M. Meighan. In a drift on the 50-foot level a streak 7 inches wide on the hanging wall assayed twenty-one ounces silver and ten ounces gold. On the 100-foot level the vein is being crosscut. Sinking will be resumed.

At Hannaph, east of Tonopah, Superintendent F. Work reports he has 12 inches of shipping ore in the Hannaph mine. Developments are slow owing to water in the mine, but this is valuable for the mill to be built to treat the second-class ores.

#### Storey County.

Work of draining the middle group of mines on the Comstock lode at Virginia City, preparatory to recovering bodies of ore, is ready to start, says Consulting Engineer and Superintendent L. M. Hall of the Comstock Pumping Association in an official report to the Ward Shaft Association, composed of the Gould & Curry, Savage, Hale & Norcross, Chollar, Potosi, Bullion, Exchequer, Alpha Con. and Julia Con. mining companies, which combined a year ago to put the Ward shaft in repair and equip it with a pumping plant to unwater the mines down to the 3000-foot level. A feature of Hall's report is the statement that for the first few hundred feet the water will be lifted from the shaft by means of compressed air instead of steam, electrical or hydraulic power. The plant to be put in at the bottom of the Ward shaft after that shaft has been unwatered and sunk an additional 500 feet, or to the 3000-foot level, will consist of two direct connected electrically driven pumps, each having

capacity for lifting 1600 gallons of water per minute, against a pressure equivalent to a height of 1050 feet, and each to be driven by an 800 H. P. slow speed induction motor.

#### Washoe County.

E. Olinghouse has started to dropping the stamps on ore from a body of ore opened in the Butte & Gold Center mine of which he is owner, at Olinghouse, near Wadsworth.

#### White Pine County.

The Spring City M. Co. of Utah has been incorporated by President J. Johnson, E. Erickson and S. Beck of Salt Lake City. The company owns two lode mining claims in White Pine County.

### NEW MEXICO.

#### Rio Arriba County.

Las Tusas Peak G. & C. M. Co. has its air compressor in place on the Tampa shaft in the Bromide district, 12 miles west of Tres Piedras, and has been steadily sinking and cutting to the vein at each level. The air compressor will furnish air to machine drills in the bottom of the shaft and also to drills in the 300-foot level to block out ore. The vein is said to carry values in copper and platinum. The Keystone Bromide M. Co. is sinking in the Boston shaft in Bromide district, and ore is being taken out. Young & Co. are deepening the Red Jacket shaft at Hopewell, to open up ore shoots that have produced gold and lead ores from levels above. It is said the Jaw Bone group and the Santa Fe tunnel will be worked with larger force this winter. G. F. Hall has resumed work in the 16 to 1 shaft. Buildings at the Dillon Dev. Co. tunnel are completed, machine drills put in and work resumed in the face of the tunnel.

### OREGON.

#### Baker County.

In the Greenhorn mountains near Greenhorn, the Morris mine has been sold to Iowa men, with offices at Webster, Ia. Development work will be under superintendence of H. O. Hyatt. The mine is in the Vinegar Hill section of the Greenhorns and is patented. Development is by tunnels and shafts.

At the Snow Creek mine near Sumpter the shaft is being sunk to 225-foot level, says Manager Smith. Next week he expects to have the station cut and drifting in progress on that level. The mill has ten stamps dropping. Shipments of concentrates will be made to the smelter.

Development work on the mines of the Hidden Treasure M. Co., near Greenhorn, is increased, and it is intended to work the Hidden Treasure and I X L veins from the ore shaft by connecting the Hidden Treasure vein with a crosscut from the I X L vein. Sinking the shaft and drifting under the ore shoots at each successive 100-foot level will also be continued. The Hidden Treasure G. M. Co.'s group consists of eleven claims, covering 154 acres, and is accessible by wagon roads for 7 miles from the Sumpter Valley Railroad station at Tipton. It is 12 miles from Whitney and 23 miles from Sumpter. There are five known veins traversing the group, on two of which development work has been done. The property is equipped with hoisting plant with a capacity for sinking to a depth of 1000 feet. Two steam stamp batteries are in. These have a crushing capacity of fifteen tons daily. In connection with this is a 20-ton cyanide plant, both plants being in operation.

#### Douglas County.

The Mayflower M. Co. is increasing development work on its properties near Bohemia. W. P. Ely of Kelso, Wash., is part owner. The company has been opening up ores of promising values and intends to put up a stamp mill.

#### Grant County.

The Buffalo mine, 5 miles from Granite, is owned by the Buffalo-Monitor M. Co. There are two claims in the group—the Buffalo and Monitor. The Buffalo claim contains three ledges. The Monitor shows one ledge, the Monitor, being 24 feet wide. The four ledges show free milling ore on surface. The Buffalo ore is principally gray copper and galena carrying silver and gold. N. Berkeley is manager of the Buffalo and has men driving a crosscut under contract.

#### Jackson County.

The Oregon Belle mine being developed by the New York & Western M. Co. under supervision of H. Foster, near Jacksonville, is working fifteen men at the mine and is cutting wood for the steam plant. He has put in a 40 H. P. boiler and an eight-ton compressor and two drills. Two tunnels are being driven and ledges opened up. It is free milling ore handled in a Huntington mill. Foster says the company will put in a 10-stamp mill next spring.

The Gold Hill & Bohemia G. M. Co. re-

ports success in development of its Red Oak group of quartz claims near Gold Hill. There are five claims in the group. The first work to be done is driving a tunnel from the gulch, which will tap the ledge at depth of 350 feet. The Gold Hill & Bohemia expects to have the Oak group sufficiently developed by next summer to put in a mill. The Millionaire mine of Gold Hill district, in which Portland men are interested, reports good showing with development. The company intends to have the Millionaire opened up and developed by next spring so as to put in a 10-stamp mill.

#### Josephine County.

It is reported the 10-stamp mill of the Eureka mine, near Grants Pass, which has been idle, will resume this week. Development has been increased.

The Champlin gold dredger on Foote creek, near Grants Pass, is operating steadily with thirty men.

J. C. Lewis & Co. of Portland have bought the Benton mine, on Mount Reuben, near Grant's Pass. Superintendent Jones will be retained in that capacity. A 1300-foot tunnel has been driven on the vein, and there are also several hundred feet of other workings. A 40-stamp mill will be put in next spring.

Grants Pass reports say the Gold Bug mine, of Mount Reuben, is held by option by McQueen & Burkhardt, of Portland. They have 25 men at work. New ore bodies are being opened, drifts and tunnels driven, and the old ones retimbered. Ore supply is blocked out, and the 5-stamp mill is in operation. The Gold Bug ledge is a contact vein, and carries values in free gold and concentrates.

Among the larger southern Oregon hydraulic mines overhauled and repaired the past summer is the Sturgis of Forest creek, near Grant's Pass, sold to Los Angeles, Cal., mining men, L. A. Vance president. The main ditch has been widened from 3 to 5 feet and the head works strengthened to increase the capacity of the reservoir. Another giant has been set, making a battery of three No. 3 monitors. The large boulders will be handled by a steam power derrick. The mine is electric lighted, says Manager Olmstead.

Progress is reported by the Bradshaw M. Co. in its development of the Blue Ledge copper mine of the Upper Applegate district, south of Grant's Pass. Three tunnels are being driven on the vein. The Bradshaw Co. is also putting in a compressor and machine drills.

#### Linn County.

W. B. Lawler, of the Lawler Mines, Ltd., says operations will be resumed on the company's properties at Quartzville, in Linn County. He reports plenty of ore in sight, with 9000 to 11,000 feet of tunnels, shafts and winzes. Quartzville is on the middle fork of the Santiam river and is reached from Gates Station.

#### Wallowa County.

A strike of a gold-bearing ledge has been made on the group of the Tenderfoot M. Co., near Innaha. The ledge is 27 feet in width and shows values of \$70 per ton in gold. The ledge is in the Blue mountains, at an elevation of 8000 feet, near the headwaters of the Innaha river.

### SOUTH DAKOTA.

#### Lawrence County.

The Aurizone M. Co. is determining water available for milling and other purposes on its ground, with a view to building a plant. Development work continues in progress in tunnels and drifts, and it is said a body of payable ore has been opened. The ore is low grade, but is claimed to be suited to cyaniding. The company owns 200 acres in one group near head of Butcher gulch, in Bear Butte mining district, near Galena. Several springs rise on the ground, and it is proposed to impound their water. The Bear Gulch M. & M. Co. and the Bear Gulch G. M. Co., owning properties in Bear gulch section, west of Lead, are reported negotiating for a consolidation of their properties.

Two carloads of silver-lead ore, which will run \$60 per ton, have been shipped from the Shamrock mine, on Big Strawberry creek, near Lead, to the Omaha smelter. Two shifts of miners are working in the mine, getting out ore and sinking through quartzite. The drift which is being run on the quartzite has struck an ore shoot. The Shamrock adjoins the Puritan. Besides the smelting ores, which occur on the quartzite, coming up through the quartzite are several verticals, one of which has developed into a vein of about 3 feet, which carries gold values of \$8 per ton.

### UTAH.

#### Beaver County.

Operations at the Wild Bill mine, near Shauntie, near Frisco, have been revived. Work has resumed at direction of M. Culen & Co. of Salt Lake City, with J. Kelly in charge. It is intended to put down a new

shaft, which will connect with a body of ore previously opened up through the incline and a winze below it. A 12-foot ledge carrying silver and lead values is opened up.

L. A. Amaden of Salt Lake of the Blackbird M. Co. says it is intended to begin development work next spring on the Blackbird, which adjoins the Cactus, at Frisco.

#### Juab County.

The main shaft of the Grand Central mine of Tintic, at Eureka, is down 1325 feet. A sump is being cut and a station will be made and a drift started to open up the ore bodies. It will take 600 feet of drifting.

The dump at the Joe Bowers mine, near Eureka, is being jiggered by Kaufman & Doyle. The capacity of the ore bins at the Grand Central mine has been doubled. Other improvements are proposed. Work is being pushed on sinking the shaft, which is nearing the 1300-foot level. The gallows-frame is in place and the smokestacks are up at the Uncle Sam mine. The engine and boilers have been overhauled and retimbering the shaft is completed. Miners are working on the ore body on the 400-foot level. G. Paxman and T. Short have a lease on the Shoebridge mine and will begin operations this week.

#### Salt Lake County.

At Alta, on the Bryan group, Chambers & Craig have an option and will start work on ore body hitherto exposed. High-grade ore has come from the Bryan group. Connection between the Howland and the Columbus mines will be completed this week, facilitating extraction of Columbus ore. The ore bins at the mines and mill are filled. At the Miller mine teams are being loaded with ore. The Pittsburg has completed its crosscut, showing 12 feet of shipping ore.

#### Summit County.

The air compressor at the Kearns-Keith mine at Park City is in place and working two sets of power drills. Manager Rood of the Ontario, Daly and Nalldriver properties says at the Nalldriver ore is being taken out. At the Federal tunnel work is being increased, though work is slow on account of the hard formation which is being driven through. At the Ontario work progresses and the capacity of the mill will be increased.

#### Tooele County.

The Honerine drain tunnel at Stockton is completed to the length of 7000 feet.

Operations have been started by the Sharp M. Co., which owns four patented claims covering forty-eight acres, including the Little Havana, Bryan, Cecile and Havana No. 1 claims, near Stockton, and adjoining the side lines on the south of the Honerine Co. ground. A. L. Jacobs, H. Dinwoodey et al. of Salt Lake City are owners. The Little Havana is the principal developed claim of the group. It has been opened by a 500-foot tunnel and a shaft sunk from that, says Manager Jacobs.

### WASHINGTON.

#### Kittitas County.

The Summit coal mines, near Cle-Elum, on the main line of the Northern Pacific Railway, have been sold to R. J. Linden and D. Goodsell of Portland, Or. The deal involves half a section of coal land covering a vein of high-grade bituminous coal with average thickness of 5 feet. The plant has a capacity for shipping 200 tons a day. It is said the owners intend to double the capacity and to build bunkers at Portland, Seattle and Spokane.

#### Okanogan County.

T. J. Thorp says the mill of the Crystal Butte Co., operated by the Interstate M. Co., near Chesaw, will start up again this week. The stoppage was caused by defect in the electric light plant. The mine is working twelve men and the mill ten. The Grant is preparing for working during the winter months. It is reported it will be equipped with a steam hoist. M. Smalley is still operating the Oregon. The ore is high grade, and shipments have been made. It is intended not to take out more ore than will be sufficient to pay expenses until there is rail transportation, as the cost of hauling 18 miles from the mine to the railroad at Midway, B. C., is heavy. The Bodie mill is running regularly. The mine is putting out fifty tons per day, with twenty-five men at work.

#### Pierce County.

Tacoma reports say to make pig iron on Puget Sound, Wisconsin and local men have bought the coal and coke properties of the Montezuma M. Co. and Washington Co-operative M. Syndicate near Fairfax. J. W. Ladd and T. O'Connor are principal owners and are organizing the Western Iron, Coal & Coke Co. The new company also acquires iron properties on Barclay Sound, Vancouver Island, B. C.

#### Snohomish County.

P. D. Peck of Colesburg, Ia., has bought

LeRoy and Vesuvius mining claims on Silver Tip mountain, near Monte Cristo, and will drive 100 feet of tunnel.

The Bornite G. M. Co. near Darrington has its tram line completed, which is 12 miles long, and a power plant in operation with compressed air to drive the drills. A contract will be let for 1800 feet of tunnel to be driven this winter. — Croppings on Gold mountain, near Darrington, opened up by C. Burns, after drilling through dolomite, exposed 2 feet of ore. The ore is charged with bornite, gold, silver and lead. The lode is opened 10 feet above low water mark of the Sauk river.

#### Stevens County.

F. W. Buchholz, manager of the Yellow Jacket mine, between Kettle river and the Columbia river, 6 miles from Marcus, reports the face of the tunnel is showing 21 feet of ore. The tunnel is in 150 feet. The ore carries values in gold and silver.

Placer mining operations have been begun on west bank of the Columbia river, 2 miles below Waterloo, by H. Craven of Rossland, B. C. He has a 100-ton plant; the average value of the gravel is 40 cents, costing 15 cents for hauling. Craven intends to increase his plant, which will reduce cost of handling. His method of working is to pump water against the gravel, bringing the material directly into the boxes. Much of the values are in flour gold.

### WYOMING.

#### Big Horn County.

The Shoshone Mountain M. Co., operating mines at Kirwin, is putting in electrical machinery, says Superintendent R. J. Brown. The company is composed of Lead, S. D., men.

#### Carbon County.

Dillon reports say the Pluto tunnel has broken through the quartz into a diorite contact with a shoot of several inches of copper and iron sulphides. This ore had been sprinkled through the quartz for 25 feet. The drift from the tunnel at the Congo is opening ore. F. E. Brown, secretary and manager of the Northwestern company, has the steam plant moved from the Eclipse, near Bridger Peak, to the Batchelder mine. E. W. Honchen and J. Glazier have started developing the Sandstone, adjoining the Pluto No. 2. It has a vein running in copper sulphide. A shaft has been started.

#### Fremont County.

Lander reports say the Belgo-American Oil D. T. has made final payment on the Murphy oil wells (the Henderson properties) at Lander. Contract for construction of the Wyoming Central Railroad from Casper to Lander has been let.

#### Laramie County.

At Silver Crown, near Hecla, 20 miles west of Cheyenne, F. S. Swartz, president of the Hecla M. Co. of Denver, Colo., has bought four copper claims adjoining the Louise mine. The properties are said to carry a continuation of the vein in the Louise. The company has men at work.

## FOREIGN.

### AFRICA.

#### Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports that on Oct. 26th there were 13,000 Chinese coolies on the Witwatersrand, and 6438 in transit and expected to arrive Nov. 30th.

### AUSTRALIA.

#### New South Wales.

Sydney reports say the mineral exports for the first nine months of 1904 are valued as follows: Silver, £91,956; silver-lead, £1,386,611; copper, £359,775; tin, £217,226; coal, £1,048,281; total, £3,103,849—being an increase of £239,949 as compared with the corresponding period of 1903.

#### Queensland.

Gold returns for Queensland for month of September were:

	Tons	Yield in
	Crushed.	Ounces.
Charters Towers .....	22,400	22,400
Croydon .....	3,500	1,900
Gympie .....	21,300	12,200
Mount Morgan .....	20,700	9,400
Ravenswood .....	2,700	2,900
Other fields .....	3,500	2,000
Alluvial .....	.....	1,200
Totals .....	74,100	52,000

Total yield for first nine months of 1904 was 466,400 ounces.

Charters Towers reports of Oct. 17th say the Brilliant mine is on fire and seven deaths have resulted. Owing to the presence of carbonic acid gas, the following mines ceased operations: Brilliant & St. George, Brilliant Block and Brilliant Central.

### BRAZIL.

The Ouro Preto G. M. Co., at Ouro Preto, reports, during September, 6004 tons of ore produced 1589 ounces of gold, valued at £6250.

## BRITISH COLUMBIA.

### Boundary District.

Grand Forks reports say 100,000 feet of lumber have been ordered for the tramway and other work at the Rawhide mine. This does not include that used for the ore bins, which are completed. Developing work has disclosed ore bodies which can be quarried at comparatively small cost.

Shipping ore on the dump of the Stem-winder mine in Phoenix has started to the smelter at Boundary Falls by the Dominion C. Co. The new converters at the Mother Lode smelter are treating copper matte from the Montreal & Boston and Trail smelters in addition to their own product. — On the Skylark, 2 miles below Phoenix, finds of ore are being made. Twelve men are employed. — The Granby smelter is using coke from the International Coal & Coke Co. collieries at Coleman, Alberta, as well as from Fernie. L. E. Shields, of St. Paul, Minn., says he will increase development work on claims in Franklin camp.

At Grand Forks, J. F. Hill is securing options on ore tonnage and says that, in consequence of building of the Kettle Valley Line railway, he will start a customs smelter at Grand Forks. Hill says the McKinley mine, in Franklin camp, and the Congress property, near Republic, Wash., will supply high-grade ore.

### East Kootenay District.

A. R. Wilson, mine superintendent of the Crow's Nest Pass Coal Co.'s collieries at Michel, says there are 600 men working in the mines and the town has a population of about 2000. Output is 1800 tons of coal daily. About 700 tons are shipped and the balance goes to the coke ovens, of which they have 464.

### Lillooet District.

R. T. Ward, of San Francisco, Cal., says at Clinton arrangements are completed for operation of his and the Ward-Horsefly Co.'s property with a gold dredge. Work will begin by Dec. 1st.

### Rossland District.

The management of the Velvet-Portland, near Rossland, will start shipment of concentrates when sleighing is good. The concentrating mill is running steadily, and the output is five tons of sulphurates a day. There are 400 tons of concentrates on hand ready to be sent to the smelter. The roof is up on the new concentrator building, and the sides are closed in. The machinery is being set up, and will increase the capacity of the plant to 100 tons per day. The mine will not be reopened until the mill is completed and in operation. All the ore now being put through the concentrator comes from the dumps. — The roads continue in good shape, and the Jumbo, at Rossland, during last week shipped 540 tons. Besides the breaking down of ore, development continues on the intermediate and winze levels, says M. R. Galusha, manager.

Development on the Centre Star mine, at Rossland, continues on the second, seventh and ninth levels. Diamond drill explorations are proceeding on the eighth level. Eight carloads of second-class ore are being sent from the two mines daily to the Rossland Power Co. works at Trail. The company figures on sending out 250 tons of second-class ore a day. Shipments of first-class ore from the mine continue. In the War Eagle development is proceeding on the sixth, seventh and eighth levels. On the seventh level it is said a shoot of ore of good grade has been opened.

The Diamond Drill C. Co. of Spokane, Wash., has contracts to make explorations in several parts of Le Roi deep levels, at Rossland. Work is making progress on the several levels of the mine. Shipments for last week were 2700 tons. Shipments aggregated for October 10,300 tons. Water is so short that there is barely enough for the compressor, and as a result the concentration plant of Le Roi No. 2 cannot be operated steadily. Outlook for Le Roi mine at Rossland is reported improving. It is producing 400 tons of ore a day, which is going to its Northport smelter, and will continue to ship at that rate. Smelting costs have been reduced. The Northport plant is being operated on a two-furnace basis instead of a six-furnace plant, as formerly. There has been talk about consolidation of Le Roi with the Snowshoe mine in the Boundary country, as advocated by A. J. McMillan, manager of Le Roi. Le Roi and the Snowshoe are both siliceous properties. When the Snowshoe was shipping to the Boundary smelters it got a combined freight and treatment rate as low as \$2.12½ a ton. It is thought the increased cost of freight to Newport would be more than compensated by reduced costs of handling Le Roi and Snowshoe ores together.

### Slocan District.

Work on the Cork concentrator on

South Fork, near Slocan City, is progressing and machinery is being set up.

The frame work of the zinc works in Kaslo is completed and the building closed in. Manager C. Fernau has a bond on two claims up Coffee creek, 7 miles from Kootenay lake. The claims are called the Black Jack and Old Timer. There is a 2-foot lead of ore which carries 40% zinc and 95 ounces of silver. J. E. Bigham of Kaslo is superintendent and will run a tunnel and do other development work.

### Vancouver Island.

(Special Correspondence).—The Tye Copper Co., Ltd., at Duncan Station, reports that during October the smelter ran twenty-seven days, 5979 tons of Tye ore smelted giving a return after deduction of freight and refining charges of \$83,547.

### Duncan Station, Nov. 12.

#### West Kootenay District.

At Trout Lake, Forbes & Morton of Minnesota, interested in the Triune, have taken bonds on the Union Jack and other properties in same belt. They will start a long tunnel on the Union Jack, about 1½ miles above the Five Mile, and drive on the lead, crosscutting at several points.

In Lardeau section, near Camborne, rawhiding of ore from the Mammoth group at Goat mountain to the timber line has started. — Work is progressing at the Eva mine for reconstruction of tram, building boarding-house and getting the mine in shape for continuous ore production. Timbers for the new aerial tram terminal are out. It is expected by Dec. 10 the terminal will be completed and the tram in running order.

## COLOMBIA.

The Darien Gold Co., at Cana, reports thirty stamps dropping on low-grade ore. During September the new shaft was sunk 18 feet. The mill and Maisounabe shaft were stopped part of the month for want of water.

## MEXICO.

### Agua Calientes.

Under management of O. Westlund, the smelters of the American S. & R. Co., at Agua Calientes, is treating 3000 long tons of ore per day. The ore comes from mines along the line of the Mexican Central, and some of the copper ore from Sonora. It is claimed that the smelter paid \$1,000,000, Mexican, in freights last year.

### Chihuahua.

The Palmarejo & Mexican Goldfields Co., near Chinipas, reports for September: Zapote works crushed 2900 tons, treated 1700 tons, producing \$18,380 gold, \$37,670 silver. Expenses, \$43,150; expenditure on new development, \$970. Abnormal rains are reported cause of reduced returns during last two months.

It is said that the American S. & R. Co. proposes driving a tunnel 1½ mile long between its Santo Domingo mine (the Gasolina) and the Mina Vieja mines, in Santa Eulalia district. The projected tunnel is to run from the 1250-foot level of the Santo Domingo mine to the Velardena mine, a distance of 1 mile, and a tunnel started at the Mina Vieja to the first in the Velardena ground. The greatest depth to be gained is about 1500 feet. One of the objects in running through the Buena Tierra is to follow a fissure which, it is said, allow easier and more economical work. This fissure is believed to run through to the Mina Vieja.

W. Mitchell, in charge of the hoisting and shipping of ore from the American S. & R. Co.'s Mina Vieja mine, in Santa Eulalia camp, reports that during the month of October he hoisted with a 22 H. P. gasoline engine from a depth of 800 feet 2217 tons of ore and consumed 870 gallons of gasoline. He shipped by burros, 2 miles to Santa Eulalia, 2080 tons during the month, and was delayed two days by heavy rains. On Oct. 29th he shipped 110 tons and 440 kilos of ore to Santa Eulalia by 1004 burro loads.

The work at the Candelaria mine of the Mexican Standard M. Co. at Farral, under the supervision of J. Bonham, is progressing. The main shaft has reached the 250-foot level and started crosscutting, which will put them into a body of shipping ore. A mill will be built.

J. E. Carse of Chihuahua says that at Bachimba he has, with J. Quick and J. Collins, taken up forty pertenencias. The district is about 40 miles south of Chihuahua, and the group will be known as the Railroad Men's mine. Gold and silver values are obtained.

C. O'Calahan, of Torreon, has bought the Nueva Chihuahua mine in Santa Eulalia camp. The group consists of forty pertenencias and is near the Santa Rita, El Carmen, Negrita and other producing mines.

### Durango.

The Torreon S. Co. of Torreon will build an electric-magnetic separating mill at its San Diego mine.

## Mexico.

El Oro M. & R. Co. at El Oro reports for month of September, mill ran twenty-eight days, crushing 9826 tons, producing from 100-stamp mill \$120,138; producing from cyanide plant \$3949; total production, \$124,087. Working expenses and development, \$66,225; profit from railway for month was \$7366. Total profit, \$65,228. There has been expended on permanent improvements \$25,586, including \$24,748 on new mill.

The duty of \$240 per ton on imported dynamite and explosives which was to go into effect in October has been postponed until Jan. 1, 1905, reports say, as the factory near Torreon is moving slowly in accumulating a stock for the Mexican market. It is said that the factory now has on hand 40,000 cases of dynamite, equal to about a ten days' supply for the Mexican market.

### Oaxaca.

J. L. Grandison et al. of Oaxaca have begun development of the oil field at Puerto Angel, and are drilling several wells.

### San Luis Potosi.

The Santa Maria de la Paz M. Co. has in full operation the narrow gauge railroad from its mines, 6 miles from Matehuala. The road runs from its mines to La Cobra station, on the National Railroad.

### Sonora.

At Caborca the San Blas M. Co. will build a stamp mill.

W. C. Greene, president of the Greene Con. C. Co., at La Cananea, says he has bought the Rio Grande, Sierra Madre & Pacific Railway, together with the El Paso Southern T. & B. Co. and Sierra Madre C. Co., allied corporations. The Sierra Madre will be extended down through Chihuahua for approximately 109 miles from present terminus. A branch line will also be built from a point near Guzman to La Cananea. Engineers have been surveying the route. The line will be built from Terrazas to Mulatos. Greene has also closed a deal for the Mulatos gold mines and will take charge of them next week.

In digging a well at Los Angeles mine, near Llano Colorado, a blind ledge of gold ore was struck at depth of 30 feet. In the same group, the Bonanza de Oro has a 5-foot ledge, which goes \$30 per ton in gold. The owners, M. P. Wright & F. Smith, are increasing development. — F. J. Ochoa of Ures is developing mines at Copete. One, the Providencia, has 18 pertenencias, through which is said to run the ledge developed by the shafts on the Sultana and San Jose mines. The latter shaft is near the Providencia ground. On the Sultana the shaft is 1000 feet deep, in ore all the way.

## Trade Treatises.

In a brochure entitled "Driving the New York Subway," the part played by the Ingersoll-Sergeant machinery is sumptuously set forth. The booklet can be had upon application to the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York.

The following illustrates a phase of publicity herein. It is from a large manufacturing concern: "Kindly omit notice of the catalogue sent you by this mail. The former notice occasioned so widespread a request for the book that we were not able to supply the demand."

Graphite Lubricants" are described in a catalogue of the Jos. Dixon Crucible Co., Jersey City, N. J., showing their general use and advantage and giving considerable interesting information about graphite. A copy will be sent on request to any address.

A typographic gem is the miniature catalogue from the A. S. Cameron Steam Pump Works, daintily describing difficult pumping problems and appliances to successfully solve them. The booklet will be furnished on request by the A. S. Cameron Steam Pump Co., foot of E. 23rd St., New York City.

The special catalogue of the Columbus Machine Co., Columbus, Ohio, portrays and describes the firm's makes of gas and gasoline engines in a variety of styles, including geared pumping engines and hoisting engines. The company is also making a traction engine that is attracting deserved attention.

"Modern Practice in Air Compression" is the subject of Catalogue No. 53, issued by the Sullivan Machinery Co., containing much in its 128 pages of interest to any one engaged in rock work. Detailed descriptions, general suggestions for operation, and numerous tables are among the contents. The treatise will be sent on application to the Sullivan Machinery Co., Railway Exchange Building, Chicago, Ill.

Personal.

E. D. BOYLE is manager of the Schwab mines at Goldfield, Nev.

J. L. NELSON is superintendent of the Geyser-Marion mill at Mercur, Utah.

W. C. RALSTON has returned from Tonopah, Nev., to San Francisco, Cal.

J. S. KUNS is superintendent of the Los Angeles G. M. Co., operating near Tuolumne, Cal.

H. N. MERWIN is with the Black Rock M. Co., near Wickenburg, Ariz., on mill construction.

W. H. ROUTLEDGE is superintendent of the New England-Tonopah M. Co., at Tonopah, Nev.

WM. TRURAN is manager of the Ada Smiddle G. M. Co., Ltd., near Libertad, Nicaragua, C. A.

G. B. WILSON has resigned as assistant superintendent of the Quartette M. Co. at Searchlight, Nev.

A. H. FLOETER is manager of the Sheba mine, south of Mill City, in Humboldt county, Nev.

J. LOSBAUGH is superintendent for a New York company operating at Gillett, Teller county, Colo.

J. KELLY is superintendent of the Wild Bill mines near Shautie, near Frisco, Beaver county, Utah.

J. C. HARTZELL has been appointed professor of geology at the University of the Pacific, San Jose, Cal.

R. S. BILLINGS is manager of the Independent S. & R. Co., at Denver, Colo., with smelter at Golden, Colo.

J. M. CARTER is superintendent of the Fletcher M., M. & S. Co. mines at Stockton Hill, near Kingman, Ariz.

GREGORY DOVETON of Doveton & Purrlington, Denver, Colo., is making metallurgical examinations at Reno, Nev.

E. C. ENGELHARDT has returned to Denver, Colo., from a two months' prospecting trip to Gilpin county, Colo.

W. H. BRYSON is superintendent of the Bullfrog M. Co. mines in Bullfrog district, near Amargosa, south of Goldfield, Nev.

T. WATSON, formerly underground superintendent of the Calumet & Hecla C. Co. at Calumet, Mich., is at Bisbee, Ariz.

H. H. CLARK is manager of the Bullfrog M. Co., operating in Bullfrog district, near Amargosa, south of Goldfield, Nev.

F. CLARK of Chihuahua, Mexico, formerly manager of the Hearst properties in Mexico, has gone to Cerro de Pasco, Peru.

F. L. NASON of New Haven, Conn., is at Chivela, Oaxaca, Mexico, examining placer mines, where he expects to remain for three months.

F. C. ARMSTRONG of Washington, D. C., is manager of the Hidalgo M. Co., operating mines northwest of Parral, Chihuahua, Mexico.

P. J. DERMODY, for several years foreman at the Granby mines at Phoenix, B. C., is foreman of the Providence M. Co. at Providence, B. C.

A. C. AIKEN has returned to San Francisco, Cal., from the San Juan mines at Santa Eulalia, Chihuahua, Mexico, of which he is manager.

J. E. SPURR of the United States Geological Survey is in Tonopah, Nev., preparatory to making his final report on the geology of that district.

W. L. HOLMES of the Engineering Company of Mexico, S. A., is at Torres, Sonora, investigating the treatment of ores in that district by cyanide.

W. A. HEWITT, president of the Compressed Air & Machinery Co., has returned to San Francisco, Cal., from a business visit to Arizona and Mexico.

H. C. KELLY, formerly superintendent of the Chandler iron mine at Ely, Minn., is superintendent of the Continental mine near Porthill, Kootenai county, Idaho.

E. B. KIRBY, manager of the War Eagle, Center Star mines and Roseland Power Co. at Roseland, B. C., has returned there from a several weeks' trip East.

E. D. GRANT, for some time past instructor in the department of mathematics and physics of the Michigan College of Mines, has been made assistant professor in the same department.

W. H. O'BRIEN has resigned as superintendent of the H. Y. mines at Roosevelt, Idaho, to devote his time to his own properties on Monumental Summit, also in Thunder Mountain district.

Commercial Paragraphs.

THE international jury of awards at the Louisiana Purchase Exposition in St. Louis have awarded gold medals to the Weber Gas & Gasoline Engine Co. of Kansas City, Mo., on their Weber gas engines and Weber suction gas producers.

COLORADO IRON WORKS CO., Denver, Colo., report sales of one set of 36x36-inch improved standard wide faced crushing rolls to the Traylor Engineering Co., New York, and of five of their impact screens to Caird & Hawksworth, Helena, Mont.

THE Portland G. M. Co. have placed contracts with the Link-Belt Machinery Co. for a large inclined pan conveyor, which will be the heaviest of its type in Colorado, and is to handle waste rock from the mine. Designs were made by their Denver representatives, A. E. Lindrooth, Shubart & Co.

A. E. LINDROOTH, SHUBART & CO. of Denver, Colo., are supplying the mill equipment for the new sand-lime brick plant of the Colorado Brick & Artificial Stone Co. of Colorado Springs. This is the first plant in Colorado to use this process, which has met with success in the East, where sand-lime brick is supplanting the clay product.

AMONG accessions to the Allis-Chalmers personnel is noted the names of W. A. Nelson, who is appointed superintendent of equipment; R. C. Wright in charge of the design of special tools and fixtures used in the manufacture of steam turbines; C. F. Barth, foreman of the steam turbine department at the West Allis Works, and C. A. Derby, who joins the selling staff of the Allis-Chalmers Co. in its sawmill department.

THE S. H. Supply Co. of Denver, Colo., reports sales of a 50-ton concentrating plant to Vancouver, B. C., and a 75-ton concentrating plant placed at Hailey, Idaho; a 10 and 20-stamp mill to Mexico and a 25-ton cyanide plant to Lordsburg, N. M.; a 20x60 Fraser & Chalmers double reel Corliss hoist to Merrellos, Mexico; a copper leaching plant to Salida, Colo.; ten stamps to Breckenridge and a 20-stamp mill complete to Boulder county; also a 50-ton stamp concentrating plant for concentration of tungsten ores in Boulder county; a complete copper smelting plant, 36x140, to Arizona, and a 5-drill compressor plant to Leadville, Colo.

THE Wellman-Seaver-Morgan Co. of Cleveland, O., was recently awarded contract to construct two large coal handling machines for the Boston Coal Dock & Wharf Co., Duluth, Minn. This is one of the docks under the management of the St. Paul & Western Coal Co., of which M. J. Patton is superintendent. The machines will consist of two conveyor bridges, each about 350 feet long, including front and rear cantilevers. The machines will be designed so that coal may be screened and loaded into box cars, as well as unloaded from vessels, and will be built to be operated by steam. They will be equipped with 2-ton Hulett patent excavating buckets, and machinery designed to give maximum speeds of operation. The structural work will be of steel throughout, and the machines will be self-propelling along the dock.

Obituary.

R. S. GAMMON, a pioneer of Nevada, died at Reno, Nev., on the 9th inst. Deceased was 80 years old and a native of Maine. He went to the Pacific coast during the gold excitement in California in 1849 and engaged in mining, and to Nevada in 1860.

M. J. FARRELL, a pioneer mining man of California and Nevada, died at Nevada City, Cal., on the 9th inst. Deceased was a native of New Jersey, born March, 1832. He was for several years connected with the Manhattan M. Co. in Nevada, and served two terms as State Senator for Lander county, Nev.

Books Received.

Under title of "Mineral Resources of the United States for 1903," the U. S. Geological Survey has issued: "Production of Natural Gas" and "Production of Petroleum."

Latest Market Reports.

SAN FRANCISCO, November 18, 1904.

METALS.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c, refined (1000 fine); San Francisco, 58½c; Mexican dollars, 47c San Francisco, 46½c New York.

COPPER.—New York: Standard, \$14.87½; Lake, 1 to 3 casks, \$14.50@14.87½; Electrolytic, 1 to 3 casks, \$14.75; Casting, 1 to 3 casks, \$14.62½; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: £65 15s spot per ton.

Following are the figures of the German consumption of foreign copper for the months January–September, 1904, compared with the same period of time for 1903–1902:

	1904.	1903.	1902.
Imports .....	83,845	63,527	62,091
Exports .....	6,379	7,797	6,718
Consumption .....	77,466	55,730	55,373

Out of the above 70,052 tons were imported from the United States, against 46,573 tons for 1903.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12½. San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £13 ½ long ton.

SPELTER.—New York, \$5.55; St. Louis, \$5.00; London, £25 ½ ton. San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$28.87½@29.17½; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, \$32½@35c. London, £132 5s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100 lb. lots, 16c.

ZINC.—Metallic, chemically pure, 3½ lb., 50c; dust, 3½ lb., 10c; sulphate, 3½ lb., .04c.

NICKEL.—Sheet, New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$13.50 @13.50; gray forge, \$12.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.50; open hearth billets, \$19.50; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 7c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, 7c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35;

Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c per lb.; carloads, 23@24½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 24@24½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, \$2.00@2.25; California refined, 13@12c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1¼@2c per lb.; nitric acid, carboys, 8c per lb.

OILS.—Linsed, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Ecocene, 23c; Elaine, 23c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.75 per lb.

CHROMIUM.—90% and over, per lb., 80c.

PHOSPHORUS.—American, per lb., 70c.

SILVER.—Chloride, per oz., 90c@1.00; nitrate, 55c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—per lb., \$2.75.

SODIUM.—Metal, per lb., 50c.

BISMUTH.—Subnitrate, per lb., \$2.10.

URANIUM.—Oxide, per lb., \$3.50.

MERCURY.—Bichloride, per lb., 77c.

FIRE BRICK.—Domestic, carload per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOVEMBER 8, 1904.

774,144.—SPIKE—J. B. Anderson, Portland, Or.  
774,641.—SHADE FIXTURE—R. Barkhurst, S. F.  
774,373.—RAILWAY SWITCH—W. J. Bell, Los Angeles, Cal.  
774,222.—DOOR CATCH—C. A. Borein, Oakland, Cal.  
774,304.—METALLURGICAL PROCESS—M. P. Boss, S. F.  
774,232.—FURNACE—A. C. Calkins, Los Angeles, Cal.  
774,465.—STEAM TRAP—J. Campbell, Port Blakeley, Wash.  
774,414.—PHOTO MOUNT—E. S. Cheney, Oakland, Cal.  
774,466.—GAS MACHINE—E. F. and E. P. Clough, San Jose, Cal.  
774,564.—BOILER—J. M. Colman, Port Townsend, Wash.  
774,167.—ARMOR PLATES—W. E. Everette, Tacoma, Wash.  
774,364.—WATER PIPES—P. E. Fisher, Spokane, Wash.  
774,470.—FIRE ESCAPE—Hamilton & Lewis, Seattle, Wash.  
774,725.—CLEANING COFFEE—Hastings & Harrington, Sacramento, Cal.  
774,476.—CONVEYOR—D. E. Hughes, San Diego, Cal.  
774,389.—BUTTER CUTTER—A. C. Hummer, Seattle, Wash.  
774,431.—EXCAVATING BUCKET—F. M. Ireland, Portland, Or.  
774,390.—ILLUMINATING TILE—P. H. Jackson, S. F.  
774,729.—AUTOMATIC TAP—C. Lewin, S. F.  
774,463.—CAN SOLDERING MACHINE—A. Lotz, S. F.  
774,442.—WAVE MOTOR—G. M. Lynch, Los Angeles, Cal.  
774,592.—CURRENT MOTOR—J. S. Mathews, Pendleton, Or.  
774,527.—DIRECTORY—G. W. Maxwell, Los Angeles, Cal.  
774,323.—EDGE RUNNER—W. A. Merralls, S. F.  
774,446.—PREVENTING SNORING—S. A. Moulton, Campbell, Cal.  
774,489.—GLOVE—O. W. Noll, S. F.  
774,273.—ORE MILL—C. C. Pratt, Portland, Or.  
774,398.—STAMP STEM—W. Reine, Quartz Mountain, Cal.  
774,206.—SASH FASTENER—C. G. Seaman, Spokane, Wash.  
774,539.—BASS DRUM AND CYMBAL—J. P. Stanton, S. F.  
774,392.—SAW HANDLE—A. E. Townsend, Centralia, Wash.  
774,315.—BANK CHECKS—S. M. & L. M. Trapp, Seattle, Wash.  
774,408.—CAR SEAL—Williams & Hinson, S. F.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT PITTER.—No. 773,885. Nov. 1, 1904. J. A. McCune, Santa Cruz, Cal. This invention is designed to split and remove the stones from peaches, apricots and like fruit, without injury to the meat portions, spread the stoned fruit upon trays preparatory to drying and deliver the trays automatically when filled. It consists of such mechanism and combination of parts as will accomplish the desired result.

ILLUMINATING TILES.—No. 774,390. Nov. 8, 1904. P. H. Jackson, San Francisco, Cal. This invention

consists in an illuminating tile structure, transversely united metal bars forming rectangular openings with surfaces of support in different planes, transparent tiles fitting said openings and having the exterior edges conforming to and resting upon the surrounding bars, and the central portion formed to deflect light into the space below, and a plastic material in which the tiles are embedded upon the bars.

PHOTOGRAPHIC MOUNT.—No. 774,414. Nov. 8, 1904. E. S. Cheney, Oakland, Cal. The object of this invention is to provide an artistic mount whereby a mat or passe-partout effect may be produced without cutting the mat portion proper and to furnish a machine-made mount which will have any kind of a border desired, plain or embossed, which will have a central countersunk portion to receive the print, with wide or narrow colored or uncolored inside bevel, and which will have a flat back. This mount can be made very cheap and in a great variety of shades, sizes and styles and carried in stock.

STAMP STEM AND TAPPET ATTACHMENT.—No. 774,398. Nov. 8, 1904. Wm. Reine, Quartz Mountain, Cal. In securing tappets to stamp stems which are used in crushing and other mills of this class it is difficult to fix the tappets upon the smooth cylindrical stems so firmly as to prevent their shifting, and the keys which are usually employed for this purpose soon become battered and useless on account of the severe blows that are necessary to properly drive them into locking position. It is the object of this invention to provide for easily and firmly locking the tappet to the stem and at the same time providing a means whereby it is easily disengaged or adjusted when desired.

ACETYLENE GAS MACHINE.—No. 774,466. Nov. 8, 1904. E. F. Clough and E. P. Clough, San Jose, Cal. This invention comprises in a gas machine the combination of a generator tank and a gasometer tank, a bell in each, stand pipes in said tanks and connections between the stand pipes in the gasometer and the corresponding stand pipes in the generator. There is a carbide receiver in the gasometer bell, telescoping connections between said receiver and one of said stand pipes in the generator, a valve mechanism in the corresponding stand pipe in the gasometer and governable by the gasometer bell and the other of the generator stand pipes, and an equalizing check valve as 28 in the carbide receiver.

SHADE FIXTURES FOR WINDOWS CURVED TRANSVERSELY.—No. 774,641. Nov. 8, 1904. R. Barkhurst, San Francisco, Cal. This invention relates to a fixture for circular windows, which fixture is especially adapted to give the shades or curtains a curvature corresponding with that of the windows to which they are applied. It consists of one or more curved guides between which the shade is caused to pass from the straight roller by which it is suspended from fixtures at the top, a correspondingly curved bottom bar for the shade, means for regulating the tension of the guides between which the shade passes, and means for hanging lace or other curtains with the curvature corresponding to that of the shade.

WATER PURIFYING APPARATUS FOR STEAM BOILERS.—No. 773,915. Nov. 1, 1904. Daniel Best, San Leandro, Cal. This device consists of an attachment having retaining surfaces, means for supplying water to pass over said surfaces under the influence of heat from the boiler, and means for delivering the purified water into the boiler. The object of the invention is to provide a device forming an essential part of the boiler whereby the water may be substantially freed from all or the greater portion of such impurities before it is admitted to the main portion of the boiler. This apparatus may be applied to any well-known or ordinary form of fire or water tube boiler, either vertically inclined or horizontal.

# PELTON WATER WHEELS

THE PELTON WATER WHEEL CO.  
124 MAIN ST., SAN FRANCISCO.  
147 LIBERTY ST., NEW YORK.

## PELTON WHEELS IN MANDALAY.

Three Pelton Stations have been installed at the Burmah Ruby Mines in Mandalay, Burma. By the installation of electrical machinery driven by three Pelton Stations, aggregating 1100 horse power, it is estimated that over \$2500 a month has been saved in operating expenses.

This great saving is due to the economical and efficient service the Pelton Wheel gives, operating day and night for 365 days in the year without cause for shutdown or repairs—the Pelton is the cheapest power obtainable and is easily adaptable for all conditions of service.

Send for 88-page catalogue; mailed free on request.

## Incidental Damages.

Wherever a great industry is built up, based on mining, there, it seems, are always those who hope to gain something by combatting these successful enterprises. One fruitful source of trouble of this kind is tailings from amalgamating and concentrating mills; another is tailings from hydraulic and dredge mining operations; a third is the fumes from the stacks of the smelters, and in other cases it is the slag from the furnaces. In every case a good, healthy, profitable mining enterprise is promptly surrounded by an active population. Merchants bring in their stores of goods; the adjacent lands—previously worthless and unclaimed in most instances—are cultivated and crops are grown to sell to the community, which is growing up about the mill or smelter or mine. Soon some one fancies he can derive more profit from harassing the mining or reduction company than by raising agricultural products or stock, and he accordingly brings suit for damages alleged to have been sustained. Several years since some vegetable gardeners in the Black Hills of South Dakota conceived the idea of making an "honest dollar" by bringing suits for damage from mill tailings against the Homestake company. They in some manner suddenly discovered that these mill tailings contained gold which could profitably be recovered by the cyanide process and then their fear was that the Homestake Co. might

claim the tailings as their own and the damaged gardeners promptly filed location notices, claiming the tailings as theirs "by right of discovery and location." The differences between the hydraulic and dredge miners and the farmers in California is an old story. The battle over the fumes at Butte, Montana, has been waged for years, off and on, but what would become of Butte and the surrounding country

if the smelters were to close down is not a difficult problem to solve. In southwestern Colorado the stockmen find that cyanide of potassium is a deadly poison, and their stock, it is now claimed, are exposed to great danger. In the desert region of Arizona there has as yet been no complaint of fumes from the copper furnaces, but the farmers below Clifton claim to have found a just cause for complaint in the tailings from concentrators. For nearly forty years smelters have been operated in the Jordan valley, near Salt Lake, Utah, and it has only recently been discovered that the fumes from the stacks are detrimental to vegetation. There are numerous other similar instances which might be cited, and in almost every case if the industry complained of were to cease all activity in the district about it would cease with it, and where are to-day thriving and prosperous communities, would be found only deserted streets, vacant stores, and the desolation which quickly overtakes a played-out mining camp. The complaining farmer would probably be last to leave, but he would only leave to go to another place where the mining industry was in full activity, and he would get as near the smelter as it were possible for him to get that he might be spared a long haul to a prompt and profitable market. There are occasions when mills and smelters do material damage, and then steps should be taken to minimize as far as possible the damage by taking the necessary precautions to prevent it, but in the majority of cases the actual damage is slight as compared with the benefits derived from the industry, and furthermore the damaged property has usually been built up as a result of this industry upon the success of which its value wholly depends.

The Discovery Claim at Bullfrog, Nevada. (See Page 361).

6000 Logs for Utica Stopes, Angels, Cal. (See Page 358.)

The Lightner Mine, Angels, Cal. (See Page 358).

LEADVILLE, Colorado, still continues to attract unusual attention by the rich strikes of large ore bodies in unexpected places. The bonanzas found there within the past two months have stimulated mining and prospecting in that district to a remarkable degree. One of the most recent strikes is in the Iron Silver mine on Iron Hill, one of the oldest and most thoroughly developed mines in the district. The recent discoveries in the Iron Silver mine were made by diamond drills at a depth of 1160 feet from the surface and the indications are that the ore body is both large and rich. It is presumed that this ore shoot is a continuation of the Rock Hill ore bodies. Statistics show that the mines of Leadville have produced since 1879 to the beginning of 1904, a period of twenty-six years, \$310,000,000 in silver, lead, gold, zinc, iron, manganese and other minerals. Notwithstanding this large output, it now begins to look as though in many instances only the superficial portions of the ore bodies had been thoroughly explored and worked, and that in the deeper region beneath the carbonate cap remains many untouched bonanzas.

FOR years the Coalinga oil field in California has been producing petroleum, but it is only within a very recent date that the development of oil in that district has taken on anything like a boom. It is at present one of the most active oil districts in the West. From a few scattering producing districts in various portions of the State, California has become the largest producer of petroleum of any State in the Union.

AT a convention of mine operators held recently in Cleveland, Ohio, the marked increase in the number of accidents in mines was taken up and discussed, and it is very evident from the recommendations and rules agreed upon by the convention, composed largely of representative mining men, inspectors, miners and others actively engaged in the mining industry, indicates that it was the opinion of those present that the greater number of accidents are due to carelessness on the part of the men injured. Many of the common practices about mines which result in accidents are prohibited.

GRAVE fears are expressed for the health of miners working in a tunnel at 9000 feet above the sea in the Swiss Alps. In the United States some of the largest mining districts are at an altitude of more than 10,000 feet and one seldom hears of any illness directly attributable to the altitude except in a few isolated cases. In Colorado are many mines at altitudes ranging between 10,000 and 13,000 feet above the sea, and in Peru are mines at 14,000 to 15,000 feet, and many men from Italy, Austria and other portions of Europe are employed in these mines, but no report of their physical unfitness is ever heard from any of these American camps.

## Pumping Water for Milling on the Desert.

In the great Southwest there are many thousands of square miles of arid territory, regions where water is scarce or not obtainable at all, and still, in these deserts are vast undeveloped mineral resources, the existence of which is scarcely more than known. There are numerous places where mining districts have been established and where a greater or less success is being achieved in the operation of mines under the difficulties inherent to a desert country, and it has been shown repeatedly that water can be pumped many miles to supply the mines of the desert, at a surprisingly low cost per ton of ore treated. One of the first, if not the first pumping installation on the deserts of California was that which supplied the Paymaster mine. The pipe line was 18 miles in length, the water being pumped from the Colorado river. The next important installation was that at Carga Muchacha mine, 20 miles northwest of Fort Yuma. This line was 14 miles in length, and the cost of pumping was stated to be less than 50 cents per ton of ore treated.

In 1893 a pipe line 12 miles in length was laid from the Colorado river to the Golden Cross mines, in the Carga Muchacha mountains. This line supplied 100,000 gallons of water daily, lifting it 500 feet at a cost of 18 cents per ton of ore crushed. Steam power was used, the fuel being wood. Elsewhere herein is described a plant supplying water to mines near Virginia Dale, in the middle of the Colorado desert, 35 miles from the railroad. The water is raised 183 feet from a well sunk in a dry lake. The pipe line is 7½ miles long, of 2 inch and 1½ inch pipe, and the water is lifted 1200 feet. The cost of pumping water at this plant is stated to be 25 cents per ton of ore crushed. The water is settled and reused. This is probably a fair average cost for supplying water under such conditions as usually obtain on the desert. The work is done by gasoline engines. In some cases a larger volume of water is available and the tonnage treated is large, consequently the cost should be somewhat diminished, while in other places the conditions may be more disadvantageous, with an increased cost of supplying water to the mines, but it is evident that the mines must be very badly situated indeed, if water cannot be supplied within a cost of 50 cents per ton of ore treated.

In Western Australia is the largest water pumping plant in the world, constructed for mining use only, but there it was imperative that a large supply of fresh water be made available, as all the water obtainable in the neighborhood of the mines was heavily charged with salt, and no fresh water could be had without distilling the salt water, which was very expensive. There are few mining districts which would justify the expenditure of \$15,000,000—the cost of the Australian installation—and it is doubtful if that would have been built by private enterprise, but the Government came to the rescue and built the plant, and the cost of water per ton of ore treated is greater in Western Australia than it is on the small individual plants on the deserts of the southwestern United States. These figures show approximately what the cost of water is likely to be and form an item of interest in the contemplation of equipping and operating mines in that arid region of the southwestern United States, no portion of which is probably more than 50 miles from a water supply of greater or less volume.

THE end of the year is approaching and those who are behind on assessment work now have but thirty-five days within which to complete the same. This is, however, abundant time in most instances within which to do the work if more than one person be employed. Those who, at the end of the year, find themselves unable to complete it, need feel no fear of losing their claims if they are at work during the last days of December and finish the work for 1904 by continuing the work after January 1, 1905. It will not suffice to stop with the \$100 worth of work uncompleted. Claims located during 1904 do not require assessment work for this year, except in those States where the State or Territorial laws and regulations demand it, but all claims located during 1904 must be "represented" in 1905 by the performance of \$100 worth of work, or the installation of substantial im-

provements to that amount. Where a locator fails to do the work required by the Federal, State and local laws he cannot take advantage of his own negligence and relocate the claim, as he might continue to do this on any number of claims for an indefinite number of years, thus defeating the purpose of the law, which is to develop the mineral resources of the country. The mining laws relative to location of claims and assessment work are liberal, and the safest way is to comply with their requirements. This secures a good title and develops a prospect into a mine, which is what the prospector now requires, as the day is past when he can sell a worthless hole in the ground for more than a month's grubstake.

THE development of a bonanza ore body within 200 feet of the surface in the W. P. H. mine on Iron Clad Hill in Cripple Creek district of Colorado is an illustration of the peculiarly fortuitous results of the miners' labor. For fourteen years that district has been one of the most actively prospected mining regions in the world, and no one will claim that such ore as has recently been found in the W. P. H. mine was too poor to work in the early days of the camp, and thus neglected, for ore running \$100 to over \$500 per ton was as eagerly sought in the first year of the camp as it is now. Within the past two years a number of rich strikes have been made in the Cripple Creek district, but none of them as extensive as that on the mine mentioned. It is clearly illustrative of the possibilities which still lie undeveloped in that district. As many shoots of ore found in that camp are known not to reach the surface, and in some instances natural surface debris covers the outcrop of veins, the only way in which prospecting lessees can hope to find new ore bodies is by taking the chance—always open to the prospector—that of sinking a shaft blindly at any point which affords the desired opportunity in the mineralized area and trusting to luck to make a strike. That luck favors many of those who try is clearly evident, but without trial no "luck" need be expected. It also indicates the value of the leasing system in opening up a mining region like Cripple Creek where the ore deposits are often blind and usually erratic in size and form. Another district which illustrates the benefits of leasing, and the many fortunate strikes resulting from taking this prospector's chance, is in the Southwest Missouri zinc fields. Within the past few years thousands of acres of farming land previously supposed to be non-mineral have been proven to have valuable deposits of zinc and lead beneath the surface and often within a few feet of it. The greater number of strikes in the zinc lead field of Missouri are made by means of churn drills or small well-drilling outfits, and the marked success attending these operations suggests the advisability of their more extended employment for similar purposes elsewhere.

IN the early days in mining in the West almost every mining State and district saw smelters built on all sorts of mines. In the majority of cases mills, and not smelters, were what were required. The mountains of Montana, Colorado, Idaho and Utah were filled with these monuments of mistaken enterprise and ignorance of metallurgical requirements. This was thirty years ago, but to-day there is still a disposition on the part of those ignorant of the conditions essential to success in smelting operations to build smelters in place of mills where it would be impossible to successfully operate a smelter on the material available. A smelter requires not only abundance of ore, but also usually a large amount of iron oxide and limestone for flux and unfortunately the flux is generally devoid of other values than those of a chemical nature which make it suitable as flux. It is a serious mistake to equip a mine with a reduction plant before the mine is prepared to supply a sufficient amount of ore to keep the plant in steady operation, but it is a much more serious—an inexcusable—mistake, in this day, to build a smelter when a mill is required, or vice versa, and worse still to put in a reduction plant of any kind where none at all is needed. Still these things are being done constantly; each year sees chronicled the usual number of failures where a competent management may have made success. There is an old saying to the effect that "a little knowledge is dangerous," and it is fully exemplified in the man who builds a smelter on a mine which should have a mill.

## CONCENTRATES.

THE boiling point of gasoline depends upon its specific gravity. Gasoline will boil at from 140° to 148° F., atmospheric pressure.

THE principles and difficulties in leaching ores are much the same whether with the cyanide or chlorination or other leaching process.

SULPHIDES OF GOLD are prepared in the form of brown or black precipitates by passing sulphuretted hydrogen through a solution of gold chloride.

SURCHARGE is the algebraical sum of the losses of gold sustained during the various operations, and the amount of foreign substance—chiefly silver—left in the gold cornet when weighed.

IN barrel chlorination, at ordinary temperatures, water will absorb two and one-third volumes of chlorine gas. Sufficient lime is added to have the solution in the barrel saturated.

BIXBYITE is a compound of iron and manganese oxide and occurs in black isometric crystals (cubes or octahedrons or modifications of these forms). It has a hardness of 6 to 6.5. Not valuable except as an ore of iron and manganese.

IN the fall of 1892 in the Con. May mine at Johannesburg, South Africa, gold ore was crushed in the cyanide solution in the battery, but the practice there was discontinued, because the coarser particles of gold remained unattacked for so long a time.

A "SKEET" is an automatically dumped skip, having two sides parallel and two sides at an angle of about 15° from the vertical and with a flat bottom. They were first introduced by I. Requa at the Combination shaft on the Comstock. They had a capacity of four to five tons each.

EVERY hoisting engineer should carefully place sharp side marks on the reels of his engine, that he may know within an inch where his skip or cage is in the shaft. Automatic indicators show approximately the whereabouts of the skip, but can not be depended upon for nice adjustment.

THE pressure of the atmosphere increases on going below the level of the sea in mines, and this condition is indicated by a barometer in the same way that a decreasing temperature is indicated on going above the level of the sea. The atmospheric pressure at sea level is about fifteen pounds per square inch.

"CUT HOLES" in either drift or shaft work are an advantage if blasted first as it relieves the "burden" upon the remaining holes of the series, and thus gives the powder an opportunity to break the ground. It is an easy matter to place so great a burden on a drill hole so that a blast fails to break the rock.

SLOTTED LINERS for stamp batteries were introduced several years ago, but the idea did not meet with great favor among millmen and are seldom seen now. The slots or grooves were placed horizontally and were supplied with quicksilver. Amalgamation did not appear to be materially promoted by their use.

IT is not uncommon for the miner to mistake a fault plane for his vein, particularly when a vein is faulted by a fissure having approximately the same strike and dip as the vein proper. Movement in a fault of this character sometimes results in doubling up a vein, making it appear for a short distance to be twice the width it is.

MEN can work in caissons under a pressure of 40 to 45 pounds per square inch without apparent discomfort, but experience has demonstrated that the life of men employed in caissons is remarkably shortened. Some men can stand a higher pressure than others, just as some men can climb to higher altitudes than others.

THE Mosquito range, between Park and Lake counties, Colorado, might be tunneled from the east side to work ore bodies in the Leadville district, but it cannot be done advantageously for the reason that the east slope is less abrupt, and the elevation at the base of the range in Park county is higher than it is on the other side.

THE mixture of sulphide mineral supposed to be galena and sphalerite (lead and zinc sulphides) may be tested with a drop of hydrochloric acid. If zinc blende is present, the odor of sulphuretted hydrogen will be given off. Zinc blende often has a metallic luster resembling galena and is then difficult to distinguish from the lead sulphide by the eye.

ONE TON OF WATER, containing twenty pounds of potassium cyanide, is generally considered a 1% solution of KCy, though actually somewhat less than that amount, but it is so nearly exact that this method of stating the strength of cyanide solutions has been gen-

erally adopted. A 0.25% solution of KCy contains five pounds of potassium cyanide in a ton of water.

IN 1840 a United States patent specification by a man named Elkington called attention to the power of a solution of cyanide of potassium to dissolve finely divided gold. Since that date numerous scientific investigators have published references to this solvent power of solutions of potassium cyanide on fine gold. Metallic silver is also slightly soluble in potassium cyanide solutions.

UNDOUBTEDLY leaks in a compressed air line admit a small amount of fresh air to mine workings, but it is an expensive way to ventilate a mine. It is more economical to run a fan. A good ventilating plant—engine, fan and 1000 feet of 12-inch pipe—should be installed for about \$700 to \$800, depending somewhat on situation and rate of wages. This should supply air to 2500 feet of workings.

PINE TIMBERS 14 inches square and 100 feet in length were used in the construction of the pump rod of the Combination (Requa) shaft on the Comstock lode. These were spliced together and strengthened by strong straps of iron firmly bolted to the timber. In the event of a rod breaking it was usually quickly repaired by bolting these straps on the four sides of the timber, making it stronger than before the break.

THE parting of gold and silver when alloyed may be effected in a number of ways, but that by means of nitric acid is that commonly in use. This latter method has been in use since at least the thirteenth century, and was probably known long before that time. It first came into use in the sixteenth century, but at that time was still a secret process, and did not come into general use until about the middle of the eighteenth century.

STAGE WINDING was in use on the Comstock over twenty years ago. The winding engines were all located at the surface. One engine hoisted the "graffe" up the incline from the bottom of the mine and another hoisted the cage vertically from the head of the incline to the surface. Automatically operated skips are now hoisted by a single winding from as great a depth (3300 feet) on the Rand, the lower portion being an incline and the upper portion vertical.

WHERE A and B own adjoining quartz locations, and on A's claim is a ditch, A has no legal right to discharge his waste water over B's claim, though B's claim is subject to pre-existing right of way for A's ditch. If A turns his waste water across B's claim, B may use it if he choose. A is responsible for any damage which may result to B's claim from the passage of this waste water over the land and A has no right to fence up the ditch on B's claim without B's consent.

FERROUS SULPHATE is the usual precipitant employed to recover gold from its chloride solutions; but many organic substances also precipitate gold from chlorine solutions, among them being oxalic acid, formic acid, ether, etc., but none of these are suitable as commercial precipitants of gold, owing to the slowness of their action and excessive cost, and also to the extremely fine state of division in which the gold is thrown down. To such an extent is this latter possible that it is almost impossible to collect the gold.

THERE are instances where the Supreme Court has decided that, where a vein crosses the side lines of a claim instead of the end lines, the end lines become the "side lines" viewed legally, and the extralateral right is confined to the width of the claim and is defined by a projection of the side lines on the downward course of the ore body. Where a vein crosses one end line and one side line, the end line crossed by the vein defines one limit of the extralateral right, and a line parallel to the end line which crosses a point on the side line through the center of the vein, where intersected by the side line, defines the other limit.

AT Deloro, Canada, sulphuretted hydrogen was at one time employed as a precipitant for gold from chlorine solutions. The H<sub>2</sub>S was made by heating paraffine and sulphur together. This gas was diluted with air and forced through the solution under pressure. The air kept the solution agitated and at the same time expelled a portion of the chlorine mechanically, thus economizing H<sub>2</sub>S, which is decomposed by chlorine. For the purpose of precipitating gold from chlorine solutions now, sulphurous acid is used in some works instead of sulphuretted hydrogen, as with the latter some sulphur is always precipitated with the gold.

IN the bessemerizing of copper mattes, a much larger percentage of materials has to be oxidized than in the similar treatment of iron. In the latter usually not more than 5% to 10% of the material treated must be oxidized, but in bessemerizing a 40% matte at least 60% of the material charged into the converter must be oxidized. In the first copper converters the blast was introduced at the bottom, but, it being unsatisfactory, the tuyeres were raised above a crucible at the bottom. The separated metallic copper collected at the bottom below the level of the tuyeres, and remained molten throughout the blow.

THE original spitzkasten of Rittenger consisted of a

hopper-shaped (pointed) box in which the material to be classified was introduced at the top. Within the box was a partition placed parallel with the side on which the pulp entered. The heavy and coarse material settling, passed out through an aperture in the bottom, and the fine silt or slimes, slow in settling, flowed out through a launder near the top. To more effectually separate the sand and slimes, an upward current of water under slight pressure was introduced (spitzluten). These two devices in a great variety of form and size are now used more extensively than ever before in the fine sizing of ore particles before and during the process of concentration.

UNDOUBTEDLY open-cut mining is the most inexpensive of the various methods of breaking and handling of ore, particularly if the ore be passed down through mill holes to be loaded into cars from chutes; but it is inadvisable to open large surface excavations on a vein in a rainy country, if there is extensive underground development, unless the surface water can be kept from entering the underground workings by properly arranged drainage channels. The large open pits of the South African diamond mines at Kimberly receive an enormous amount of water during the rainy season. This is prevented from reaching the lower workings by having a circular drift run in the solid rock and entirely surrounding the diamond-bearing pipe. It is graded from one side in each direction, so that all water is collected and flows to a rock tank, from which it is pumped to the surface. Comparatively little water is encountered in the mine workings below the level of the drainage drift.

HARDPAN is an indurated earth, usually cemented by clay, iron or lime, any or all of these. It usually lies within a short distance of the surface, and sometimes outcrops there. In some gold-bearing regions this stratum of indurated subsoil is gold bearing, or gold is found lying concentrated upon its upper surface and in the layer of alluvial above. The caliche of the desert regions is an example. In southern California and in some parts of Arizona and New Mexico these occurrences of gold-bearing hardpan are not uncommon. The gravel beneath, however, is usually very poor in gold. The reason for this probably is, that the gold occurring on and above the hardpan possibly represents an enrichment or concentration of the material, which is often found to be coarser than the gravel beneath the hardpan, due to the fact that the finer and lighter particles have been washed and blown away by the rains and winds, thus enriching the gold-bearing stratum, the gold being too heavy to be either washed or blown away. The distinguishing line between earth and rock is that material which may not be plowed. Hardpan may be considered as a sort of a rock, but is distinguished from other rocks by its position in the earth, with reference to other material above and below it.

THE dimensions of a lead smelting furnace at the tuyeres is not considered as having any important significance excepting the capacity of the furnace, but the height of the furnace above the zone of the tuyeres has an important bearing on the losses in lead. If a lead furnace has too great a distance between the tuyere level and the feed floor level the result will be the furnace will get hot at the top, and while the zone of the tuyeres becomes black the fire will reach upward, and although an abundance of slag may be produced little or no lead will come down. Under such conditions if pigs of solid lead are fed they will disappear and no lead will reach the tap hole. Experiments with lead furnaces have proved that a furnace closed in on top will quickly show "over fire," that is fire ascending the ore column above the tuyeres, and that a lead furnace having too great a distance between the tuyere level and the feed floor level has the same effect as if the furnace is closed in at the top. The result of a closed top or too high an ore column is the volatilization of lead, owing to the inability of the cold air to reach the top portion of the charge. The proper height of an ore column in a lead furnace is about 12 or 13 feet and 22 or 23 feet from the furnace floor to the charge floor.

THE passage of a vein from one sort of formation to another is not always accompanied by a material change in the character of the deposit, though this is sometimes the case. On the mother lode of California veins striking and dipping with the slates have uniformly a banded or ribbon structure. Those occurring in greenstone (either the massive dikes, the more or less massive tuffs or in the schistose rocks) have a massive structure, often enclosing fragments of the wall rocks, which are usually much altered and silicified. Where slate occurs on one wall and some type of greenstone on the other, that portion of the vein adjacent to the slate has a ribbon structure, and that portion next the greenstone is more massive. The banded portion of these veins is usually richer than the massive part, though there are exceptions, and some of the typical ribbon veins are destitute of values. At the Rosario mine at San Juancito, Honduras, the vein—a fissure—cuts through black metamorphic shale, hard and dense, with many veinlets of calcite, and leaving the shale enters an eruptive rock, but the vein is not materially influenced by this change in country rock, as the ore is equally rich in shale or eruptive rock. In many other localities the character of the walls apparently have a direct influence on the metal value of the vein and its base contents. There is no rule by which to be guided,

## Operations at Dry Desert Mines.

TO THE EDITOR:—It is possible that in our efforts in the Dale mining district to overcome some of the difficulties of mining and milling ore in a country where wood is scarce and water difficult to obtain, we have gained experience, both useful and entertaining, to the mining fraternity in general. Dale is in San Bernardino county, Cal., on the Mojave desert, about midway between the Santa Fe and Southern Pacific Railroads, and about 35 miles south of Amboy, on the Santa Fe.

That we have been to a degree successful is attested by the fact that in this district there are at present a well equipped, up-to-date, 10-stamp mill, with cyanide plant, in continuous operation, two other mills crushing dry with rolls for direct cyaniding—one having a 30-ton capacity and the other 60 tons—and also several smaller mills.

Water is furnished to these mills for \$2.50 per 1000 gallons. The stamp mills use the most water per ton of ore crushed. The 10-stamp mill running twenty-four hours per day, and crushing from thirty to forty tons per twenty-four hours, uses about 20,000 gallons of water per week, or to be more exact, the actual amount reported for September, 1904, was 74,060 gallons. This includes all the water used for domestic and other purposes about the mine, as well as in the mill, which was in nearly continuous operation during this month.

The cost of water at the O. K. mine operating the above mill, where the methods used are typical of the best practice in wet crushing, is after all not a large item, approximating something less than 25 cents per ton of ore crushed. This expense is nearly, or quite, counterbalanced by the advantage of dry mines, minimum use of timbers and convenience and comfort in working underground.

The pumping plant which furnishes the district with water was installed by the writer for the Brooklyn M. Co. in the spring of 1901. The water is pumped to the surface from a well 183 feet deep by an ordinary plunger pump, thence is forced by means of a 1½x4-inch Dow triplex single acting pump through 7½ miles of pipe. The pipe line consists of 2 miles of 1½-inch standard pipe adjacent to the pump, the remaining 5½ miles being 1-inch pipe. For the greater part of the distance the line is laid over an extremely rough and rocky country.

The Supply mine, upon which there is nearly completed a 60-ton cyanide plant, takes its supply of water from the pipe line at a distance of 3½ miles from the pump, and at an elevation of 800 feet above it. The town of Dale is supplied 1 mile farther on at the same elevation. The O. K. mine, owned by the Seal of Gold M. Co., and the property upon which the 10-stamp mill is in operation, takes its water from the highest point on the line. The elevation here is 1200 feet above the pumping station, the distance 5½ miles. From this point the water flows by gravity 2 miles farther on to the Brooklyn and Los Angeles mines owned by the Brooklyn M. Co. The Ivanhoe M. Co. take their supply of water for their 30-ton cyanide plant at a point 5 miles from the pump, and at nearly the same elevation as that of the O. K. mine.

The pumping plant has a capacity of 7000 gallons per day. The power is furnished by a 10 H. P. Weber gasoline engine. The engine operates both the well pump and the Dow pump, and for the past six months has been in nearly constant operation night and day.

This pumping plant has made possible the development and operation of the various mines of the district on an economical basis as regards their water supply, and has shown what can be accomplished with a very moderate amount of capital in furnishing our desert mines with water.

Dale, Cal., Nov. 19.

H. H. A.

ONE of the most important problems which the mining engineer has presented to him is that of hoisting. In considering it, there must be taken into consideration the underground and the surface conditions, the probable requirements both at present and in the future and the cost of plant and expense of operation.

## Metallurgy at Deadwood, South Dakota.

Written for the MINING AND SCIENTIFIC PRESS.

Within the Black Hills of South Dakota are found many varieties of ore, carrying gold, lead, silver, copper, zinc, tin, etc., but there are two kinds which constitute the principal ore output of that region—a siliceous schist or white vein quartz, carrying gold and auriferous iron sulphides, and a highly siliceous ore, largely the result of replacement of sedimentary

Archæan terrane rest the sedimentary beds representing every important large division known to geological science, from Silurian to Tertiary. In the Cambrian and Carboniferous beds, and in part also possibly the Devonian, occur the so-called siliceous ores, though these are really no more siliceous than the pure quartz ores of the Archæan. The presence of these ores in the sedimentary beds near Galena, Bald Mountain, Green Mountain and Terry's Peak was recognized early in the history of mining in the Hills, and a large number of claims were then located on

Cyanide Mills, Deadwood, S. D. Golden Reward Left, Imperial in Foreground and Dakota Mill Just Beyond.

Golden Reward Cyanide Plant, Deadwood, S. D.

rock, which contains payable values in gold associated with tellurium. The gold ore occurring in the schists and slates does not differ greatly from gold quartz elsewhere. Usually the ore is, to a great extent, free milling, readily yielding its contained gold to amalgamation, with the subsequent concentration of the sulphides, and in some cases treatment of tailings by the cyanide process. At the Homestake no concentration is practiced, but the slimes and sands are leached by cyanide solutions separately.

All of the schistose ores occur in the Archæan, which forms the basement series of rocks of the Black Hills region. On the upturned edges of this

these beds, particularly in the districts named. A few hundred tons of ore were shipped out of the Hills from Galena, rich in silver, lead and gold, and later several hundred tons from the other districts were shipped to Omaha, Denver and other smelters. For years repeated efforts were made to treat these ores at the mines, but without success. Up to 1886 it was not determined positively that the gold was associated with tellurium in these ores. The pioneers in the school of experimental metallurgy were the Portland Mining Co., near Portland; the Welcome Mining Co., at the eastern base of Terry's peak, near Terry; the Snowstorm Mining Co., near Terry, and the Sitting Bull Co., at Galena. The latter company

was really an exception, as their ore was either a lead-silver ore, which was smelted at the mine, or a siliceous chloride silver ore, which was milled (after roasting in various types of rotary furnaces) by amalgamation in pans with salt, bluestone, etc. The Portland, Welcome and Snowstorm companies expended large sums in building mills and trying various methods of treatment, but without success, viewed either chemically, mechanically or commercially. The next company to take up the still unsolved problem was the Buxton, near Terry. Here the first steps toward the real solution of the problem were taken. Leaching by means of bromine solutions was the process tried, but, although it gave results superior to any others that had been attempted, it was not a

the most important plants at Deadwood, in which city the cyanide and chlorination plants were first installed in the Black Hills. The Imperial Co.'s mill and that of the Golden Reward Co., near it (both illustrated), are the only ones where the ore is crushed dry, the solutions being subsequently introduced. In the Dakota mill (also herewith illustrated) the ore is crushed in the solution, the battery water containing 0.1% of potassium cyanide, and four pounds of lime are added at the battery to each ton of ore fed. This is to aid in the settling of the slimes, as the ore is not noticeably acid.

In addition to the numerous cyanide mills now treating these tellurium ores in various portions of the Hills, the Golden Reward smelter also has

age of values, while decreasing the cost, and if the past may be considered an index of what the future has in store, these efforts will meet with success.

Lead Statistics for 1902-03.

The following figures give the latest authoritative statement of the statistics of lead production, etc., for the years 1902-03. The world's production for these is given in long tons as follows:

	1902.	1903.		1902.	1903.
United States.	259,780	266,691	Austria-Hung'ry	13,307	13,953
Spain	174,936	172,521	Turkey	3,622	7,493

THE PROSPECTOR.

In order to be able to identify rocks as he finds them in the hills, the prospector should have a knowledge of the most important rock-forming minerals, and this requires study and the careful discriminating power and habit of observation.

The most essential minerals are quartz, mica, hornblende, augite, the feldspars, magnetite, garnet, etc. Quartz is usually easy of identification if it can be readily seen by the eye or by aid of a magnifying glass. The micas are several in number, the most common in rocks being muscovite, the colorless kind, and biotite, the brown to black kind. Other micas are also more or less abundant, but are not essential constituents of rocks. Mica is often the result of alteration of other minerals, particularly of feldspar. Hornblende (amphibole) assumes many forms, colors, shapes and conditions and must be studied. Ord-

Imperial Company's Cyanide Mill, Deadwood, S. D.

financial success, and was eventually abandoned. All of these expensive operations were carried on in a new country, from 200 to 300 miles distant from the railroads.

In July, 1886, the first railroad reached Rapid City, at the eastern gateway of the Hills, and within four years following that date the barrel chlorination process was in operation and doing much to simplify the vexed problem of the metallurgy of these ores. In 1892 the cyanide process was introduced in the treatment of these same ores, and was found to yield as satisfactory a result as, if not better than, the chlorination process. Many experiments were made—and for that matter are still being made—in the treatment of these ores by wet process.

The accompanying engravings illustrate several of

treated a large tonnage of this ore successfully. This enterprise, owned by the Golden Reward Mining Co., was originally known as the Deadwood & Delaware pyritic smelter. It was the outcome of a long series of experiments made along the line of pyritic or partial pyritic smelting by Dr. F. R. Carpenter. The first plant built had a capacity of 400 tons daily. This plant burned several years ago and was rebuilt by the Deadwood & Delaware Co., the new plant having 800 tons daily capacity. It was subsequently bought by the Golden Reward Co. (See accompanying illustration.)

Notwithstanding that the metallurgy of these telluride ores has reached a high degree of perfection, the energetic metallurgists of the Black Hills are constantly striving to extract a still higher percent-

narly, when fresh and unaltered, it is almost black (green in thin section under the microscope usually, but brown in basaltic rocks). The white variety is fibrous and silky, and is called tremolite; the light green, also fibrous, is actinolite; the blue variety (uncommon) is glaucophane. Augite resembles hornblende, being normally dark green, almost black, but is in short stumpy crystals. Both hornblende and augite alter to chlorite and epidote, and the rocks containing these minerals are often altered to schist when probably the greater portion of either the hornblende or augite is no longer recognizable as such, but appears as scales of chlorite. The identification of the feldspars, of which there are about a dozen varieties, will be found difficult, and often it is impossible for expert petrographers to tell to what variety a certain feldspar belongs without microscopic investigation. There are, however, two important divisions of feldspar: First, the potash variety (orthoclase), so named from its crystallization. This feldspar is often pink in color, but as this is not always the case this means of identification cannot positively be depended upon. This is the essential feldspar of granite, trachyte and other acid rocks. It has several other varieties—microcline and sanidine being most important; the latter is usually clear and glassy, and is common in trachyte and its quartz-bearing variety, rhyolite; also occurs in phonolite. The feldspars may be distinguished from quartz by their cleavage, the latter never showing this property, while the feldspars have smooth faces which reflect the light. The second division in the feldspars is grouped under the general term "plagioclase," and includes all of those feldspars in which lime and soda are present. The several varieties are albite, oligoclase albite, oligoclase, andesine, labradorite, bytownite and anorthite. Albite has a minimum of lime and maximum of soda, and anorthite has a maximum of lime and a minimum of soda. Between these extremes the several varieties contain variable (but always definite in each species) amounts of lime and soda. The feldspars high in soda are associated with the more acid rocks, granitic dikes, quartz porphyry, etc., and those high in lime with the more basic rocks, diabase, basalt, etc.

As a matter of course, those wishing to take up rock study so that they may be able to identify, even approximately, the rocks in the field, must become acquainted with the various combinations which form the typical rocks, the general appearance and manner of occurrence. When the prospector has become familiar with the various minerals he must then learn what mineral combinations are grouped to form the various rocks. Granite is composed of quartz, feldspar (orthoclase) and mica. Hornblende is also often present, but should the feldspar be oligoclase instead of orthoclase, the rock would be diorite, and the presence of mica would make it quartz-mica diorite. If it were a combination of orthoclase and hornblende without quartz or mica it would be syenite (quartz may also be present in syenite). So it is throughout the entire series of eruptive rocks that largely make up the mountain masses in the regions where the prospector is most likely to be found. The rocks graduate from one to another, by addition or omission of some important mineral. Still the intelligent prospector desires knowledge of these things, and the merest outline has been given, as suggestive of what those who care to take up the study should do.

In addition to the intrusive and volcanic rocks, there are many sedimentary rocks with which the prospector should become familiar. Among these are limestone, sandstone and shale and their metamorphosed products, marble, quartzite and slate. In mining regions the sedimentary rocks are usually metamorphosed, and we find marbles, quartzites, slates, schists, gneiss, etc., but as these depend largely upon their physical characteristics they are usually much easier of identification than the igneous rocks.

The mineral sample from Fraser, Colo., is a compound of potash, iron and aluminum. It contains no uranium. It is the result of decomposition of some mineral, probably feldspar.

### Hoisting Engine.

Herewith is illustrated a double cylinder, double independent band friction hoist engine manufactured

by the Ottumwa Iron Works Co., Ottumwa, Iowa. The friction mechanism is operated by a hand lever

placed conveniently near the throttle valve and the position of the operator. Each drum is equipped with a compound indicator, driven by sprocket chain direct from the drum hub, and with cut gearing that drives the fingers. One indicator finger moves rapidly around the dial to assist the operator in making his landings, while the other fingers travel slowly and record the distance, which is a great convenience in long hauls and inclines.

The drums of this engine are self oiling, and the bearings are bushed with brass. Post brakes are used, and either foot treadle or hand lever with ratchet quadrant will be furnished, as the condition may require. This engine is especially designed for long hauls or incline planes, or for double compartment shafts where adjustment of the cage is required, or where one cage is to be operated separately from the other. It may also be used as an ordinary hoisting engine.

The manufacturers or their Western agents will furnish full information and catalogue on request.

### Jeffrey Hammer Pulverizer.

The manufacture of this type of pulverizer has recently been taken up by the Jeffrey Manufacturing Company of Columbus, Ohio, being made under the Schoellhorn-Allbrecht patents acquired by it.

The one illustration shows the pulverizer with its interior or crushing parts; the others show the sec-

Jeffrey Hammer Pulverizer.

tional screen frame which is one of the special features in this machine.

It is designed for crushing and pulverizing material such as coal, clay, shale, rock and other materials. The manufacturers claim it to be the simplest of its kind made. Strong features are its simple beater hammer, "V" shape bar screening surface, adjustment of the beater arms to accommodate wear, adjustable dust-proof pillow blocks, top feed hopper while in suspension. The accessibility of its inner parts is also mentioned as one of its strong features. The taking off of the rear plate and the hand hole plates on the side of the machine make it possible to change the beater arms as well as the screening surface when necessary. The screening surface is made up in sections, so that it is the work of but a few moments to take out or change from one size mesh to another.

The manufacturers say that many of these machines are in use, and hence there is no experimental period to be gone through with.

It is made in many sizes to suit the various requirements. For instance in coal the capacity varies from 50 to 100 tons of coal per hour, depending upon the degree of fineness. In pulverizing material, such as rock, its capacity is stated to be from ten to twenty-five tons per hour.

The Jeffrey Company make free crushing tests for interested parties, thus demonstrating before sale what the machine is capable of doing. A complete catalogue on this subject can be had by addressing the manufacturers.

### Determination of Silver in Ores in the Wet Way.

Written for the MINING AND SCIENTIFIC PRESS by F. ALTNEDER.

In commercial chemical laboratories there often arises the necessity to make only one or two silver determinations from ores. For these determinations the chemist gets only \$1 to \$2 (50 cents to \$1 for one silver assay), yet he has to make his determinations immediately, and is not permitted to wait until more samples accumulate. In such cases he is bound to fire his furnace and to expend more money for fuel alone than he gets for his assays. In this case the chemist would naturally prefer to do his assays in the wet way.

Prospectors generally would like to know the assay of their ores immediately after finding it, but they have to send it from the mountains to the city for assay and often have to wait one or two weeks, perhaps, before they get their assays. The prospectors could carry with them a light assay furnace (for example a gasoline furnace) and their balances, but this is attended with difficulties, and they would be glad to know some assay method by which they could dispense with the heavy assay outfit and necessary accessories and with the expensive and delicate assay balances. For such cases I recommend the following method. This method is based upon the following fact: If into a silver solution containing 1% to 4% free nitric acid and some starch solution potassium iodide is added, this precipitates the silver in the form of silver iodide (AgI), and as soon as all of the silver is precipitated the free nitric acid liberates I from the KI, which reacts upon the starch, turning the solution blue.

PROCEDURE.—Dissolve one-half A. T. (1) ore in 40 to 50 c.c. nitric acid (2); evaporate nearly to dryness (3); take up residue with hot water; filter (4); wash with hot water; dilute to 100 c.c.; add 5 c.c. strong nitric acid (5); cool (6); add some starch solution and titrate with KI (7).

(1). From poor ores you may take more, from rich ores less than one-half A. T. For ores or furnace products containing 200 ounces or more silver and much copper, I specially recommend to take only 5 to 10 grams for the assay in order to make the assay quicker and to get less intensive bluish solution.

(2). If you are afraid that the ore will not be thoroughly decomposed by nitric acid alone, you may use

the mixture of nitric and sulphuric acid for decomposition, but this is generally not necessary.

(3). Avoid the baking of the residue—better leave some acid in solution and neutralize it with ammonia. This neutralizing is necessary only in order that a fixed percentage of free HNO<sub>3</sub> (nitric acid) be in the solution.

(4). If the insoluble residue is white and not in great amount, you may omit the filtering, thereby saving a great deal of time.

(5). The right amount of the free nitric acid in solution is the most delicate point of this assay. If there is not enough free nitric acid in solution, the reaction of the nitric acid upon the KI is so slow that the blue coloring is retarded. You use more KI than necessary and your results will be too high.

Again, if there is too much nitric acid in the solution, this decomposes the blue iodide of starch. In this case the solution turns blue, but this blue coloring soon disappears. In this case you have to add some alkali (I always used NaOH solution) and the blue coloring reappears. Now you may add a measured quantity of silver solution to your assay and proceed with your titration. To get the right acidity and, therefore, a prompt and decisive reaction, is made difficult by the presence of much iron salts.

The ferri-salts react upon the KI and starch solution similarly to the free nitric acid, and you do not know exactly how much nitric acid to use. This is the reason why this method does not give as close results as the fire assay.

I made some experiments to eliminate the iron

from the solution, thus rendering this method an exact one also for ores containing much iron, but as yet I did not succeed.

First, I tried to precipitate the iron with ammonia, wash with ammonia water, acidulate the filtrate with the right amount of  $\text{HNO}_3$  and titrate as usual, but to wash out the bulky  $\text{Fe}_2\text{O}_3\cdot\text{H}_2\text{O}$  precipitate resulting from the treatment of one-half A.T. ore takes too much time and dilutes the filtrate so that I found the method practically useless.

Then I tried to precipitate the silver with test lead, decant the solution from the precipitate, dissolve the precipitate with nitric acid, neutralize and again acidify with 5 c.c. of strong nitric acid. With this procedure I got better results, but it would be necessary to make more experiments before recommending this method. However, this procedure, or the precipitating with aluminum, deserves further experimenting.

(6). It is necessary to cool the liquid before titration, because in the hot solution the iodide of starch is decomposed rapidly.

(7). I found the most practicable to use was KI solution containing 1.535 grams KI in a liter. One c.c. of this solution precipitates 0.001 gram silver, so that treating one-half A.T. ore every 0.1 c.c. KI solution corresponds to 0.2 ounce Ag per ton of 2000 pounds. This solution is near to the  $\frac{1}{100}$  N.KI solution— $\frac{1}{100}$  N.KI solution contains 1.658 grams KI.

It is necessary, however, to standardize your KI solution with silver nitrate solution containing 0.02 to 0.05 gram silver. At the standardizing take care that your standard silver solution be of the same volume and contain the same percentage of free nitric acid as your ore solution contains. As very dilute K.I. solution is used for the titration, we must always add 0.2 to 0.3 c.c. more KI solution to get the blue reaction. The amount of the KI solution is to be taken into account. At present my laboratory notes are not at my disposal, therefore I am only able to state that I got very good results with pure galena ores, and also pure quartzose, and calcareous silver ores, but not as good results with cupriferous iron sulphide ores, and still less satisfactory results with oxidized iron ores. For ores containing chlorides or where the silver is alloyed with more than one-third part gold to the silver, my method is not applicable.

I am sorry that I cannot give here an accurate method applicable to every kind of ores, and methods worked out in detail, but other professional duties prevent me from further experimenting, and I thought it better to publish now this somewhat crude but quick wet method rather than publish a more accurate and precise method based on further experiments made at some uncertain time in the future.

I hope my colleagues will experiment with this method, perfect it, and publish the results of their investigations along this line.

I made my experiments in the laboratory of Dr. I. R. Moeschel in Kansas City, Mo., and I think it my pleasant duty to thank him for affording his laboratory and chemicals to make these experiments.

### Saxon Ore Sample Box.

Mining men realize the value of system in conducting their business, the advantage of having everything in its place, and a place for everything being apparent in every line of work. There is no reason why, in taking samples of ore either by diamond drill borings or other methods, the samples so obtained should be mixed up or dumped in boxes, and it is not always convenient to have uniform boxes or

Saxon Ore Sample Box.

bags in which to keep such samples. The Saxon ore sample box, illustrated herewith, is manufactured by Greenleaf & Bacon, 42-Michigan street, Chicago, and is a great convenience. It is manufactured of tin, with hinge cover, and the regular stock size is as follows: 2 inches wide,  $1\frac{1}{2}$  inch deep and 12 inches long.

One strong feature of this box is an arrangement on the outside of each end whereby a card can be slipped in on which records can be kept. This card is then locked in place when the cover is closed. In this way one can tell at a glance what samples are contained therein, and when and where they were taken. The manufacturers have been making these boxes for mining companies for some time, and are therefore in position to give just what is wanting. They would be pleased to furnish further details, with prices, upon application.

Most valuable ore deposits are accompanied by igneous dikes, or occur within eruptive areas. There are some important exceptions where the mines occur in metamorphic rocks.

### The Gold Mines of Angels, Cal.\*

Written for the MINING AND SCIENTIFIC PRESS.

One of the oldest and most noted mining districts in California is that about Angels, in Calaveras county. Originally a placer camp, the large outcrops of gold-bearing quartz and zones of auriferous schist soon attracted attention, and shallow workings resulted in the discovery of numerous pockets of gold along these outcrops, which in the aggregate produced many thousands of dollars. The most important mines of the place are the Stickle, Utica, Light-

into this mine, which in size vary from 8 inches for sprags, etc., to 24 inches for posts, caps and ties. All of these logs are 16 feet in length (see engraving, front page, Lightner mine). The cost of timbering in this mine is stated by Superintendent Chalmers to be 65 cents per ton of ore extracted, based on the cost of removing 70,000 tons of ore and securing the stopes, which is somewhat higher than would otherwise be the case, owing to the conditions obtaining at this property, as above mentioned. The total cost of mining, milling, concentration and chlorination, together with general expenses, is stated to be but \$2.25 per ton. There are said to be six years' ore

Gold Cliff Cut and Hoist, Angels, Cal.

ner, Angels, Bovee and Gold Cliff. All of these are on one zone, or series of veins, except the Gold Cliff, which lies several hundred feet to the westward. Probably no mines in California have had a more varied history than some of these at Angels. In its early history the Utica mine was superficially developed, and on the showing then made a 9-stamp mill was built, but as it did not pay the mill was removed and taken elsewhere. Several owners in succession, during a period of twenty years, operated this mine, each in turn failing to make the venture profitable, until C. D. Lane struck the pay shoot in 1886, since which time this mine and the Stickle, adjoining it on the south, and owned by the Utica Co., have been largely profitable.

The Stickle mine was an early producer, and the

supply in sight in the Lightner mine, which has been credited with a production of \$1,250,000 during the past four years. The equipment consists of hoist, 40-stamp mill, chlorination works, etc. The present depth of the Lightner mine is 850 feet.

The Angels mine, adjoining the Lightner mine on the north, is in operation, and is said to have found recently three new veins, or zone of ore, in depth, beneath a fault plane, which has previously been considered the foot wall of the upper mine. In the early history of the Angels mine it was worked steadily for ten years, and at that time the barren quartz vein outcropping west of the main pay vein was recognized as likely to either join the pay vein or to cut it off at a depth of 300 to 400 feet, but when the intersection was reached the heavy talc zone underlying the quartz of the west vein was mistaken for the foot wall of the nearly vertical pay zone, and for years no work was attempted below that level. The recent finding of the pay shoots below the talc zone shows how nearly the oldtimers guessed right. It is reported that these same pay zones have been cut also in the Lightner and Utica-Stickle mines, as well as in the Bovee mine, lying immediately north of the Angels mine. In the Bovee are several nearly parallel veins, some of which carry pay rock, and some are barren. Recent exploitation in this property indicates the discovery of pay rock in the mineralized zones beneath the fault plane above referred to.

About  $\frac{1}{2}$  mile west of the above-mentioned mines is the Gold Cliff mine, owned by the Utica-Stickle Co. A heavy outcrop originally marked the surface of the Gold Cliff, but this was removed years ago by the mining operations carried on in a large open cut. (See accompanying engraving.) The ore in this mine occurs in several zones, which overlap in the foot wall going northward. On the 400 level, drifting northerly, the vein was found to be split by an intrusion of diabase. In depth the Gold Cliff ore bodies have proven to be large and contain better values than those at the surface.

The ores of the Angels district are, as a whole, easily treated by amalgamation and concentration, and the chlorinating of the sulphides for the gold. Some successful experiments have also been made in cyaniding the fine sulphide slimes produced in milling.

A few miles northwest of Angels is the Demarest mine, at which some interesting metallurgical experiments were made in the early history of mining in this county. The rock treated was a banded or "ribbon" rock characteristic of veins having slate walls in the mother lode. The experiment of roast-

\* See illustrations on front page.

ing the ore with superheated steam was tried for the purpose of rendering the quartz more readily amenable to amalgamation. A furnace was built 20 feet in height and having a diameter of 16 feet externally, with an ore chamber 7 feet wide at the bottom and 9 feet wide at the top and 16 feet high. The fire boxes were on the sides of the ore chamber, near the bottom, something like those of a quicksilver furnace. Over the grate at the bottom of the chamber was arranged a perforated iron pipe, through which steam could escape. The ore as it came from the mine was charged into this furnace and for fifty to seventy hours was roasted in the presence of superheated steam. It was the practice to heat the rock to redness, and to vary the temperature somewhat by turning in more or less steam. It was claimed that the sulphides were completely desulphurized by this process, and that the capacity of the stamps to crush the ore was doubled by it, but the strangest thing is that, though it was claimed that the gold now amalgamated readily, the quicksilver was lost. This experiment is said to have cost \$25,000, and was declared a failure.

## Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 15, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINER'S SQUIB.—No. 774,269; E. C. Owens, Priceburg, Pa.

Blank for miners' squibs, consisting of strip of paper having unequally tapered edges at one end of same, whereby strip may be rolled into tube having tapering end, slits formed in and arranged at acute angle to one edge of strip, and means whereby tapered end blank may be unrolled and rolled again without disturbing tubular end of same.

EXCAVATING BUCKET.—No. 774,431; F. M. Ireland, Portland, Oregon.

Excavating bucket comprising semi-cylindrical body having flat bottom, plow plate b hinged to front edge of bottom, lever f pivoted to one side of body, rigid arm c on plow plate, link d connecting arm with lever f, so that plow plate may be suitably positioned and controlled by lever f, runners j pivoted to two sides of rear end of body, yoke-like lever l pivoted to body, links k connecting ends of lever l with movable ends of runners, and hooks or stops l<sup>2</sup> on lever ends, so that runners may be dropped, to tilt body on its front end by operating lever l, hinged door n, closing rear open end of body, latch therefor and bail h, and stay-chain i for perpendicularly suspending body from tackle.

PULVERIZING MILL.—No. 775,130; J. H. Elspass, Los Angeles, Cal.

In pulverizing mill, combination with suitable frame, of circular rotary mortar whose pulverizing

face is highest at its outer edge and inclined downwardly to its inner edge, and pulverizing rollers whose faces and axes are parallel with pulverizing face of mortar.

PULVERIZER.—No. 775,068; A. Raymond, Chicago, Ill.

In pulverizer, the combination with a driving roller, of driven roller normally resting upon and rotated by frictional contact with driving roller, rollers being out of vertical alignment, driven rollers comprising plurality of disks each having central bore, hub of less diameter than bore of disks on which disks are mounted and have independent radial movement, hub having longitudinally arranged bolt openings, disks of smaller diameter than disks forming roller arranged at opposite sides of latter, and bolts passed through smaller diameter disks and bolt openings in hub.

SAFETY ATTACHMENT FOR HOISTING ENGINES.—No. 774,767; F. W. Lyon, Grand Junction, Colo.

Combination with hoisting mechanism, including operating device, of screw shaft revoluble with hoisting mechanism, nut disposed on shaft and movable longitudinally thereof, means for holding nut from revoluble movement, pair of rods serving partly as guides for nut, tappet blocks disposed in path of movement of nut, and means connected to tappet blocks for cutting off actuating medium of operating device.

MINER'S PICK.—No. 774,748; W. H. Foley, Mapleton, Ill.

A handle socket for tools comprising a member having a slot and seat, of handle socket provided with tongue in slot, projection in seat and fastening device projecting through projection connecting socket and tool.

GOLD-SAVING APPARATUS.—No. 774,786; L. Sachse, Oroville, Cal.

In gold-saving apparatus, combination, with tank having upper and lower compartments arranged one above other and having floor between them, compartments intercommunicating through an opening in floor, means restricting outflow from upper compartment; means vertically over opening adapted and arranged to intercept precipitates from such liquid through opening into lower compartment, and means for supplying current of water in opposition to downward current of water above opening in floor.

PROCESS OF REDUCING ORES.—No. 774,930; H. F. Brown, Oakland, Cal.

Process of reducing ores as continuous operation which consists in first passing ore in finely crushed or pulverized condition through non-whirling atmosphere, and subjecting highly heated ore to action of whirling heated atmosphere moving in same direction as travel of falling body of ore.

MINE CAR.—No. 775,007; F. C. Hockensmith, Pittsburgh, Pa.

In mine car, combination of car bottom, and truck, one of parts having openings closed on all sides, and other part having integral projections which interlock with such openings, whereby bottom and truck are held against lateral movement or displacement in any direction.

## The Extralateral Right Law.

TO THE EDITOR:—Having read the article on the above, together with other references on the same head, it may be permitted to say a few words.

That article would appear to state that while this law permitting the following of a vein through all dips, spurs and angles was undoubtedly fruitful of much litigation—in fact, more so than any other feature pertaining to the mining code—yet, despite all that can be said against such a law, those countries enjoying this harassing and disturbing element were undoubtedly in a far more vigorous state than other countries, where the blessed peace-assuring vertical side lines prevailed.

"It is a noticeable fact that in those countries where the extralateral right is not in force that there is less activity in mining." It is safe, then, to assume as a natural inference that this state of activity is, in a measure, due to this law, and is not merely a coincidence from the fact of its happening to prevail in those countries that are said to be in such a flourishing condition.

"As a rule, where the extralateral right is not in vogue mining is less active than in those regions where the law is in force." And yet, as a matter of fact, in those two districts mentioned—Michigan and the Transvaal—as being eminently suited to the extralateral right law, both are prospering under the beneficent sway of the vertical side lines. If this is the intended line of argument, backed with the flourishing mining industry of the United States as an example, it would doubtless admit of practical application elsewhere.

Looking for these flourishing communities of the extralateral right, where do we find them? Nowhere, in the writer's knowledge, amongst the leading mining countries outside of the United States and possessions, and in Rhodesia, an exception amongst British colonies. In South Africa, therefore, where we have in the Rand the vertical side and end lines, with a magnificent prosperity of the gold mining industry, the greatest the world has ever seen; and, in Rhodesia, where the industry never has assumed any magnitude, nor ever may, it would appear as if this argument were not thoroughly sustained.

We may be told next that what the mining industry requires at present in the Transvaal is not so much an increased labor supply, Kafir or Chinese, as the adoption of that inestimable elixir, the extralateral right law. Doubtless, such a ruling would have been welcomed in former days by the outcrop companies. But with what result to the mining industry of the Rand? Such is not difficult to foresee, for, with the right to follow these conglomerate beds to illimitable depth, it is inconceivable these companies would have showed the extreme vigor of the deep-deep companies in putting down shafts, half a mile in depth or over, in order to work these deeper deposits, in places several miles from the outcrop itself.

Look again at Australia, that great mining colony, also an excellent example of the working results of the vertical plane quadrilateral. Take, for example, the colony of Western Australia, where the writer remembers the days of 1895, when many thousands of hardy prospectors risked even their lives in their haste to prospect the waste places of that inhospitable colony, in the face of the most stringent labor regulations, which necessitated the continuous working of one man to six acres, and after approval one man to three acres, each man costing about \$15 to \$20 per week. Should such conditions be unfilled even for one day the claim was jumpable. Patents, even, were never procurable, the only title being the leasing from the Government for a term of twenty-one years. What was the consequence in spite of these severe conditions? The country was opened up; prospects were located by the thousand; and if more ground were required to protect the dip of the vein the depths of such claims were taken up; for, in that country, there is no such unpractical requisition as ore in place essential to mineral location, which at the most can but be regarded as a farce in the application of the mining regulations of the United States. Without doubt, every country has special requirements calling for special regulations; but, for universal application, it would be hard to devise a more unsatisfactory code of laws than those containing the law of the apex, and extralateral right, ore in place, side lines 300 feet on either side of the vein, for such in no way conforms with nature's provisions as typically illustrated world wide.

Are not Mexico, the Transvaal, Australia, Canada, all examples of prosperous mining communities; and are not all, to-day at least, examples of that just and equitable law of the vertical end and side line?

How, then, can that statement be maintained with regard to the evident prosperity of extralateral right countries being due to the stimulating influence of that law? Nay, rather, may it not be contended from a more comprehensive outlook that these few and unfortunately regulated countries with regard to their mining laws have flourished not by virtue, but actually despite such handicapping regulations.

Scientifically speaking, it is doubtful whether there exists always adequate data for formulating any

such law as that of the apex, for the simple reason that in a number of cases there is no readily ascertainable and incontrovertible apex. How then can there be formulated into a hard-and-fast law that which does not exist?

The writer has had experience in all these countries mentioned in mining, and has no hesitation in saying, in his opinion at least, that the vertical plane extension is a law uniformly equitable and just, and worthy of adoption by all mining countries.

The question is not one confined to the prospector; he has his rights undoubtedly, but the whole mining industry, infinitely greater, and the law that conduces to the benefit of that industry most should be that adopted by such a progressive and essentially practical people as those of the United States.

The writer well remembers attending the Mining Congress at Butte, two summers ago, as a delegate. At this Congress the Kearns bill, supported by Mr. Dignowity of Salt Lake City, was made a prominent feature, which bill aimed at the abolition of the extralateral right and the adoption of vertical side lines. The bill, as it stood, was not a complete remedy for the suggested defects of the present mining regulation, it is admitted; but certainly deserving of support until such a time as by amendment it is made more suited to the alleged needs and requirements.

That bill was hopelessly killed, although there must have been many of the mining men present in favor of it. The writer was amongst one of the largest delegations present, from a great Western mining State, whose chairman, in summing up the pros and cons of the bill influencing the attitude of that particular State thereto, spoke in some such discriminating words as these: "Here, boys, is a new bill; come, let's kill it." That State voted solidly against the bill and assisted in its general slaughter.

Surely such an important measure warranted a more enlightened discernment than was afforded it in this instance. Whilst doing a little lobbying previously in favor of the bill, the general objection seemed to be a want of fairness against the worthy prospector, doing him out of his just rights by cutting off the extension of his vein at depth. It never seemed to occur to these individuals that other features of the present law would need altering as well—necessarily that referring to ore in place; and that, therefore, not only in length but in width also, the blocks obtainable by any one man could be unlimited; so that there would not necessarily be any occasion for the prospector to ever part with his beloved vein, even at depth.

The most painfully grotesque feature of the situation lay in the fact that there in the city of Butte—than which there is no more stupendous monument to the harassing effects of the existing law of the apex, in a mining district where most, if not all, the principal mines were then tied up by long and bitter legal controversy directly resultant from this law, and where geologists were ranged on either hand in serried ranks, prepared to construct and destroy apices to order—there, then, was this assembly of the mining interests of America in solemn conclave sitting, actually found engaged in killing that measure that would have rendered such another painful and disgraceful episode as that of Butte absolutely impossible; and they killed it—killed it as dead as the proverbial door-nail.

It is to be hoped that coming mining Congresses will take a more comprehensive view—and also the American miner—so that the many defective features in the present mining regulations may be amended, and be brought at least up to the standard of other advanced and progressive mining communities.

H. E. WEST.

Matagalpa, Nicaragua, Central America, Oct. 10.

TO THE EDITOR:—On the subject of extralateral mining rights, I am so impressed with the advantages of the American law on this point, and so certain that disaster to the industry would follow if it were altered, that I will trespass on your space briefly to state the arguments as they appear to me, for the consideration of Mr. Boss and others who think with him.

A mining law, to be of the greatest benefit to those who operate under it and to the country in general, must be construed with regard to the nature of metal mining as an industry. This seems to be self-evident. Let us now examine the inherent nature of the business. The first step, of course, is to find the mine. This is done by a special class of men—prospectors. They are not scientists, engineers, capitalists, merchants, nor even miners. We all know that the average prospector rarely sinks a 50-foot shaft without having it cave in, for shaft sinking is not his business. His forte is traveling over the surface, observing the outcroppings rocks, and looking up particles of float. He is usually a man of nomadic habits, but full to the eyes with hope, optimism, and curiosity as to minerals. He is a wanderer and theorist, and it is these very temperamental characteristics that keeps him in the open, that sends him into vacant and unexplored lands where no one will go but himself, and his self-appointed function is to find the indications or outcroppings of lodes and deposits. Having found one, his next desire is usually

to sell it and start on the search of another. He rarely cares to settle down and mine, or even open his discovery. A 10-foot shaft or a shallow trench displaying the ore sufficiently to enable him to get out a good line of specimens, represents about the limits of his working tendencies.

Now this man is at the very foundation of the industry. Without him the mines will not be discovered. Neither you nor I have the time nor inclination to do his work, but, after he has found his mine, if he shows us a lot of fine specimens from it, how ready we are to go and examine it. And if on inspection our experience in mining leads us to believe that money can be made out of it, either by working or by developing for a sale, how eager we are to buy. A good mining law then must primarily and above all things afford encouragement to this kind of a man, which means:

First, that when he makes a discovery, he shall be able to acquire enough of it to have something that you and I will care to buy, and

Second, that the acts of location, and of initiating a title, shall be simple and inexpensive.

Now the American mining law—for which we can not as a nation be too grateful—does just these two things. It gives the prospector his vein indefinitely as it goes down into the earth, thus including all those pleasing possibilities that satisfy his optimistic temperament, and excite in others all sorts of beliefs as to what may be found by development. Moreover, the costs of location are a mere bagatelle, and the process of marking the boundaries extremely simple.

But observe the different conditions under a vertical boundary law. If the vein turns out to be a flat one, or to dip at an angle of even 45°, the discoverer has only a few hundred feet of its downward extension to offer you, and you rarely care to buy such a small thing, even though there be several claims along the strike. Or, if the prospector finds out these physical peculiarities himself, his only safeguard is in the location of one or more side line claims, involving increased expense in first cost and title maintenance. And, if these precautions are postponed or neglected, others quickly step in and locate alongside of him, and get the benefit of his discovery except as to the little piece of ore in the apex claim. In each event the prospector is discouraged; he loses his fair reward, and soon disappears. This means that the country goes unprospected, which is the greatest possible misfortune.

The second step in mining is the development of the lode or deposit. When this operation is thoughtfully done the strike is carefully traced out the first thing, and if necessary the corner stakes are moved so as to make sure of covering the apex. Or, if that is not possible by reason of adjoining claimants, attempts are made to bond or buy the latter. In other words, if the miner or mine operator is an average good business man, and exercises ordinary prudence at the inception of his mining operations, there is nothing in the system of extralateral rights that need cause him serious trouble.

The legal difficulties attendant on a definition of such rights, when preliminary precautions are neglected, are numerous and need not be minimized. The results in the past have at times been most aggravating and unfortunate, but, in extenuation, the following may be said:

There are always two sides to a mining litigation—a winner as well as a loser.

There is nothing that advertises a mining district so well, scatters money so freely, attracts new population so briskly, and creates such general local good times as a first-class mining lawsuit.

After a quarter of a century of litigation, nearly all the legal points that can arise under the dogma of extralateral rights have been carried to the higher courts and decided. Thus American mining law is now a body of well established precedents, under which litigation is rapidly decreasing. We cannot expect that legal causes of action will ever disappear, or that questions of fact will not continue to arise, but now that the laws of the industry are on as good a foundation as those of any other line of activity, all possible reasons for a change to a vertical boundary law seem to me to have disappeared.

Whoever impartially examines into the condition of metal mining in all parts of the world will, I am confident, be compelled to admit that nowhere does the progress of discovery begin to compare with that in our own land. It is only necessary to cross the boundary lines a mile into Mexico on one side, and Canada on the other, to note the astonishing difference. Of course some of this is due also to other causes not necessary to go into at this time. In Australia, New Zealand and South Africa, though production is large, it is confined mainly to gold, and the great bulk of the metal comes from a few rich spots, proclaiming the fact that the country is not well prospected. There are no prospectors in South Africa, and very few in Australasia, in spite of the bounties offered by the governments. The Mexican laws in point of liberality come next to those of America, but it is difficult to find the real prospector across the southern line. Many of those who have gone over have degenerated into company claim locators. There is little individual prospecting and mining in Mexico in spite of the fact that it is one of the richest mineral regions on the globe. Compare

the brisk status of the industry in California, Arizona and New Mexico with the situation in Baja California, Sonora and Chihuahua. Though these latter are quite as rich in mineral resources, and are living under an otherwise good law, many of the mines in operation are but reopenings of old Spanish discoveries, and are being run by foreign corporations.

THEO. F. VAN WAGENEN.

Bulawayo, Rhodesia, South Africa, Oct. 14.

The above, received this week from Central America and South Africa, illustrate the widespread interest continuously manifested in the question under discussion; a question of interest to every mining man the world over.

## The New Gold Camps of Southern Nevada.\*

[FROM A STAFF CORRESPONDENT].

**GOLDFIELD.**—Goldfield district, as developed to date, may be best described as lying in the form of a horseshoe, or arc of a circle, a possible cause being that this mineralization may mark the rim of an ancient crater. This zone is little more than a mile wide and has a diameter of about 3 miles, with the open side to the east. The northern point begins at Diamondfield with the Black butte, which is what its name signifies. The zone swings from here westward, marked by such properties as the Quartzite, Vernal, Daisy, Palace, Great Bend, Goldfield Tonopah, Tonopah Club and Adams to the Sandstorm, thence south to Columbia mountain, and the January, Combination, Jumbo, Florence, St. Ives, Velvet and hundreds of lesser note, and easterly to the Blue Bull, Lone Star and Tin Horn with many other properties being prospected. Almost anywhere within this magic circle surface values can be found and the great puzzle is to determine where to sink—no small consideration in a large territory of erupted country, where a few feet may miss the ledge.

Inside the circle are Vindicator and Banner mountains. Every square foot of country on every side is located and surface indications are almost equally good throughout the district, being even less promising on some of the phenomenally rich strikes than at other places. The country rock in general is rhy-

the surface, and it is stated that its development will be regularly taken up shortly. On the Spokane a shaft is being sunk in which considerable water has been encountered at 80 feet. The Palace Co. has several prospect shafts in which good ore has been struck and the work is being carried on under direction of T. W. Webb. The property is owned by H. D. Allert of Langdon, N. D. The greatest depth attained is 65 feet, and enough has been developed to insure that it is at least a good low-grade proposition. On the hill west of the Palace is the property of the Goldfield-Great Bend M. Co., in charge of V. P. Strange. It has immense surface croppings of iron, and consists of five claims and two fractions. No leasing is done on the property but ten men are employed on development. There are two shafts, one 75 feet, the other 40 feet, with about 150 feet of

Columnar Andesite Near Tonopah, Nevada.

The Sandstorm group occupies the saddle between the two hills lying just north of Columbia mountain and overlooking the dry wash that extends from Goldfield northerly to Tonopah and beyond. The northernmost claim of the group is now the property of the Kendall M. Co., 300 feet of which is under lease to T. L. Oddie and M. C. Gardner, Jr., known as the Sandstorm lease, which runs until the 5th of September, 1905. A one fourth interest in the lease is held jointly by J. Duffield, George W. Richard and M. E. Ish. The rich deposit on this lease was found within 50 feet of its south end line. Soil gathered on the surface netted \$8800. One shipment of fifteen tons of ore netted \$80,000, and another of ten tons netted \$15,000. Nothing has been shipped under \$250 per ton, and about 100 tons of this is now on the dump. At present twelve men are employed. A gasoline hoist is on the ground and will soon be in operation. A shaft, now 60 feet in depth, is being sunk by contract. The ledge crops along the entire ridge and dips to the east at an angle of about 75°. The shaft is being sunk over this with a purpose of crosscutting to it from the several levels and encountering the ledge directly at 400 to 500 feet, opening enough ground to work during the life of the lease. A blind ledge has been encountered in this shaft carrying from \$50 to \$80 values. The ledge matter is an altered rhyolite, through which run quartz veins carrying free gold in an iron oxide matrix.

On the Sandstorm proper are several leasers, and while, as yet, nothing has been encountered in shipping quantities, there is reason to believe that other strikes may be made. The entire ledge for 300 feet wide carries fair values in milling ore.

M. C. Gardner, Jr., Percy Gardner and other leasers have machinery for a 10-stamp mill now in transit which will be installed at Columbia as a custom mill. It will be equipped with plates and vanners and will be ready to operate within sixty days. Water for this will be supplied by a company of Eastern capitalists, who are developing water 10 miles north of Columbia. This plant will involve an outlay of about \$200,000 and will have a capacity of 500,000 to 750,000 gallons per day. Storage tanks will be erected at both ends of the line. A 14-inch pipe line will be laid and it will have an 850-foot lift from the pumps to the mill.

On the south slope of Columbia mountain Curtis & Ridge are installing a gasoline hoist on the Midnight property. Active development is under way by the

Fault Scarp at Goldfield, Nevada.

Jumbo Mine, Goldfield, Nevada.

lite. There is a general silicification of vein matter with much fissuring and faulting, which continued, has brought about a secondary silicification with deposition of values. The ore is unique for Nevada, being almost entirely gold bearing, while Tonopah and Nevada in general produce mostly silver.

In giving a detailed account of the district it will probably permit of a better grasp of the situation to again begin at Black butte and follow the circle around.

The Goldfield-Black Butte M. Co. covers the butte proper. It is developed by tunnel and shaft, a large body of milling ore, which is improving with depth, offering the hope that it may also be a shipping proposition.

On the north slope of Black butte the Diamondfield G. M. Co. has three claims. It is an incorporated company, of which G. Nixon of Winnemucca, Nev., is president. A lease on the property was taken in June by B. J. Riley, A. J. Poak, C. Krise and M. Robinson and a strike of ore was made in August. Fifty tons have been shipped to date, of a value of \$400 to \$500 per ton. Work is being carried on under Superintendent F. Chapman and, while only a horse whim is in use, development shows up large bodies of milling ore.

The Daisy Fracture and Vernal are doing development work, with encouraging prospects. The Daisy has been trenced and more or less prospected on

crosscutting and drifting. Some shipping ore is developed and prospecting both by surface trenching and underground is being carried on.

The Goldfield-Tonopah M. Co. is sinking a shaft in the dry wash under which the Great Bend ledge dips to come up again on the other side where it is covered by the Red Butte group, owned by W. H. Rouse, and farther west the Conqueror M. Co., on the Tonopah Club claim, a rich strike has been made. The Goldfield-Tonopah M. Co., owned by K. M. Jackson, J. B. Lindsay and Superintendent S. F. Lindsay, has a shaft down 60 feet and is going on to 100 feet, at the same time crosscutting on the 50-foot level. Values up to \$80 have been found.

Superintendent E. Heuback, of the Adams & Conqueror Cos., is carrying on development by surface trenching and sinking. On the Conqueror some ore is being sacked. A shaft (now down 25 feet) is being sunk on the hanging wall. The ledge is about 40 feet wide, paralleling the Sandstorm, and also dipping east. The property consists of two claims, the Tonopah Club and Bonanza, on the former of which the rich strike was made. It is owned by J. R. Duffield, M. E. Ish, H. Weber, E. Heuback, J. P. Hennessey and G. Wingfield. The above partially covers the Diamondfield district, in which there have as yet been no discoveries of phenomenal values, but throughout which there seems to have been less volcanic disturbance than in any other part of the district. The ledges are more in place, better defined and values apparently more uniform.

Red Top M. Co., the Silver Pick M. Co. and the Mohawk M. Co.; on the first named by the company and by leasers on the others.

This brings us to the property of the Goldfield M. Co. made famous by the strike on the January. Owners are R. L. Johns, H. T. Bragdon, A. C. Eisen, J. R. Duffield and M. N. Clark. A lease was taken on the January claim the 7th of last January by L. L. Patrick and John Jones, one-third each, the remaining third being held by B. J. Riley and Z. Kendall. January 22d ore was struck and there has been shipped to date ore to a net value of \$310,000, with 8000 to 9000 tons of milling on the dump of an average value of \$40 per ton. Nothing is shipped carrying less than \$100 per ton, and that shipped has averaged \$200 per ton. There are two shafts, one 200 feet, the other 240 feet deep, and about 350 feet of drifting. Stopping and shipping will be rushed until the expiration of the lease, January 10th, next. A 30 H. P. steam hoist is now employed. Freight, shipping, treatment and costs average about \$35 per ton. An assay office is connected with the mine and shipments are closely checked. In addition to this lease the Goldfield M. Co. owns two claims adjoining the Adams group and three, the September, October and St. Paul, adjoining the Portland group.

Next to the January is the property of the Combination Mines Co., an incorporated company of which J. D. Hubbard of Chicago is president. The company is working its own property sinking a shaft, now down about 300 feet, on which is installed a gaso-

\* See illustration on front page.

line hoist. It is stated that the mine to date has produced about \$400,000. The company is building a 10-stamp mill at the mine, which is being constructed in two 5-stamp sections, one to be used in treating ore from the mine, the other to work on custom ore. The construction is under superintendence of Ira Bess, for Harron, Richard & McCone of San Francisco, Cal. It employs the cantilever construction of stamps the same as installed in the Midway mill at Tonopah last year. Amalgamation, including the Huntington, concentration and grinding will be method of extraction. The stamps weigh 1500 pounds, mortar buckets are of concrete. Water is being piped from a small spring 11 miles northwest. The construction has been much delayed by lack of building material, but it is expected that the mill will be in operation by next February.

The mine on the Fortune held by J. P. Sweeney, F. F. Athan, W. W. Haines and G. W. Dargan, has been one of the most productive of the district. Ore was discovered by Mr. Sweeney on the property last November and after an ineffectual attempt to buy the property it was finally leased last January. Work began in February and shipping ore was extracted from the start. The ore is at first to about a point within 15 feet of surface and at each level below it has lengthened uniformly until on the 200 level it is about 50 feet long with a strong vein 4 feet to 6 feet wide. To date about \$250,000 has been extracted, with \$100,000 sacked and ready for shipment, while production goes on at the rate of 200 to 300 sacks per day, and all so far from the 200 level and above. The shaft is now down 250 feet and will permit another 50 feet of drifting and stowing. In the sulphide zone, which comes in between the 150 and 200 foot levels, the vein shows a very uniform enrichment and is all good mining ore. No effort has been made to stay closely with the main ore shoot. The 200-foot level was drifted 60 feet and there interrupted by another shoot, which, while not yet exploited, is believed to be about the size of the present one and as rich. The ore shipped averages about \$300 per ton, though one shipment of 928 sacks averaged \$724 per ton. About sixty men are now employed in three shifts. The ore is shipped to the Western Ore Purchasing Co. at Reno, Nev., and to Salt Lake, Utah.

The Junco M. Co., owned by J. McKane, C. D. Taylor, H. Taylor, Geo. McCollan and Geo. Kernick, has been exploited entirely by leasers, and has in the aggregate produced more than any other property at Goldfield. The Bowers-McKane lease is credited with a gross production of \$550,000, the Fuller McDonald, \$200,000, the Richard, \$40,000, the Vermilyea, \$40,000, the Curtis & Ridge, \$150,000. The last three are approximate, not official, and figures for the Zion lease cannot be stated exactly, but will run the production of this wonderful property well along into the second million.

The Richard, Vermilyea and Curtis & Ridge leases have expired. The Fuller McDonald is tied up with an injunction owing to internal disagreement, leaving only the Bowers-McKane and the Zion leases working. The former runs to January, the latter to April 30, 1905.

The Bowers lease has a 250-foot shaft, from which a drift will be run to the vein, opening new ground. From the 200 foot level to the surface it has been stowed out with exception of some pillars of ore. In this, as throughout the district, little or no timbering has been done, it being impossible to procure timbers. From one pocket, approximately 7x13 feet, \$30,000 was extracted.

The Fuller lease has a shaft 175 feet deep, with 125 feet of crosscutting and 150 feet of drifting. The vein varies from a few inches to 20 feet in width and dips to the east at an angle of 30°. Veins of the district run approximately north and south.

The Zion lease has sent fifty-four tons to Seloa. During October 115 tons were shipped that yielded \$50,000, and the shipments bring \$500 to \$400 per ton regularly. On it is a 100-foot shaft, with about 400 feet of crosscutting and drifting. Considerable milling ore is on the dump.

The St. Ives is another property of immense surface showing. It has been in the hands of various leasers and some ore has been shipped from it.

G. R. L. L. and G. W. Richards, G. Lewis, W. J. Douglass and K. Jackson have a lease of 300 feet on the Yankee Doodle claim, on which is an 80-foot shaft and 5 feet of drifting. The pay streak is from 3 inches to 6 inches wide. Ten tons of ore now sacked on the dump average about \$500 per ton. The lease expires January 15th next. Seven men are employed in two shifts. Production of the St. Ives is probably conservatively \$25,000.

From the St. Ives is a short step to the Velvet M. Co., on which are several leases. No. 1 lease is being worked by Messrs. Rickert, Shea and Charles Taylor. It was here that the strike was made in the Puma, and a heap of surface soil on the spot is said to be worth \$10,000. Other leases on the property are being developed, but no shipping ore yet encountered.

Farther east on the Lazy George Lemley & Hughey leasers, recently had a \$29,000 assay at the bottom of a 35-foot shaft. As yet they have failed to locate the pay streak.

East of this the Lone Star, which recently changed hands, has had some good showings. Several leasers are working it.

South of the Lone Star, on the Base But, a strike was made in 1901, about 1/2 mile as the line goes from the fraction. This fraction was bought by the miners who made the find. The Base But M. Co. is now operating off on the H. Ramsey, C. Peters, H. C. Moore, G. Niles and T. F. Dunsay. The property consists of eight acres. Eight men are working it in places and the company has a 30-foot shaft and 100 feet of crosscutting with H. C. Moore's superintendent. It has most of the Goldfield properties it has been mining and prospected by surface tracking, that is to say the first economic way of locating ledges which is to map across the surface.

The Empire M. Co., adjoining the Lone Star on the north, has one shaft and three fractions. It is owned by Weber, I. O'Brien & Mitchell. Two leasers are working. The company is also surface-tracking and sinking a shaft. The ledge, as opened, shows good values.

The Kanganee M. Co. owns a claim and fraction between Winchester and Banner mountains, on which a ledge 6 feet wide has been developed.

On the north end of Mediator the Black Ant M. Co. has two claims and a 40-foot shaft. The same company owns three claims adjoining the Vernal at Diamondfield, on which is a 35-foot shaft. Owners are Ish. Dougherty, D. H. Reynolds & Weber.

Between Goldfield and Columbia is a group of 12 claims owned by G. S. Phoenix. With a 150-foot shaft and 400 feet of crosscutting he has developed some of the ledges and opened up some mining ore. The property is deeply covered with wash which may overlie an extension of the January or other power ledges. The property is known as the Esmeralda M. Co.

All of this territory is in a highly disturbed state, and while phenomenally rich ore has been taken from the surface over a large area, nothing can yet be stated as to what may be expected with depth. The development has been extremely rapid in spite of the obstacles, but almost co-systematic, methodical mining has been done.

Goldfield itself has sprung from a camp of a few tents to a town of 1000 or 2000 people within the year, with Columbia as a thriving suburb, and smaller centers at Diamondfield, Junco and Milltown. Lumber has been had to get out wherever possible, the improvements have been of a substantial nature, in some cases stone and adobe being utilized. Almost every class of business is well represented, and, considering its isolation, living is fairly good and rates not exorbitant. The town water, supplied by springs near town, and a few wells in town, is very good. There is comparatively little sickness as yet outside of an epidemic of colds. The outbreak of an epidemic would mean great hardship, as there would be scant accommodations for the sick. Also, there is the ever-present danger of fire, with which there is no water to combat, and no insurance protection can be had.

Therefore, the winter at Goldfield resolves itself largely into a matter of luck. There is no work for the crowds that are now there, and there will probably be even less as the leases expire. The production is liable to fall very low during the first months of the year.

With proper equipment the country south offers a great field for the prospector, but too much stress cannot be laid on its dangers and difficulties with the return of hot weather.

The miner at Goldfield receives \$4 per day, as also does the laborer, when work can be obtained.

An electric light plant is being installed; also a brewery is being built, and some good rooming and apartment houses, but at present accommodations are not good. There are few rooms to be had, and these are worth \$1.50 per day. There are many tent lodging-houses, some having only a common room, some partitioned off, seating for 75 cents to \$1 per day. Owing to the scarcity of lumber this state of things cannot be remedied altogether this winter. With another year of prosperity Goldfield will be the metropolis of this Nevada desert, especially should the proposed railroads be built—one, the extension from Tonopah, the other the branch from Borate, 16 miles from Daguerre, through Bullfrog to Goldfield and Tonopah.

BANNER DISTRICT.—Early possibilities of Goldfield have now passed largely into permanent hands. Its story is already ancient history, and the later romances are rushing through it with marvellous rapidity. The name to conjure with now is Bullfrog. Nobody knows just what Bullfrog has to offer, and this rather hazy story has more power of attraction than a more definite knowledge would exert. This state of affairs is a reflection of the meteoric rise of Goldfield, and is speedily fostered by real estate dealers, who already have plotted four towns in the shifting sands of the Amargosa desert and are booming choice corner lots with as much gusto as if they located in the heart of Los Angeles or San Francisco.

It is needless to say that they have a speculative value, or, also, that the district has great prospective value. Good mines undoubtedly will be discovered and developed, but the desert is not yet entirely robbed of its terrors, and to prospect it thoroughly requires forethought, preparation and plenty of money. The prospector who goes in with a rush is likely to come out the same way.

On the eastern slope of Death valley rises a chain

of hills cut by a canyon through which flows Funeral creek. South of this the range is known as Funeral mountains. North of it are the Grapentine mountains.

Last June a strike was made in the Funeral range, known as Kears's Window, which is a promising development and gives promise of being a good low-grade proposition—just what value and quantity it is not safe to say, perhaps large quantities of \$15 to \$25 rock may be found.

This is near the mouth of Funeral creek, where it rises from Death valley. On the 24th of last August E. Cross and F. Harris found and located Bullfrog, 20 miles north of Kears's Window, in the Grapentine range. This link in the mineral chain which apparently extends from Tonopah and stretched to second light across the Colorado down through Arizona has caused widespread interest in this hitherto almost inaccessible region.

Cross's San Jose road at Tonopah is within 50 miles of Bullfrog, and that is probably the best way in, but the crowd is growing into numbers and continuing southward to it, stopping very long en route to buy an outfit. Another way is by way of Mesquite and Kears, but this is the most tedious of the three.

From Goldfield this is 10 miles in the town where water may be had. Just beyond this the road forks, one branch continuing south to Copper Hills, 20 miles, and 20 miles farther on it again connects with the other fork, which has made a detour to the west to Thorpe's quartz mine. This detour is 6 miles longer than the direct road, but the water at Thorpe's is better than at the Hills. Continuing a short distance is Indian Camp, from which it is only 2 miles to Howell's farm, 4 miles to Davis farm, 3 miles to Beatty's farm, 3 miles to Good Center—a townsite laid out on the Amargosa river—5 miles to Amargosa townsite and 2 miles to Bullfrog, a total distance of 45 or 51 miles, depending on the route taken. Recently a new route has been opened directly to Bullfrog. Leaving the main road just after the two forks come together the cutoff bears to the right, reaching Bullfrog within 20 miles. This is said to be a shorter and easier route.

The Bullfrog Mines Syndicate owns Bullfrog No. 1 and No. 2 and a water claim. The company is incorporated under the laws of Arizona, with 1,000,000 shares—300,000 in the treasury. It is owned by J. W. McGalliard, M. Dech, W. Fray, E. Cross, R. Lanka and P. E. O'Brien, each holding a one-sixth interest. A contract has been let for a 300-foot shaft and it is now being sunk. The ledge cropping is 50 feet long and of unknown width. Assays from the surface have run from a few dollars to \$625, \$800, \$1100, and one \$2085. The owners expect a low-grade, milling ore proposition to be developed from it.

Four and one-half miles east of Bullfrog is the Bullfrog Mining Co., the original Beatty & Ladd strike, which is now reported to be prospecting its large ledge with fifteen men. So far as prospecting the ledge carries values throughout. H. H. Carr of the January mine is a large stockholder.

The Bell & Jones strike, 3 miles northwest of Bullfrog, is assaying well and has a strong ledge 12 to 14 feet wide.

A bond has recently been taken on a group of claims adjoining the Bullfrog mine by Goldfield parties, who will proceed immediately with development work.

There are a store and tents at Bullfrog, and also at Beatty's farm, and about 500 men are estimated to be now on the ground, with the number daily increasing.

Three springs have been developed about 3 miles above the town and pipe will soon be laid to convey the water. It will have a fall of 575 feet and be in quantity sufficient for domestic purposes of the camp.

The ore of the district carries some silver and copper, with gold predominating. It is a grayish-white quartz. A general characteristic of the ledges of the district is their large size and strength, and it is the general opinion that large low-grade, milling propositions will be the outcome of their development.

GOLD CHARTER.—The business of another mining camp has been termed at Good Center, 20 miles southeast of Goldfield. Curtis & Ridge have several claims and on one side have a 40-foot shaft with considerable crosscutting and drifting and are preparing to sink one. They have a 1-foot vein and one foot runs from \$40 to \$240. In this district Wright & Marshall recently made a strike on their property and are developing.

I. P. Sanders and O. C. Inman have six claims, on which they have sunk a 40-foot shaft and are crosscutting. They have a 30-foot vein of ore which shows up well at the bottom of the shaft, and have recently six sacks of ore on the dump that averages \$240 per ton.

The Crater is eight miles in diameter, the rim rock rises on three sides, but occasionally by deepness and has been eroded on one south. Trend of the veins of the district is northwest and southeast. Considerable prospecting is being done at the neighborhood and the surface indications are promising for the existence of good ore bodies.

SEASONABLE CAME.—As is natural the excitement about Goldfield has infused itself into the other surrounding camps. Elmore east and north of Goldfield, about 15 miles, has several good prospects

on which more or less work is being done. Gold Hill, a few miles south of Tonopah is receiving considerable attention also.

**LIBERTY DISTRICT.**—This is 17 miles north of Tonopah, and has several excellent properties. Among them The Tonopah-Utica M. Co., owned by Salt Lake parties, is now being surveyed and patented, and some development work is being done. There is a 35-foot shaft on the property and considerable cross-cutting on the surface for leads is being done.

The Tonopah Liberty Co., under Superintendent W. C. Wynkoop is doing some work. It is owned by Cramp & Sons of Philadelphia. About \$60,000 has been spent in developing the property on which there is a shaft 485 feet deep and a carload of ore was shipped netting \$219 per ton. The ledge is 6 feet to 8 feet wide, pay streak 48 inches wide. Ore carries gold and silver and averages \$40 to \$60 per ton.

The Tonopah-Independence, consisting of six claims, is owned by D. G. Doubleday, C. F. Maunder, Mr. Kramer, and others. On it is a contact ledge, with three ore shoots that assay \$15 to \$35 per ton on the surface. As yet only assessment work has been done on it. There is water within a mile, and plenty of wood for timbering and domestic uses. It is 15 miles from the Tonopah railroad.

**TONOPAH.**—Tonopah is receiving little attention just now more than as a point of departure for the south. Nevertheless a great deal of quiet work is being done that will put the silver camp in the front rank of producers as soon as the railroad is able to handle the freight. Spurs are being built to all the old dumps to facilitate loading, and ore is being blocked out under ground against the time when it can be hoisted and handled. The Tonopah M. Co., owning the Mizpah and Valley View ledges, is thus far the most important of the district. The ledges parallel and trend east and west, the Mizpah dipping 70° to the north and the Valley View with a dip of 45°. These are believed to come together, and from the 926-foot shaft on the Mizpah it is expected the point of junction will soon be cut. The Mizpah ledge is 20 feet wide and carries high values in silver. On the eastern extension of the Mizpah is the Belmont which, under Superintendent J. J. Jordan, is hoisting some high-grade ore. Recently a spur has been built to the dump and shipping will be carried on as fast as the railroad can handle the ore.

On the western extension of the Mizpah ledge is the Tonopah extension M. Co., owned by Charles Schwab and managed by John McKane. Just now it is sacking and shipping the highest grade ore the district has yet produced.

The McNamara, adjoining it on the south, is also getting some good ore.

North of the Mizpah and a little higher up the slope of Mt. Oddie, the Montana Tonopah M. Co. is operating on the Montana ledges, which parallel the Mizpah and are strong ledges carrying good silver values. Above the Montana is the North Star on which a great deal of work has been done, but the property is now tied up by litigation.

North of Tonopah the Golden Anchor Co. and the Pittsburg Tonopah M. Co., both Schwab properties, are being developed, being down in shafts between 500 and 600 feet.

The Little Tonopah (officially the Electro-Geodetic M. Co.) is also operating on the outskirts of the field, with a shaft now down over 600 feet, and a larger hoist is soon to be installed, which will carry it deeper. Considerable water is being developed in the shaft. The Midway mine, near the Mizpah, is being developed and its 10-stamp mill is now working on custom ore.

South of Tonopah a strike was recently reported in the California Tonopah M. Co.'s shaft, but its truth is not yet assured.

The Rescue M. Co., southeast of town, is doing development work. The shaft is now down 375 feet. A mile southeast of this the Halifax Co. is doing considerable development work.

Tonopah has substantial, developed ore bodies that assure her prosperity for years to come, but the greatest need of the district is a reduction works to handle this ore at home and save the heavy transportation charges. If this is supplied the excitement that carries the crowds on to the south will not in the least affect her steady-going prosperity. Even with the heavy freight charges, there are large quantities of ore that will net a handsome profit to the owners.

### New Timber Seasoning Stations.

The extensive experiments which have been made and which are to be made under direction of Government experts in the preservation of timber, are of more than passing interest to miners in consideration of the vast amount of timber which goes underground into mines annually.

The Bureau of Forestry has recently signed an agreement to make extensive timber seasoning tests in two Western States in co-operation with two telegraph and telephone companies. Experimental stations will be located at Marinette, Wis., and Escanaba, Mich., and probably a third station will be established at Ashland, Wis. The expense of the experiments will be borne jointly by the Bureau and the companies. Cedar and tamarack telephone and

telegraph poles will be furnished by the State of Wisconsin free of cost, and two railroad companies have agreed to haul them to the experiment stations without charge for freight.

The object of the experiments is to determine how many years can be added to the life of each pole by proper seasoning. Since millions upon millions of poles are used along telegraph and telephone lines, even one year's extra service for each pole will amount to a tremendous saving in expense. Unseasoned cedar poles last from twelve to fifteen years. Seasoning experiments have shown how to increase this time by three or four years, and it is now expected to improve on this increase. Past methods of seasoning have effected a drying out of 20% of the original weight of the poles. The better seasoned the pole, the less chance there is for decay, which is promoted by moisture.

Such experiments are of large importance not only to telegraph and telephone companies, but to all users of heavy timbers which come in contact with the ground, at which line decay gets in its most deadly work. It is believed that still greater economies can be secured by the use of proper methods of preservative treatment. The latter is a subject which the Bureau of Forestry has for some time been investigating, as set forth in its Bulletin No. 41, "Seasoning of Timber," and other publications. Further bulletins dealing with different aspects of the same problem will be issued later.

### A Dredging Wagon.

The Soo Nome Mining Co. of Alaska has had a machine built by the Quincy, Ill., Electric Wheel Works which is the only one of its kind in existence. It might be termed a dredging wagon, as it is mounted upon and is moved by wheels. The plan is to use the machine for beach dredging, it being designed to stand stationary among the breakers. The iron wheels are 8 feet in diameter, 64 spokes to the wheels,

A Dredger on Wheels.

which have tires 24 inches wide,  $\frac{3}{4}$ -inch thick; forward wheels track 16 feet; the rear wheels 14 feet. The difference in trackage is to provide room for two carriages which work in front, one running lengthwise, which projects 7 feet out from the wheels, and the other running crosswise, requiring a 7-foot projecting distance each way for its movements. The machine is presumed to have a capacity of sixty yards per hour. It will be run by a 35 H. P. gasoline engine and will have one 6-inch centrifugal pump to draw sand and gravel through 30 feet of suction hose, the discharge pump to be made in a cone or gold separator 16 feet in front of the pump. The cone is vertical, 6x6 at the top, 3 feet 10 inches deep. It is arranged so that most of the sand and gravel will overflow from the top; at a depth of 18 inches there are valves on either side. This cone is the only invention of its kind now in existence and is patented by the inventor, R. J. McKoene of Sault Ste. Marie, Mich. The nozzle of the hose is held by a stiff leg. The calculations are to cut holes in the beach 7 feet square and down to bedrock with the machine. The machine is 10 feet in width and on either side has 6-inch I-beams 30 feet in length. Its entire construction is of iron; it weighs ten tons.

### Separation of Blende From Pyrite.

A new zinc process was recently devised by C. V. Potter, and now in use on one of the Broken Hill mines, which is described as follows by the Australian Mining Standard: Dry ore in a fine state of division

is fed in a thin stream into a hot dilute acid solution contained in a shallow vessel which forms the body of the machine. The ore is drawn along the bottom of this vessel and discharged by rakes formed of wire attached to suitable chains. The bottom of the machine is covered by deflector plates arising from a short distance above it. Some of the plates are joined together at the bottom, forming troughs, while the adjacent plates overlap them, leaving a small space between at the top. As the ore passes along, the action of the acid upon it generates gas, the bubbles of which attach themselves to the zinc-blende and raise the particles to the surface, the gas there disperses and the blende falls into the trough, along which it is drawn to the discharge end by suitable scrapers attached to a chain, and is thus recovered in a very clean state.

### Production of Petroleum in 1903.

F. H. Oliphant's annual report to the United States Geological Survey, entitled "The Production of Petroleum in 1903," contains in part the following:

The total production of crude petroleum in the United States in 1903 was 100,461,337 barrels, a gain of 11,694,421 barrels, or 13.17% over the production of 1902. The great increase was mainly due to the remarkable output in California, which is now larger than that of any other State. California produced 24.27%, or nearly one-fourth of the entire production.

Next to California the largest gain in production was in Indiana, which was 1,705,515 barrels, an amount that represents a gain of 22.80% over the State's production in 1902. Kansas showed a remarkable gain in production—600,465 barrels, or 181%; Kentucky and Louisiana showed gains of about 369,000 barrels each; Indian Territory gained 101,811 barrels, or 274.4%; and New York gained 43,248 barrels, or 3.86%.

On the other hand there was a slight decrease of production, 128,086 barrels, or 0.708% in Texas; and

Ohio, Pennsylvania and West Virginia all showed decreased production, amounting to a total of 1,856,619 barrels, or 3.98%, in 1903 as compared with 1902. The largest decrease in production in 1903 was in Pennsylvania, and amounted to 708,724 barrels.

The increased production in the States of Texas, Louisiana and California of large quantities of an inferior grade of petroleum made necessary new markets and new conditions of transportation that were unknown to the older fields. Demand was also made for a large amount of capital to be invested in tanks, pipe lines, tank cars and tank vessels. The markets and transportation for this new product have been secured to a very large extent. During the year 1903 the consumption of petroleum as fuel and as an enricher of gas has been very largely increased.

A considerable quantity of Texas petroleum has been refined with satisfactory results, but the percentage of the yield is much smaller than from the Eastern petroleum.

The general average price paid for crude petroleum was greater by 14.07 cents per barrel than the average price for 1902. The average price paid for Pennsylvania petroleum showed an increase of 35.25 cents; and the average price in the Lima-Indiana field was about 27 cents a barrel more in 1903 than in 1902.

Mr. Oliphant's report is an extract from the Survey's forthcoming volume, "Mineral Resources of the United States, 1903." It is published also as a separate pamphlet and may be obtained on application to the Director of the United States Geological Survey, Washington, D. C.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

## ALASKA.

The Alaska-Mexican G. M. Co., on Douglas Island, reports for month of October that the 120-stamp mill ran 29½ days; crushed 18,210 tons ore; value of bullion, \$27,665. Saved 445 tons sulphurets of value of \$30,571. Working expenses, \$32,326.—Alaska-Treadwell G. Co. for October reports that the 240-stamp mill ran 28½ days; crushed 78,746 tons ore; value of bullion, \$89,357; saved 1850 tons sulphurets of value of \$97,000. Working expenses for month, \$83,918.—Alaska United G. M. Co. for October reports the Ready Bullion claim, 120-stamp mill, ran 29½ days; crushed 18,410 tons ore; value of bullion, \$19,257. Saved 390 tons sulphurets of value of \$13,233. Working expenses, \$28,521.

At Windham bay the California-Alaska M. Co. has let a contract to drive 100 feet extension to the tunnel on the Doctor claim. The Yellow Jacket M. Co. has men driving a tunnel on its mine, and the Missouri M. Co., whose claims are at the south side of the basin, will have electric plant set up this week and will keep men at work during the winter with machine drills. J. P. Bartels and E. H. Patten have started driving a tunnel on their claim, the Dark Horse, about ½ mile south of the basin. All of the claims show free gold on the surface.

At Eagle the Eagle River M. Co. has a group of thirteen claims on Eagle river, 7 miles from salt water, with B. L. Thane in charge. From the beach a tram has been built for 3½ miles, and the remaining 3½ miles to the workings is covered by a wagon road. A 20-stamp mill is in operation. The mine is 260 feet up the hill from the mill. Ore is brought from the mine to the mill by a cable tram. Work has been done in thirteen stopes. The ground is loose and requires careful timbering. In the "long tunnel" they have struck a 4-foot lead of ore. A mill test of the ore shows \$40 per ton. During the fifteen months since the first ten stamps were started \$70,000 has been taken out. About fifty men are on the payroll.

## ARIZONA.

### Maricopa County.

(Special Correspondence).—Work will be resumed at the Gold Coin mine by Dec. 1st.—J. A. Moore reports several properties working in Cave Creek district.—Preparations are being made to resume work at the Union mine in Union district.—J. Lambeye is working a promising copper prospect west of Morristown. Phoenix, Nov. 20.

### Mohave County.

Superintendent Featherstone of the Cedar Valley M. Co. will put in a hoisting plant on the Doyle mine, near Cedar.—J. N. Cohenour reports having struck 10-ounce gold ore in his mine in the Gold Road country, near Acme.

G. W. Jonas has bought the 15 H. P. hoist of the Cedar Valley M. Co., and will remove it to the mines of the Standard G. M. Co. in Mohave wash, near Kingman. The mines are said to carry gold and copper values.

### Pinal County.

Manager Sieboth of the Superior Co., near Florence, says the tunnel he has been driving on the Boman mine, near the Superior group, has crossed the vein at 100 feet below surface outcroppings and shows width of 10 feet. The vein where cut by the tunnel is in a contact between lime and diorite and the vein filling is ribboned with quartz carrying lead and gold. A steam hoist will be put in at the mine and a shaft put down several hundred feet on the ore shoot shown in the tunnel. The property is owned by the Arizona-Hancock M. Co.

### Santa Cruz County.

H. Barnett, manager of the Happy Jack M. Co., near Nogales, reports a strike in the Happy Jack, which gave values of 120 ounces silver, \$5 gold and 12% copper.

### Yuma County.

The Cinnabar mine, 18 miles southwest of Quartzsite, in the Weaver Pass section, is owned by the Castle Dome M. & M. Co. Operations are reported progressing.

The Amalgamated G. M. Co. reports development progressing on its mines, 6 miles southwest of Quartzsite. The road from Congress Junction to Quartzsite is being repaired and a road built from Quartzsite to the mine. Foundations are made for a stamp mill.

## ARKANSAS.

### Boone County.

The Fuller M. & M. Co., at Zinc, is

resuming operations at both mine and mill.

### Searcy County.

Miners have started sinking a shaft on the first drill hole of the Foster tract, near St. Joe, which is being operated by a company of Wichita, Kan., men.—At the Excelsior mine, above St. Joe, arrangements are made to build a road 1 mile in length that may be hauled to the St. Louis & North Arkansas Railway.

## CALIFORNIA.

### Amador County.

At Defender, F. B. Joyce says he is sinking a new shaft on south end of the Defender claim, which is down 95 feet. There is a 3-foot ledge which shows values. The Lone Star mine, on the Defender ledge, but on Calaveras side of the river, has developed a 3-foot ledge of \$50 rock on the 240-foot level. The Riverside mine, near the Lone Star, has struck ore carrying free gold and galena.

### Calaveras County.

Work in the Utica M. Co. mines at Angels has been resumed, repairs and improvements having been completed. Another sawmill has been built to be run by the Utica Co. for sawing logs, wedges, etc., to be used in the Stickle and South Stickle mines.

It is reported that the Campo Seco C. Co., at Campo Seco, is experimenting with a new copper furnace, and if successful will erect seven more at the smelting plant.

Near San Andreas the California Placer M. Co. broke through the lava into the gravel channel last week. There were only a few feet of gravel to the bedrock, which, however, pitched off steeply into a deeper channel. The water is easily handled and the work of developing the channel is proceeding.

Manager Phillips of Pueblo, Colo., at the Campbell mine at Italian ranch, near Murphys, says work is being done to strike the lode, which is expected to be reached by Dec. 1st.—W. H. Clary Jr. is arranging for a mill to be placed on the mine of the Clary G. M. Co. at Indian creek, near Murphys.—E. Cunliffe, who has charge of the Sonora mine, is doing development work and the vein is 6 feet in width. It assays in gold and silver.

The mill of the San Andreas Gold Channel M. Co., owner of and operating the Chris Anderson mine at San Andreas, has started crushing cemented gravel. Fifteen additional men have been put to work this week, which will make twenty men at the mine. Fifty feet of bedrock tunnel have been run and a 20-foot sump sunk in bedrock, which drains the workings. Raises are made from the tunnel to the gravel banks and the cars are loaded automatically. The company has spent \$20,000 in putting the property in shape, says President Miller.

Work of sinking and retimbering the shaft on the mine of the San Andreas Blue Gravel M. Co., near San Andreas, is progressing under the direction of F. J. Juchter, mine foreman. Buildings have been completed and a whim is in place.—D. P. Gray is starting work on the Hagerman gravel mine, on the Calaveras river.

### El Dorado County.

(Special Correspondence).—J. F. Burslen has bought the Lytten placer mine at White Oak flat, near Shingle. The holdings cover 150 acres and are said to show 12 feet of payable gravel. Shingle, Nov. 23.

The Rio Vista M. Co. mine, near Fair Play, has twenty-five men employed. Ore is being dumped to await development of the copper deposits. The company expects to put in machinery. The shaft is being deepened. F. B. Hood of Oakland is interested.—A boiler to furnish steam for hoist on the Ohio mine, adjoining the Mt. Pleasant mine, near Grizzly Flat, has been set up. This is the old Col. Knox mine, afterwards Val de Oro, and is owned by W. Brown.—The Stillwagon mine has been sold to a company, represented by K. C. Crawford, which is also operating the Eagle mine. There are six men on the Eagle and the tunnel is being driven.

The manager of the Crystal gold mine, near Omo, has put on men and started work again.—The men at work on the B. & M. gold mine, near Omo, have found the channel. It is reported 50 feet wide and shows payable gravel.

### Fresno County.

The steamer Rosecrans was loaded with 23,000 barrels of crude oil at Monterey on the 21st inst. for Honolulu, being first cargo loaded through the pipe line from the Coalinga field. The pipe line has been built by the Coalinga Oil Transportation Co.

### Mono County.

The Bridgeport Chronicle-Union says returns of twenty-eight sacks of ore shipped from the Jump-Up-Joe mine at Masonic showed that 1650 pounds of rock

yielded \$800. The Tiny claim, adjoining, also shows values.

### Nevada County.

Improvements will be made at the Orleans mine, near Nevada City. An electric hoist is under construction to be put up at the Houston shaft, through which waste rock will be hoisted, while ore will be taken out through the Orleans shaft. A larger compressor will also be put in. The ore being taken out averages \$40 per ton. A raise is being run from the 700 to the 400-foot level. The ledge is 18 inches wide, and a mill will be built, says Superintendent C. A. Brockington.

### San Diego County.

(Special Correspondence).—The mining outlook in Cuyamaca district is improving. A 10-stamp mill will be installed on the High Peak mine in Julian and a double-compartment shaft sunk to cut the ledge at 500 feet (200 feet below the present workings). This mine is well developed by shafts and tunnels and high-grade milling ore is being taken out and placed on the dumps. The Helvetia, which is on the same vein to the south, has a 10-stamp mill in operation. Ore is being taken from a 5-foot ledge on the 350-foot level, and is plating \$50 per ton. Another shaft will be sunk in the spring.

The new camp of Boulder Creek, 9 miles from Julian, is opening up. Fuller & Moore are working and have a 2-foot ledge of ore which will plate \$25 per ton. The ore carries 1% of sulphurets, which assay \$300. The Nobles mine in Pine valley has changed hands and work will be resumed. Harper Bros. are developing a mine adjacent to the Cuyamaca Co.'s group. They have a ledge 12 inches wide and are putting in a 2-stamp mill to prospect their ore, which they claim will average \$20 per ton.

At the Stonewall mine, near Cuyamaca, work is progressing. The water is down to the 300-foot level and unwatering is at rate of 10 feet per twenty-four hours. There is yet about 25,000,000 gallons to be removed. The twenty stamps are dropping on ore from the waste dump and good returns are reported. Buildings are being put up. G. H. Clarke is manager. Cuyamaca, Nov. 23.

### Shasta County.

The Mountain C. Co., Ltd., operating at Keswick, has issued a circular stating that operations are being carried on satisfactorily, and deliveries of refined copper to buyers this year will approximate 10,000 tons. A site has been bought and buildings started on a sulphuric acid and artificial manure plant on San Francisco bay. When these works are ready the company's ore will be utilized for the production of sulphuric acid and the manufacture of manures, as well as for the extraction of copper. As an adjunct to and in connection with the sulphuric acid business generally, the works and business of the San Francisco Chemical Co. have been bought.

### Trinity County.

Near Weaverville power has been turned on from the new ditch and pipe line at the Fairview mine, says the Searchlight. Ten additional stamps have been put in operation, making thirty in all. Ten more will be added by Dec. 1st, says Manager J. Porter.

### Tuolumne County.

Superintendent W. Vincent has men at work on the Expectation and Realization claims on the main Tuolumne river above the Mohican mine, near Groveland.

Grading is in progress at the Horseshoe Bend mine, near Columbia, for a 60-stamp mill and a railroad track is being laid to Melones, a distance of 2 miles. Other buildings are also being erected.

Operations with forty men will be resumed at the Golden Gate mine, near Sonora.

At the Black Oak mine, near Soulsbyville, forty stamps are dropping in the mill. A second and larger gyratory crusher is being added to the plant. A steam dryer is being built. Improvements have been made in the electrical arrangements.

Z. T. Lillard of Los Angeles has bought the Mackey copper mine, below Jamestown, and will put men to work.—A strike has been made at the Mack mine at Big Oak Flat.—The Over mine, on Bald mountain, near Columbia, is again in operation.—T. H. Bluett will open up the mine on the John Orr estate, adjoining the Norwegian mine, near Tuttle-town. He has a lease on the mine and has put in a 3½-foot Huntington mill with a capacity of twelve tons, which will be started this week.—A rich shoot of ore was struck at the Jumper mine at Stent last week at the 1000-foot level, 750 feet north of the shaft. The ledge shows free gold.

A dynamo with capacity for 150 lights has been set up at the Horse Shoe Bend mine, near Columbia. Four drilling machines are in operation. Foundation has

—Prospecting is going ahead at the Moody mine, near Big Oak Flat, and thirty-five men are at work. The mill has started. Fuel supply is the only drawback, says W. A. Nevills, owner.

Sinking the shaft at the Black Hawk mine, on the Trevithick ranch, 7 miles east of Sonora, is progressing. A hoist and compressor are being put in, says Manager Irish and Superintendent Barnes.

Development work is being increased at the Yellow Winton mine on the main Tuolumne river, near Groveland. Men have been put to work driving two tunnels. J. Burns of Groveland is superintendent.

Two concentrators are being put in at the Republican mine at Jacksonville. Several buildings are under construction and other improvements are being made. The mine is under the superintendency of T. F. McGovern of Sonora.

## COLORADO.

### Boulder County.

C. O. Nelson & Co., who have a bond and lease on the Coney Island group on Guinn mountain, near Eldora, report they have opened a body of sylvanite in their tunnel. The vein is 5 feet wide, the pay streak is 6 inches wide. Nelson will make shipments and a plant of machinery will be put in.

Near Boulder, the Cochran mill at foot of Black Tiger gulch in Boulder canyon, built to treat gold ore, but proved a failure, is being fitted up to treat tungsten ore, which is said to be found in paying quantities in that gulch.

### Chaffee County.

Development work will be in this week on the Uncle Tom group of copper mines, 9 miles north of Salida and 1½ mile from the Salida copper leaching plant, which is in operation. T. N. Elledge and A. E. Hatch of Salida are interested. The main body of ore runs about 6% copper. The Copperopolis vein is from 10 to 100 feet wide and gives average values of 4%. It has been opened in ten places by shafts and tunnels from 25 to 200 feet in depth. The Two Republics Co. of Pittsburgh, owner, figures on treating 3% ore at a profit by copper leaching process. The Uncle Tom group comprises five claims.

### Clear Creek County.

G. A. Pease, who is working the Nabob mine near Georgetown under lease, has opened up a body of ore in the upper adit, 700 feet from the portal and 600 feet from the surface. The adit is being driven ahead for another vein which produced high-grade ore in surface workings.

Near Idaho Springs, President T. M. Marsh, of the Signal M. & T. Co., reports a strike made in the Helen mine in Virginia canyon. The tunnel from the Virginia canyon roadway has been enlarged. A 4-foot vein of ore showed average of 0.44 ounce gold, 24 ounces silver per ton, with lead and copper values.—S. Engle & Co. of Denver, operating the Summit mine in Hukil gulch, under bond and lease, have opened up a 2-foot streak of 2-ounce gold ore and are making regular shipments to the Hudson mill. The ore is oxidized quartz, free milling. In 250 feet the adit level will reach the junction with the Refugee vein, opened previously in a crosscut from the Summit shaft at the 300-foot level, and where a 6-foot vein of milling ore was cut.—A streak of ore assaying \$200 has been opened on the foot wall of the Gem vein in Cascade creek at depth of 150 feet from the surface. The claim is owned by W. W. Cannady of Idaho Springs and Oklahoma men.

Mill run has been made from the recent strike in the American Boy claim in Cascade district, near Idaho Springs. The vein is opened by a tunnel. The mine is owned by the American Boy M. & M. Co., with headquarters at Cheyenne, Wyo.—A 100-foot contract has been let and work resumed on the Sterling tunnel on Soda creek.

The Independent pyritic smelter of Golden has bought the Kilton sampler at Idaho Springs and by December 15 expects to have the mill in shape for sampling and buying ores. A new floor and sampling device will be put in and the plant overhauled. The mill has been idle for several years. J. H. Kemp of Boulder is agent. A sampler has also been established at Black Hawk.

Manager Slater reports the Gold Anchor Co., near Idaho Springs, will continue sinking its shaft to the 450-foot point. Stations will be cut at the 350 and 430-foot points. A mill will be built next spring for treatment of ore blocked out. The Gold Anchor shaft is 250 feet in depth, the deepest shaft in Alice district. At the 250-foot point levels have been extended along the vein for several hundred feet in either direction.—The manager of the Beaver mine says he will sink the shaft an additional 100 feet. The machinery has been overhauled and timbers are on the ground for the work. It is

been built for another engine of 50 H. P. thought the junction of the Beaver with the Sewall vein will be reached. The shaft is 240 feet deep. Low-grade ore is being shipped under the new smelting charges at a profit.

#### Gilpin County.

The Benjai M. Co., incorporated under Colorado laws, with head office in Denver, has bought the After Supper mine in Black Hawk. L. R. Tatum is president of the company. A plant of machinery will be put in and management will be under A. Watters. The main shaft is 140 feet in depth, from which a drift has been run west. The shaft will be sunk several hundred feet and drifts extended. The After Supper is thought to be east extension of the Fiske mine on Bobtail hill.

A hoisting engine and iron water tank have been set up at the Pittsburgh mine of the Cashier G. M. & R. Co., near Russell Gulch. Sinking the shaft an additional 200 feet will be started. Increased developments will follow, also ore shipments.

The Rialto group of mines in Gregory district, near Central City, has been bought by the East Boston M. Co., in which Eastern men are interested. The Rialto group consists of the Rialto and Jean lodes, with surface ground on these and other lode claims. The buyers are owners and operators of the East Boston group, and the two will be worked in conjunction, as they adjoin. The smelting ores from the East Boston mine produced during the past three months gave values of \$100 per ton. It is intended to unwater the property and sink the shaft another 100 feet, its present depth being 550 feet. The Rialto group is equipped with a main shaft, down 600 feet, shaft building, together with two boilers and engine, and a double set of pumps. It is intended to handle the water of both properties. Unwatering has begun and when the bottom is reached they will sink 100 feet more. S. Hoskin is manager.

The Colorado-Tellurium G. M. Co. has bought the Bonanza or Oliver stamp mill, in Chase gulch, near Central City, and has made alterations and improvements. It is equipped with twenty-five slow-drop stamps. A switch has been built from the tracks of the Gilpin Tramway Co. to the rear of the mill, so that delivery of ores is convenient. J. Gundy is mill superintendent. The capacity of the mill is thirty-five tons per twenty-four hours. Manager R. Borchardt reports that they are making satisfactory saving. At the Freedom main shaft operations have been stopped for the time being at the stopes above the 500-foot workings. The last car of smelting ores from these workings netted \$265 at the smelter. Manager Borchardt has been extending the 500 west level and has opened ore. The main shaft is down 822 feet and as soon as the water is taken out it is intended to sink the shaft 200 feet farther. The water is down to the 571-foot point (the pump station) and as the Rialto and East Boston properties are to be unwatered it will relieve the Freedom of doing the major portion of the work, as in the past. Lessees are working in the Freedom No. 2 shaft, east of the main shaft, and drifting towards the main shaft at a depth of 150 feet, and have been shipping milling and smelting ores, the smelting ores running \$50 per ton. The company expects to start work on the tunnel running in from Chase gulch and extend it to the Freedom main shaft, which it will cut at a depth of 350 feet, the total length of the tunnel to be 1368 feet.

#### Lake County.

The shafts going down on Rock hill, Leadville, near the Reindeer, are nearing the point when sinking will be stopped and drifting started, says the Carbonate Chronicle. At the Bessie Wilgus the shaft is down 460 feet and drifts to the ore body started. The Reindeer shaft was sunk 500 feet and the first drift started at the 400-foot mark and the ore body caught 150 feet from the shaft. The Bessie Wilgus is 700 feet farther down the hill, and with the difference in the dip the ore is expected to be found at 450 feet. The southwest drift of the Reindeer is in ore to the end line. The shaft of the Iron Silver, to the north, and the two shafts being sunk by J. Murphy east of the Reindeer, should be in position to drift this week. The shaft being sunk on the President group is in the wash. The shaft being sunk by J. Daly on the California gulch side of the hill is through the wash and entering the solid formation. The Reindeer is shipping 100 tons a day.

The mill at the Yak tunnel, Leadville, is nearing completion. The frame work is completed, and the buildings going up on California gulch, west of mouth of the Yak tunnel, are ready for the roof. This mill is intended primarily for the reduction and concentration of the low-grade ores found in properties tapped by the Yak tunnel. The electric plant, which is in operation, has increased the work in the tunnel and connected properties, but

the full capacity of the Yak plant for the production of mineral will not be reached until the mill is in operation. The Yak is turning out ore from its older properties, and is opening up the new ore bodies in the Tankertown and Bob Ingersoll claims. Electric hoists and pumps have been put in in several of the mines, including the Silver Cord, from which a large tonnage is being taken. The electric appliances will eventually be extended to all the mines operated through the tunnel, and it is expected development of the Belgian will be started.

Work on Johnny hill mines at Leadville is progressing. The lessees on the Ibox properties are doing considerable work and are shipping a large tonnage daily. Development of the Elk is being carried on by J. W. Moore. He has awarded a contract for driving a drift 100 feet from a level below that in which the ore was found. The Elk is near the Ibox.

E. A. Swallow et al. of Denver have bought the Sunnyside claim on Mount Elbert, near Twin Lakes. A company will be formed to develop this claim in connection with the Yellow Jacket and Dan groups and to prospect through the tunnel for the Gordon vein. The Sunnyside lode is 4 feet wide and shows a shoot of pay ore on the surface.

H. C. Norton of El Paso, Tex., has located six claims 6 miles distant from Paisley, and is pushing development work. He will run a 500-foot tunnel on one of the claims. Due to this move, all the adjoining vacant ground has been located as mining claims. Gaylord Bros. have been doing work on a group of claims and the ore shows \$40 per ton in gold.

#### La Plata County.

(Special Correspondence).—The May Day mine is showing improvement. The crosscut tunnel opened the vein a month ago at a depth of 400 feet. The vein at that depth is 2 to 8 feet wide and drifting in both directions has been pushed, the ore taken out being shipped to the smelter and yielding satisfactory returns.

The Neglected mine is taking out two or three tons of high-grade tellurides per day. The mine makes considerable water and pumping expense is heavy. The cost of transportation to Durango is \$12 per ton, but with these drawbacks the mine is paying dividends. The State has appropriated \$5000 for building several miles of wagon road, which will enable wagons to reach the district, when the output will be increased, as there are adjacent to the Neglected several properties which heretofore have been unable to operate profitably.

The Bonnie Girl employs fifty men on the power plant and development. The mill building is completed and much of the machinery is in. Test runs on ore are being made in the old 10-stamp mill, to which a cyanide plant has been added.

The Empire G. M. Co., operating the Small Hopes group at the head of La Plata river, has put in a compressor and air drills and has driven 1000 of the 1400 feet required in the crosscut to tap the main vein at a depth of 900 feet. Nine veins have already been cut and drifting on the last one is showing encouraging results.

The Bulldozer made another shipment last week and smelter returned values of \$130 per ton.

Durango, Nov. 20.

Durango reports say in La Plata county while the volume of production is not greater, the value of tonnage is greater than ever before. The closing down of the Neglected mine several weeks ago, first pending a sale and later a decision of the management to await building of the State road to the district, reduced tonnage of the camp, but this has been made up by other producers, chiefly the May Day, having proven up bodies of ore at depth of 400 feet by crosscuts and also high-grade tellurides. The Neglected is taking out enough ore to justify running the pumps, being high-grade tellurides. Since work has been started by La Plata county on construction of a wagon road, it is expected the Neglected will resume operation. The Oro Fino hill, on which the mine is located, has other mines, which have been operated under disadvantages for lack of thoroughfare over which ore can be transported to Durango for less than \$12 per ton.—The Bonnie Girl company is working fifty men on its dam, power plant and development, and is making trial runs on ores in a 10-stamp mill with cyanide tanks added for tailings. The larger mill building, which will afford 200 tons' capacity, is completed and part of the machinery is on the ground.—The Empire G. M. Co. is operating the Small Hopes group, leased from the Swiss company. It is using machine drills, driving a 1400-foot crosscut to tap the Small Hopes vein at depth of 900 feet and is now in 1000 feet. Nine veins will be cut.—There are approximately 300 men working in the district,

either for wages at mining or in individual leasing and development.

#### Mineral County.

At Creede, the Mollie S. mine, of which R. S. Light is manager, has put in a tramway from the road to the mine so that the ore that formerly was too low grade to ship can be shipped at a profit. Last month he shipped four cars of high-grade ore.

The East Willow M. Co., which operates the Solomon and Ethel mines near Creede, under management of C. Loughbridge, has put in a compressor and will follow the ore body which goes below the tunnel level. The Solomon mill, owned by the same company, is making zinc concentrates running 62% zinc. The company ships about 300 tons of zinc and 100 tons of lead concentrates a month.—J. Hannifin has a lease on the Corsair dump and says he is taking out ore that pays well.—The Bachelor mine, worked by leasers, is making progress. G. Gleason and A. Weaver have a streak of ore in their lease 200 feet long and 60 feet wide which averages twenty-five ounces in silver per ton.—A. M. Collins, who has a lease on the New York dump and the Last Chance dump, is shipping. The ore averages \$15 per ton.

The mineral output of Creede camp for month of October was 7240 tons. The Humphrey Mill Co. has built a flume from the mill along the mountain side to its land south of the mill 400 feet, where the tailings from the mill will be conveyed and there spread over the ground. As this ground is made up of large rocks several feet in depth, the water is expected to seep down a long way before reaching the creek and prove to be an effective filtering device.

#### San Juan County.

Near Silverton, the Dry gulch Galtie Boy mine's lower tunnel of 1300 feet is nearing the ore shoot of free gold opened in the upper workings. P. Lonergan is in charge.

The Ruby mill, near Silverton, is working. The ore bins are filled. There are 1000 tons of ore on the dump. The mill capacity is fifty tons a day. The December vein has 12,000 tons of ore blocked out. Manager T. J. Hurley expects to work forty men in the mine and ten in the mill during the winter. Shipping of concentrates will begin next week.

#### Summit County.

Near Breckenridge, the Washington group on Nigger hill, consisting of 200 acres of patented ground, has been taken over by the Washington-Joliet M. & M. Co. J. Dicoct, W. Seltzer and H. T. Keltie of Joliet, Ill., and A. E. Keables and C. S. Newsome of Breckenridge, incorporators. The property consists of both lodes and placer ground. There are fourteen veins in the group, from which smelting and milling ores have been produced, chiefly under operations of lessees. Low-grade ore is on the dump and in the workings. There is a 20-stamp mill on the mine that is equipped with concentrating tables. It is intended to increase the capacity of the mill and twenty-five men are at the plant erecting buildings. The average value of the Washington smelting ore is \$40 per ton. The deepest workings are 300 feet. Deep mining will reach the blanket contact underneath Nigger hill and the adjacent district containing the Puzzler-Ourray and the high-grade ore mines of Little mountain.

The operations of Hoyle & Hoyle in developing the Gold Dust vein (adjoining the Washington's Puzzle Extension) through a 2600-foot tunnel, cutting the vein 200 feet deeper than the lowest Washington workings, are said to show that the vein of that section carries values with depth.

Near Breckenridge, the lessees of the Morning Star mine, Zerbe, Condon et al., have opened up a streak of heavy lead-silver-gold ore at 175 feet from mouth of tunnel. The vein shows 2 feet of pay ore. The boring machine (modeled after a coal boring machine) is reported doing satisfactory work in boring instead of drilling the holes for blasting the frozen ore, waste and rock. The mine is above timber line, where the line of perpetual frost extends down into the earth for about 100 feet. Ore from the newly developed ore shoot is said to run \$50 per ton in gold, silver and lead.

The Old Union Co. on Mineral hill, near Breckenridge, has its plant of machinery set up at shaft No. 2, and three shifts of miners are sinking the shaft to 500 feet. Later sinking will be continued to 1000 feet. In No. 1 shaft drifting is being done east and west on the 150-foot level; also on the 250-foot level a drift is being run and a raise made in a body of cerussite that carries silver and gold values, says Manager A. E. Keables. G. C. Smith is superintendent.

#### Teller County.

At Cripple Creek the ore shoot in the Rose Maud mine on Gold hill has been

cut in the 200-foot level, giving the leasing company an additional 50 feet of stopping ground. It is being operated by the Pueblo B. & L. Co. The ore shoot is 1 foot in width, and shows sylvanite. The lessees have built ore bins and regular shipments will be maintained.

J. J. Bodfish & Co., who have a lease on the Teutonic mine, on Ironclad hill, Cripple Creek, are putting in a plant of machinery. The shaft is down 90 feet. They will continue it another 100 feet, when they will drift for the Jerry Johnson and W. P. H. vein system. On east end of same claim E. Duncan and Cain, operating under lease, have cut a dike dipping at 45°, which measures 18 feet in width. The ore is of low grade.

At Cripple Creek lessees operating the Puffer claim, of the Anaconda Co., are increasing development work. Larger ore bins have been built. The ore shoot has been opened in a winze sunk from 50-foot level.—Cripple Creek reports say the City of Cripple Creek G. M. Co., the newly incorporated leasing company, has taken the assets of the Cripple Creek Enterprise Co., whose franchise allows it to operate under the streets and alleys of the city. The sale includes improvements on the mine. It is intention of lessees to sink a shaft. The company also has a lease on the Maid of Orleans claim on Beacon hill.

A larger ore house is being built at No. 2 shaft of the Portland G. M. Co., on the south slope of Battle mountain, near Independence. This building will replace the one in use. It will be equipped with washing and picking belts and its floor area is such as to permit of all ore raised during the shifts being sorted in daylight, a decided advantage in handling, owing to the inaccuracy of work by night. It is estimated the building will cost \$75,000. Underground conditions in that section of the Portland are reported improving. Bodies of ore have been opened on several levels. The general value of the product is \$35 gold per ton.

The Columbine G. & C. Co. has been incorporated by W. H. Sanford, R. A. Kincaid, L. L. Rees, E. Whitley and I. F. Peck, with principal office in Denver. They will operate near Cripple Creek.—I. F. Peck has bought the Zennet and California lode claims in East Beaver mining district, near Cripple Creek.

At Cripple Creek the Ophelia T. L. Co. has been incorporated by C. C. Chapin, president; H. M. Gilbert, manager, and W. H. Spurgeon. It is intended to explore for mineral the territory contiguous to the Ophelia tunnel (the Smith-Moffat tunnel), being operated by the Cripple Creek & Pueblo Railroad Co., of which C. C. Chapin is president. The tunnel starts in Cripple Creek gulch 1 mile south of the city, its objective point being the Old Victor mine on the other side of the camp, 3 miles away. At present the breast is half way toward completion, or 7500 feet from the portal.

Cripple Creek reports say with few of the properties being worked to any great extent the mines on Ironclad hill are furnishing a large part of the total value of the monthly output of the district. The mines of that hill will do more when the cyanide mill of the Cripple Creek Co. is completed. The mill will have a capacity of 1000 tons daily. Operations on the W. P. H. mine, under lease to Harrison & Seaver, are being increased. Ore is being broken on an average of 33 feet in width, most of the rock running \$100 per ton. Since the ore was first struck sufficient waste rock has not been hoisted to fill in around the ore house. On the Jerry Johnson lessees are operating. Another ore shoot has been added to the network of veins and ore is being mined practically at surface. On the Damon, near by, several lessees are working who send out a good tonnage every month, while on the Flying Cloud, Forest Queen, Midway, Pride of Cripple Creek and Olive Branch claims lessees are making good production.—On the Summit claim work for the cyanide mill has been started. There is considerable idle territory on the hill, but this is the fault of the owner and not the lessee, says the Gazette. High royalties is the cause which is retarding the development of that ground.

Steam has been turned into the plant of the Bull Hill M. & Dev. Co., on Raven hill below the Moose mine, near Cripple Creek. The property is owned by the Cresson Co. The plant includes a hoist good for 1500 feet, boilers and a compressor. The company, which holds a lease, has crosscut from the 300-foot station into Bull hill. Three hundred feet was added to the shaft during the summer and at the 600-foot point a crosscut of 600 feet will be started to get under the shoot.

Cripple Creek has nearly 5000 miners at work; a production exceeding \$2,000,000 a month and pay rolls aggregating \$600,000 a month, says the Gazette.

Cripple Creek reports say all the sam-

plers of the district are taxed to full capacity with ores at present and in every part of the camp cars of ore are crowded on the side tracks waiting to be moved to the samplers.

It is said a cave-in has opened a body of ore in the Vindicator mine on Bull hill. Lessee Colwell & Co., who have the property under lease, claim they have \$100,000 worth of ore. Two months ago a cave-in occurred which damaged the Cripple Creek Central depot at Independence, besides undermining their tracks for some distance. The rock and dirt that slid into the ground of Colwell was assayed and gave returns of \$80 per ton. A carload shipment was then made, with same values returned. They are operating under lease one of the upper levels of the Vindicator mine and are hoisting the new ore body in Nos. 2 and 11 shafts.

Ore is being developed on the Mimi S. claim of the Abdallah G. M. Co. on south of Squaw mountain, near Cripple Creek. Initial development of the shoot was through the Climax tunnel of the Little Puck Co. and through the shaft on the Mimi S. claim. At 1600 feet from portal connection was made with the shaft at depth of 512 feet. At depth of 300 feet in the shaft a lateral was run north along the vein. The shoot has been opened for 60 feet horizontally. It is 2 feet in width.

A company has been organized to operate the acreage of the Cameron Co. in Cripple Creek district. Within 450 feet of the southwest portion of Cameron, the Pride of Cripple Creek has opened payable ore. The Long John has been leased to Canon City men, and two leases are being operated north of the Long John. This area, comprising 160 acres, has the Sunshine on the north and the Flying Cloud on the south. The company is headed by C. L. Arzeno. Work will be started in December.

## IDAHO.

### Boise County.

The Mineral Hill mine, near Placerville, is developing values. Thirty-two men are at work and the mill is running. The cyanide annex is also in full operation and returns are satisfactory. At the tunnel level the main ledge is 30 feet wide of milling ore. There are several leads 3 to 4 feet wide cut by the tunnel which contain ore. The company will sink a shaft near portal of present working tunnel. It will be sunk 200 feet for double purpose of development and for securing more water. A tunnel will be run from the bottom of the shaft to cut the main ledge, which will be drifted upon, says Superintendent A. C. Gallupe.

### Custer County.

Challis reports say the wagon road being built by the Lost Packer M. Co. from Jordan creek to its mines at Loon creek has been completed. Supplies are being hauled in. J. A. Czizek is manager of the company.

### Elmore County.

At Atlanta the Benton M. Co. has a 3-stamp quadruple-discharge mill in successful operation on ore from the Benton mine. The stamps weigh 1100 pounds each and handle twenty tons per day. The concentrates are high grade and are shipped to smelter. The ore carries values of \$15 to the ton. It is intention of the company to treat custom ore pending increased development of its own ground, which will be of advantage to claim owners of Atlanta district. This will require enlargement of the plant, says Manager Ennis.

### Idaho County.

The Big Creek & Thunder Mountain Railroad Co. has been incorporated, to build into Thunder Mountain mining district. The road will start at Payette Lake and follow the Payette river to Secesh creek to the south fork of the Salmon river, then to the east fork of Profile creek, then along Profile creek to Big creek, thence along Big creek to Monumental creek, and thence to Roosevelt, a distance of 130 miles. The directors are W. H. Powell, J. M. Devere, of New York, and M. B. Jacobs, F. W. Hunt and C. J. Perkins of Boise. F. W. Hunt is president and M. H. Jacobs secretary. Work will be started on the road in the spring.

### Owyhee County.

H. S. Green of Cohoes, N. Y., part owner of the Cumberland group of claims, mills, etc., on War Eagle mountain, near Silver City, says they have formed the Pioneer M. Co. and will proceed to work the Cumberland. A. Buckbee will remain with the company as manager. The company has forty men at work and the 10-stamp mill, which has been idle for three years, was started up the first of the month. The ore is said to run \$25 per ton.

### Shoshone County.

Near Wallace the King of Pine Creek M. Co. is developing a group of five claims along Pine creek,  $3\frac{1}{2}$  miles south of

the Pine creek spur of the Oregon Railroad & Navigation Co., and 3 miles west of the Bunker Hill & Sullivan mines. For 10 miles along that creek the ground is covered with locations, on many of which development is under way. Among these are the Douglas, Highland Chief and Ross Gulch. From the Bobby Anderson, on which there is a 300-foot shaft, there has been extracted shipping ore. There is abundance of timber for mining and fuel. From Pine creek and its feeders there is water supply available. Four ledges show in the King of Pine Creek group, three claims covering the east-west strike of the leads. One ledge is being developed by an adit, in 200 feet, in the face of which the ledge is 8 feet in width. The gangue is quartz and quartzite, associated with pyrite and arsenical iron. Lead-silver values are shown.

Wallace reports say for \$11,000 and other considerations the Idaho Con. G. M. Co. has sold five mining claims to the Golden Chest M. Co. The claims are the Stevens bar placer claims, the Stevens fraction, Timber King, West fraction and Jim lode claims, which adjoin the Golden Chest group, a mile from Murray. F. Watson of Spokane, Wash., is president of the Idaho Con. M. Co. The suit brought by the Idaho Con. G. M. Co. against the Golden Chest M. Co. to recover \$20,000 for ores extracted from one of the plaintiff's claims has been dismissed by Judge Beatty in the federal court, the suit having been settled out of court. It was alleged that the Golden Chest Co. drove the tunnel from its claim through the Timber King and extracted ore to value of \$20,000, in September, 1903.

Wallace reports say that December 5 the property of the Portland M. Co. will be sold at sheriff's sale. The property, which comprises the Red Dragon, Mule Deer, Silver Tip, Sitting Bull, Silver Tip Fraction, Parallel Fraction and West Fraction claims, is on Sunset peak.

Carbonate ore is being taken from the Tamarack mine on Nine Mile, near Wallace. Work is progressing. The dump for concentrating ore is growing and cribbing must be put up. The ore is lead carbonate, carrying high values in silver. Some of it is sand carbonates, as it is broken down from the ledge with a pick, being loose. No powder has been used in the stope except in its starting. The tunnel below the raise has been driven in concentrating ore.

### Washington County.

Mineral City reports say the new furnace at the smelter of the Ladd Metals Co. is in place and ore treatment will be resumed. The ore bins at the smelter are full and the mines adjacent are in position to supply ore necessary for continuous run, says Manager G. W. McDowell.

## KANSAS.

### Neosho County.

Chanute reports say the Standard Oil Co. has begun paying for oil on the straight gravity basis and the terms north and south Neodesha have been dropped. Hereafter all oil bought by the Standard in the Kansas-Oklahoma field will be paid for on the following scale: Oil grading 32° B. and better, 87c a barrel; 31½° at 82c a barrel; 31° at 77c a barrel; 30½° at 72c a barrel; 30° at 67c a barrel; 29½° at 62c a barrel; 29° at 57c a barrel; 28½° at 52c a barrel; 28° at 47c a barrel. Since the first shipment of oil from wells in Kansas to the refinery at Neodesha, there has been an arbitrary line drawn through the county, south of Chanute. All oil produced north of that line was paid for at the rate of 20c a barrel less than the oil produced south of it without regard to grade. Thus oil of 32° gravity at Chanute was worth 20c a barrel less than 32° oil produced 3 miles south of Chanute. The effect has been to turn the tide of investment to the southern end of the field. So far as the producer is concerned, says the Record, in many cases the new scale means a loss to him. But the average returns to the field will be made up by increase in lighter grades. There is a great deal of 32° oil produced east of Chanute on the "Mundy trend." The old rate for the oil was 67c per barrel, while under the new scale the operators will get 87c a barrel. The companies on that belt are the Logan, Clermont, P. C. C., North Petroleum, Ideal, Garden City, Diamond and others.

## MISSOURI.

### Jasper County.

The Tamworth mine, on the Aylor land south of Duenweg, owned by Webb City and Carterville men, is reported improving. They propose building a mill.—The Harrington M. Co., operating on the Hummel lease, has put in jigs and begun cleaning ore.

A. W. Canada has begun building a mill on the site of the Oceola plant, east of Ohio mine, near Webb City. A lower

run has been developed in sheet ground.—At Alba the Morris & Co. mine has been sold to J. W. Durby et al. for \$12,000. J. Varner et al. of Webb City are erecting a mill on the same land, which will be ready to start this week.—J. Lesly is drilling for R. M. Cain, Sanders & Co., on a 5-acre lease of the Setser land.

E. P. Church, T. Shelton, W. R. Marsh, L. Hamilton and G. Bayless of Carterville have leased the Old Colony mine and mill on the Missouri Zinc Fields ground and have been cleaning up and breaking dirt. They are making a test run of the ore. The former operators were cutting a face 18 feet high. They will put in air drills.

### Newton County.

Carterville men have leased 20 acres in Newton county, 5 miles south of Joplin. A shaft has been sunk on the lease and they have put in a steam hoist and begun drifting in favorable ground with shins. J. H. Shimmons of Carterville is superintendent.

## MONTANA.

### Broadwater County.

J. Limpke, driving a tunnel to the Burlington lead, reports progress. The tunnel is a crosscut. The Burlington is on Beaver creek, near Winston.

### Deer Lodge County.

The Amalgamated C. Co. is digging up the ground around the old smelting works at Anaconda. The old plant has been removed. There are large dumps of slag on the ground, and it is said these are being assorted and sent to the smelter for reduction. Under the old methods a percentage of the copper was lost. At present, the blister copper turned out at the Washoe smelter is sent to Baltimore for refining. The contract with the Baltimore company has almost expired, and when it does the Washoe company will refine its product at Anaconda. At the news works the "slums" from the concentrator are being saved to be re-worked. Reverberatory furnaces are being built at the smelter. At the old works the largest reverberatories were 40 feet long. The new furnaces are 112 feet long and turn out 280 tons of copper a day.

Near Anaconda, the Jennie Dell mine is being opened up. The shaft has reached depth of 450 feet and a station is being cut. It is reported they have struck a vein of gold and silver ore near the bottom of the shaft.

### Lewis and Clarke County.

The quartz mill owned by Lindt & Co., Scratch Gravel district, north of Helena, has been started up. The mill is of ten stamps.

### Jefferson County.

G. Sweeda, owner of the Copper Queen group between Cataract and Jack's creek, above the Cataract C. M. Co.'s mines and smelter, near Basin, says the group has been bonded for \$65,000 to Springfield, Mass., men. The veins are large and carry values in copper. Machinery will be put in to concentrate the product. The haul to the railroad is considerable at present, but with the building of the proposed railroad from Elliston to Basin the mines of the district will have added facilities. E. R. Dean is in charge.

### Silver Bow County.

At Butte the Minnie Healy mine, operated by F. A. Heinze, was closed on the 20th inst., by an injunction issued by Judge Clancy at the instance of the Amalgamated C. Co. The shut down throws out of employment 1000 miners, smeltermen and other laborers. By an order of the lower court Heinze was allowed to work the property, which has been in full operation until this shut down. The injunction was granted on allegations made by the Amalgamated Co. that Heinze was using the Minnie Healy as a means of looting the adjoining property, which belongs to that company. The Minnie Healy injunction follows a suit for \$5,000,000 against Heinze for ore alleged to have been looted from Amalgamated mines.

## NEVADA.

### Esmeralda County.

In Bullfrog or Amargosa district, 7 miles east of the original discovery, is the townsite of Beatty. R. Montgomery, interested there, says surface values run from \$20 to \$120 per ton, mostly in gold, while on the townsite there are 10 inches of running water. On one of the claims owned by Sweeney & Garner, there is a shaft 80 feet deep, supposed to have been sunk by Mexicans, who worked the gold ores in an arrastra and ran a small furnace on silver ores. Beatty is 63 miles from Goldfield, on the old road from Austin to Fort Mohave. The railroad being graded by F. M. Smith to the borax deposits is near Pahump, 55 miles south of Beatty, and will pass through the district.

The Gold Bond M. Co. has been incorporated to operate the Tinhorn group of

five claims at Goldfield by R. L. Mayfield of Shreveport, La., president; W. H. Clark, W. F. Bond et al. Ten men, under Superintendent A. H. Crampton, are at work. Two shafts are being sunk and milling ore is on the dump.

Seventeen miles northwest of Goldfield, in Silver Peak mining district, W. F. Bond & Co., J. H. Allen and J. G. Brown have a group of five claims—the American Boy, Last Chance, Silver King No. 1, Silver King No. 2 and Silver King Fraction. The ledge on the American Boy has been opened up by a series of open cuts. The ore goes \$40 per ton, the values being in gold, silver and copper. On the Silver King lead ore has been opened up. Men, under Superintendent Allen, will start work this week and ore shipments will be started. At a point 175 feet south of the present working shaft a shoot of ore which crops at surface has been opened on the Combination mine at Goldfield, says the Review. The shoot has been proved for a distance of 100 feet, the ore body varying from 3 to 8 feet in width, with values \$100 per ton.

The Goldfield Lone Star M. Co. has been incorporated under Wyoming laws to operate the Lone Star group of 300 acres, bought by Shove, Aldrich & Co. of Colorado Springs, Colo., and R. W. Griswold of Goldfield. The company will start operations for development of its ore bodies.

### Lincoln County.

The Little Mendah M. Co. has been incorporated at Salt Lake City, Utah. The company owns claims adjoining the Mendah mine, near Pioche. The officers are W. A. Wright, president; L. A. Copeland, J. Zink, B. S. Rives and J. Langton.

### Storey County.

(Special Correspondence).—Two enterprises of importance to the future of the Comstock are under way. One is draining of the lode by a comprehensive plan, being carried out by the companies interested combined under a pumping association to reduce expenses and get results that would otherwise be very costly. The other is the treatment by cyaniding of low grade tailings left by the mills in the bonanza days. The latter is still in the experimental stage. About a year ago the Chas. Butters Co. erected a \$400,000 cyanide plant in Six-Mile canyon, 2 miles east of Virginia City, at the base of Sugar Loaf mountain, and began treatment of the tailings impounded there. The tailings were bought cheaply, but are low grade, and the attempt to treat them on a paying basis has developed many difficulties peculiar to that ore. Some of the problems have been satisfactorily solved and substantial contributions to the process made. The most important one is probably the handling of slimes by filter, by means of which the item of time for settling—one of the chief difficulties encountered here—has been eliminated, and it is stated a saving of as close as 99% obtained. The slimes are introduced into a square tank closely filled with frames to which filter cloth is attached, and the liquid solution carrying the values is drawn through by a vacuum pump. The process is rapid and economical in saving the cyanide solution and values, as well as the element of time. The tailings vary in value in different parts of the dam, and some of them, after exposure to the air, yield satisfactory results. The plant is under supervision of W. R. Crosby.

At the Con. Cal. & Va. shaft unwatering and renovation have been going on for six years past, and though it has entailed drainage of much contiguous property, has yielded satisfactory results. Ore is being taken out down to the 2350-foot level, 600 feet below the level of the Sutro tunnel, to which the water must be pumped, and although the water at this depth is very hot, the mine is well ventilated and conditions for the miners fairly comfortable. The entire mine is lighted by electricity, which also furnishes power for pumps, compressors and other purposes underground at a great economy over steam. The power is transmitted from Floriston, 37 miles west, on the Truckee river, west of Reno, and is also utilized throughout the city and entire district, which includes Gold Hill and Silver City.

On the 2150-foot level of the C. & C. shaft are three Riedler pumps, with a combined capacity of 45,000 gallons per minute to the Sutro tunnel level. From the 2350-foot level of the shaft to the 2150-foot level water is lifted by the hydraulic elevator to a sump from which the Riedlers take it. They are not worked to their full capacity, and alternatives are prepared against a failure of the power. Superintendent McKinty is installing another compressor. The hoist is one of the largest in the West. All cables, as well as cages and every article used in and about the mine is manufactured in the company's shops on the ground.

About one year ago the Pumping As-

sociation bought the Ward shaft, which is being retimbered and deepened as another pumping station. A pumping plant at the cost of \$80,000 will be put in by Superintendent L. M. Hall. The intention is to sink this shaft to the 3300-foot level. It is connected with the Suro tunnel and has been retimbered to that level. The Ward is a mile south of the C. & C. shaft. Another mile south of this the Alta shaft is being retimbered, to be used as a third pumping point, and it is believed that these three will thoroughly drain the lode and permit deeper working in all the mines of the district.

The Kinkead mill, J. H. Kinkead, manager, a short distance below the C. & C. shaft, is working on custom ore and making satisfactory saving of concentrates. No attempt is made to amalgamate the sulphide ores, but plating is done when high-grade ores are run.

Near Silver Hill the Justice mill, a 10-stamp, old-style stamp, is treating ore from the Justice mine. Amalgamating and concentrating is the process. Near it the Taylor mill is treating custom ore, at present from the Chollar. The process is grinding and pan amalgamation.

The Silver Hill mine is preparing to re-new work in its shaft.—The Overman and Yellow Jacket are working.

Although it is not expected that these camps will be brought again to their past standard of bonanza production, it may reasonably be hoped that they will still continue to turn out a large amount of ore which modern methods of mining and treatment will handle at a profit to those concerned.

Virginia City, Nov. 22.

## OREGON.

### Baker County.

At Baker City, Judge Eakin has rendered a decision in favor of Owens, in the case of the Virtue Mines Dev. Co. vs. J. Owens of the Cyclone mine, in which it sought to enjoin Owens from removing the tailings from the old Virtue mill dump. Defendant has a contract with the company by the terms of which he had the right to remove seventy-five tons for sampling purposes free, and all in excess of that amount he was to pay for at rate of 75 cents per ton. When the tailings were tested by Owens by cyanide process they proved to carry from \$10 to \$40 per ton. Owen has renewed work on the dump.

In the Standard mine, near Sumpter, the drift on the Cleveland-Willie Boy has opened a shoot of gold-bearing sulphide ore and Superintendent Heath says he has a width of 10 inches, with galena next to it. The company also has a body of cobalt-gold ore in the Standard vein. Metallurgist Nicholson of the company has been testing the ore for treatment methods.

Work has begun on a wagon road from the California mine, Cable Cove district, near Sumpter, to the Constellation group. The first section will be a mile and a half long, and will connect the Constellation, Gipsy Queen, Gipsy King and others with the main Cable Cove road, and will be the means of getting the output of several properties to the smelter. Smelting ores are blocked out and on the dumps of these groups.

### Douglas County.

Since the recent rains the Oregon Securities Co., operating in Bohemia, has water to run its electric plant to full capacity. More men have been added and the main tunnel is being driven ahead at rate of 6 to 10 feet per day and by Dec. 15 it is expected to reach the Champion vein, which has been opened on surface. The company has its mill and tram completed.—On the Riverside group during the past few weeks men have been putting in a flume from above the tunnel on Horse Heaven creek to run the blower to force air to the breast of the tunnel, which is in 700 feet. The contractors will begin work on contract for 500 feet more.—The contractors on the Oregon-Colorado report progress. Work will be continued during the winter.

At the Vesuvius mine, near Bohemia, Manager F. J. Hard reports the 10-stamp mill and the 2000-foot tram are working satisfactorily.

J. C. Lewis has bought nine claims on both sides of Rogue river at mouth of Whiskey creek, near Glendale. They form the Royal Rogue group, and carry copper, nickel and gold.

### Grant County.

The concentrating plant at the Dixie Meadows mine, near Baker City, is in full operation. The mine has ore blocked out and its continuity, it is reported, has determined the length of six claims showing a width of 30 feet between walls. The greatest depth attained is 350 feet. The mine, comprising eight claims, is located on Dixie butte in northern part of Quartzburg district, and has 3000 feet of underground workings. The Ruby claim has

had principal development. The mill is equipped with a gyratory crusher, two sets centrifugal rolls, a Huntington mill, five concentrating tables and a 120 H. P. steam plant. The Dixie Meadows G. M. Co. is owner. Development has been done under Superintendent Reese. Men are blocking out ore preparatory to putting in a reduction plant of increased capacity in the spring.

After proving continuity of the vein the length of three claims on the Ruby group by open cuts, C. Jensen has started a crosscut tunnel of 200 feet to tap it at depth of 150 feet. The vein parallels the Dixie Meadows vein, near Prairie City, and the open cuts show it 15 feet wide, with values of \$12 per ton. The group is on Ruby creek.

### Josephine County.

The Mount Pitt M. Co., whose mines are on Jump-Off-Joe creek, 12 miles above Merlin, has completed two arrastras. The tubs are 12 feet in diameter and the power is furnished by a 50-foot overshot wheel, says Superintendent Hooper. He ran a crosscut, striking the vein at a depth of 60 feet, and cutting 8 feet of ore which carries free gold. The arrastras will handle four tons of ore in ten hours.—The Golden Wedge, on Rogue river, in Galice district, laid up for two months this fall, is equipped with a 2-stamp mill and has again started up, says Superintendent Miller. The ore is high grade. A crosscut is being run, which will tap the vein 150 feet below the main tunnel and 80 feet below the present workings. The ledge is 4 feet in width.

Grants Pass reports say the owners of the Sterling placer mine, on Sterling creek, V. Cook of Portland, manager, have shaped the hydraulic for increased operations this winter. The Sterling M. Co. is owner of the Sterling mine, with H. E. Ankeny, superintendent. A battery of four giants has been set. There is water enough to operate at least two giants day and night. The gravel banks of the Sterling are cemented, requiring blasting. The company has prepared to do the blasting from tunnels or drifts driven into the banks. The powder will be set in these and fired by an electric battery.

Near Grants Pass the 10-stamp mill of the Eureka mine of Soldier creek, which has been idle while the mine has been undergoing overhauling and more extensive development, will be started again this week. The Eureka is owned by California men, and is under the management of A. P. Nelson.

Work for the winter's run has begun by the Galice Con. at Galice. Manager A. Cousin says he has started four giants of the battery of five. Two are being operated on Gambler's bar, on the Rogue, below Galice, and the other two are at work on the high benches along the creek. Later two more will be put in operation.

## SOUTH DAKOTA.

### Lawrence County.

Ninety stamps are dropping at the Horseshoe mill, says Manager W. L. McLaughlin of Deadwood. The daily tonnage is 400. The refinery and melting room is completed. The precipitates as they come from the mill will be dried and smelted with litharge, the resulting bullion cupelled, and the bars will be ready for sale. The slags from the process will be treated on the ground.

Manager Farnham states that he is driving a tunnel following a 6-foot vertical between the porphyry and quartzite at the Queen of the Hills mine, near Pluma. The ore assays \$6 on the average. The company is grading for a 20-stamp mill, expecting to put in a combined amalgamation-cyanidation process. The Victor G. M. & M. Co. has been incorporated to operate a group in Two Bit district, between Two Bit creek and the head of Lost gulch, near Deadwood. The property is 1½ mile north of the Gilt Edge-Maid mine. The officers are J. A. Barnet of Kansas City, Mo., president; I. N. Lawrence of Deadwood vice-president and manager; R. Lawrence and T. E. Regan.

The Alliance G. M. Co. has been incorporated by Alliance, Neb., men and has bought 600 acres of land near Mystic. The property is reported to show several quartz lodes and promising placer deposits. The ores are free milling and the country is supplied with water and timber. The officers are D. Bowman president and T. J. O'Keefe and I. Read.

### Pennington County.

The Commonwealth M. Co. of Lead City has bought the Montezuma mine near Rochford. The Montezuma is equipped with a Griffin mill. The Commonwealth Co. will open the mine. The ore occurs in a free milling vein developed by an open cut. It can be cheaply mined and transported to the mill. The Commonwealth Co. also owns mines on the west of the Globe group, between Lead and

Terry, where development is being increased. W. F. Dutton of Lead is president.

The Redfern M. Co. is sinking a working shaft on its mine, near Tigerville.

## UTAH.

### Beaver County.

The Majestic C. Co., at Milford, reports during the month of October a total of thirty-seven carloads, or 1000 tons, of ore were shipped to the Salt Lake smelters, from which a net profit of \$8000 was realized. The shipments came from only two mines—the Harrington & Hickory and the Old Hickory. It is estimated there are 100,000 tons of ore ready to be mined in the Harrington & Hickory lead-silver mine; this tonnage being exposed in the Gomer shaft workings. The smelting charge was \$6.50 per ton. The ore sent out from the Old Hickory copper mine averaged two ounces in silver, 12% copper, 30% iron, .015 ounce gold, 9.3% sulphur and 28.4% silica.

W. W. Wait, treasurer of the Blue Acre C. Co., operating near Milford, reports the management has applied to systematic development of its territory \$29,373. They have opened up several showings of shipping ore. Work is being centered on No. 4 shaft and developing paying quantities of concentrating ore.

The tunnel being driven to connect the Newhouse concentrator at Newhouse, near Frisco, with the 600-foot level of the Cactus mine, has been completed to length of 5300 feet. About 550 feet more driving will be required. Progress is reported at rate of 100 feet per week.

Progress is reported at Frisco by Peck Bros. on their zinc plant, which is to run on Horn Silver ores. Manager P. T. Farnsworth of the Horn Silver Co. says the plant will be ready for operation in January next. Pipeline will be built to convey water over the mountain range from the reservoir at Newhouse.

### Box Elder County.

The Midland G. & C. M. Co. at Ogden has been incorporated. It owns fourteen mining claims in the Sierra Madre mining district in this county. The officers are: G. Dean, president; F. J. Hirt, A. Swinkwood, D. Cowvey, C. E. Dean and C. C. Touck.

### Millard County.

The Oasis M. Co., operating in Drum district, owns claims 30 miles from Oasis, from which ore has been shipped running \$20 in gold, and 10% copper. The ore also contains iron. J. Clive, part owner, says if a railroad enters the district work will be increased and lower grade ore can be shipped.

### Salt Lake County.

A. Murphy, in charge of operations at the Pioneer group, in American Fork canyon, near Alta, says a strike has been made in the property of the Pittsburgh M. Co. at head of American Fork canyon. The vein has been crosscut for 12 feet, showing galena ore. The Pioneer group adjoins the Pittsburgh.

S. Bamberger, manager of the Fortuna mine at Bingham, reports exploration being increased and he is working thirty men. He is making progress in opening up of ore bodies and in shipments. The mine is sending out an average of five cars of ore weekly to the smelters. Part of this ore comes from the lead-silver veins and the balance from those in which copper predominates. The Fortuna mine has been developed by three tunnels, also crosscuts.

The fifth furnace at the Bingham Con. smelter at Bingham is in operation.

It is said the Boston Con. C. Co. at Bingham is earning \$1000 net per day, owing to increased price for copper, on an output of 250 tons of ore per day shipped to the Bingham smelter. An advance of 1½ cents per pound in the metal makes a difference of \$225 per day to the Boston company on this output. The company reports no difficulty in meeting requirements of its Bingham smelter contract to deliver 250 tons of ore per day, containing 3% copper.

### Summit County.

The work of extending the Ontario drain tunnel to the Daly-West ground at Park City is progressing at rate of 5 feet a day.

## WASHINGTON.

### Chelan County.

Near Chelan, C. Rubin, superintendent of the Crown Point M. Co. at Railroad creek, says they have a mill building up for their dry concentrator, which will be put in next spring. A house for the ore crushers will also be erected. They have been running tunnel No. 4, which is to connect with tunnels Nos. 1 and 2 on the molybdenite ledge. It is intended to put in electric drills next spring.—Superintendent R. Earl of the Thunder Creek M. Co. says the 4 H. P. dynamo, an electric drill and other machinery are in operation. W. H. McAllister is mine foreman

in charge. The mine is said to be an extension of the Boston ledge. The Boston mine is across the divide from Horseshoe basin, and the ledge parallels the Davenport and Blue Devil ledges. Average assays from the Willis & Everett claims, from an ore body 3 feet thick, give 100 ounces of silver.—Superintendent H. F. Bruckner is running a union tunnel for the Cascade G. & C. Co. and the Horseshoe Basin M. Co. to cut the Davenport ledge. The tunnel is in 200 feet of the 700 feet to be run.

The Crown Point M. Co., on Railroad creek, S. J. Gray's property on Meadow creek, the Davenport companies in Horseshoe basin, the Thunder Creek M. Co. on Thunder creek, and the Holden G. & C. M. Co. on Railroad creek will continue work throughout the winter.

### Ferry County.

Near Republic the California mine will be reopened. Since the mine was closed several months ago the shaft caved in above the water level and will be retimbered, says Manager Case. The mine will be unwatered and exploration work resumed.

The Colorado group, on Nine Mile creek, 18 miles northeast from Keller and same distance west of the Columbia river, has been sold to J. C. Davenport of Spokane for \$5000 cash. The group consists of the Colorado, the Prospect and the Prospect Fraction claims. A shaft has been sunk which has developed a body of ore 5 feet wide that carries 50% of lead, much silver and gold values. Ore has also been developed in a tunnel. Davenport will build a wagon road from the mine for an outlet to the smelters.

Fisher & Miller, lessees of the Lucille Dreyfus mine at Danville, expect to ship from two to three carloads of ore a week. They have struck ore 8 feet wide on the 100-foot level. They also have ore in the upper workings.

Near Republic, the Mountain Lion is shipping 100 tons of ore per day to the Granby smelter, over the Kettle Valley lines, and twenty men are employed, says Superintendent Cochrane.—Superintendent Case of the California mine has put men to work to resume development. The shaft will be retimbered.—C. Verill, in charge of development work on the Mountain Boy at Park City, near Republic, reports 90 feet of tunnel and drift run in eighteen days. The mine is being worked in both upper and lower tunnels.

### Lincoln County.

Near Springdale, the Turk smelter of Cedar canyon has been blown in. The smelter has a capacity of 100 tons daily. The plant is owned by the Turk M. & S. Co. and cost \$50,000. The company owns eight claims. The ledges worked carry copper and gold. There are several shipping mines in Cedar canyon, and ores will also be secured from the camps of Ferry county and from other districts in Stevens county. The officers of the Turk M. & S. Co. are: A. W. Turner, president; H. A. P. Myers, and H. J. Davis, manager.

### Okanogan County.

The Bodie mine at Bodie, near the Ferry county line, is reported improving. The 52-stamp and cyaniding mill has proven successful. There are twenty-five men at work.

The Buckeye M. Co., operating near Molson, is putting in a stamp mill and other machinery.—The Ben Harrison Co. at Chesaw has received an engine and boiler to operate the Opal mine, and is planning to put up a mill.

## WYOMING.

### Uinta County.

Deposits of coal and copper are reported found by O. Grimmelt, W. G. Johnson and J. B. Heenan of Lander, who have located several claims in the coal region geologically known as the Snake River coal field, in Jackson's Hole, Uinta county, 15 miles east and southeast of the Teton mountains. The coal veins are from 4 to 6 feet thick. The claims located are on Buffalo Fork, an upper tributary of the Snake river, a stream capable of furnishing a supply of water power and on the route of a proposed railroad which will be built west from Casper through Wyoming to Boise, Idaho. In addition to the coal a 12-foot vein of ore, giving assays of copper, gold and silver, has been located on the same stream and is being developed by G. Hays and C. Peterson of Dubois. Placer gold is found in the streams of the section, and a company has been organized to do placer mining there.

## FOREIGN.

### AUSTRALIA.

#### New South Wales.

The Minister for Mines of New South Wales reports the matter of establishing a limited number of State batteries on goldfields (particularly upon prospecting

fields), and of so amending the mining act as to provide for local mining boards of practical men to control the prospecting vote, are under consideration.

The management of the British Broken Hill Co., at Broken Hill, has arranged to install the Delprat salt cake process at its mine. The company has 200,000 tons of tailings at surface, averaging 4.5% lead, 5 ounces silver and 17.5% zinc. The company also intends to carry on prospecting operations from Marsh shaft on block 16.

Queensland.

At Charters Towers the underground fire in the Brilliant mine having been overcome, the Brilliant Block G. Co. reports work resumed in its mine on October 31st.—The Brilliant Central G. Co. resumed work on October 24th. On November 2nd six weeks' returns are reported: Crushed 2568 tons of quartz for a yield of 2849 ozs. of gold, including the clean-up of the plates; cyanide bullion, £1601. New Queen G. Co. resumed work on October 24th; started mill crushing October 31st.

The Mount Sampson G. M. Syndicate has been formed to work property on Upper Cedar creek, Samford district, 20 miles from Brisbane. Leases have been acquired for 560 acres of freehold property.—During September, 38½ tons of stream tin (value £2761) and 21½ tons of copper and silver matte were shipped from Stanthorpe, the latter being the product of the Silver Spur silver mine. At the Silver Spur silver mine at Texas operations are being extended and the working and output will be doubled. The new furnace is in full working order. Manager E. Hall is enlarging the old furnace to the same dimensions as the new one.

The Mungana M. Co., Ltd., operating at Chillagoe, in its report for the past fiscal year shows 7005 tons of copper ore and 10,720 tons of lead ore treated at the Chillagoe smelters. Production was 353 tons of copper, 1904 tons of lead and 167,496 ounces of silver. Work at the mines is being conducted at the Lady Jane and Girofla shafts. In the Lady Jane, at the 150-foot level, the lode showed 18% copper, 16% lead and thirty-four ounces silver. Stopes are opened up and sinking resumed. No. 3 shaft is equipped and 8000 gallons of water per hour are being handled. The open-cut at the Girofla mine produced 15,987 yards overburden and 10,132 tons of ore, containing 44.85 tons copper, 2602 tons lead, 85,271 ounces silver. From an intermediate level at the 180-foot level of the shaft 3119 tons of ore were stopped out, yielding payable values. This formation at 200 feet proved unpayable. In the Lady Jane levels are being opened up at 200 feet and 250 feet.

Western Australia.

The Great Fingall Con. Co. at Kalgoorlie reports for month of October: 100-stamp mill treated 14,911 tons for 9964 ozs. gold; 14,706 tons of tailings treated by cyanide for 3153 ozs.; 205 tons of concentrates treated for 1034 ozs. Total 14,151 ozs. fine gold. In southern end of Day Dawn shaft have met foot wall of reef at depth of 1271 feet, averaging 1 dwt. per ton for width of 9 feet. Have met foot wall northern end of shaft at depth of 1273 feet; reef 9 feet wide, averaging 7 dwts. per ton.

At Leonora the Sons of Gwalia reports for October: Ore crushed, 9270 tons; 3731 ozs. fine gold recovered; tailings treated by cyanide, 6212 tons for 844 ozs.; concentrates treated, 156 tons for 619 ozs.

BRITISH COLUMBIA.

Cassiar District.

Atlin reports say the total gold output of the Atlin district the past summer is estimated at \$600,000, or \$100,000 in excess of that of last year. The season has been shorter than usual.

East Kootenay District.

Work is being carried on at the Bull river placer camp, near Fort Steele, for a dam and flume. Mining machinery will be put in by the Bull River M. & P. Co. The company has four placer leases which will be worked by hydraulic mining, and will put in a power plant for electric lighting and supply power to mines in the Kootenay valley.

In the St. Eugene mine, at Moyie, a strike has been made in the 125-foot level of the shaft and in 1250 feet. In the face of the drift are 15 feet of galena. It is shipping ore and will be sent to the smelter. The ore body has a depth of 1200 feet from surface.

J. C. Drewry, a director of the St. Eugene M. Co., says the normal output of the St. Eugene mine at Moyie is 3000 tons of concentrates a month; but, owing to shortage of water, the output was curtailed during August, September and October. A pumping plant is being set up to pump water from Moyie lake to supply water for the concentrator. A 200 H. P. engine is being added to give the concentrator additional power. These improve-

ments are about completed and the St. Eugene output will be brought up again to the 3000-ton per month mark. In making a raise from the 1800-foot level, they struck a shoot of galena which is 5 to 15 feet wide. Then they drove ahead on the 1700-foot level and cut the ore shoot found in the raise. On the 1925-foot level, the first shaft level, in the east drift, they have been driving steadily in ore since last May. The drift is 7 feet wide. This ore is of concentrating character and will concentrate 5 into 1.

Roseland District.

At Roseland, Manager M. R. Galusha of Spokane, Wash., says he has arranged for building an aerial tramway to connect the Jumbo mine with the tracks of the Red Mountain Railway. He has surveyed the line for the tramway. Since the Jumbo mine began operations, eighteen months ago, ore has been hauled in wagons. Ore has been found at depth, and the tramway will be built on an air line from tunnel No. 2 of the Jumbo down to Little Sheep creek, connecting with an ore bunker on Big Four flat and with the railway at a point about 1½ mile west of Roseland. The length of the tramway will be 5080 feet and will cost \$15,000. The Jumbo Co. intends to ship 500 tons a day, instead of 500 tons a week.

Vancouver Island.

A body of ore, running in copper and carrying an ounce of gold per ton, has been struck on the Victoria mine, of the Vancouver Island Ex. S. group, 2 miles north of Ladysmith. A drift was run from the tunnel that cuts the ledge at a distance of 120 feet. The vein shows a body of ore 7 feet wide. Shipments will be made to the smelter.

West Kootenay District.

In Trout Lake district the Winslow group is on Silver Cup mountain, 2 miles northeast of Trout Lake landing, which is 7 miles southeast of Trout Lake City. Two miles west from the Winslow is the Copper Queen group consisting of three claims. The outcrop shows a vein of quartz 30 feet wide. The owners of the Copper Queen are Copp, Westfall and Windsor. They have increased developing work this year and put up winter quarters. It has tunnel sites, and can be reached by a 2-mile tramway line from the lake shore. East of the Winslow are the Lucky Jim and U and I groups, both showing gold values. The Copper Queen and Lucky Jim are adjoining the Silver Cup mine. On the Winslow the lead is 8 feet wide; a tunnel has been driven which is in ore. Near the Winslow and belonging to the same owners is the Cromwell claim. The Winslow ore is pyrite with free milling gold.

BRITISH GUIANA.

Georgetown reports say exports from January 1 to October 18 includes: Gold, 64,005 ozs. 17 dwts. 19 grs. at \$1,131,800.61, a decrease of 4191 ounces, compared with same period of 1903. Diamonds, 8633½ carats, value \$67,839.22, an increase of 1616½ compared with 1903.

The Chronicle of Georgetown says the Peter's mine on the Pururi river will be opened up by the British Guiana G. Con. Co., Ltd. The superintendent has forty men clearing ground and erecting buildings. The mine will employ 1000 men. A 15-stamp mill will be put in to be built in sections, no one piece to exceed 300 pounds in weight to facilitate transportation. This is expected to handle 1000 tons of ore from the Peter's mine per month. The place will be fitted with an electric lighting plant.

CANADA.

Ontario.

Wabegoon reports say that in the Manitou J. E. Burns, president of the Northern Light Co. of Detroit, Mich., operating the Paymaster mine, has arranged for development during the winter. So far 100 feet of sinking has been done.—In the Eagle Lake district, in addition to the two Buffalo companies operating, the Honor Bright G. M. Co. of Ontario will start development.—Steam was turned on in the 10-stamp mill at the Redeemer mine, in Dryden belt, last week. G. A. Corbell of Tiffin, Ohio, is part owner.

—Reports from the Sturgeon Lake district say that J. S. Steele expects to have his mill running on St. Anthony reef this week.—H. J. Tharle of Buffalo, N. Y., with Pennsylvania men, has bought the Minto mine, near Fort Williams, for \$108,500. It is 5 miles from the Sunbeam mine, which is a regular producer. It comprises 120 acres.

IND'IA.

For month of October, the following reports are made by gold mines at Kolar: Champion Reef G. Co., 15,732 tons of ore produced 15,277 ozs. of gold; 17,672 tons of tailings (cyanide process) produced 2137 ozs. Total, 17,414 ozs. There is a

slight reduction in the return due to smaller quantity of tailings now available for treatment.—Hutti (Nizam's) G. Co., 1207 ozs. of gold from 1950 tons crushed.—Mysore G. Co., 15,800 tons of quartz produced 15,330 ozs., 12,900 tons of tailings (cyanide process) produced 951 ozs. scrapings from plates 365 ozs.; total, 16,646 ozs.—Mysore West G. Mysore-Wynad G. Co., 1044 ozs. from 2180 tons.—Nundydroog G. Co., 6500 tons of quartz produced 5364 ozs.; 5018 tons of tailings (cyanide process) produced 479 ozs.; total, 5843 ozs. of gold.—Ooregum G. Co., 10,644 tons of ore produced 5030 ozs.; 10,704 tons of tailings (cyanide process) produced 970 ozs. Total, 6000 ozs. of gold.

MEXICO.

Chihuahua.

W. K. Ryan, of Chihuahua, has bought the Hidalgo zinc mine of Gibbs & White, of Minaca. The property consists of thirty-six pertenencias adjoining the Calera zinc mine of the Calera M. Co. It is 12 miles from Minaca, but a spur will be run from the Chihuahua & Pacific's extension up to the Calera, on which development work is being done.

G. B. Jacobs and S. Lawrence report their jig concentrating plant in Santa Eulalia working successfully. It is what is called the "intermittent jig of the Joplin type," operated by a gasoline engine. The plant does not require a continuous stream of water, water being packed on burros. The plant has a capacity of twenty tons of ore per day. Jacobs & Lawrence are also shipping twenty tons of ore per day. The ore concentrated is of lead.

P. H. McDermott, of Los Angeles, Cal., and W. N. Cannon, of San Diego, Cal., have bonded the Americano lead-silver mine at Terrazas on a basis of \$125,000 gold and will start work by Dec. 15. The mine is owned by the American M. & S. Co. They expect to handle the water with the pumps already on the mine. Bodies of ore are said to exist below water level, and they expect to put in a fifty-ton smelter. The Americano mine is said to have produced in the past two years ore to value of \$125,000 gold, from above water level at 250 feet.

Coahuila.

The Monterey News says the Torreon smelter, of Torreon, which has a lease on the Cabrillos mine in Coahuila, is preparing to increase the present output of 3000 tons per month. Engineer C. Bluse has taken charge of the work. The Torreon smelter exchanges this ore with the "smelter trust" and it is shipped to Monterey, and the "trust" delivers a like amount at Torreon.

A. Longega, W. Beckman, et al. have acquired title to 25,000 acres of coal lands 25 miles west of Sabinas and development will be started by Dec. 1st. Machinery, including engines, boiler and hoists, is on the ground. It is stated that a branch railroad will be built from the mines to Sabinas, on the International Railroad.

Durango.

It is reported from Guanacevi that the De Soto mine has been sold to J. A. Corani of Boston, Mass., for \$600,000, Mexican. About 200 men are at work in the mine and a 100-ton concentrating plant will be built. It is claimed \$100,000 of ore is on the dumps and \$600,000 blocked out underground.

Jalisco.

S. S. Gates, superintendent of the Pazas mine, near Ahualulco, says cyaniding equipment will be added to the company's milling plant.

Lower California.

(Special Correspondence).—The Ybarra G. M. Co. holdings near Calmali have been leased to B. Hall et al. of San Francisco, Cal.

Calmali, Nov. 12.

The Alamo Electric P. & M. Co. is preparing to put in three gas engines, single cylinder construction, 20 inches diameter, 30-inch stroke; also a gas plant, to operate with wood, of 240 H. P. capacity. The plant will be built at Alamo, and is to drive electric generators for furnishing electric power for gold mines.

Mexico.

R. M. Raymond, manager of El Oro M. & R. Co., Ltd., operating at El Oro, in his report for the year ended June 30, 1904, shows mining expenditure of \$794,357; bullion recovered, \$1,424,745; railroad receipts, \$255,411. Mining operations during the year opened up 13,182 feet of workings. From these and older workings 109,288 tons of ore were taken, of which 106,921 tons went through the mill. The ore carried \$14.54 gold and \$2.11 silver per ton. Extraction was:

	Gold.	Silver.
By stamp mill.....	\$2 22	\$0 05
By cyanide.....	0 89	0 83

Another mill is being built to treat the

tailings by a combination of amalgamation and cyaniding. Cost of handling the ore was:

	Per Ton.
Mining.....	\$1 78
Mine development.....	1 08
Milling.....	1 19
Cyaniding.....	1 25
General expenses.....	1 55
Total cost per ton.....	\$5 85

The mine development is reported as showing 561,073 tons of ore in sight. The company has contracted with the Mexican L. & P. Co., Ltd., for electric power.

Sonora.

The Sonora M. & M. Co., C. O'Keefe of Nogales, Ariz., president and manager, will put in a 20-stamp mill and cyanide process on the Juarez mine, near Altar, which it has bought for \$65,000.

Manager C. H. Johnson says coal mining machinery will be put in at the coal mines in which he is interested at San Marcial.

Vera Cruz.

P. N. Furber, president of the Oil Fields of Mexico, says he is putting in machinery, materials and tankage for his company, which is drilling its second well at El Cuguas, near Papantla.

Zacatecas.

La Gloria mine is shipping ore. D. McLaughlin has installed improved methods and machinery. La Gloria mine is at San Pedro de Campo, in Concepcion del Oro district, and shows production of gold with silver and lead values.

NEW ZEALAND.

The Department of Mines has issued its annual report for 1903, showing an increase of \$309,032 in gross value of minerals produced over 1902.—The quantity of gold entered for export during 1903 was 533,314 ounces, valued at £2,037,831, and of silver 911,914 ounces, valued at £91,497, being an increase of £105,920, as compared with the export returns for 1902. Total value of gold, silver, coal and other minerals (including kauri gum) produced to end of 1903 was \$85,813,240. The quantity of gold entered for exportation through the customs for the year was: Auckland, 232,681 ounces; Marlborough, 927 ounces; Nelson, 7962 ounces; West Coast, 125,241 ounces; Otago and Southland, 166,458 ounces.—The report states that hydraulic and alluvial mining continues to give employment to a large number of men in Middle Island (the Nelson, West Coast, Otago and Southland districts being the principal centers of operations). During the year work had been carried on heavily at a majority of the claims, but a severe winter caused damage to water races in parts of Otago, the length of the working season being shortened in consequence.—The dredger mining branch of gold mining was steady during the year, total number of working dredgers returned for 1903 being same as previous year—201. Both the West Coast and Central Otago showed a decrease in number of dredgers at work; but in Southland the number increased.—The sum of £1088 17s 3d was expended in subsidies, for the year ending March 31, 1904, to prospecting associations and parties of miners engaged in prospecting. The royalty obtained by the government in respect to purchase of patent rights of the invention of the cyanide process of gold extraction amounted to £7565. The sum of £5176 17s 7d was paid during the year as compensation to land owners in respect to rivers and streams which had been proclaimed as water courses into which tailings and mineral debris may be discharged. Under the heading of "School of Mines" the report says these institutions continue to prove of benefit to persons employed in and about mines and batteries, and the instruction given is such as to enable students to attain the knowledge necessary to qualify them to hold the responsible positions connected with their profession.—The output of coal and lignite (including a small quantity of oil shale) during 1903, was 1,420,229 tons, being an increase of 55,189 tons over 1902. The Northern district produced 209,795 tons; West Coast district, 781,032 tons; Southern district, 429,402. The total number of mines returned as having been at work during the year was 178; average number of men worked, 2852. There are two State coal mines in New Zealand, one at Seddonville, which started to put out coal towards the end of the year, and the other at Point Elizabeth. Both are producing coal suitable for steaming purposes.—During 1903 the number of fatalities in connection with mining operations was greater than had been the case for each of the previous three years. In the quartz mines, employing total of 3597 men, there were nine fatalities; in hydraulic and alluvial mines and dredgers, employing 6613 men, ten fatalities; and in coal mines, with 2852 persons employed, four fatalities.

## Personal.

J. HALL is foreman of the Wildman mines at Sutter Creek, Cal.

W. J. ADAMS is examining copper deposits near Nacoziari, Mexico.

J. LEWIS is superintendent of the Peabody coal mine, Springfield, Ill.

H. B. LIND is manager of the Jupiter Goldfield M. Co. at Goldfield, Nev.

ERNEST LEVY is manager of Le Roi No. 2 copper mine at Roseland, B. C.

V. P. STRANGE is manager of the Goldfield-Great Bend M. Co. at Goldfield, Nev.

W. ERNEST is mill superintendent of the Columbus Con. C. Co. at Alta, Utah.

J. E. BARNES is superintendent of the Bonanza group of mines at Goldfield, Nev.

FRANK NEWTON is superintendent of the National M. Co. mill, Steins Pass, N. M.

A. H. CRAMPTON is superintendent of the Gold Bond M. Co., operating at Goldfield, Nev.

J. GUNDY is mill superintendent for the Colorado-Tellurium G. M. Co., near Central City, Colo.

A. MURPHY is superintendent of the Pioneer group in American Fork canyon, near Alta, Utah.

J. F. STANDISH is manager of the Sunset M. & M. Co., near Russell Gulch, Gilpin county, Colo.

S. HOSKIN is manager of the mines of the East Boston M. Co., operating near Central City, Colo.

A. WALTERS is superintendent of the After Supper mine of the Benzai M. Co. at Black Hawk, Colo.

T. RATSON is head mining captain at the Ahmeek copper mines, near Calumet, Mich., vice W. Daniel.

L. W. TATUM has returned to Chicago, Ill., from Kentucky, where he had been examining fluor spar lands.

A. BUCKBEE is manager of the Cumberland mines and mills of the Pioneer M. Co., near Silver City, Idaho.

Y. WATERABE, professor of metallurgy in the Imperial College of Tokio, Japan, is inspecting California mines.

R. B. MCGINNIS of Douglas, Ariz., is mining engineer for the Marquette Exp. Co., operating at Goldfield, Nev.

F. L. FOREMAN of Wardner, Idaho, is manager of the Dannemora G. & C. M. Co., operating near Wallace, Idaho.

I. N. LAWRENCE of Deadwood, S. D., is manager of the Victor G. M. & M. Co., operating in Lawrence county, S. D.

R. C. W. KESWICK, a mining engineer of southwest Australia, is studying gold dredging operations at Oroville, Cal.

E. MASSY is superintendent of the La Brisca gold mines of the Greene Con. G. Co., near Magdalena, Sonora, Mexico.

J. E. MILLER, formerly State mine inspector for Illinois, is superintendent of the Superior C. M. Co. at Gillespie, Ill.

J. E. HEWSTON, E. M., has left San Francisco, Cal., to take the management of gold mines near San Jose, Costa Rica, C. A.

E. F. DUNN of Kew, Victoria, Australia, has been appointed as Victorian Government Geologist, vice J. W. Gregory resigned.

A. W. BUCHANAN, secretary of the American Conduit Co. of Chicago, Ill., is in Pasadena, Cal., where he will spend the winter.

W. H. HILL is building a 100-ton amalgamation and concentration plant for the Lucky Tiger G. M. Co. at Yzabel, Sonora, Mexico.

C. E. HEIZER is in charge of the Spearfish mines and mill, near Cyanide, S. D., during the absence of Manager Brown in California.

D. G. JEWETT of Los Angeles, Cal., has been making an examination of the Gold Basin mines, Tuolumne county, Cal., for Los Angeles parties.

C. H. REPATE, formerly with the Washoe C. Co., at Anaconda, Mont., has re-entered employ of that company, as mechanical superintendent.

F. BUTLER, formerly superintendent of the Chainman mine at Ely, Nev., has accepted a position with the Topaz M. Co. at Rama City, Nicaragua, C. A.

A. K. BREWER, superintendent of

Smelter No. 2 at Monterey, Nuevo Leon, Mexico, returned there last week from an extended trip in the United States.

J. R. FINLAY, formerly manager of the Portland G. M. Co., Cripple Creek, Colo., has opened office at Colorado Springs, Colo., as consulting mining engineer.

T. F. BODY has declined the position of the late Edw. Doerr at the Chapman mines, Durango, Mexico. The appointment carries with it a salary of \$10,000 per year.

HARRY P. STOW left San Francisco yesterday for Treadwell City, Alaska, where he assumes charge as assistant superintendent of the Alaska-Treadwell G. M. Co.

F. W. BRADLEY, who sustained severe personal injuries by the explosion of gas at his residence in San Francisco, Cal., last week, is convalescent, and will not lose his eyesight as at first feared.

I. DAVIDOV of New York City, N. Y., has resigned as manager of the Santa Barbara Placer Co., Bertha G. M. Co., Fortuna G. P. Co. and other companies operating in Colombia, S. A., to devote his time to personal holdings.

E. G. COKER, assistant professor of civil engineering, McGill University, Montreal, Quebec, has been appointed professor of mechanical engineering in the City and Guilds of London Technical College, Finsbury, London, Eng., vice W. E. Dalby, appointed professor of civil engineering in Central Technical College, London, Eng.

## Obituary.

JOHN ALLEN, reputed one of the discoverers of gold in what is now Montana City, Mont., died in Helena, Mont., on the 22nd inst. Allen went to Last Chance in 1864. He made his home near Marysville, and discovered and named Pigeon gulch.

M. SOMMER of Salt Lake City, Utah, part owner of the Steele mine at Park City, Utah, died at Park City on the 13th inst. while inspecting the Steele mine. He was also interested in the St. Louis-Ontario mine in the same district. Deceased was a native of Frankfort, Germany, aged 44 years.

H. S. MUNROE, a pioneer miner and mine owner of Tuolumne county, Cal., died at Sonora, Cal., on the 18th inst. Deceased was for several years associated with the late T. C. Birney in working the Bald Mountain pocket mine and the Tanzy lead. He was a native of Massachusetts, aged 73 years.

## Books Received.

"Oiled Roads of California" is the title of Bulletin No. 2, issued by the State Department of Highways, Sacramento, Cal., from whom it may be had on application.

Under title of "Mineral Resources of the United States for 1903," the United States Geological Survey has issued: "Production of Mineral Waters" and "Production of Mineral Paints."

"A Preliminary Report on the Bauxite Deposits of Georgia," by T. L. Watson, is the title of Bulletin No. 11, issued by the Geological Survey of Georgia, W. S. Yeates, State Geologist, Atlanta, Ga. It is well illustrated with engravings of the mines and plants, and contains chapters of the distribution and description of the mines, the geology of the deposits, their genesis and chemistry, and the technology of bauxite in the manufacture of aluminum and alum.

Many books have been written on assaying. Any addition to this great library is now received with some curiosity as to why it should displace standard treatises that have stood the test of time. Each of these fills some place in the varied needs of different assayers. Wet methods, dry methods, theoretical methods, rule-of-thumb methods and practical methods have each been exemplified. "Notes on Assaying and Metallurgical Laboratory Experiments," by R. W. Lodge, is really an account of some of the experimental work carried on by the mining students of the Massachusetts Institute of Technology. It is a treatise on methods of fire assay of metals. As a text book for students it offers a good guide for their work. It requires a previous knowledge of chemical methods and reactions for intelligent study. Its main value lies in

giving reasons why certain results follow certain treatment. In this respect it is far superior to many of the rule-of-thumb manuals issued by correspondence schools. Its chief lacking seems to be practical methods for the immediate and accurate assay of ores when all the equipment of a modern laboratory is not at hand. The new material in the book consists of data derived from experiments in laboratory work. Some new ideas on cupellation appear; the effects of varying the heat and the charge for a number of typical ores is ably discussed. They show that careful scorification gives as accurate results as any other method for the treatment of zinc box residues. 0.05 A. T. of residues ground to pass a 200-mesh screen, mixed with 35 grams of test lead in a 3-inch scorifier, and covered with 30 grams of test lead and 10 grams of borax glass, will give the best results, the temperature being reduced to 780° C. after five minutes of fusion. Laboratory means for testing the most economic treatment of various ores are fully described. John Wiley & Sons are the publishers; it will be sent postpaid by the MINING AND SCIENTIFIC PRESS upon receipt of \$3.

## Commercial Paragraphs.

The Century Electrical Works of San Francisco, Cal., has bought property in Richmond, Cal., on which to erect a factory for the manufacture of electrical apparatus.

The United States Government has just purchased from the Rand Drill Co. twenty-seven Imperial pneumatic hammers and drills. These are to be used in connection with the Manila harbor improvements.

## Latest Market Reports.

SAN FRANCISCO, November 25, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59c, refined (1000 fine); San Francisco, 59c; Mexican dollars, 47c San Francisco, 47c New York.

COPPER.—New York: Standard, \$14.87½; Lake, 1 to 3 casks, \$14.87½@15.12½; Electrolytic, 1 to 3 casks, \$15.00; Casting, 1 to 3 casks, \$14.62½; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: 286 spot per ton.

Copper shows a further slight advance over the quotations of last week, the highest price quoted being \$15.12½ for Lake. No further rapid advance is anticipated at this time, though the price may continue to slowly climb upward.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: 41½ long ton.

SPELTER.—New York, \$5.87½; St. Louis, \$5.00; London, \$25 5s 3d ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$29.00@29.17½; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½@35c. London, \$132 10s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100 lb. lots, 16c.

ZINC.—Metallic, chemically pure, 3½ lb., 50c; dust, 3½ lb., 10c; sulphate, 3½ lb., .04c.

NICKEL.—New York, 40@47c 3½ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$14.60 @—; gray forge, \$12.00; San Francisco, bar, 3c 3½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.50; open hearth billets, \$19.50; San Francisco, bar, 7c to 12c 3½ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¾ lb. above kegs price; in 1 and 5-lb. tin cans, 100 lbs. per case, ¾c. per lb. above kegs price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for car-load lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city 3½ bbl.

CEMENT.—Imported, \$2.15@2.65 3½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 3½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c 3½ set; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c 3½ lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 3½ lb.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c 3½ lb.; Cal. s. soda, bbls., \$1.20@1.40 100 lbs.; sks., \$1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c 3½ lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66½ B, 1¼@2c 3½ lb.; nitric acid, carboys, 8c 3½ lb.

OILS.—Linseed, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 80° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do. in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c 3½ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c 3½ lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c 3½ lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 3½ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c 3½ lb.

MOLYBDENUM.—Best, \$2.75 3½ lb.

CHROMIUM.—90% and over, 3½ lb., 80c.

PHOSPHORUS.—American, 3½ lb., 70c.

SILVER.—Chloride, 3½ oz., 90c@1.00; nitrate, 55c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—3½ lb., \$2.75.

SODIUM.—Metal, 3½ lb., 50c.

BISMUTH.—Subnitrate, 3½ lb., \$2.10.

URANIUM.—Oxide, 3½ lb., \$3.50.

## In Need of Information.

The strange and somewhat unusual spectacle is sometimes seen of a mine remaining idle for years when adjoining it are mines which are working and

mines are idle because the owners are unable to treat the ore satisfactorily, and are unwilling to risk the money necessary to build experimental works for the purpose of gaining information on the subject. In these days there are few ores the successful treat-

lar ore under discussion. Again, a satisfactory and inexpensive method of treatment may be known; but the mine owner, being wholly unacquainted with it, seeks in vain through the range of his own limited experience for a solution to the vexing problem.

each month pay a dividend. If it be known that the idle mine contains no ore of value, its idleness is easily explained, but when the idle mine has produced a large amount of gold and it is known that ore bodies still exists in the mine its idleness is difficult to explain, particularly when no legal difficulties are responsible for the idleness. In some instances good

ment of which is beyond the knowledge of metallurgical engineers, but the well known methods may not be economically applicable to a particular case. Smelting is the last resort in a great number of instances, but while it is known that smelting will successfully reduce the ore, it may be too expensive for the values contained in the particu-

For years the MINING AND SCIENTIFIC PRESS has devoted itself to the exposition of all that was reliable and valuable to the miner, the metallurgist and engineer, and there are few processes in actual and successful operation in any part of the world that have not been exploited in these pages—often illustrated by engravings and drawings.

THE usual number of fatalities resulting from the thawing of dynamite is being reported. In these accidents the cook stove, steam boiler, open fire and other methods, long since recognized as very hazardous, figure as prominently as usual upon the approach of each winter.

IN a suit for alleged damages resulting from sulphurous fumes from the copper reduction works at Ducktown, Tennessee, the Supreme Court of that State has rendered a decision in favor of the copper companies, and dissolves the perpetual injunction issued by the lower court restraining the copper companies from roasting sulphide ore in heaps in the open air, on the ground that the process was a nuisance. The court evidently judged the matter from the standpoint of the relative benefit and damage to those interested, and decided that heap-roasting was not a nuisance in these cases and that no damages were obtainable as a result of the failure of vegetation to grow in the vicinity of the roasting heaps.

THE prolonged strike which has been on in the Telluride district of southwestern Colorado since September 1, 1903, has been declared off by the Western Federation of Miners, who claim they have gained all they asked—that is, an eight-hour day and \$3 per day. Nothing is said about the employment of union men only and, as press dispatches are silent on this subject, it is probable that this point was not insisted upon. All Colorado will no doubt give a sigh of relief at this fortunate ending of a long and bitterly contested fight between organized labor and organized capital. The probability is that mining in southwest Colorado will receive a decided impetus and that greater confidence in the future will be felt throughout that State.

## Annual Labor and Relocation.

The question of the right of a locator of a claim to profit by "his own negligence in failing to perform the annual labor" (or to make improvements) required by the Federal law is one which has run the gauntlet of the courts. The question as it came before the Supreme Court of Utah was: "Can the locator of a quartz mining claim, who has allowed his location to lapse by a failure to perform the necessary work, make a relocation or a new location covering the same ground?" The court decided that such right was recognized by the Circuit Court of the Ninth Circuit (Warnock v. De Witt, 11 Utah, 324; 40 Pac., 205. Case dismissed by the United States Supreme Court on appeal, for failure to comply with Rule 10) and also by the Land Department. Further, the fact that a prior locator, after his right has lapsed, may renew it by resuming work, would appear to be a favor or right granted to such prior locator, but to deny him the right to locate is to deny him the right given to strangers. The case in the circuit court referred to is that of Hunt v. Patchin, 35 Fed., 816, and that of the Land Department was a letter from Acting Commissioner Holcomb to a man in Leadville, Colo. The case of Hunt v. Patchin does not appear to apply directly to the question, that being a case wherein several co-owners were concerned, and arose over an instance where one of a number of partners attempted to relocate for himself alone, while excluding his copartners. In the instance of the Land Commissioner, it was not a litigated case, but merely the opinion of the Commissioner, expressed in a letter, that one of several co-locators, all of whom are in default, may relocate in his own name, and hold the claim adversely to his former partners.

The Federal law makes discovery and location of a mineral vein, or deposit, the basis of the title to such property, and subsequently its development, by working and improvement, as a condition upon which it may be held. (Erhardt v. Boaro, 113 U. S., 527, 535, 5 Sup. Ct. Rep., 560.)

Lindley on Mines calls attention to another important phase of this question, which is of particular interest at this time, on the eve of a new year, which is that "the forfeiture is not complete until a relocation has been made. It is the entry of a new claimant with intent to relocate the property, and not mere lapse of time, that determines the right of the original claimant. The right to resume work before relocation by another is evidence that the original estate is not wholly lost by the failure to do the work. (Larkin v. Sierra Buttes G. M. Co., 25 Fed., 337, 343.)

The Supreme Court of Colorado has said: "As between the locator and the general Government the failure to do the annual assessment work does not result in a forfeiture. In other words, it is not necessary to perform the annual labor, except to protect the rights of the locator against parties seeking to initiate a title to the same premises. \* \* \* To otherwise express our views, it might be said that, after a valid location, the title thus acquired remains so, whether the annual assessment work is performed or not, until forfeited or abandoned. (Beals v. Cone, 27 Colo., 473.) \* \* \* Forfeiture is not complete until some one else has appropriated the property." (McCarthy v. Speed, 11 S. D., 362.)

By location the locator is given by the Federal laws from one to two years (according to date of making location) within which to perform his assessment work. Within this period his claim is valid and no one can deprive him of it. If at the expiration of the time (end of the second calendar year after date of location) he is permitted to relocate he may hold the claim another period of two years without work, and in this manner, by making a relocation biennially, he could hold the claim indefinitely without any work whatever, which is clearly contrary to the spirit of the law.

Annual work if performed as required by the Federal statutes (in addition to such further acts as may be required by State or Territorial and local laws) secures the locator in his title as against all others, and if the locator has failed to perform his assessment work his claim is subject to relocation, which he can only prevent by resuming work before a stranger enters upon the claim for this purpose.

Unfortunately the Supreme Court of the United

States has never passed upon the question, but there is little doubt but that the attempt to hold a claim indefinitely or for any period longer than that allowed by the statutes by the mere act of relocation would be declared non-compliance with the law and the claim subject to relocation by a stranger.

## Deeper Tunnel for Cripple Creek, Colo.

Realizing the great benefits derived from driving the El Paso drainage tunnel in the Cripple Creek district of Colorado, the mine owners are now seriously considering the driving of another tunnel under the hills of the district which will be 1500 feet lower than the present tunnel. The El Paso tunnel was driven a total distance of about 6000 feet. A portion of this distance was already in existence when the tunnel was projected, being the lowest level of the El Paso mine. The cost of this work was about \$85,000, which was subscribed by those directly benefited by the enterprise. It has been even more far-reaching in its beneficial effects than was anticipated. It is known that such a tunnel as that now proposed would make available a large amount of ore lying below the present lowest drainage level, but that this immense block of ground—1500 feet high and in some places 4000 feet high, to the surface—would necessarily require a long time for its drainage, consequently the tunnel should be started as soon as possible in order that the benefits may be enjoyed as soon as practicable. There is still a large amount of unexplored ground above the level of the El Paso tunnel, but in all probability this will be mostly worked out before the proposed deep tunnel can be completed, and before it has had a noticeable effect on the drainage of the ground between the level of the El Paso tunnel and that now proposed. The rate of progress in such a tunnel would probably not exceed 3500 feet per year, if it attained that much, though the first year this distance might be passed by working from three or more headings, but it is unlikely that any attempt would be made to sink to the tunnel level in the deep portion, as sinking any faster than the water level receded in the rocks would be very expensive. It is said the tunnel will be started near Marigold, a village on the Canon City road.

THE gold districts of Western Australia are struggling with the "theft-of-gold" problem and are seeking legislation which will provide more extreme penalties than those at present existing for the repression of this growing evil. An effort is being made particularly to reach the receivers of stolen gold, of whom it is said no less than fifty were known to the authorities a few months ago, but the active efforts made to apprehend these receivers of stolen gold has made them more cautious if not more honest, and the stealing continues without serious interruption. Legislation does not prevent the theft of gold from a mine any more than it does the theft of other valuables, but a means of thoroughly searching the men is undoubtedly the best preventive. This theft of gold is world-wide and appears to be one of the penalties which the owners of rich mines must pay for their possession. It is always the mines which produce rich pockets of native gold, or very rich tellurium ores, that are the heaviest losers. It is rarely that ore rich in gold is stolen if the evidence of the richness is not apparent.

THE principal, and in fact, the only, objection to wild cat mining reports and mine promotions is that they do not, as a rule, state facts. A good prospect may develop into a large and valuable mine, but the "fact" that it is at first a good "prospect" does not justify the statement that it is a property worth millions. If promoters would state the truth in their prospectuses no one would object, and those who were willing to take the risks such an investment involves could have no cause for complaint, but the glittering promises made by these irresponsible schemers is often too much for the cupidity of the unsophisticated, who go in to win, but always lose. Mines are made, rarely found, and a prospect which at the beginning makes an unattractive showing, sometimes proves to be a great and valuable mine, while on the other hand good prospects do not always develop as satisfactorily as anticipated. In either case why should not the facts be told, that they who desire to speculate may know just what risks they are taking?

## CONCENTRATES.

It is impossible to judge the value of ore in a single mine, much less that of an entire camp or district, without a thorough examination of every mine in the district.

SMELTERS cannot reduce ores without a certain amount of silica being present in the charge, and if the ore does not furnish the necessary amount it must be supplied from some other source.

WHERE governors on engines are run by a belt they should be in duplicate, so that in the event of one belt breaking the other would probably remain intact and thus maintain control over the engine.

THE proper way to learn what lands have been patented to the railroad companies is to apply to the United States Land Office in the district in which the lands, concerning which information is desired, are situated.

ZINC ores, to be considered first-class, must contain at least 60% zinc in the Missouri field. The attempt is made to produce, by dressing and concentration (magnetic and otherwise), as high a grade ore as possible. Pure zinc blende contains 67% metallic zinc.

THE tin mines on the east coast of Australia, near Lottah, occur in granite as a stockworks, there being no sharply defined limit to the ore zone either longitudinally, vertically or laterally, though the granite in which the ores occur outside of the mineralized zone is wholly barren of tin.

THE greatest element of danger in mine work is in the falls of rock from the roof of drifts and stopes, in places where no imminent danger is apparent. This is often the case in those portions of veins where the walls converge upward, leaving A-shaped masses to drop, and with little or no warning.

THE longest "V" flume in California is that in Madera county. It has a length of 53 miles, with 18 miles of branches. The sides are 36 inches, with a width at the top of 46 inches. It was built to float lumber from the mountains to the yards in the San Joaquin valley. It is stated to have cost \$270,000.

THE silver sulphide resulting from precipitation from sodium-hyposulphite solutions by means of sodium sulphide is often difficult to reduce to bullion. It were better in many instances to ship the silver sulphides thus obtained to a refinery, if the shipper and refiner can agree upon the value of the shipment.

MANGANESE is associated with a very large number of minerals, some of them very common, others comparatively rare. It exists principally as oxide, but also occurs more or less abundantly as silicate and carbonate. It occurs with tungsten, tantalum and other rare and heavy minerals. The principal production of manganese ores is from its various oxides.

AN apex discovered beneath a later flow of volcanic rock, or of gravel or other detritus, is as valid as an apex occurring at the surface, but in all cases where the extralateral right is involved it is necessary to absolutely identify the vein and its continuity from the apex to point of contention, and this is sometimes difficult where the vein system is complex and broken.

AT present in California the law protecting the owners of mining claims, bonded to others, from attachment by workmen, by posting a notice to the effect that the claim owner will not be responsible for debts contracted, etc., is somewhat involved, but it is probable that a new and more comprehensible act will be passed at the coming session of the Legislature of that State.

ERUPTIVE ROCKS are often found to contain fragments of unaltered sedimentary rocks which occur in the vicinity. Thus, a sheet of rhyolite may be found to enclose fragments of quartzite which underlie the rhyolite. Sedimentary rocks near contact with intrusive eruptive rocks often contain crystals of feldspar and other minerals, the result of contact metamorphism.

WHERE a large volume of water is obtainable under low head, turbine wheels may be put in to develop power, and often such installation is less expensive than the high head and impact wheel installation, because of the longer ditch and pipe line required. In the latter, less water will do more work under certain conditions. Of these conditions the person contemplating an installation must be the judge.

A BARREL of crude oil in the California oil fields contains forty-two gallons; 2240 pounds of oil (long ton) is equal to seven barrels, or about 7.6 pounds per gallon. It is generally estimated that four barrels of California fuel oil equals 2240 pounds of good coal, and a ton of good coal is usually estimated to be equal to two cords of dry pine cord wood. Numerous experiments made with oil have demonstrated that a pound of good oil

burned under a tubular horizontal boiler, with a burner of proper construction, will evaporate from 13 1/2 to 15 pounds of water. Nearly all the varieties of clean fuel oil in California give approximately the above result. The fuel value of coal varies greatly.

A PATENT may be applied for to a mining claim as soon as the necessary \$500 worth of work has been performed. In this the element of time is not considered. The work may all be accomplished in a single day if desired. It is not necessary to do the work for five years—\$100 worth annually—in order to obtain patent, though a patent may be obtained at the expiration of this time if \$500 worth of assessment work has been done or improvements made.

It has been claimed that gold was never present in rocks in the absence of pyrites, but this has been proven to be without foundation. Gold is known to occur in many instances in quartz, marble, sandstone and in other rocks—eruptive, metamorphic and sedimentary—where no pyrite is present. Pyrite is said to always contain gold, but it is sometimes present in that mineral in such infinitesimal amount as to escape detection, if actually present at all.

DIKES AND FAULTS are of such frequent occurrence in the Transvaal as to seriously affect the position of the surface plants, and the mining operations in the mines. It has been customary in estimating the tonnage of any given area on the Rand to deduct 15% as an allowance for faults and dikes. In some instances, however, the faults are thrusts and the payable area is duplicated over a certain portion of the beds, which will result in giving a greater tonnage than the estimate calls for, but most of the faults are normal.

THE machinery (attached to the soil), such as engines, mills, derricks, pipe lines, etc., which may be found on a mining claim, either quartz or placer, subject to relocation, passes to the relocater of the claim, on the general principle that the title to the claim passes to the relocater, and that the original owner cannot enter the premises to remove the machinery, for the reason that he is a trespasser. It should be understood that the law does not specifically state that the relocater becomes the owner of such improvements as are attached to the soil, but that it is the principle above stated that operates in such cases.

THERE are now in California few tailings piles containing values. Nearly all have been treated or are in process of treatment by the cyanide process. The exception to this statement is found in numerous large dumps of tailings from chlorination works in various parts of the State. These tailings consist largely of iron oxide, partly roasted iron sulphides, a little silica, lime, magnesia, etc., and gold and silver to the amount of \$3 to \$10 per ton. Thus far all efforts to work these tailings at a profit have been abortive, though the attempts in that direction have been many, and some of them elaborate and expensive.

THE best idlers to carry running ropes are grooved wheels. They are superior to cylindrical idlers, and do less injury to the rope. When idlers are placed in at a bend in a shaft, it is well to put in two or three wheels provided with double grooves. These should be placed side by side, forming a series of either four or six grooves covering a space of 8 to 12 inches, which is almost certain to come within the range of the rope as it rises on approaching the bend. The idlers should run loose on the shaft, being held in place by collars and given only sufficient play to keep them from binding. The shaft may also turn in boxes, thus reducing friction and lessening the liability of the idlers to cut the shaft. The idlers should be oiled daily, and more frequently if necessary.

IN some smelters it has been found advisable to charge into the furnace with the ore blocks of wood, which, as they reach the zone of fire, burn and at the same time serve to keep the charge from packing too firmly. It is only with ores which show a disposition to thus pack tightly that wood is used. The coke charge in furnaces varies greatly from almost none to 20%, or even more. From 6% to 7% is probably the average with copper furnaces treating sulphide ore. The general impression is that all coke is alike, but smelters are aware that such is not the case. One shipment of coke may be all right, and good work is done with it, when another shipment from the same manufacturers will give very different results on the same ores. This is particularly noticeable in lead smelting.

IN mica schist lenses of quartz are often found which are gold bearing, and many mines have been opened on this type of vein formation. Usually the lens feathers out and mining ceases until some one has the courage to prospect blindly for another lens in the vicinity of that worked out, and in many cases the effort is successful, and the mine again becomes profitable. These lenses usually occur along a definite strike approximating that of the schists, and they also generally re-occur in depth in similar manner. No mine of this kind should be considered worked out until careful search has been made on both strike and dip of the mineral zone for other shoots of ore. In some instances ore deposits of this character are accompanied by intrusive dikes, and in others none are found. Where such do occur they are

often of granitic character—pegmatite or aplite. The dikes themselves are also sometimes gold bearing. In San Diego county, Cal., in Julian district, pegmatite accompanies veins of the same description, and also in the Harney Peak region of the Southern Black Hills of South Dakota. In Madera county, Cal., the intrusive dikes associated with gold veins are mostly aplite. Dikes often occur with the gold quartz lenses of Georgia and the Carolinas, and also some of those north of Lake Superior, in Canada.

SOME mill men recommend the use of dilute cyanide of potassium on mill plates, and some even think it a good thing to introduce to the battery; but the consensus of opinion among mill men is that cyanide hardens mill plates and eventually renders them unfit for amalgamation. The copper should be thoroughly cleaned, and, after proper annealing, given a heavy electroplate of silver. It is then in first class condition, and, with proper care, should remain so. For many years it was thought by mill men that raw copper plates were superior to all others; but experience has shown that silver-plated plates are superior to all others for amalgamating gold, and tests in mills with raw copper plates have proven that the percentage of gold saved was increased materially by the use of silvered plates.

THE copper mines of Ducktown, Tenn., were discovered about 1846, and systematic work commenced in 1850. In 1854 smelters were built at the mines, since which time the mines have been operated almost without interruption. The outcrop of these mines consisted of a ferruginous gossan first worked for iron. The country rock is mica schist, with siliceous zones of semi-schistose quartzite. The formation is presumed to be Archean. The ore occurs in zones of fracture and shearing. Below the iron gossan were found rich copper oxides and carbonates; lower in the sulphide zone occur chalcocopyrite, pyrite, pyrrhotite, zinc blende and galena, with calcite, quartz, zoisite and amphibole. The average value in copper is 3.5%. In some respects these deposits resemble those in northern Madera and southern Mariposa counties, California.

THE rich gold quartz veins of Charters Towers district, Queensland, Australia, are so flat that one can walk up and down the inclined workings without difficulty. Few of the veins have a dip of 40°, and some are as low as 10°. The country rock (syenite) is generally hard, the veins comparatively small, and the cost of mining is, accordingly, much higher than in some other fields. Most of the mines are dry, and in some of the workings the men walk along the levels ankle deep in dust, which, rising, permeates the air. The vein material is quartz carrying pyrite, galena, blende, chalcocopyrite, and sometimes arsenical sulphide. The average size of the veins is 3 feet. Owing to the scarcity of timber in the region, the walls in the larger stopes are supported by cribs of timber filled with waste rock. These are locally called "pig sties" by the miners. In some of the mines the walls swell upon exposure to the atmosphere, which makes timbering expensive.

FERRO-MANGANESE is added to the molten metal in steel making for the purpose of driving certain injurious substances into the slag, thereby purifying the steel. Manganese is also added to steel to make a metal for certain purposes where hardness or toughness are desired. Nickel is used also in making hard, tough steel, and particularly in armor plate. Some of the armor plate also contains chromium. The percentage of these metals used in steel armor plate is 3.5% nickel, 1.5% chromium and 0.25% carbon. Molybdenum is used in steel making, its use being on the increase. Tungsten is another substance used in steel making, molybdenum and tungsten acting much the same, except that less of the former is required to produce the same results as the latter. The peculiar property imparted to steel by the addition of tungsten or molybdenum is that the steel will harden, after heating, in the atmosphere without resorting to the usual tempering methods, such as plunging in oil, water, brine or other special solutions.

TANTALITE is a tantalate of iron and manganese with the formula  $\text{FeMnTa}_2\text{O}_6$ , and is often accompanied by small amounts of cupric oxide and lime. Tantalite contains about 84% tantalum pentoxide. It is retailed at \$9 to \$10 per gram. The metal is insoluble in mineral acids, including aqua regia, but dissolves slowly in hot hydrofluoric acid. The color of tantalite ranges from cinnamon-brown to brownish-black, with a sub-metallic luster. It occurs in crystals and also massive in granite and schist. To test for tantalum Ohly gives the following: Take 5 grams of the finely powdered mineral, moisten with 5 c.c. water in a platinum capsule; treat with 10 c.c. of fuming hydrofluoric acid, which decomposes the mineral in ten minutes; heat on water bath until the excess of acid is expelled, when 30 to 40 grams of water are added and the mixture filtered; the residue is washed, adding one or two drops of hydrofluoric acid. The filtrate contains all the metallic acids present, beside iron and manganese, and the residue remaining on the filter contains the earths, yttrium, cerium, thorium and uranium oxides. Carbon dioxide passed through the filtrate, obtained as above, precipitates anhydrous tantalate; hydrochloric acid precipitates tantalum pentoxide at first, and then redissolves it by addition of acid; ammonium chloride or sulphate precipitates tantalate hydrate.

## Producing Mines of Eastern Oregon.\*

[FROM A STAFF CORRESPONDENT.]

The gold fields of eastern Oregon are in the north-eastern part of the State, in a complex mountain group known as the Blue Mountains. These consist of an irregular sequence of apparently detached mountain ridges, the whole forming a spur from the more pronounced system of Idaho. This region extends from the Snake river on the east to the eastern watershed of the Deschutes river on the west, and from the Columbia lavas on the north to the deserts of the Malheur river and Harney lake on the south. The Columbia river drains the whole.

Geologically, these numerous smaller mountain ridges are cores of older rocks, surrounded and partly covered by more recent lava flows. They consist of various sedimentaries, chiefly argillites, with their strata folded, compressed and shattered by different intrusive granular rocks. The enveloping lavas are various in their composition. The geological history of the region has apparently been similar to that of the Sierra Nevada mountains of California. During Paleozoic and Triassic times various argillaceous muds, together with lavas and tuffs in the latter end of the period, were unconformably deposited upon an Archaean gneiss under the sea. Later these deposits were uplifted, folded and compressed by the intrusion of granular rocks, consisting of grano-diorites, diorites, gabbros and peridotites. An active period of erosion ensued, only to be checked and diverted by great intrusions of rhyolite and flows of andesite and basalt, which covered the lower levels and left the higher mountains as islands in a sea of lava. Subsequent erosion modified the region to its present condition.

Economically, the above account of the formation of the country is necessary for a proper understanding of the various mineral occurrences which are closely connected with the geological changes. In the first place, no important gold or silver deposits are found in the recent lavas. They are confined solely to the older rocks. Moreover, all veins containing gold or silver appear to be massed near the contacts of the sedimentary rocks with the granular intrusives. They do not necessarily follow the line of contact, but are found indifferently in either the sedimentaries or intrusives, continually branching and crossing the contact, the fissures dying out at one place only to be replaced by other parallel fissures. They are usually found as a number of local aggregations of rather short, irregular veins, and not as a well-defined and continuous belt. It is these separate occurrences that constitute the districts. Each district may consist of several mines, usually similar in formation. It is the object of this paper to describe in detail a few of the producing mines of the more important districts.

The principal workings in the immediate vicinity of Baker City are at the old Virtue property, 8 miles east of Baker City. This mine is one of the pioneer properties of eastern Oregon, having been worked intermittently since 1863, producing over \$3,000,000 in that period. In June, 1904, the Virtue Mines Development Co. acquired this and adjoining properties and has finished the installation of a hoist with a capacity for 2000 feet, preparatory to further development of the property.

The present holdings consist of five parallel veins, three of which—the Virtue, Palmer and Chicago—have been worked more or less extensively in the past, but hampered by water from deep mining.

These veins strike northwest and dip 45° to 80° southwest, being simple fissure veins with a quartz filling, in a fine-grained greenstone, probably an altered volcanic tuff. The ore is mostly free milling, the gold being remarkable for its fineness, mint reports showing an average above 900. Small amounts of chalcopryrite, pyrite and a trace of tetrahedrite, argentite and stibnite make up the sulphurets.

A new shaft has been started near the center of the property for the purpose of working these main veins. This new shaft has three compartments, two for hoisting and one for manway, pipes and pumps, the hoisting compartments being 4½x5 feet and the other 5x6 feet. The shaft has been sunk 375 feet, with two stations, that at the 350-foot level having been cut to work the Palmer and Chicago veins.

A direct-acting double-drum hoist has been installed by Allis-Chalmers for this shaft. It is designed to hoist a load of 6000 pounds at a speed of 1250 feet per minute from a depth of 1500 feet. Steam is used as motive power in Corliss engines. Station and sinking pumps are on the ground ready for installation. The hoist is further equipped with two 80 H. P. boilers, Ingersoll air compressor and dynamo for lighting.

Within the past eighteen months the 20-stamp mill at the 600-foot Virtue shaft has been completely overhauled. The ore is mostly free milling, yet five 4-foot Frue vanners have been installed.

At present steam is used for power; but with the completion of the electric power plant at Sanger the company contemplate putting in a complete electric plant. When ore is hoisted from the new shaft it will be hauled in wagons to the mill until the installation

of a new tramway from hoist to mill. J. K. Romig of Baker City, Or., is manager. (See engraving front page.)

At the Emma, Manager W. L. Vinson of Baker City reports that the 5-foot Bryan mill installed in May is running steadily.

A gasoline hoist is in use in sinking a 1000-foot winze 700 feet from the mouth of the main tunnel. The 10-stamp mill is also run by electricity. It is located at the mouth of the 1000 foot tunnel, which taps the pay shoot at a depth of 500 feet.

The White Swan mine is situated 3 miles east-southeast of the Virtue. Here the vein is nearly vertical, consisting of quartz and calcite in a country of soft black argillite near contact with altered diorite. The property was sold for debts contracted by the older management to the White Swan M. Co., Ltd., C. H. Stuller manager. A year ago the pumps were removed and the mine permitted to fill with water; but it is intended to sink a new shaft, using electricity to run the hoist and mill.

A small amount of work is intermittently done upon the other properties of the district—the Mammoth, Brazos, Friday, Cyclone, Flagstaff and Cliff.

The Sparta, Sanger and Cornucopia districts lie to the east of Baker City. Considerable work has been done throughout these regions, but at present the Sanger mine is the most important producer. The Sanger mine and 10-stamp mill are near the head of Goose creek. (See engraving front page.) It is owned by the Sanger Gold Mines Co. and is under the management of J. K. Romig. It is proposed to install a large electric power plant on Eagle creek to

property the ore bodies have been opened up both to the northeast and southwest by a series of drifts.

On the Excelsior side the two tunnels have each been driven 1000 feet; upon the Eureka side 1400 feet. Winzes, shafts and connecting levels give a total of 15,000 feet of development work. The vein consists of a shattered zone in black siliceous argillite. The ore body is well defined, existing as three shoots, with narrow division areas. On August 1, 1904, a new three-compartment shaft was started in an attempt to recover some of the old workings. Compressed air is employed in hoisting and Rand machine drills are in use. The mill is equipped with twenty stamps, ten 4-foot Frue vanners, three 6-foot Frues, one Johnson and two No. 5 Wilfleys. Water, with auxiliary steam, furnishes power.

Six to seven carloads of concentrates are being produced monthly, the tailings being banked. Considerable experimentation has been done with regard to cyaniding these latter, but thus far without much success, owing to the basicity of the ore.

The Columbia M. Co. owns the Columbia and Apomattox claims, to the south of the E. & E. A 750-foot shaft has been sunk on the Columbia, opening up the ore bodies through 8000 feet of workings. Electrical power, with auxiliary steam, is used for the hoists, pumps and 10-drill compressor. The mill capacity has been enlarged to eighty tons. A 60-ton cyanide plant is working the tailings. F. S. Baillie is manager. The Climax property, to the east, is being developed in a small way under the bond of E. L. Linns of Houghton.

The mines of the Cable Cove district are 11 miles

E. & E. Mill, Bourne, Baker Co., Or.

furnish power for the Sanger and Virtue mines. Considerable development work has been done, showing the country to be a black clay slate. The ores are mostly free milling.

The Cracker Creek district, with Bourne as a center, lies about 7 miles north of Sumpter. The "mother lode" of this district extends strong and unbroken for 5 miles southwest from the North Pole mine, through the E. & E., Columbia, Golconda and other claims, and is accompanied by smaller veins parallel to the main lode. The country rock consists of various argillites, the veins occurring in shattered zones with a quartz gangue containing gold and sulphurets. Lindgren states it to be the most strongly developed and persistent vein in the Blue mountains.

The North Pole mine is owned by the Eastern Oregon M. Co., under the management of Emil Melzer. The mine has been developed and stoped through a crosscut of 1000 feet and drift of 1700 feet and four smaller tunnels and drifts, giving a depth of 450 feet. The surface ore was oxidized and easily treated, but the sulphuret ore met in depth is difficult of treatment. Two Hallidie tramways, 10,500 feet in length, convey the ore from the mine to the mill.

The mill is equipped with thirty stamps, twelve Frue vanners, four Johnson, six Overstrom and two Wilfley tables.

The pulp is pumped from the vanners and distributed by Butter's distributors to the main cyanide tanks, each 24x6½ feet, the slimes being treated in six agitation tanks. Two 48-inch Pelton wheels and an auxiliary steam plant furnish power. Sixty tons are being treated daily. Seventy-five men are at work.

The Eureka & Excelsior, or E. & E., lies between the Columbia and North Pole mines upon the main lode. (See accompanying illustration.) Since August 1, 1903, it has been continuously worked by the Bourne Gold M. Co., under the superintendence of J. S. Wyatt.

From the sides of the creek flowing through the

north of Sumpter, on the divide between the north fork of the John Day and the Powder rivers. In general the deposits are normal fissure veins in grano-diorite with northeasterly strike, most of them being located on the hanging wall of the Eagle vein—a strong lode traceable for over 2 miles. The prevailing dip is to the southeast. The ores are arsenical sulphides, carrying iron, lead, copper and zinc, with but little free gold below 50 feet from the surface. Many prospects have been worked in a desultory way since the discovery of the district in 1872; but at the present writing the California, Imperial, Overland, Alpine and Valley Queen are the only mines being actively operated.

The California is being worked by the Turnagain Arm G. M. Co. The mine is opened by six tunnels and a crosscut of 1360 feet. Tunnel No. 1 has been driven 93 feet; No. 2, 143 feet; No. 3, 200 feet; No. 4, 322 feet; No. 5, 880 feet and No. 6, 255 feet. The workings give a depth of 990 feet. A Hallidie gravity tram carries the ore 4280 feet from the mine to mill, where a 200-ton Austin gyratory crusher, two sets of Cornish rolls, two Standard concentrating tables, and Sturtevant shaking screens treat the ore. A reverberatory roasting furnace and two 300-ton cyanide leaching tanks and accessories treat the tailings and oxidized ore. An 80 H. P. steam plant supplies power. L. R. Bellman is manager.

The Imperial has been in operation since the middle of August under the management of John Arthur. Over 4000 feet of development work has been done on the group of twenty claims. A stamp mill and jigs have been installed to treat the lower-grade ore for shipment. (See illustration front page.) The ore is washed in water boxes to remove the clay and mud and then hand sorted, the waste and the rich shipping ore being taken out and the remainder run through a 7x9 Dodge machine, crushing to 1 inch. Together with the screenings this product is automatically fed into a trommel with ¼-inch screens. The product not passing this is crushed in the 3-stamp

\*See illustrations on front page.

mill. Perhaps 10% of the values can be removed by amalgamation, and the remaining value is concentrated ready for shipment by three hand jigs, each with a capacity of five tons per day.

In Grant county, the Blue Bird mine, at Lawton, has been under the superintendency of George J. Barrett since July 15, 1904. The property contains three veins, which have been opened up by about 2000 feet of development work. A 5-stamp mill and rolls have been installed and a cyanide plant is planned to handle the base ore. This will be crushed in three sets of rolls and then run to the cyanide plant over copper plates.

This account is in no way complete or finished, but embodies an outline description of some of the properties visited by the writer. A large number of important mines have been left out, simply because unforeseen circumstances prevented a visit to them. It is hoped to remedy this omission in a future paper.

This part of the country is prosperous, as a whole. In contrast to the condition of two years ago, the producing mines are running steadily.

### Pumping Water on the Comstock.

TO THE EDITOR:—The capacity of the electric pumps on the 2150 level of the C. & C. shaft on the Comstock, Virginia City, Nevada, is 4500 gallons per

### A Free Gold Mine.

Written for the MINING AND SCIENTIFIC PRESS.

In the Black Hills of South Dakota are many varieties of ore bearing gold, silver, lead, tin, copper and other metals and minerals of value, and among them are some which are typically free milling gold ores. Originally the Homestake yielded a large percentage of its values to amalgamation and was considered free milling, but the change from the oxidized zone to that of the normal sulphide resulted in the necessity for changes and elaborations in the treatment. In Pennington and Custer counties, however, are veins and deposits of gold ore which are practically free milling, though there are many where the values in depth are associated with sulphur, arsenic and other substances which render the ore base and difficult of treatment. Prominent among the free milling mines is the Uncle Sam, owned by the Clover Leaf Gold Mining Co. The mine is situated on a low ridge on the south side of Elk creek, near Perry station. The formation is the crystalline slates, mica schist, amphibolite schist, and a dense, fine-grained quartzite which has been recrystallized by the infiltration of silica. No intrusive rocks occur with or in

vicinity of the main ore body the schists are worked, as it were, about the irregular quartz lens.

From the surface an inclined stope extends to the 250-foot level, a distance of about 300 feet on the dip. A horizontal section of the quartz mass on this level has the shape of the letter U, the arms diverging slightly. This occurrence is described as resembling somewhat the saddle reefs of Bendigo, Australia, and those of Nova Scotia. The summit or apex of this flexure has a strike south 64° east. The northern arm strikes north 40° west and the southern south 75° west. Over this ridge-like dome the schists curve in conforming lines. The limbs of this curious fold of gold-bearing quartz thin out as they gain distance from the crest of the anticline.

The rocks immediately inclosing these peculiar saddle-shaped masses of quartz are mica and hornblende schists, graphitic schist, chlorite schist, etc. It is possible that the hornblende and chlorite schists are ancient eruptives (Archaean). In the quartz pyrite is abundant and galena is usually associated with the pay ore. The ore is remarkably free milling considering the large percentage of sulphide present, it being claimed that 90% is saved by amalgamation. A peculiar occurrence of coarse gold is noticed in the center of the largest quartz mass. Here is a strip of galena about  $\frac{1}{2}$  inch thick in a milk-white quartz. In the center of this streak and entirely surrounded by galena is a continuous string of nuggets of gold.

Clover Leaf Hoist and Mill, Perry, South Dakota.

minute, against a pressure equivalent to a head of 430 feet. Two and one-half of these pumps are now running and are lifting about 3750 gallons per minute. This water is raised 220 feet to them by the hydraulic elevator, while is now using 1240 gallons per minute under a pressure of about 1130 pounds to the square inch.

The pumps are, therefore, lifting at the present time about 2510 gallons per minute of mine water to a height of 650 feet. This capacity just holds the water a few feet below the 2350 station. The temperature of the mine water is 127° F. In addition to the water pumped, there is about 300 gallons per minute that drains into the Sutro tunnel, so that there is about 4050 gallons per minute flowing through the tunnel.

We are just about to begin pumping at the Ward shaft, but the quantity will not exceed 200 gallons per minute for the present.

LEON M. HALL.

Nov. 23.

### Gold in Coal Mines.

The latest gold mines are in coal mines in Africa and America. Gold and silver are present in small quantities in the coal fields of Wyoming, says Fuel. From the occurrence of iron pyrite, which is distributed throughout the coal seam, it is suspected that this mineral carries the precious metal. The coke made from the coal is used in the smelting works at Deadwood, S. D., and averages from 1 to 2 pennyweights of gold a ton, which is enough to compensate for high ash content. In South Africa the gold occurred in small seams running through the coal and in places was quite rich in gold, the ash being colored a bright purple by the finely divided particles of metal.

the immediate vicinity of the ore bodies. The nearest eruptive rock known is a large dike about a mile west of the mine, where a light-colored acid rock forms a bold outcrop. Four miles to the southwest is Custer peak, an outburst or "neck" of igneous rock (phonolite). So far as known, the Uncle Sam mine is an instance of valuable ore deposits absolutely independent of igneous intrusions, unless some of the amphibolite schists were originally intrusive in Archaean time, and have since been metamorphosed together with the sedimentaries—slates and quartzites.

The mine was discovered in 1878. The outcrop was a vein of iron-stained quartz, in which was a small, rich pay streak. From this latter the discoverers recovered several thousand dollars by means of a spring-pole and mortar. They then ingeniously rigged up a 1-stamp mill, using a horse for power to operate it. With this outfit they took out several thousand dollars more, and bought an idle 15-stamp mill. Of this, five stamps were run intermittently, with satisfactory results, but the appearance of a considerable amount of water—more than they could handle by simple means—induced them to sell out. The buyers operated it for a year or two and sold to a corporation, which moved a 60-stamp mill from the Esmeralda, a conglomerate mine in Blacktail gulch, near Deadwood, to the Uncle Sam. After several years of doubtful success in mining, the property was closed in 1889 and remained shut down for ten years, being reopened in 1899 by the present owners, the Clover Leaf Gold Mining Co., O. B. Amsden superintendent. (See accompanying engraving.)

One very remarkable thing about this mine is the extremely variable strike of the slates and schists of the vicinity. About 1000 feet west of the main shaft the strike of the schists is east-west and dip south at 44°. About 1000 feet north of the shaft the strike is north 15° west, with dip 53° east. In the immediate

Accumulations of galena in bunches or pockets is of common occurrence throughout the quartz mass, and the galena is always accompanied by visible gold, but not as a rule as rich as the streak first referred to. This galena-gold ore runs from \$40 to \$400 per ton, with merely a trace of silver, which is unusual in the presence of so much sulphide of lead, outside of the limestone lead districts of the Mississippi valley. The average value of the large mass of quartz is stated to be \$6 to \$7 per ton. The rich streak that made a fortune for the original discoverers and their grubstake partners, continues to the lowest level thus far opened, specimen ore being found on the 600 level of the mine as rich as any found nearer the surface.

### Temperature of Deep Mines.

At a recent meeting of the South Staffordshire and East Worcestershire Institute of Mining Engineers in England, R. A. Redmayne, in speaking of the temperature of deep mines, said:

In respect to the question of temperature, though no very definite practical conclusions can be said to have been arrived at, the best and fullest information yet to hand is undoubtedly that contained within the pages of the minutes of evidence of the first and second reports of the Royal Coal Commission at present sitting; but based on such data as we do so far possess, I do not think any formula for determining the heat at any depth can be of any practical value. For instance, we find that at Pendleton Colliery, in Lancashire, the increase in the temperature of the air was only 28.5° F. in a depth of 3483 feet—that is to say, a gradient of 1° F. for every 122 feet, whereas Prof. Dixon stated that at the deep boring at Schladebach the temperature at a depth of 5630 feet was 133.9° F., which, taking as the starting point a

temperature of 51.8°—the temperature at 118 feet—would give an increment of 1° F. for every 67.1 feet. The first instance is, however, much the more valuable as tending to show the probable temperature of the air under actual working conditions. I do not think we can take the data obtained from boreholes as helping us much in this direction. In the case of the Bezuidenville borehole on the Rand, the rise in temperature worked out at 1° F. for every 208 feet in depth over a depth of 3251 feet. The Turf Club Syndicate began the boreholes before the war and have completed them since the war. The west borehole cut the Reef series at 4743 feet and the east borehole at 4825 feet; experiments as to heat gradient have been made in the west borehole, though not to the full depth, and definite and conclusive results have not yet been obtained, but are not expected to be materially different to the results obtained in the Bezuidenville borehole—so writes Hennen Jennings, of whom I had inquired. In 1895, at the Calumet & Hecla copper mine in Michigan, the increase was 1° F. for every 223 feet calculated over a depth of 4580 feet, at which the temperature was only 72° F. When I visited this mine in 1902 the temperature in the Red Jacket vertical shaft at a depth of 4900 feet was said to be 87.6° F.

## Volumetric Standards for Technical Work.\*

Written by W. J. SHARWOOD.

The choice of materials available for standardizing volumetric solutions is so large as sometimes to be embarrassing, and the object of this note is to point out how very limited is the number of fundamental substances which are actually required to standardize the more important solutions in ordinary use. The metals obtainable in a nearly pure condition are sufficient for almost all technical purposes, and for most of the determinations necessary in investigation.

The scheme following indicates how the solutions, which are shown in prominent type, may be most directly referred to, or checked by, metallic standards; the principal determinations which can be made by them are shown in smaller type. All the numerous determinations by oxidation and reduction methods are thus based on iron; while the standard acid and alkali are obtained preferably from silver, though the oxalic acid may also be based on iron.

Ferrous ammonium sulphate crystals, normally containing 14.25% of iron, are in common use for checking permanganate and bichromate solutions, and are extremely satisfactory for the purpose. They are not, however, absolutely constant in composition, the water content being apt to vary by two tenths of 1% or more, though there appears to be no tendency to oxidize when kept closely stoppered. The variability in water content is much more marked in most of the other crystalline salts which are available as standards, especially when kept in loosely stoppered bottles, and in climates where extremes of temperature and humidity prevail.

Metallic iron is sold in the form of wire, containing from  $\frac{1}{10}$ % to  $\frac{1}{5}$ % of impurity, but subject to no such fluctuation as the salts, any oxide which may form on the surface being readily removed by emery cloth. Iron of this degree of purity, which can be readily checked by gravimetric estimation, can generally be taken as exactly 100% when used as a volumetric standard, the impurities themselves having a reducing effect on permanganate averaging near to that of iron itself, provided that solution of the metal is effected in a small flask, the air of which has been displaced by addition of a little sodium bicarbonate, and that freshly boiled water is used for dilution.

For instance, a sample of iron wire was found to contain 99.8% to 99.85% of metal by solution as chloride and precipitation of the oxide. A permanganate solution was first standardized absolutely on ferrous ammonium sulphate, free from ferric iron, the actual iron content of which had been similarly determined by precipitation. When estimated by this permanganate the apparent percentage of iron in the wire averaged 100.1.

The error introduced by assuming this wire to be absolutely pure would, therefore, be only one-tenth of 1%, causing a variation of only 0.07% in titrating a 70% iron ore, an error which would be nearly doubled if the iron were taken at its true value of 99.83%.

At another time a permanganate solution gave the following results per cubic centimeter:

Iron value based on pure ferrous ammonium sulphate. 14.25% Fe.	Iron value based on 99.7% wire, assuming wire to be 100% Fe.
.005577 gram,	.005563 gram,
.005560 gram,	.005566 gram,
.005565 gram,	.005577 gram,
.005574 gram,	

the averages of the two methods being almost identical.

Electrolytic copper, sold in thin sheets or in the form of high conductivity wire of over 99.9% metal, is almost universally used as a standard for the copper assay, the exception being in such cases as the

\*Cal. Jour. Tech.

cyanide titration of mattes or ferruginous ores, when the interference of iron must be corrected by the use of a standard matte or ore, the copper content of which has been most accurately determined. Thio-sulphate solutions may be standardized by it with slightly less accuracy than by permanganate.

Silver may be obtained or prepared of equal purity, but a much cheaper source is the commercial fine silver of guaranteed fineness (about 99.8%), the alloy present being without effect when it is used in analysis. Either the calculated weight of this or of recrystallized and fused silver nitrate may be used with thiocyanate to standardize other solutions, or to directly prepare standard silver nitrate if chlorine-free distilled water is obtainable.

Metallic zinc of almost absolute purity is produced at a very few works, operating on favorable ores, the metal containing less than 0.02% iron and negligible traces of arsenic and lead. The special assay lead prepared by several smelters is almost equally pure. These metals deserve preference as standards over the zinc oxide or lead sulphate usually recommended, the former of which is quite hygroscopic.

The great advantage attending the use of metals as fundamental standards is their permanence, allowing of their being indefinitely preserved with comparatively little trouble, while the fact that they can for nearly all purposes be assumed as being of 100% purity, and can be weighed out on an assay balance, is of additional convenience. For the attainment of the highest accuracy it is generally advisable to so adjust the solutions, and the amount of metal taken, that from 20 to 50 cubic centimeters of solution shall be used. The error in weighing the metal must be less than 1 part in 1000. For instance, if about 0.2 gram of iron is taken, it should be weighed with an error not exceeding 0.1 milligram. The precision attained is sufficient for the most accurate work in nearly every case, the principal exceptions being in acidimetry and alkalimetry of great refinement, which are best based on hydrochloric acid or sulphuric acid determined by precipitation as silver chloride or barium sulphate, and in such work as the cyanide assay of copper above referred to, where the presence of interferents and the incompleteness of reaction must be empirically corrected by the use of special standards.

Although gold can be estimated volumetrically with considerable accuracy, there is no apparent advantage in doing so when an accurate assay balance is available, since the metal is so easily isolated in a weighable state, as is also the case with silver and mercury in ores. For alumina, magnesia and silica no satisfactory volumetric method has been found. Silica and sulphur (in sulphates) are both very readily and accurately determined gravimetrically, but some of the indirect processes for titrating sulphates, based on the insolubility of barium chromate, can be used in certain cases with advantage. The following are some of the applications of metal standards to volumetric solutions:

their explanation according to physical and chemical principles. Chapter VII treats of the belt of cementation, which is defined as extending from the belt of weathering to the bottom of the zone of fracture. Each of the cementing substances is considered, and an explanation is offered as to why cementation rather than solution is a general process in this belt. The zone of anamorphism, which is the zone in which rock flow occurs, is the subject of the eighth chapter. Full explanations of the meaning of rock flow and of the development of such secondary structures as slatiness, schistosity, and gneissosity are offered. In the ninth chapter a classification of the sedimentary rocks is given, their genesis is discussed, the series of transformations through which each of the rocks passes is traced out, and the resultant rocks are indicated. It was not found possible to discuss the igneous rocks in a similar manner. With the ninth chapter the subject of metamorphism proper closes, but the results contained in the nine chapters have an important bearing upon other parts of physical geology. The remaining chapters consider these relations.

The relations of metamorphism to stratigraphy are discussed in the tenth chapter, the relations of metamorphism to the distribution of the chemical elements in the eleventh chapter, and the relations of metamorphism to ore deposits in the final chapter. The last two chapters will probably receive more attention than any others, as the attempt made in the eleventh chapter is the most daring generalization in the treatise, and the subject of the twelfth chapter is of interest not only to geologists, but to all who are concerned in the mining industry. Dr. Van Hise believes that the majority of ore deposits are produced by metamorphic processes, but he gives a new classification of ore deposits, the fundamental divisions of which are the same as those of rocks.

It is not possible in a summary to give an adequate idea of the scope of this treatise on metamorphism. A very broad range of facts, extending far beyond what might first be regarded as the field of a treatise on metamorphism, is considered from the viewpoint of energy. The volume, which is listed as Monograph XLVII in the Survey's publications, is for sale at the price of \$1.50. It contains 1286 pages and is illustrated with thirteen plates. Application for copies should be made to the Director of the United States Geological Survey, Washington, D. C.

### To Decrease Accidents in Mines.

At a recent convention of mining men, held in Pittsburg, Pa., the great increase of accidents in and about mines was discussed, and it was agreed that many of these accidents were due in a great measure to the carelessness of those injured, and in view of this fact it was considered advisable to formulate a code of rules which, if enforced, would have a tendency to greatly decrease these fatalities and serious injuries resulting from ignorance and carelessness. The most important regulations adopted were as follows:

All persons not employees are forbidden to enter any mines or loiter around mines or the machinery connected therewith, without permission of the management of the mine, and accompanied by an employee designated by the management.

All employees are forbidden to enter or travel around old works, or visit the working places of others where duty does not call them.

Machine runners are forbidden to cut any place unless the soapstone has been taken down from the previous cut.

Loaders after machines are forbidden to load coal under soapstone or draw slate under any circumstances until it is made secure by ample posting whether there is any apparent danger or not.

When the working place of any miner or loader has been securely posted, and it is necessary for any machine runner to remove any posts for the purpose of conveniently cutting place or for other cause, the machine runner positively must replace the posts before leaving such place.

Trappers, switch boys, or other boys employed in and around the mines positively must not leave their places during working hours to go where duty does not call them; they shall not run around with drivers or ride on loaded or empty cars or trips under any circumstances, unless it is a part of their duty.

All employees are forbidden to ride on loaded cars or trips. This rule not to apply to drivers, trip riders or motormen.

Drivers trapping their own doors must close them after passing through, and not prop them open until they return from the outside or from the inner workings.

Under no circumstances shall drivers ride with their feet on the tail chain and on a down grade must not even ride on the front end of a loaded car.

The trip rider or motorman or somebody designated by the mine management shall attach to the rear end of the rear car of both loaded and empty motor or locomotive trips a signal (light preferred).

No explosives shall be taken into or out of any

part of the mine, in mine cars when propelled by electric power.

No person shall fire any shot until he has given warning to all those working near him, and know that they are out of danger.

Neither miners nor any other person shall keep blasting powder or explosives dangerously near the electric wire or power cable in any part of the mine where electric wires are in use, and in preparing cartridges no lighted lamps nor fire of any kind shall be used within 6 feet of where such cartridges are being prepared.

All employees are forbidden to leave doors open, commit nuisances, block air ways, or in any respect violate or ignore the provisions of the mining laws; or to use other than the proper legal test oil for illuminating purposes.

### Rate of Solution of Gold in Potassium Cyanide.\*

Written by T. H. PLUNKETT.

Authorities on the use of the cyanide process as an extractor of gold from its ores, while being unanimous in the opinion that potassium cyanide can only be used on fine gold, have made few attempts to define the exact limits of fine and coarse gold. These terms, fine and coarse gold, so commonly used in discussing the merits of the several methods of gold extraction, are very indefinite. While authors do not hesitate to assign certain processes of extraction for fine, and others for coarse gold, no one seems to have endeavored to find a limit so as to be able to state definitely to what extent certain processes can be used to advantage.

Having had occasion to use this process on different ores, the writer has made several experiments to find what effect cyanide solutions have on particles of gold of varying sizes. This effect varies greatly with the manner in which the solution is applied. Elsner made it clear that oxygen was an essential element to enable the potassium cyanide to do its work. It has also been suggested, by recent writers, that temperature played a part in the extraction.

With these points in view the writer has treated the gold in three ways. First, by allowing the solution to percolate around the gold. The gold bead was placed in a porcelain dish containing the solution and the latter was drawn off at intervals of an hour or two to enable it to absorb oxygen from the air. Second, air was made to bubble through the solution while in contact with the gold. Third, the solution, with air passing through it, was heated to about 100° Fahrenheit.

In preparing the gold particles a known weight of the metal was dissolved in aqua regia and diluted with water to 500 cubic centimeters. Certain volumes of the solution were then taken, and the nitric acid boiled off, after which it was evaporated to dryness on troughs made of pure lead foil. The lead was then cupelled, leaving beads of gold, spherical in form. These were carefully weighed and their diameters measured under a microscope.

A .3% cyanide solution was used in the following experiments:

#### RESULTS OF EXPERIMENTS.

Weight of Bead. Mg.	Average Diameter. Mm.	Process.	Time.	Weight Dissolved. Mg.
.800	.455	Percolation.....	16½ hours	.040
.800	.455	Agitation.....	16½ "	.180
.800	.455	Agitation and Heat	16½ "	.250
.300	.399	Percolation.....	7 "	.007
.300	.399	Agitation.....	7 "	.080
.300	.399	Agitation and Heat	7 "	.060
.170	.260	Percolation.....	3 days	.100
.170	.260	Agitation.....	16 hours	.070
.170	.260	Agitation and Heat	7½ "	.080
.130	.247	Percolation.....	3 days	.080
.130	.247	Agitation.....	20 hours	.130
.130	.247	Agitation and Heat	16 "	.130
.110	.208	Percolation.....	16 "	.060
.110	.208	Agitation and Heat	7½ "	.050
.100	.201	Percolation.....	3 days	.088
.100	.201	Agitation.....	16 hours	.070
.100	.201	Agitation and Heat	12 "	.100
.070	.195	Percolation.....	3 days	.070
.070	.195	Agitation.....	16 hours	.070
.070	.195	Agitation and Heat	10 "	.070

From these results it would seem that agitation and agitation aided by heat have a decided advantage over the percolation process, while agitation aided by heat has a less decided advantage over agitation alone. To obtain an extraction in a reasonable time, beads of about .100 mg. in weight, with an average diameter of .201 mm. seem to be the maximum size.

### Problems in Hoisting.

The hoisting problem has several phases closely related and no one of them can be settled irrespective of the other two. These phases are, the problem in relation to the underground requirements—its engineering and mechanical features—and the financial end of the problem, which usually dictates the final decision, said James R. Thompson before the Lake Superior Mining Institute.

The loads hoisted have varied from one ton in the

\*Trans. Can. Min. Inst.

early days of shallow mines to a maximum of five tons in the iron mines and of seven and one-half tons in the copper district. It has evidently been found wise to increase the product by increasing the load hoisted, rather than to increase the rate of hoisting. It may be stated, then, as a result of Lake Superior experience, that in general the underground requirements are that it must hoist its load in a minute and make a round trip in three minutes, no matter what the load or depth of the mine.

### THE PROSPECTOR.

The average prospector has some fixed ideas, the result of learning from the other members of his craft, and occasionally these ideas are erroneous. On one occasion a mining engineer visited a prospect and went down into the mine—a shaft nearly 100 feet deep. On his return to the surface one of the workmen asked, "Did you see the granite down there—what do you think of it?" The engineer replied, "I saw no granite, though there is trachyte there." "Oh, no," said the prospector, "that rock at the bottom is granite—I know granite all right. I've worked in it for years and ought to know." "True," responded the engineer, "so you should; now, what is granite?" "Why, it's granite," said the miner. "Yes, I know, but what minerals are necessary to granite?" "Why," said the miner, in some astonishment, "everybody knows granite—it's a gray, hard rock—granite, you know; something like syenite, but not so hard." "Well," said the visitor, "granite is composed of quartz, feldspar, of a certain kind, and mica—when you have this combination you have granite. If the combination of minerals is not of these three, the rock is something else." "Well," said the miner, "I have been mining for twenty-five years, and I'll be blamed if that ain't news to me—quartz, feldspar and mica, hey? I know quartz, but I don't know the other two."

This is merely an instance of how the prospector is sometimes led astray, and for years calls things by names which do not properly describe the ore or rock, or whatever it may be. Throughout the West, and particularly the Northwest, many miners and prospectors mistake azurite, the blue carbonate of copper, for bromide of silver. In Dana's "Mineralogy" are given descriptions of several silver bromide ores, of which the following are the principal ones: Embolite, a silver chloro-bromide, color grayish-green and yellowish-green to yellow; bromyrite, silver bromide, color bright yellow to amber yellow, and iodo-bromite, a composition of bromine, iodine and silver, color sulphur yellow to greenish. No silver bromide of blue color is mentioned. It is probable that the idea that silver bromide is blue comes from some of the Mexican ores where bromides occur, which also contain the blue carbonate of copper, and this has been mistaken for the silver mineral. Chloride of silver is sometimes, though rarely, violet blue, but this in no manner resembles the bright, beautiful blue of azurite so often erroneously called "silver bromide."

The rock from Sanger, Cal., is serpentine, of which there is a vast amount in California, both in the Coast Range and in the foothills of the Sierra Nevada.

The mineral specimen from Rich Gulch, Plumas county, Cal., has the appearance of gold-bearing quartz. The dark mineral is sphalerite (zinc sulphide). It is often gold and silver-bearing.

The rock specimens from Tonopah are undoubtedly andesite, but whether of an earlier or later flow can only be told by an examination of the rocks in situ in the district from which they came. Andesite is a name applied to volcanic rocks containing predominant andesine (feldspar). The rock from Tonopah contains no quartz; hornblende, if ever present, is altered to other minerals and is also probably scattered through the rock in dust-like particles. Biotite (black mica) is abundant and the feldspars are all much decayed. Still, the rock shows the habit peculiar to andesites in the distribution of the feldspars.

The mineral specimen from Placerville, Cal., is quartz containing limonite (brown iron oxide) and siderite (a translucent iron carbonate). The rock also contains a small amount of chalcopryite (copper sulphide) and traces of arsenic. It may also contain gold.

The dark colored crystals from Cranbrook, B. C., are garnet, and the light yellow ones are zircon.

The mineral specimen from Ophir, Utah, is mostly quartz in crystals and grains. The brown, earthy mineral is a mixture of the oxides of iron and manganese and known as "wad." The bright metallic scales are micaceous iron, a variety of hematite. It is magnetic.

The rock specimens from Mazama, Wash., are: No. 1, amphibole rock; No. 2, a granular quartz rock containing streaks of amphibole similar to that

forming No. 1. It also contains several per cent iron sulphide, some limonite (iron oxide) and a trace of copper. It may also contain gold and silver. No. 3 is apparently a much altered eruptive rock, now consisting largely of quartz, carrying iron and copper sulphide. No. 4 is similar to No. 3.

The pulverized mineral from Kansas, and sent from Leadville, Colo., is volcanic ash—neither fuller's earth nor kaolin. It might be used as an abrasive material. It consists of microscopic plates and threads of volcanic glass, with a very small amount of mica and feldspar.

### Auriferous Bench Diggings of Bonanza, Yukon Territory.

Written for the MINING AND SCIENTIFIC PRESS by  
A. W. KIMBLER.

I have taken as representative of the locality that portion of the channel situated on Cheechaco hill, it being about the center of the known channel, and the conditions herewith presented can be taken as approximately those of the whole channel, with the exception that the fine gold is more uniform farther down the stream.

The richest body of gravel is composed of white, water-worn quartz, grading from immense boulders to a fineness of slickens, the balance of the channel filling being a stained red gravel and clay, especially on the western shore, which is a distance, in some places, of 500 feet from the edge above the modern creeks. The red color is derived from decomposed feldspar, proving that the channel headed in some immense belt of granite or kindred rock. As far as I can discover, the nearest locality of a granite belt is the Rocky mountains, a distance of 100 miles. At the same time, there are no granite boulders, or, at most, very few, disseminated through the mass of gravel. In fact, in the numerous diggings I have observed but very few pieces of granite, and these were very much decomposed.

Bedrock is various and appears as belts of country rock crossing the channel at nearly right angles. It is of such a decomposed and friable nature in the majority of places as to be difficult of determination. It clearly shows there has been an immense pressure from the accumulated superimposed body of gravel, about 150 feet in depth, combined with subsequent movement—proven by the ice seams, somewhat similar to faulting, that extend in all directions—owing to which causes the bedrock in the majority of cases is ground into an impalpable clay, especially those rocks of a schistose nature. The following are the principal belts of bedrock observed, named in the order of importance: Hydro-mica schist, manganese slate and chlorite schist, with here and there a few streaks of mariposite, observed on the Lynch claim. Some few pieces of basalt and kindred rocks, belonging to the Plutonic series, are occasionally seen in the gravel, but the white quartz exceeds other rocks about 95%; hence its name of White Channel.

It appears on all prominent points—at an approximate elevation of 300 feet above the modern creeks—from the mouth of Bonanza to 29 above discovery, a distance of 13 miles. At Grand Forks it branches and also follows the course of El Dorado creek for 1½ mile, with some traces found yet farther up, notably at Gay gulch. The same characteristic gravel is also found on Hunker, Dominion and Sulphur creeks carrying varying pay.

The channel appears at one time to have been filled with the aforementioned red gravel, that a subsequent slight elevation of the country produced a greater fall, and, consequently, a swifter running current and a larger area of watersheds. That this increased watershed and elevation contributed the white quartz gravel, and probably the gold, with velocity of water sufficient to cut a new channel deep into the old gravel bed, and deeper yet into bedrock, thus defining the white channel so clearly from the red gravel, which also would account for the pay being found only in the white quartz gravel, and, it being deeper, into the bedrock, proves conclusively that it was cut and deposited subsequent to the red gravel. It is supposed by the majority of the miners in this district that this old river bed was the ancient Yukon river, and certainly, judging from its immense width, it was as big or larger than the present Yukon in the same locality.

PROBABLE SOURCE OF THE GOLD.—The gold has very evidently not been moved a great distance—proven by its rough and angular form. In fact, I have found a number of pieces that, looking at one side, one would surely suppose they had just been taken from a quartz vein. Now the country rock, being a heavy schist traversed by small seams and layers of quartz, it is my belief that these small veins are the source of the gold. It is, I believe, a well-established fact that gash veins and veins of segregation are usually very much richer proportionately than an adjacent larger vein. Also, that such small veins usually carry coarse gold—for instance, the pocket veins of California, and, notably, those of Tuolumne county. It is well also to call to mind that wherever

in this northern country placer gold has been discovered in quantity, the bedrock has invariably been mica schist—as, for instance, at Nome, Bluff City, Golovin bay (Fish river), Dawson and Yukon river points. Indeed, it is understood that at the new diggings at Alsek (White Horse), the bedrock is also mica schist. Of course, there are numberless other localities with a mica schist bedrock where no gold has been discovered; but I can not believe otherwise than that the source of the gold is as stated above.

In a few years from now, when the white channel gravel has been hydraulicked off, I think an era of pocket prospecting will commence. At present the country, being so heavily covered with moss, muck and slide, it is impossible to prospect for quartz with any degree of certainty, although there is considerable work being done in that line, but in the majority of cases there is very little promise of success. Most of the men with quartz locations appear to be very inexperienced in that respect and anything that looks like quartz is located. I know of but one locality that gives fair promise—namely, Stampede Hill—on which is one claim with considerable surface work done, showing up a broken ledge of good size, the rock carrying gold, galena, carbonate of copper and some silver. In my opinion, should the owner find the vein in place, he will have a good property. On the same range is located the Violet mine, on which they are down 80 feet. The rock is a ferruginous quartz; the ledge is 3 feet wide and said to assay over \$100 a ton.

### Methods of Saving Flour Gold.

Written for the MINING AND SCIENTIFIC PRESS by  
DENNIS H. STOVALL.

Above the blue and gray strata of the old channel placer deposits of northern California and southern Oregon there is often a capping of from 4 to 10 feet of red clay—and in this red clay, as well as through all parts of the "pipe clays" of the lower strata, is distributed the fine or flour gold values of the diggings. Sometimes these values run as high as 8 and 10 cents to the yard, and as the dirt and gravel containing it must be washed down and carried through the sluices in the usual way, in order to clear the banks for the main work, it is for the placer miner

across the sluice floor the entire width. A wide trough is fitted beneath, and the water, or a large part of it, is drawn down through the grizzly and into the trough, pouring out on either side and spreading over a wide sluice table. On either side of the sluice box is set a gate which can be raised and lowered to regulate the flow of water through the grizzly into the trough and over the wide sluice. (See accompanying illustration.)

The wide sluice floor, or table, is 8x10 feet in size, and has a drop of about 12 inches. Its riffles are made and its bottom composed of 2x8 planks nailed together edge up, every alternate one having a drop of 2½ inches, thus making a crevice and likewise a riffle. Still another and, perhaps, better way, is to have the floor of the riffle table smooth, and spread over it a thick sheet of burlap.

The principle on which the undercurrent operates is as simple as the contrivance itself. As before stated, by the time the minute particles of flour gold reach the end of the sluice they are down near the bottom of the current, and so are drawn down by the part of the water which passes through the grizzly. The water is then spread out thinly over the riffle table of the undercurrent, and the fine gold is given an opportunity to settle into the riffles of the burlap. To clean the riffles the burlap is lifted gently and dipped into a large vat of clear water and washed thoroughly; the gold settling to the bottom. The cloth can then be placed back over the riffle table floor.

Not only flour gold, but the very fine particles of platinum, if present, are caught by undercurrents of this kind, thus adding to the miner's receipts a considerable revenue that would otherwise be lost.

### The Tallerday Plant.

The Tallerday plant at Dolgeville, a suburb of Los Angeles, Cal., is built especially for making sheet steel pipe and tanks. Mr. Tallerday, the moving spirit in this company, is also president of the Tallerday Steel Tank & Pipe Co. at Waterloo, Iowa, but the Dolgeville, Cal., plant now receives his personal attention.

The factory utilizes such special devices as the Tallerday steel rolling machine that rolls pipe from 4 inches in diameter up to any required size, in 10-

Undercurrents in Operation, Seen Below the End of the Upper Sluice.

to save as great a percentage of these values in flour gold as possible, in order to secure the best returns.

This is best done by a system of undercurrents—a simple contrivance attached to the sluices, the attachment being made near the end of the sluice line and directly over the dump.

The ordinary bedrock race, and the sluices with their riffles of blocks, steel rails, or Hungarians, though well adapted to catching and saving coarse gold, and gold of ordinary fineness, will not save the minute, dust-like particles that constitute a large part of the values of the upper strata of the diggings. Flour gold particles are very thin and flat, and when caught by the current of the sluice they float very readily, and before they get to the bottom and in reach of the riffles, they are well out toward the end of the sluice and ready for the final plunge over the dump where they are forever lost.

Hence, some other system aside from that of riffles had to be devised to save the flour gold, and the undercurrent was happily hit upon. A California miner, whose name is unknown, is said to have been the first one to apply the undercurrent system of saving fine gold.

Out, within 8 or 10 feet of the end of the sluice box, is placed a grizzly in the sluice bottom. It is usually made of ½-inch steel bars set up edgewise, and a half-inch apart, thus giving a long ½-inch opening. This grizzly should be about 2 feet in length and laid

foot lengths, from 20, 16 or 14-gauge steel. Among the advantages of pipe in 10-foot lengths are the smooth interior, increasing carrying capacity and decreasing friction—fewer joints adding strength and increasing the life of the pipe. Numerous minor points of manufacture, as described, are interesting. The long seams are riveted on a special mandril and the rivets are swelled to completely fill the hole before they are headed down. On the round seam used to join two 10-foot lengths, the holes are drilled instead of punched, to do away with the burr on the inside.

These methods are designed to apply both to the pressure pipe and the pipe for surface irrigation. A form of galvanized surface pipe introduced by this company for use in place of troublesome and unsatisfactory flumes is a special slip-joint pipe, easily and quickly fitted water tight and readily taken apart. One end of each length is reinforced with a heavy band; the other carries a taper metal collar riveted and soldered to the pipe, designed for use where transportation is difficult, surface of ground irregular, and for temporary lines.

In the construction of the steel storage tanks manufactured by this company small sizes are usually shipped set up ready for use; tanks of 1200 gallons and larger are shipped knocked down; all seams are made water tight at the factory except two—one side seam and one bottom seam—designed to effect

saving in cost of setting up the tanks at destination.

The Tallyday Manufacturing Co. makes a specialty of wagon tanks for hauling water, oil, etc. An oil company that had been using tank wagons of 860 gallons capacity which weighed 2400 pounds was equipped with Tallyday tank wagons weighing only 700 pounds, making a saving of 1700 pounds on every tank of oil hauled.

### The Kaffir as a Miner.

WRITTEN FOR THE MINING AND SCIENTIFIC PRESS.

Ever since the discovery of diamonds and gold in South Africa the labor problem has been one of importance. Up to the time of the Boer war this problem was satisfactorily solved by the employment of the Kaffirs and other native Africans, whose work, if not efficient, was sufficiently cheap to offset any shortcomings of skill or physical ability. Since the war, however, it has been difficult to secure enough of these natives to perform the unskilled labor in the mines of the Rand. During the war the natives left the country in great numbers and they have since not returned in sufficient numbers to meet requirements. The Kaffir's idea of work is not very liberal. He has barely emerged from condition of savagery and barbarism, notwithstanding his long years' contact with white men and their ways. He was not obliged to labor to live before the mines were

above or below ground during summer months, unless compelled to. They are cared for in large fenced or walled enclosures, within which are the sleeping and eating houses and large tanks for bathing, etc. The enclosures, or compounds, as they are called, often cover several acres of ground. The houses are built for most part of corrugated iron, as a preventive against fire, and the place is lighted by electricity and provided with every precaution against the spread of contagious diseases.

No natives are employed at the larger mines unless he signs a written contract in which he agrees to work steadily at a stated occupation for a period agreed upon at a stipulated rate of wages. He also agrees to live in the compound and to observe all of the rules and regulations provided for its government. When the contract expires he may either renew his term of employment or leave for his home, where he may resume the habits of indolence and savagery.

In the Kimberley mines the men each wear a band on their wrist on which is inscribed his number, for the purpose of identification should he be killed or seriously injured. The men are lowered and raised from the mine workings in cages or skips, thirty or forty at a time. All work underground is done under the direction of white bosses, and it is seldom that a native is permitted to handle dynamite or other explosives. The natives are particularly useful in shaft sinking and as muckers. In drilling "down holes" by hand they become adept, but they do not often become equally proficient in drilling breast holes or

A Kaffir Drill Crew, Robinson Deep, Johannesburg, South Africa.

opened and he sees no advantage to himself in laboring now. At Kimberley there are 10,000 to 12,000 natives employed in the diamond mines, and on the Rand there were, prior to the war, upwards of 50,000 natives in and about the gold mines. Many of these natives came from the lands to the northward of the Zambesi and Limpopo rivers, as well, also, as from the more southerly States and colonies. Nearly every tribe in South Africa is represented in this motley army of black men. Often those coming from great distances arrive at the mines footsore and sick, mere skeletons, from starvation. The African native is like a child in many respects. He needs some one to care for him constantly and to anticipate and supply his wants should he ever leave his native kraal. Supply a native with abundant provisions for a ten day's trip, and tell him he must use it with care, endeavoring to impress upon him the serious consequences to himself should he fail to act according to instructions, and all is forgotten in a few hours. He will gorge himself the first day and throw away the greater part of his load the second, if he is not watched, and the remaining days he is with little or no food. All African travelers agree that this is characteristic of the native.

When the natives arrive at the mines in this half-starved, emaciated condition they are totally unfit for work for days, and sometimes for weeks, until they have recovered their strength. They are comfortably housed and well fed, though it cannot be said clothed, for, as a class, they wear few clothes, either

uppers. Occasionally the natives become good machine runners. The accompanying engraving shows a Kaffir drill crew in a Rand mine. They have set up a machine at a loading chute for the purpose of having their photographs taken—evidenced by the drill being pointed into a hole in a dry wall. The crew is composed of the runner, the chuck tender and the water boy. Often the machines are run by white miners who have natives for assistants. The Kaffir usually becomes expert in the use of the churn drill in surface work, as this requires no great skill. The place of the native African is now being rapidly taken by the Chinese coolies in the mines of the Rand, and although the Chinese, when first set to work, are in no way superior to an African recruit, they learn quickly and bid fair to make a good substitute for the Kaffir, and they may possibly excel him. At any rate the Chinese coolies seem destined to prove the solution of the labor problem on the Rand.

THE methods of ore treatment in Australia are often ingenious and complicated, but successful in most instances, though, judging from official reports, less effort is made to extract as high percentages of values as in America. This is probably due largely to existing economic conditions, and in ten years from now the tailings piles, at present valueless, will probably be worked at good profit. This has repeatedly been the history of metallurgical processes in America, and there is every reason to believe it will be duplicated in Australia.

### The Production of Precious Stones.

The report entitled "The Production of Precious Stones in 1903," which G. F. Kunz has recently prepared for the United States Geological Survey, contains a summary of the most recent discoveries of gems throughout the world and descriptions of their latest uses in jewelry.

Within the year important and extensive developments in diamond mining have been made in the Transvaal district, and it is clear that diamond deposits of a character similar to those of Kimberley and of very promising richness exist throughout a wide area lying east of Pretoria. Many mines have been located and about 100 prospecting shafts have been sunk to different depths to test the nature and the extent of the deposits. Among the mines actually in operation, the most important is the Premier, which should not be confounded with the De Beers Premier. Its output is superior in yield per load to that of the De Beers property; but the diamonds bring only about \$6.75 per carat, while the De Beers and Kimberley stones are worth \$11.62 per carat.

Mr. Kunz incorporates into his report abstracts of a paper written by T. L. Carter on diamond mining in the Vaal district and one by C. V. Allen on the mechanical equipment of the Kimberley mines. He also quotes an article by S. C. Rudra as authority for interesting data about the diamonds of India, the country which once produced all the diamonds of the world.

Considerable interest has lately been manifested in the mining of beryls and tourmalines in the province of Minas Geraes, Brazil, where a number of remarkable blue and green beryls have been obtained. One of the green beryls was a crystal that weighed 18½ pounds—more than twice the weight of the great beryl in the Imperial Berg-Academy Mining School at St. Petersburg, Russia, which is valued at \$13,000. During 1903 a remarkable discovery of blue beryls was made near Rio de Janeiro. These were deep-blue crystals, from which single gems were cut that weighed 100 carats each. At Villa Rica two dozen magnificent crystals of euclase were found which measured from ¾ inch to 1½ inch.

Among the various green minerals used by the ancients for decorative purposes, compact fuchsite must now be included.

The peridotite dikes of Elliott county, Ky., which at one time were considered a possible source of diamonds, because of special resemblance in their occurrence to the rock at Kimberley, South Africa, have recently yielded some fine pyrope garnet and olivine of gem quality. Some pyropes have also been obtained from a similar peridotite dike at Highland street, Syracuse, N. Y.

Considerable space is given to a discussion of the recent discoveries of jade described in a book by A. B. Meyer, director of the Royal Saxon Museum.

The chapter on spodumene, hiddenite and kunzite is one of the most interesting in the report. The finding of the new variety of the transparent lilac spodumene in California (which was christened kunzite, after the author of this report), is one of the most notable discoveries of a gem mineral that has been made in a long time. These large and beautiful crystals were first obtained early in 1903, close to a deposit of colored tourmaline, itself of notable interest, 1½ mile northeast of Pala, in San Diego county, Cal. In habit the California crystals resemble the spodumene from North Carolina, but for beauty, transparency and great size of perfect material they are not equaled by those obtained from any other known locality.

A discovery has lately been made in the Sunrise mine, near Hartville, Laramie county, Wyo., of a beautiful mineral association, consisting of a brilliant coating of quartz crystals over a blue or greenish blue copper silicate. This quartz is generally thick enough to take a polish and makes a very pleasing ornamental stone.

A series of agate and chalcedony specimens, ranging from 2 inches to 6 inches in length and 4 inches across, beautifully polished, was shown in the exhibit of the State of Texas at the Louisiana Purchase Exposition. These agates were found in a great many places in the counties of Pecos, Brewster, Presidio, Jeff Davis and El Paso. Large masses of moss agate have been discovered in the Hartville mining district, about 130 miles north of Cheyenne, Wyo. More than seven tons of it were mined during the year 1903 and sent to Germany for cutting.

Crocidolite opal has been discovered in the Bulgaroo opal mine, West Australia. Minute crystals of moonstone were found at Rialto, in Inyo county, Cal. An occurrence of saganitic moonstone has been noted near Bakersville, Mitchell county, N. C. Moonstones have also been found on the old beach at the mouth of the Bows river, West Australia.

The precious stones of Peru and Bolivia are discussed by Mr. Kunz.

Mr. Kunz's report is an extract from the Survey's forthcoming volume "Mineral Resources of the United States, 1903." It is also published in separate form and may be obtained on application to the Director of the United States Geological Survey, Washington, D. C.

## Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 22, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE ROASTING FURNACE.—No. 775,147; A. P. O'Brien, Richmond, Va.

Roasting furnace comprising casing, hollow shaft mounted therein, vertically arranged parallel flat partitions dividing shaft into vertical compartments, rattle arms extending into shaft and through compartment walls, rattle arms having internal air passages for leading air from one compartment in shaft through rattle arms to another compartment in shaft.

APPARATUS FOR TREATING FINELY DIVIDED MATERIAL FOR THE RECOVERY OF METALS.—No. 774,736; D. C. Boley, Deadwood, S. D.

In apparatus for treating material by upward flow of fluids, combination of tank having bottom perforated for upward passage therethrough of fluid, of lining of textile fabric secured to bottom of tank by means of folds of fabric itself, whereby overlying battens above fabric are dispensed with and perforation of fabric obviated.

STAMP MILL.—No. 775,151; B. T. Scott, Los Angeles, Cal.

In stamp mill combination of stamp having stem, collars rigidly secured to stamp stem, sliding collars on stamp stem one above the other below rigid collars; frame slidably mounted on stem intermediate rigid collars; levers pivotally secured to frame and extending inwardly toward stem; links pivotally connecting inner ends of levers with sliding collars on stems; rods pivotally connected to levers intermediate ends thereof and projecting through frame both above and below same; nuts on ends of rods; springs

on rods, outer ends of which bear against nuts and inner ends against frame; means to reciprocate frame.

MINER'S PICK.—No. 775,325; W. Ashert, Des Moines, Ia.

Combination of tool formed with sockets obliquely in its trend, stem formed with projections obliquely to its trend and screw arranged parallel with sockets and projections and connecting tool and stem.

PROCESS OF EXTRACTING METALS FROM THEIR ORES.—No. 775,405; F. H. Long, Chicago, Ill.

Improvement in cyanide process of extracting precious metals from their ores by effecting passage of entire charge of mixed ore and cyanide solution in successive portions through contracted channel by injecting into channel air blast of sufficient force and volume to maintain flow of charge and to revivify cyanide and clear ore.

PROCESS OF EXTRACTING PRECIOUS METAL FROM ORES.—No. 775,509; J. J. Berrigan, East Orange, N. J.

Process of extracting precious metal from ore which consists in projecting ore in comminuted form through aqueous solution chemically active to dissolve precious metal.

PROCESS OF SEPARATING COPPER OR LIKE METALS FROM THEIR ORES.—No. 775,548; P. Weiller, Vienna, and A. Weiller, Trieste, Austria-Hungary.

Process for separating from their ores copper, silver, lead and other metals adapted to be precipi-

tated from acid solution by means of sulphuretted hydrogen, consisting in mixing crushed ore with iron filings and saltpeter, placing mixture in suitable small furnace and igniting mixture, whereby metal is reduced and fused down.

ROTARY SLUICE BOX.—No. 775,578; J. L. Porter, Mountain View, Cal.

Combination of two pairs of vertical rollers, one pair being at higher level than other pair, cylinder revolving on four rollers and having circular flange, roller revolving in plane parallel with axis of cylinder and bearing against circular flange, cylinder having series of annular riffles in middle portion thereof, longitudinal opening over riffles, and tight-closing shutter for opening, cylinder extending at each end considerable distance compared with distance between adjacent riffles, and having at upper end annular internal flange and at lower end spiral ribs.

PROCESS OF EXTRACTING GOLD FROM ORES.—No. 775,597; H. R. Cassel, London, England.

Process for extraction of precious metals, which consists in gradually and continuously generating, by electrolysis at high current density exceeding ten amperes per square foot of anode surface, nascent cyanogen in pulp containing cyanide and halogen salt, simultaneously agitating pulp, dissolving and converting precious metals into soluble cyanides and retaining them in solution.

TAPPET FOR STAMP MILLS.—No. 775,625; W. E. Ingram, Stockton, Cal.

Tappet for stamp mills comprising sleeve having downwardly tapered bore, and also having lower and upper horizontal passages 7 arranged off its center and intersecting tapered bore, and downwardly tapered, vertically movable locking gibbs, one of which has upper and lower recesses 8 in outer side; lower wall of upper recess and upper wall of lower recess being arranged to be engaged by tapered device introduced through horizontal passages in sleeve.

TIMBER GROWING on south hillsides is usually better for mining purposes than that growing on slopes facing the north. The probable reason is that the north slopes being damp the trees grow more rapidly, and, consequently, are softer, and therefore less enduring than those on south slopes. It is also material as to the season in which timber is cut, both in mine timbers and in wood for fuel. That cut during the winter is harder and better than that cut in spring, after the sap has commenced to run.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

Ten months' figures (to Nov. 1, 1904) by the United States Department of Commerce and Labor through its bureau of statistics show a total value of mineral oil exported at \$66,000,000, which is a larger total in value than in the corresponding months of any preceding year, though in quantity the total is less than that of the corresponding months of 1901 or 1902. In five of the ten months of the present year the value of mineral oil exported has exceeded \$7,000,000 per month, while prior to December, 1903, the value seldom, if ever, reached so much as \$7,000,000 per month. The total quantity of mineral oil exported in the first ten months of 1904 is 823,000,000 gallons, against 872,000,000 gallons in the corresponding months of 1902 and 874,000,000 gallons in the corresponding months of 1901; but the value exported is \$10,000,000 over that for ten months of 1902 and \$6,000,000 over that for the corresponding period of 1901. Should the present rate of exportation continue during the remainder of the calendar year, the total quantity exported during the calendar year would exceed 1,000,000,000 gallons and the value exceed \$80,000,000, or an average of about 8 cents per gallon for the total exportation. Of the 823,000,000 gallons exported in the ten months ending with October, 629,000,000 was illuminating oil, 81,000,000 crude oil, 69,000,000 lubricating and paraffine, 17,000,000 naphthas and 26,000,000 residuum. Comparing exports with production, the growth in exportation has been justified by production in the United States, which has grown from 21,000,000 gallons in 1860 to 220,000,000 in 1870, 1,104,000,000 in 1880, 1,924,000,000 in 1890, 2,661,000,000 in 1900, and 4,219,000,000 in 1903, according to the preliminary figures of the Geological Survey.

## ARIZONA.

### Gila County.

The Inspiration M. Co., of which J. D. Coplen is manager, has had two carloads of high-grade ore from the Woodson tunnel, near Globe, tested at the Old Dominion smelter and reports satisfactory results. Experiments are under way to determine best method of treatment. The company has men driving the Martin tunnel, which is in 300 feet. It will have to be driven 800 feet farther to bring it in line with the proposed main working shaft which it would meet at a depth of 500 feet. The Mercer tunnel, started on the opposite side of the hill, if driven to connect with the shaft, would reach depth of 300 to 350 feet.

### Mohave County.

The Blue Ridge M. Co. reports making strike of ore in the Tom Reed mine, near Kingman, and proposes building a milling plant. The shaft is down 100 feet and crosscuts and drifts have been driven on the vein. The Ben Harrison is on the same lead.

## CALIFORNIA.

### Amador County.

The mill of the South Eureka mine, near Jackson, is nearing completion. The galvanized iron covering is on and work of placing the machinery is progressing. Superintendent Haven expects to have the mill running by January 1.

The 40-stamp addition to the Kennedy mill at Jackson is completed. The full capacity of 100 stamps will be running this week. The ore bins have been filling with rock. Additional machines have been put to work in the mine breaking rock.

The Whitmore mine, near Volcano, is operating. The 4-stamp mill is idle temporarily. Rock is being accumulated.

### Calaveras County.

C. B. Engstrom of the Hanby mine, near Fostoria, is moving the remaining twenty stamps of the Balliol mill at Sutter Creek, Amador county. The stamps are to be used by the Hanby Co., instead of the Lamphear (as previously reported). The Hanby mine is on the mother lode between Mokelumne Hill and Fostoria.

D. P. Gray has bought the Ginocchio mine, at Lower Calaveritas, and will begin development work this week. He has bought the Hagerman mine, near San Andreas, and has men at work there.

### El Dorado County.

The B. & M. Gold M. Co., which bought the W. H. Coleman group near Omo Ranch last summer, is working eight men and expects to increase the number. One tunnel being run in gravel gives encouraging results. A second tunnel will be started.

### Inyo County.

Near Poleta, J. E. Dunlap, running 160-foot tunnel on the Dunlap group of claims

north of the Poleta mine, reports a ledge struck and has been cut for 13 feet without showing foot wall. Samples run \$8 per ton. It shows free gold.

R. Curtis of Denver, Colo.; F. J. Campbell, manager of the Vindicator mine at Cripple Creek, Colo.; C. M. Hobbs, L. B. Curtis and C. F. Potter are preparing to build an electric plant on Bishop creek, near Bishop, to supply power to the mines of Tonopah and Goldfield districts in Nevada. L. B. Curtis is chief engineer in charge. Power locations have been made on Bishop creek and preliminary surveying is under way. It is expected that a line 12,000 to 15,000 feet long will be required, in which distance about 1000 feet fall will be secured. The unit to be first installed will be of 3000 H. P. capacity. The transmission line will run direct to Goldfield, following the general course of the Bishop & Goldfield toll road across the White mountains.

### Nevada County.

At Willow Valley, near Nevada City, the Cyane quartz mine has been started up. It adjoins the Federal Loan Constitution, Posey, Bellefontaine and Le Compton. A tunnel 150 feet in length on the vein and a crosscut tunnel 200 feet long will be reopened and driven ahead. C. H. and A. J. Kistler and G. M. Carey have a bond on the property.

Headway is reported being made at the Siberian quartz mine at Badger Hill, near North Columbia, and the 4-stamp mill is running steadily. A raise is being run to connect the lower tunnel with the one above to give better ventilation, says Superintendent Bigelow.

The Con. Nevada G. M. Co., which has bought the Julia quartz mine on Deer creek, near Nevada City, is cleaning out and retimbering the tunnel, which is in 300 feet. S. A. Gilmore of San Francisco is superintendent.

### Placer County.

(Special Correspondence).—At the Soldan mine at Towle the flume is completed, the compressor is running, and other improvements at mine and mill are about finished. A new tunnel 250 feet vertically below the present adit tunnel will be started. C. G. Dennis is superintendent.

Towle, Nov. 29.

The Elite mine of Shady Run after running a tunnel 1800 feet struck gravel in a raise of 35 feet last week. The Blue Canyon M. & Dev. Co. mines are in same section.

### Santa Barbara County.

At Santa Maria the Barca Oil Co. has been organized by J. B. Bonetti, S. Fleisher, S. A. Johnson, T. R. Finley, M. Grossmayer, C. F. Bramming, J. Smith. The property consists of a 250-acre lease on the Barca tract, adjoining the Graciosa Oil Co.'s ground on the west and being  $\frac{1}{2}$  mile north of Purissima well of the Union Oil Co., which is flowing 500 barrels of oil daily. Lumber and machinery will be put in and it is intended to begin drilling this month.

The Graciosa Oil Co.'s well No. 3, near Santa Maria, continues to flow at the rate of 900 barrels per twenty-four hours. No. 2 yields 425 barrels.—The Final Oil Co. is shipping 1500 barrels daily, being the production from five wells. It expects to have at least three more on the beam by Jan. 1st.

### Shasta County.

Operations are to be resumed at the Mt. Shasta, and the 550-foot shaft is to be sunk 500 feet deeper.

Contract for the 2 $\frac{1}{2}$ -mile tramway, to be built at the Mammoth mine, near Kennett, will be let. The United States M. Co. of Salt Lake City, Utah, is owner, with A. F. Holden, managing director.

The Nigger mine has been bonded to J. H. Thain. The Nigger mine is west from Keswick. Thain says that he will unwater the mine and work it.

Ore from Tonopah, Nev., is being shipped in carload lots to Keswick and treated at the Mountain C. Co. smelter, says the Searchlight. Ore is also being received from Mojave, in southern California. The ore from Nevada is used by the Mountain C. Co. for flux in smelting its sulphide ore from the Iron Mountain mine. The company has been paying \$2 a ton for quartz for fluxing purposes, even if barren of gold.

### Sierra County.

Near Forest City, men are at work extending the South Fork main tunnel, in 3400 feet, to tap the lower part of the Ruby lava-capped channel, about 900 feet beyond them. About 2000 feet of this ancient river bed and auriferous gravel lead is undeveloped on the Bald Mountain Extension, 4000 feet on the South Fork and 2000 feet on the Maple Grove locations. In what was known as 45 incline on the Bald Mountain ground gold was obtained from the Ruby channel. The extension of the South Fork main tunnel is expected to be completed in six months. A branch tunnel will be run north from

the main tunnel for a block of payable gravel on the South Fork ground, not worked by the Bald Mountain Extension Co. There are timber and water privileges on these claims.

### Siskiyou County.

J. B. Scott, manager of the New York quartz mine on Indian creek, near Fort Jones, reports success in taking out ore. His men have sunk 700 feet and found a ledge 10 inches to 4 feet in width. The mill is running steadily.—A. C. Brokaw of the Golden Eagle quartz mine on Indian creek, is doing development work in sinking shafts and extending tunnels. Ore is crushed with his small mill, which he intends replacing with a large one.

### Stanislaus County.

La Grange M. & Hydraulic Co., of which T. Donohue is superintendent, has begun hydraulicizing in the Patrickville placer diggings near La Grange.

### Trinity County.

The Red Mountain mine, near Weaverly, under management of M. A. Senger, has begun sluicing for the season. The owners have a 60-foot bank of payable gravel.

### Tuolumne County.

Contract to drive 200 feet of tunnel has been finished at the Presonta (the Precious Roost) mine, 2 miles above the Mohican mine on the main Tuolumne river, near Groveland. The vein is 18 inches in width, showing ore values. The mine is owned by Groveland men, as the Presonta G. M. Co. Contract to run the tunnel an additional 200 feet will be let.

### Yuba County.

The head dam of the Bay Counties Power Co. on the Yuba river, near Bullard's bar, is finished and water is flowing from it through 8 miles of flume to Colgate. The dam was washed out last winter and since then water was pumped from the river to the flume.

J. Moore & Son have begun boring on the Colmena Colony tract of 3100 acres, half way between Marysville and Wheatland, to prospect for gold for dredge mining.

## COLORADO.

### Boulder County.

The Fourth of July mine has resumed work at its main tunnel on Arapahoe Peak, near Eldora. The company has started to drift on the vein of concentrating ore cut at the 1700-foot point.

### Chaffee County.

Near Buena Vista, the strike in the Latchaw tunnel, Mt. Princeton, is showing the vein 22 feet between walls. A foot and a half of black sulphurets runs through it. President Torpy says the contractors will continue driving the tunnel and begin to drift and raise on the mineral. Ore will be treated in the company's mill at the foot of the mountain, which they will build this winter. The stoping ground from which they can take out mineral will be 1300 feet from the tunnel to the surface of the mountain.

### Clear Creek County.

C. I. Burt, interested in the Vulcan mine, near Silver Plume, will start work in the mine again and will let a contract to run a crosscut from the Pay Rock lode on the Silver Bank level to intersect the Vulcan vein at that depth, which it is estimated will be reached by driving 1600 feet. This will open the Vulcan at 300 feet deeper than the former workings.

Superintendent B. J. Martelon of the Silver Leaf M. Co. reports progress being made in the tunnel being driven to develop the Liberty Bell group of claims on McClellan mountain.

### Gilpin County.

Near Central City the Elizabeth G. M. Co. reports opening a streak of high-grade smelting ore in the 200-foot level. They are crosscutting in the 300-foot level to open into the ore body at that point. Development work is being carried along and shipments of milling ores gave two and one-half ounces gold to the ton.—The Lamberson & Warren vein has been cut after crosscutting in the third level of the King mine, on King flats, in Nevada district. The crosscut was driven south under direction of Manager T. Cornish and the vein shows 5 feet of concentrating ore. Drifts are being driven both ways on the vein.

Near Black Hawk the Robert Emmet mine is being developed. The vertical shaft has reached a depth of 525 feet and is completely timbered. The expense of the shaft was \$17,000. Drifting shows an ore body 125 feet high and 750 feet in length. No ore is being shipped except what is broken in extending the levels, making raises and sinking winzes. Plans are being made to sink the shaft 200 feet deeper and to extend 1500 feet of new levels at the 600 and 700-foot stations. The vein has paystreak 2 feet wide. Shipments to the local mills average  $4\frac{1}{2}$  ounces gold to the cord and the smelting ore \$43 per ton. The property is equipped with

boilers, hoists and air compressor. H. J. Stephens of Denver is manager.

Denver men are interested in lease and bond on the Pride group, near Central City, and they have the shaft down 175 feet. They have started running drifts on both sides of the shaft and are opening up mineral. Development work is slow on account of hoisting with a horse whim.

### Larimer County.

Near Pearl, J. F. Johnson, with D. C. Huling, owning the Viking group of five claims on Big creek, near the Cox mine, reports the main tunnel, under the Mayflower claim, has been driven 105 feet into a 34-foot lead, carrying payable values.

### Ouray County.

The Continental S. & R. Co. plant at Red Mountain is progressing. The main building for smelting purposes is completed and ready for machinery. A 52-foot brick Stetefeldt furnace and dust chambers, resting on heavy stone foundations, are in position. They will have a 150-ton daily matte furnace in operation and will treat low-grade gold and silver ores. The company owns, in addition to the smelting plant, three developed patented mines and controls, under ten-year bond and lease, the Saratoga group of mines, containing  $1\frac{1}{2}$  mile of tunnels, drifts and raises.

### San Juan County.

The Big Colorado mine has reached 3000-foot point with its tunnel in Boulder mountain, near Silverton, and an additional 2000 feet of drifts has prospected the several veins cut by the tunnel. The electric drills used have done satisfactory work, says Manager Bloodgood.

### San Miguel County.

Operations on the Ophir Con. group, near Ophir Loop, have been temporarily discontinued. The thirty stamps of the 50-stamp mill which have been dropping steadily for several months past have hung up.

At the Butterfly-Terrible mines and mill, near Ophir Loop, Manager J. F. Keating says steady work continues. Driving the mill crosscut tunnel will start near the mill building, and it will be 2000 to 3000 feet in length when completed. It will cut the Ida vein, the objective point, between 750 and 800 feet below the lowest of the upper workings. The tunnel will be driven on a vein most of the distance.

It is expected that G. W. Pierce et al. of Denver will build a plant for milling low-grade ores in Sawpit district, 17 miles down the San Miguel river from Telluride. Pierce has an option on a group of mines near Sawpit.

### Summit County.

Another ore shoot has been opened in a drift from the 180-foot level of the Old Union M. & M. Co. shaft No. 1, near Breckenridge. The ore carries galena and will be shipped. Development work is under way through two shafts, which are equipped with hoisting plants, and a tunnel being driven from the mill level. Work on the separating and concentrating mill is progressing. Superintendent G. C. Smith is opening up and blocking out ore. With completion of the mill-level tunnel, which will be 1000 feet long, the ore will be more cheaply taken out than by means of the shafts, says Manager A. E. Keables.

The Hancock M. & M. Co., of which C. F. Fry of Keystone is an incorporator, has been organized to operate at Montezuma. The Hancock and other claims of the company's group are on Glacier mountain, Montezuma.

Near Breckenridge the Gold Run M. & M. Co. has extended its tunnel 2500 feet. The breast of the tunnel shows heavily mineralized porphyry. The tunnel is being driven to cut a vein at 3000 feet. C. L. Lighburn of Cripple Creek and West Virginia men are owners.

### Teller County.

At Cripple Creek the Elkton Con. group on Raven hill has 100 men at work and by the aid of the new washing machine profits are reported being saved. The management is confining most of its operations to the sixth, seventh and eighth levels. Shipments are sent out regularly to mills and smelters.

A bond of \$150,000 has been given on the Jefferson mine, in Victor, to A. A. Barnes, who will start operations. The Jefferson contains three and one-half acres. The claim adjoins the Strong and Independence mines and the extension of the ore-bearing dike of the former is supposed to go through the Jefferson. It is developed by a shaft 510 feet deep.—The Milwaukee Mutual M. Co., leasing on the Gold Dollar Con., is breaking ore 3 feet wide and maintaining shipments of three carloads of \$40 a week.—The Elkton Co. is outputting 100 tons of ore per day. It is also doing a great deal of development.—The air compressor of the La Bella plant at Goldfield was closed for three days last week to make repairs, causing a suspension of operations on several properties on Bull hill. Heretofore

the compressor has been furnishing air for sixty-one drills, but now it will have a capacity of eighty drills.

The Spinney mill, built in 1893, on the Colorado Springs wagon road east of Cripple Creek, is being torn down. The mill contained ten stamps and was built at a cost of \$20,000.

On Beacon hill the Exposition M. & L. Co., composed of Cripple Creek and Kansas City, Mo., men, has leased that portion of El Paso estate known as the Barbee block. It is proposed to sink to the 500-foot point. Equipment is being put in, including a 40 H. P. boiler, hoist, compressor and gallows frame.

P. Logan, lessee, will put in a washing machine and other apparatus on the dump of the Jo Dandy mine, on Raven hill, near Cripple Creek. The values run \$15 in gold to the ton; and after the washing machine is in, it is expected slimes running \$100 may be saved.

Near Cripple Creek C. B. Burch will build a 100-ton cyanide mill on the Little Giant mine in Pony gulch.

At Cripple Creek, the City of Cripple Creek G. M. Co., which has bought the assets of the Cripple Creek Enterprise Co., which held a franchise from the city to mine under the streets and alleys, has started operations through the main shaft. The shaft, which has been sunk 200 feet, has been unwatered. They expect to sink the shaft 200 feet more.

Cripple Creek reports say W. P. Dunham, manager and part owner of the Hull City placer mine at Bull hill, has effected a settlement and is starting up the property. Dunham says he will cut the property up into blocks, when it will be thrown open on the leasing basis, which will give employment to 100 miners.—Lessee McDonald & Co., operating on the Clara D. of the Lexington Co., is sending out regular shipments. The lessee is also saving one carload per week from the dump which returns values of \$17 per ton. The shipments from the mine return values of two ounces per ton.

Near Cripple Creek, the property of the Astor G. M. Co., which comprises sixteen and one-half acres on Copper mountain, has been sold by sheriff to G. R. Lewis of Cripple Creek.

At Cripple Creek, the Ajax M. Co. has twelve sets of lessees operating on its territory, besides the company is working on its own account. Between 600 and 700 tons of ore per month are being removed. The production is being made from the 900-foot level to the surface. The average ore runs \$30.

Northeast of Cripple Creek the Colorado-Quincy Granite Co. owns 160 acres of granite, which will be quarried for building purposes. The owners are F. C. Smith, F. Ferguson and H. M. Gilbert. The property is at Devil's Slide station, on the C. S. & C. D. Railway. Machinery, including a 60 H. P. boiler, a 30-horse derrick and a 40-drill compressor, is being set up. Within sixty days the company will be shipping granite.

## IDAHO.

### Boise County.

G. M. Snow of the Trapper Flat M. Co. says the company has taken up the bond on the Thunderbolt mountain mining claims, near Idaho City, in advance, development work having justified the step. A sawmill will go in this fall. The company has a stamp mill which will be taken in next spring.

### Idaho County.

(Special Correspondence).—The Imperial Corona G. M. Co. which owns the Atlas group and the Consolation group, 2 miles from Elk City, is driving a tunnel on the former and sinking a shaft on the Consolation. The working force on both properties is being decreased.

Elk City, Nov. 26.

At Roosevelt, in Thunder Mountain district, the Sunnyside has completed installation of the 40-stamp mill and it will be operating next week. The mine is working eighty men. The tramway is finished. At the Dewey the 10-stamp mill continues crushing and about fifteen men are employed. The H. Y. S.'s new sawmill is working. The Copper Mountain and the Wendenhoff properties are also working. The camp is well provisioned and many miners will remain during the winter.

H. O. Johnson, Schofield, Snider, Hamill and Sugrue are owners of twenty-five claims east of the H. Y. and Old Crater mines, near Roosevelt. They will incorporate the group, which is known as the Paragon and North Star.—M. F. Kirkpatrick, superintendent for the Co-operative Mines Association, also the Crown, Empress and East Dewey, says he has completed 200 feet of work on the East Dewey since taking charge. In an adit below the mine buildings he opened ore showing sulphurets and free gold.

### Owyhee County.

The Cleveland M. & M. Co.'s hoisting

plant at the California mine on Baxter hill, near Silver City, is in operation. The engine is of gasoline type fitted for sinking 800 feet. The Baxter shaft is being retimbered. A bedrock shaft is being sunk through the cap rock on the Helm claim of this group to determine the course of another vein 300 feet east of the California vein.

### Shoshone County.

At Wardner at the Bunker Hill & Sullivan concentrator improvements are under way. An addition to the ore bins is being made and several hundred feet of track have been laid so that the cars can be loaded direct from the bins. On account of the low stage of water the mill is partly operated by steam. The steam power will be supplanted by electric power, for two 50 H. P. electric motors are being put in. A small compressor has been put in to assist the large one. It is operated by electricity.

G. A. Rubedew and E. Desvoigne of Moscow report at Pierce City the Hunch M. & M. Co., in which they are interested, has men running a drift on the ledge. They opened up a ledge 10 feet in width with a pay streak 2 feet, giving mill test of \$40 to the ton. On the Wild Rose the cyanide plant is being worked. The tunnel is in 300 feet, with 150 feet yet to run.

The owners of the Teddy group of claims in Evolution mining district, near Wardner, are incorporating their property. The owners are J. B. Cox, J. B. McKenzie, A. H. Rambo, J. W. Branthly, J. Pelkes and L. O. Whitsett of Wardner. The upper tunnel is in 125 feet and the lower tunnel 100 feet. Work will be increased. A body of galena is showing.

Wallace reports say J. M. Burke has bonded the Cooney group and the Murphy-Kelly group which adjoins the Tiger-Poorman mine on the northeast. Each group is bonded for, approximately, \$100,000. First payment has been made and work started by Burke. The two groups are in a favorable situation at head of town of Burke. The Murphy-Kelly group consists of five claims on O'Neil gulch. On the Marsh lode, one of the claims adjoining the Tiger-Poorman group, a 100-foot tunnel has been driven and it is claimed the Poorman lead followed 60 feet. The vein on all the claims can be tapped with this tunnel. Burke is also developing the Polaris group, owned by S. Heyburn et al.

## KANSAS.

### Cherokee County.

At Galena Boughton Bros.' mill is running regular. Crowe's mill has started up after a prolonged shutdown.—The Pittsburg M. Co. shafts, Nos. 2 and 3, have been shut down temporarily on account of the large amount of dirt which was held for the mill. The same is the case with the Bonanza mines, says Superintendent Murdock. The pumps in the bottom have been shut down. The water has been lowered to the 160-foot level and will not be lowered any more until miners start to sink again.—G. McCullagh's mill been started again.

At Galena the management of the Maggie Taylor tract is starting work.—Manager Van Pelt will work his Bonanza mines. Superintendent C. Moll has placed a pump in the shaft and the ground will be drained.—The B. & E. mine is taking out payable ore, which is sent to the Marshal mill.

At Baxter Springs the Mission mines of Ford & Troupe have been sold to McCarthy & Bailey of the Baxter M. Co. for \$75,000.—Zinc ore has been found in the Joanna mine.—Haines & Co. are placing a new boiler and engine.—Kent & Co. are taking out ore at the M. K. & T. mine.—Hubbard & Co. have struck a fine run of lead ore on the Angel ground.—A new hoist and hand jigs are being put in at the Tom Clark mine.—Two shafts are being put down by Canterbury & Wilson on the Charters land.

## MISSOURI.

### Jasper County.

J. Seaton of Atchison, Kan., has incorporated his interests in Joplin district, as the Charlotte M. Co., with W. H. Condit, S. S. Winn and W. M. Garrad. The company owns a productive property near Centerville.

The Hungry Five M. Co., on the Stephenson-Moore lease, near Duenweg, has been sold to Thomas, Coyne & Weaver for \$3000.—Two strikes have been made on the 560-acre tract, owned by C. M. Wilson, north of Joplin. One was a drill hole strike on the Cincinnati-Joplin lease. The drill penetrated an ore body from 145 to 175 feet. The drill first went through 6½ feet of lead. The jack cuttings are also said to be rich. The other strike was made in a shaft at a depth of 32 feet. After going through 6 feet of lead a body of jack was cut and they are sinking in it. This development is on a lease owned by G. Lilly.

The Pim-Mays M. Co. on the Greer

lease east of Carterville is sinking its shaft, taking up lead and jack.—C. T. Orr of Webb City and J. B. Miller of Warrensburg have bought the Great Scott tailing mill. They will keep the plant busy on tailing piles near the plant.—The Hayseed mines are opening up a rich run of ore.—A drill strike of lead and zinc is reported on the Luscombe mining land at Carterville. The owner of the ground is T. T. Luscombe of Carthage.

A. B. Griffith of Cleveland, O., is at Webb City and resumed operations on the Baker land, between Webb City and Oronogo. They have a prospect in sheet ground. The company is operating as the A. B. C. Mining Co.—The mine on the Cornfield, operated by Daugherty, Wallace, Smith, Nearing, Daniels & Howard, is producing from a 6-foot face of block lead at a depth of 115 feet.

C. M. Wilson has bought a tract of land comprising 1652 acres of the Allen tract at Spring City, 5 miles south of Joplin. The developed portion of the land has been a producer of high-grade ore. The La Salle mill will be put in operation. Wilson has also secured the J. Dessoux forty acres of land at Zincite, together with the Stewart lease and 100-ton mill recently completed. That property is being opened up.

### Lawrence County.

At Stotts City the Three C mining plant, the property of H. Bromback of Mt. Vernon, was destroyed by fire last week. There was no water or means of fighting the fire. The plant was built at a cost of \$10,000.

## MONTANA.

The Montana State Bureau of Labor, Agriculture and Industry has a table in the biennial report showing the production of the coal mines of Montana for the past two years. In 1902 Cascade county led in the production of coal, the aggregate being 791,949 tons. Carbon county was second, producing 548,923 tons. The value of the coal produced in Cascade county was \$1,072,130 and in Carbon county \$676,231. The value of all coal produced in the State was \$2,222,488. In 1903 Carbon county had total of 776,234 tons, while Carbon county produced 582,497 tons. The total number of tons produced in the State was 1,553,285, value \$2,524,069. The total amount of capital invested was \$5,567,200. The amount paid for labor was \$1,712,092. An average of 2112 men were employed, as against 1974 in 1902. The report says the area of coal-bearing formation in the State is estimated to be 13,000 square miles, exclusive of the lignite-bearing formations, according to the United States Geological Survey.

### Deer Lodge County.

Near Anaconda, preparations for the winter are made at the Golden Eagle mine on Flint creek by J. Wegener and H. Moen. There are 100 sacks of ore filed to be sent to the smelter.

A gold strike is reported made in the Hidden Lake group of mines on Warm Springs creek, near Anaconda, owned by T. O'Leary, W. A. Law, P. J. Dooley and other Anaconda men. An 8-foot ledge of free-milling gold ore is showing.

### Flathead County.

The Spokane Placer M. Co. has been organized under Washington laws by F. W. Schwellenbach, president and manager, F. Bahler, R. H. Hoag, H. J. Schutte, A. Morin, W. J. Noland and H. Teichman of Spokane, Wash. The company owns 1280 acres of placer ground on Standard creek, in the West Fisher gold belt, near Libby. It is said the ground has been tested over an area of 1000 acres and that it will vary from 1 to 75 feet of pay dirt and will yield 41 cents to the yard. The company owns water rights and a mile of ground farther down the creek for dumping purposes. The water will have a fall of 500 feet on the company's ground.

### Granite County.

The Sunset M. & R. Co. has been organized at Phillipsburg to open up mining ground 1 mile north of Phillipsburg, by H. Kaiser, F. Bowen and D. Olson. The claims owned by the company are the Sunset, Great Surprise, Bay Horse and Summit. The company also owns a one-half interest in the Hello Girl group and has a bond on the Gold King, an adjoining claim. The claims are along northwest portion of Hope hill and near the Hope group. The Sunset group carries values in gold, silver and copper. The vein shows an iron cap of average width of 120 feet. It is on a contact between porphyry and quartzite, and as far as developed carries values of six ounces silver, 6% copper and several dollars in gold per ton. The company will sink a shaft and cross-cut the vein. Machinery, including a hoist, pump, etc., will be put in.

### Jefferson County.

In the Reliance mine, operated by Red Bird M. Co. in High Ore gulch, near the

High Ore mine, near Basin, and about 1 mile from the railroad, the company has expended \$22,000 in development and will develop further with a diamond drill. In taking out shipments of high-grade ore, bodies of concentrating ore have been blocked out.

### Lewis and Clarke County.

(Special Correspondence).—The Whitlach M. Co. is increasing development work on its group of mines (formerly the Whitlach-Union), near Helena. The Whitlach-Union is one of the oldest developed gold mines in the State. F. L. Sizer is manager.

Helena, Nov. 27.

### Park County.

The New World S. Co. has been organized by G. L. Tanzer, J. C. Lavold and C. R. Tuttle of Seattle, Wash., and owns 860 acres of placer ground, five quartz claims, 8,000,000 feet of standing timber and three water rights out of Clark's Fork river, near Livingston. Its Montana agent is F. C. Byrne of Red Lodge.

## NEVADA.

### Elko County.

The Trophy M. & M. Co. has been organized to operate at Mountain City by W. H. Dickson, F. E. McGurrin, A. J. Weber, W. I. Snyder, G. Gutch and J. J. Broecker of Salt Lake City, Utah.

### Esmeralda County.

At Goldfield a strike is reported in the Loftus & Davis lease in the Sandstorm mine. J. P. Loftus and J. R. Davis were prospecting on abandoned lease 5 of the Sandstorm. They secured a lease and began sinking a shaft. Three ledges have been uncovered. One of the ledges is said to average 4 feet and goes \$1000 a ton.

### Lincoln County.

M. Blake and F. Williams, owners of the Golden Crown group of mines, near Moapa, report assays of \$22 gold and 100 ounces silver per ton from a 3-foot ledge at breast of tunnel in 230 feet, with a depth from surface of 120 feet. The vein lies between quartzite and shale walls.—L. McNamee and F. Woolsey, on the Golden Dawn group of gold mines on upper Virgin river, have struck a 3-foot vein of free gold ore. The values are in white honey-combed quartz. They propose building a stamp mill. They have five claims in the group and water from the Virgin river to handle the ore. Grey & Noble of Denver, Colo., are also part owners.

G. Brown and F. Calles, owners of the Red Light group of gold claims on Virgin river, near Moapa, struck a 4-foot vein of ore. They will erect a mill and start milling ore by February 1.—L. Meyers and J. Peters, owners of the Black Bird and Fairview mines, northwest of Caliente, 65 miles, have struck a ledge 5 feet wide at a depth of 160 feet of galena, going 450 ounces silver and 23½ lead per ton.

### Nye County.

Reno reports say the Southern Pacific Railroad Co. has given notice that after Nov. 29th, until further notice, the company would not receive freight from any points along its system destined for Tonopah or Goldfield, except "such freight as is absolutely needful in the mining camps for sustaining life of man and beast"—the result of the congested condition of the freight traffic between Reno and Tonopah. According to the figures of the railroad company, there are standing on the sidings between Reno and Moundhouse 300 cars loaded with freight awaiting shipment into the mining camps. The newly built Tonopah railroad has been supplied with additional cars for relieving the congestion, and although its entire rolling stock has been kept moving all the time the supply of cars has been inadequate. It is expected that it will be twenty-five or thirty days before new freight will be accepted by the companies. A cessation of freight traffic is believed to be the only means of amply providing the mining camps with necessary food for the winter months.—Last week five mule teams of twelve mules each started from Reno with heavily loaded wagons, being the first time since the days of the Comstock that this slow mode of travel has been used. It will take the mule teams twelve days to cover the distance that a freight train can travel in one day. More teams are being put on.

Tonopah reports say the case of Porter against the North Star mine has been decided in favor of the latter. Judge Hawley held that the North Star had made prior location and was therefore entitled to the patent.

E. Hirschler, president and manager of the Tonopah-Wilmington Co. (previously known as the South Tonopah), has let contracts for work. The group comprises seven claims, 4 miles south of Tonopah on the Goldfield road. On the Needham claim a shaft is going down on the foot wall side of the vein. A 15 H. P. gasoline hoist will be put in on the Needham shaft.

T. Lynch & Co., who took an option on

the Reveille group at Reveille, east of Tonopah, have made final payment of \$50,000. The mine has cost them \$250,000.

Manager H. H. Douglas of the West Tonopah reports seven claims owned by the company, adjoining the Pittsburg Tonopah mine on the west, have been surveyed and sinking a main working shaft has started. This shaft is 2000 feet west of the Pittsburg Tonopah shaft and north of the vein which crops on the surface. A steam hoisting plant will be ordered.

## NEW MEXICO.

### Grant County.

The Mountain Key mine, at Pinos Altos, is developing into a steady producer and shipment of ore will begin this month. The number of men at work will be increased. There are 300 tons of ore on the dumps waiting shipment. Water has delayed the work.

During the ten days preceding Nov. 24 over seventy cars of freight were shipped to Silver City, of which number a large percentage were loaded with mining machinery consigned to the Burro Mountain C. Co., Comanche M. & S. Co., Ernestine M. & M. Co. and the Mogollon C. Co. The Burro Mountain C. Co. received additional concentrating tables, a Huntington mill, new boiler and other machinery for the mine and mill; also a car of lime, a car of lumber and four mixed cars of small machinery. The Comanche M. & S. Co., at Silver City, has started to receive ore, preparatory to opening its smelting plant.

### Lincoln County.

It is reported the magnificent plant at the Vera Cruz mine, south of White Oaks, in the Capitan mountains, is in full operation with its five Huntington mills.

## OREGON.

### Baker County.

Sumpter reports say the flume work and ditching for the Thornburg placers has been completed, and they will be ready for operations next spring. Steel rails are being hauled out, and these will be used as runways in the flumes. Road work to the placers has also been completed. Concentrators will be put in for handling the black sand and also a cyanide plant. The name has been changed from Thornburg to Vinson placers, says Manager W. L. Vinson. Other claims along the creek have been bought.

A. Geiser of Baker City has an option and lease on the Dell group, near Sparta, and has put men to work. The property is near the Gem mine, which Geiser is operating.—J. S. Hughes and Cleaver Bros. have sold their interests in the Standard mine, in Quartzburg district, to the Killen, Warner, Stewart Co. of Sumpter for \$40,000 cash.

### Douglas County.

W. Cochran, working mines in Bohemia, says with O. G. Gilbertson he has been opening up City creek bodies of both oxidized and sulphide ores. They expect to build a mill next season.

### Jackson County.

The Millionaire mine, 2 miles south of Gold Hill, was sold last week to W. R. McKeene of Terre Haute, Ind., for \$40,000 cash.

### Josephine County.

M. Armstrong, with T. Reid of Medford, owning a placer mine on Taylor creek, near Grants Pass, report they will start piling this week. Their equipment consists of a No. 2 giant, but another No. 2 will be put in this winter. Work will be started this week to put in another ditch of a mile in length, which will give a larger quantity of water and higher head than the present ditch, which is also a mile in length.

H. E. Booth of Pickett creek, near Grants Pass, owning the Gold Standard group of six claims, says he is developing ledges of gold and copper bearing rock, the copper assaying up to 13%, and the gold ore \$6. The copper is in a ledge 12 feet in width and development work consists of 200 feet of tunnel and a 50-foot shaft. The gold is in a porphyry dyke. The rock is decomposed, giving ore that is free milling. The group is on Pickett creek which would afford water for power and other purposes, and is 6 miles from the railroad at Merlin, with a wagon road of easy grade.

The placer season was opened in southern Oregon last week by the beginning of operations on Galice creek, near Galice. The Galice Con. has four giants at work in its diggings, and Manager J. Harvey will begin operations in the Royal group next week. The Alameda and Rand mining companies are working men in quartz mining development. The new wagon road makes the district easier of access from Merlin.

Near Grants Pass the forty-ton cyanide plant, rolls, rock crusher, engine, boiler and other machinery for the Oro Fino have been set up at the mine on Jump-

Off-Joe. The Oro Fino is owned by Portland men. S. Chase is superintendent. The property is over the divide from the Granite Hill.

A. E. Dodson and J. Bumgardner on Oscar creek, near Grants Pass, are opening up two claims, one a placer, the other quartz. The placer claim embraces the creek channel and the earth to be handled is from 1 to 12 feet deep, with a layer of gravel on bedrock that prospects well. Dodson & Bumgardner will put in a ditch 500 feet in length, which will give them a pressure of 60 feet to operate a hose in piping the earth through the sluices. The quartz claims are near the placer.

C. L. Mangum of Grants Pass owns in Silver creek district the Old Glory group of quartz claims. He says the ore will be tested by cyanide and amalgamation. It is expected a mill will be built and the mine further developed.

### Lane County.

The Treasure mine in Blue River district has 6000 feet of tunnels completed, and drilling of 1400 more on the main tunnel under way. It will connect the two watersheds of Blue river and the Calapooia, affording convenience of getting water and timber for the stamp mill, besides yielding ore. D. H. Park, manager, says work is being increased in the tunnel, and when completed the mill will be placed at the Blue river end, while the sawmill will be moved to north entrance of the tunnel on the Calapooia side. There is but little timber on the Blue river side, and lumber supply as well as water for use in the stamp mill will be brought through the tunnel. The ore is said to be easily worked, power drills not being required. The cost of working averages \$5 per foot in the tunnel. The ore is free milling. A stamp mill of 100 tons capacity will be put in next summer.

E. A. Hamilton, of San Francisco, Cal., has bought half interest in the Tate Bros.' mine at Blue River. He will begin work of running a 250-foot tunnel to tap the veins in the Tate Bros.' group, and next summer will put in a 5-stamp mill.

A 2-stamp quartz mill is being put on the Red Buck mine near Blue River. The mine has been bonded by W. H. Scott of Crawfordsville and T. P. Howard of Gervais. Buildings are being repaired for the plant. The Red Buck adjoins the Nome Con. M. Co. group on the northeast and is a half mile from the Calapooia river.

### Marion County.

Erection of the pyritic smelter and concentrator plant and the extensive development of the mines of the Gold Creek M. & M. Co. of the Santiam mining district are planned, says President O. Hansen at Salem. The property consists of eighteen claims with 1000 feet of tunnels. The main working tunnel is on the Bimetallic claim and has cut ore veins at three points. The ore ranged from 10 inches to 7 feet, the latter width being the Bimetallic ledge. In addition to the group of lode claims the company also owns 160 acres of placer ground at Gold creek, obtained and held for use as a mill and smelter site. The nearest railroad point to the mine is Gates, on the Corvallis & Eastern Railroad, 9 miles distant. Work is in progress building roads to that section.

## SOUTH DAKOTA.

### Custer County.

The Ivanhoe M. Co., operating at Camp Ivanhoe, 8 miles east of Custer, reports developing ore which chemical analyses show contains from 0.1 ounce to 0.2 ounce platinum per ton. Superintendent C. J. Sine says the company is experimenting to determine a process and equipment for profitable recovery of the platinum values. A stamp mill with a capacity of fifteen tons daily is being built. The gold values will be saved by amalgamation. The mill is going up beside the hoist, so as to use the same boiler equipment. A 1000-foot tramway is being built to connect the mill with the Chilkoot vein, and a tunnel driven to tap the vein at 200 feet vertical depth. The shaft is being sunk to 500 feet, going down between the Chilkoot and Detroit veins.

### Lawrence County.

The Puritan G. M. & M. Co., near Deadwood, proposes to add a cyanide department to its 20-stamp, concentrating mill. W. J. McGoffin is president.

The Elliptic M. Co. is putting in shipment of machinery at its mine near Maitland, including hoist, compressor, drills, two boilers, pumps, etc., and a dynamo and engine for lighting the mine and plant. Sinking will be resumed and the shaft continued to quartzite.

As showing the costs of handling low-grade gold ores in the mills of the Black Hills, the following figures have been furnished the Black Hills Review by the companies indicated. Some of the figures are for the month of October:

Plant.	Costs Per Ton.
Wasp No. 2 cyanide	\$1.03
Clover Leaf amalgamation	.71
Maitland cyanide	1.80
Imperial cyanide	1.38
Dakota cyanide	.90
Homestake (stamps)	.40
Homestake cyanide	.28
Horseshoe cyanide	1.32
Spearfish	.80

The following will show points of difference and features of the above mills: Wasp No. 2: Dry, coarse crushing mill, treating oxidized quartzite, easy of percolation. Rolls used in crushing, belt conveyors transfer ore to leaching vats, where product is treated without discrimination between sands and slimes. The plant is nearly automatic, requiring small crew.—Clover Leaf: An amalgamation mill, operating sixty stamps.—Maitland: Cyanide plant, wet crushing, with forty stamps. Ore, complex and difficult of treatment. Extreme hardness of ore in a measure responsible for high cost. Long leaching time is given—sixteen days.—Imperial: Dry crushing plant, built on level ground and equipped with elevators and conveyors. Costs based on monthly tonnage of 3500 to 4000. The mill is being enlarged by additional crushing machinery.—Dakota: Thirty-stamp, wet-crushing mill. Ore averages \$4.80 per ton. Tonnage, 120 daily. It is thought permanent improvements, repairs, etc., are not included; but the figure gives barely the cost of operating.—Homestake: In the stamp mills, by amalgamation, the ores are treated for 40 cents a ton. Sands, after separation from slimes, are handled at cyanide plants for 28 cents a ton. This latter figure represents the cost merely of leaching, discharging, cleaning up, etc., as the ore is not pulverized for the cyanide treatment.—Horseshoe: The largest wet crushing cyanide mill in the Hills, with present tonnage of 350, and 90 of its 120 stamps in operation.—Spearfish: Dry-crushing plant, handling ore of character for quick and easy treatment. Ore is crushed to size of grains of corn, dumped into vats and treated by cyanide. A high recovery is made in short time. The ore is described as a silicified lime, running \$5 to \$6 a ton.

### Pennington County.

Manager T. R. Griffith of the Bismarck mine, at Keystone, has men at work taking out ore for shipment. Additional machinery will be put into its 30-stamp mill.

## UTAH.

### Juab County.

Near Eureka, the Orient M. Co. will continue developments all winter.—J. M. Wheeler & Co. have started work on the Blue Jay group of claims, near the Orient and Scotia mines, in West Tintic.—Development will begin on the Prairie Bell group of claims in West Tintic. They have a vein of ore opened to a depth of 70 feet and have drifts on the vein for 100 feet. The vein has values of 100 ounces silver and a high per cent in lead.

The stamps at the Mammoth mill, at Robinson, have been hung up, pending a more satisfactory solution of the milling problem, says the News.

### Kane County.

Kanab reports say operations are resuming at the Coconino copper mines, on Buckskin mountain. The company has been reincorporated and is putting in machinery for treatment of the ores.

### Salt Lake County.

In the Continental-Alta, at Alta, Manager H. M. Crowther says that, after driving sixteen months in lower Grizzly tunnel to cut known ore bodies, they have opened an extra vein 100 feet from objective point. This vein carries 15 ounces silver, 10% lead, 5% copper and 20% excess of iron, including \$1 in gold, and is about 18 inches wide. This ore is encountered at a depth of 200 feet below any point previously mined and at a depth of 1000 feet under apex of the vein. They have thirty-five out of sixty-two tram towers erected and the upper terminal is framed. The first carload of pipe for mill power line has arrived. This pipe line will be 14 inches in diameter and 4000 feet long.

### Tooele County.

At Stockton the Galena King M. Co. reports the faulted vein which was lost has been recovered and with it a good body of lead carbonates and galena. Into this the level is being extended.

### Utah County.

The Utah County L. & P. Co. will put in an auxiliary plant at the head of American Fork canyon, near American Fork, for furnishing power for the mines of Bingham, Alta, Big Cottonwood and other camps. The plant will be 1500 H. P.

At Lehi the Lehi Clay & Silica Co. has been organized with S. W. Ross as manager. The company owns clay beds in Cedar valley and also silica beds in Rush valley, both of which will be opened up and the products shipped.

## WASHINGTON.

### Ferry County.

H. W. Vierich and H. P. Schul of the American Onyx & Marble Co., whose properties are on the Colville reservation, 15 miles southwest of Northport, report they are taking out building stone and will start shipments.

J. L. Harper of Republic, interested in the Belcher mine in Belcher camp, the Mountain Boy mine at Park City, and the Manila mine, near Keller, says Republic camp proper has one mine a regular shipper, Belcher camp has two shippers, Orient has one shipper and several which could ship. Park City, 25 miles from the railroad, has one shipper and Mountain Boy and two others will be added to the list. The Manila mine, on which the Jupiter-Ammon M. Co. will place men to work this week; the Congress mine, the Gold Cord in Summit, and other mines on Silver creek have ore blocked out for shipment. He says an American smelter will be built near West Fork and that preliminary work will begin in January. A railway will be built down the San Poil valley by the Republic & Kettle River Railway Co. The Washington S. & R. Co. has been organized to build a smelter. The initial capacity will be 600 tons daily, two copper matting, hot blast furnaces of 200 tons each and one lead stack. One matting furnace will be utilized in producing a nickeliferous-copper matte from ore from the Congress mine. E. R. Fraser of Spokane and R. McCaig of Rosalia are interested.

### Lincoln County.

Davenport reports say a wagon road is being built from the Spokane river, north of Davenport, to the Cedar canyon mining camp. The old road from the river to the mining camp was 20 miles long, and the grade heavy in places. The new road is 12 miles long, and at no place is the grade expected to be over 7%. This makes the total distance from Davenport to the Turk smelter 32 miles. It is intention of the smelter company to put on traction engines to haul coal and supplies. Coal for the smelter is being hauled from Davenport by teams at a cost of \$9 per ton. This cost will be reduced by use of traction engines. The smelter company has bought an iron mine 4 miles from the smelter site. A lime quarry has also been secured 1 mile distant and teams are hauling the fluxes. Wagons are also transporting ore from the mines of the camp. The Turk group and the Silver Queen and Silver Seal are being operated by the owners of the Turk property and much ore is being taken out. Many of the dumps have accumulated smelting ore that was not rich enough to stand transportation. These dumps are being utilized. They run in values from \$40 per ton down. In the past it cost \$40 per ton to mine, transport and smelt the ores of the camp.

### Snohomish County.

At Monte Cristo the trams at the Golden Chord and Rainey mines are completed, and the Northern Pacific railroad is preparing to extend its tracks. A shaft house and hoist, the latter to be operated by air from the Justice M. Co.'s plant, is about ready for operation at the Rainey. Superintendent Brown is working nineteen men at the Philo mine.

### Stevens County.

Under the supervision of A. J. Dunton, the Chewelah Marble Co. is shipping white marble from the company's property on Deep creek, 5 miles east of Northport. Machinery is being put in. F. O. Streed of Minneapolis, Minn., is part owner of the Chewelah Marble Co. The company works twelve men and owns 480 acres of marble land, a millsite and a water power right on Deep creek.

Near Northport the Last Chance mine, on Deep creek, has completed the shipment of the galena on the dump and the ore in the upper tunnel, and has laid off several teams until development work in the lower levels justifies a renewal of shipments. One six-horse team is hauling ore.—The Le Roi smelter is being overhauled and the double-deck calcine furnaces coupled up, preparatory to further increasing the capacity of the plant for the treatment of custom ores.

H. H. Baker, manager of the Nellie S. mine, at Chewelah, reports a drift of 80 feet from the 100-foot level in the shaft is showing payable ore. The miners are crosscutting for the parallel vein. The mine is equipped with boiler, engine, hoist, steam drill, steam pump and ore bins.

## WYOMING.

### Carbon County.

Dillon reports say a trench being run on the Octavia group cut a vein carrying galena 20 inches in thickness. The trench is 300 feet north from portal of the 900-foot tunnel. It is 4 miles from Dillon. The Octavia group comprises thirty claims, and E. W. Honchen is principal

owner. A tunnel has also been started on one of the group adjoining the Congo and Independence. While driving the main tunnel they packed supplies in from the Saratoga road at a point 6 miles distant.

#### Crook County.

H. C. Stillwell of San Francisco, Cal., has bought the Barrett coal properties near Aladdin and will put them on a producing basis. The Stillwell Coal Co. has been incorporated and W. A. Remer of Deadwood, S. D., is vice-president and manager. The mines are on the Hay Creek beds. Several workable veins of a good quality of coal are said to be developed.

## FOREIGN.

### AFRICA.

#### Rhodesia.

G. Mitchell, president of the Rhodesian Chamber of Mines at Bulawayo, says the first eight months of 1904 yielded 162,507 ounces of gold, 39,979 ounces of silver, 276 tons of lead and 38,308 tons of coal. Comparing this with similar period in 1903, the production then was 160,749 ounces of gold and only a small quantity of silver—the total value for that period being £576,668—whereas the total value of mineral productions for the eight months of 1904 is £624,935. If, however, the figures for the five months from April 1st are taken, the date when the Chamber's financial year starts, and when the fiscal year of the Administration also begins, the comparison is more favorable as regards the total mineral production.

### AUSTRALIA.

#### New South Wales.

The New South Wales gold yield for October is reported at 15,719 ounces, valued at £59,395, as compared with 32,319 ounces, valued at £119,246, in the corresponding month of 1903. The yield for the first ten months of the year was 247,495 ounces, valued at £899,512, as compared with 269,373 ounces, valued at £985,707, in the first ten months of 1903.

#### South Australia.

The Northern Territories M. & S. Co. reports via Adelaide that the returns for the month of October were low on account of coke being exhausted. Wood blocks and charcoal were used, but they were not satisfactory. A further supply of coke arrived Nov. 12th. At the smelting works the water jacket smelter was run on charcoal and wood twenty-three and one-half days, treating 1495 tons, an average of 63 tons daily, including 498 tons of slag, the production being 47 tons of matte of an assay value of £3775. In the Iron Blow mine the main shaft has a total depth of 205 feet. The Mount Ellison mine main shaft has a depth of 146 feet, the winze on the 120-foot level being down on the lode 19 feet in payable ore.

#### Queensland.

Gold returns of Queensland for the month of October were:

	Tons	Crushed.	Yield in Ozs.
Charters Towers.....	17,100		20,600
Croydon.....	2,800		900
Gympie.....	19,000		9,700
Mount Morgan.....	30,700		9,800
Ravenswood.....	3,200		3,600
Other fields.....	3,400		2,400
Alluvial.....			1,200
Totals.....	65,700		48,200

### BRITISH COLUMBIA.

#### Nelson District.

At Ymir the Hunter V mine has doubled its rate of output and is shipping 200 tons of ore a day. This product is divided between the smelters at Northport, Wash., Nelson, Trail and Granby. The aerial tramway which connects the Hunter V with the Nelson & Fort Sheppard R. R. track is running.—The Broken Hill M. & Dev. Co. has bought an additional mill to replace the 4-stamp mill at the Wilcox mine. The 10-stamp mill previously owned by the Oro M. Co. to work the Golden Wedge mine on Six Mile creek, near Nelson, has been bought.—On the Foghorn mine the high-grade ore opened on surface has been uncovered in the drift 500 feet in from portal of crosscut. This gives a depth of 400 feet.—Placer mining is reported progressing in Ymir district. The gravels at the junction of Hall creek and the Salmon river were worked for placer gold by Colville Indians in 1880. Hall Bros. also worked them and Chinamen have also worked at various times. All this work, however, was done with primitive appliances. An area of 400 acres has now been leased from the Government for hydraulic mining and a company formed by E. Fellowes of Portland, Or., to put in a hydraulic elevator and other machinery.

#### Slocan District.

The lessees of the Blackburn mine at head of Ten Mile, near Slocan City, will keep men at work during the winter.—The American Boy at McGuigan resumed shipments last week. Several cars of ore are being loaded at the mine.

The following are ore shipments from Sandon for the year to November 17th:

Mine.	Tons.
Ruth.....	416
Slocan Star.....	2,468
Ivanhoe.....	1,246
Reco.....	772
Last Chance.....	348
Payne.....	1,031
Sunset.....	813
Mountain Con.....	200
Idaho.....	476
Rambler.....	777
Cinderella-Medford.....	175
Nine others, total of.....	278
Total.....	8,477

#### ZINC.

Ivanhoe.....	873
Payne.....	974
Idaho.....	30
Total.....	1,877

H. M. Stevenson of the Highlander mine says a portion of No. 1 mine at Ainsworth has been leased by Jones, Stearns & Scott, and they have started stoping in a body of high-grade ore, taking out two sacks of native silver. The Highlander mine is working seventeen men on development. The Black Diamond T. Co. is developing the Black Diamond, Donnell and twelve other claims, but the chief work is being done on the first two properties, under Stevenson's direction. The men are drifting on two ledges. On the Highlander mine the tunnel is in 2605 feet and work on it has been discontinued for the present, as it has cut the ledge on the Black Diamond claim, for which it was run. This tunnel gives a vertical depth of 1500 feet.

#### Vancouver Island.

(Special Correspondence).—The Tye Copper Co., Ltd., has declared a dividend of 2 shillings per share, payable on Dec. 15. This brings the total dividends paid since starting smelting operations in January, 1903, to 4 shillings per share, or \$180,000. Besides this distribution a large reserve fund has accumulated, which is invested in Government stocks. Extensive improvements have been made in the plant and buildings at both mine and smelter, all of which has been paid out of profits.

Duncans Station, Nov. 27.

#### West Kootenay District.

Nettie L. mountain, near Ferguson, has been taken over by Forbes & Morton of Minneapolis, Minn., acting through R. H. Battey. The plan calls for spending \$100,000 in driving a tunnel for 1½ mile on Nettie L. mountain. The claims in the deal are Rattler, Rantler No. 1, Morning Star, Jumbo, Florence, Union Jack, Independence, Gloosecap A, 2 and 3, Kootenay group of three, May Queen group of four and Lardo.

### CANADA.

#### Alberta.

Gold will be dredged from the bottom of Saskatchewan river, near Edmonton, by a company headed by G. W. Keith of Toronto. The Saskatchewan river is crossed by a branch of the Canadian Pacific railroad on the company's placer ground, placing the workings within easy reach, and on the watercourse veins of coal crop. The company has several miles of gravel. On the average the gravel is said to run 45 cents to the yard.

### INDIA.

The output of the gold mines of India for October was 51,238 ounces. The production in ounces for 1904 to Nov. 1st, compared with 1903, has been:

	1904.	1903.
January.....	51,588	48,080
February.....	50,151	46,298
March.....	51,634	48,327
April.....	50,509	48,271
May.....	51,142	48,628
June.....	51,606	48,950
July.....	51,283	50,571
August.....	51,517	50,286
September.....	51,666	51,452
October.....	51,238	52,724
November.....	52,016	
December.....	54,457	
Totals.....	513,334	600,060

### MEXICO.

#### Chihuahua.

El Continente M. Co. has been organized at Chihuahua by W. K. Ryan, president; T. Dale, treasurer; L. J. Gandara, R. M. Dudley and H. Anderson, manager, to develop mining properties in Santa Eulalia district, where they have bought 16 pertenencias of the third group of El Continente and 40 pertenencias of La Isla. They have also taken over the bond and option which H. Anderson has on the Ibera mine. This will give the company 106 pertenencias surrounding the 9 pertenencias which comprise the Santa Juliana, owned by the Hearst estate. They will start sinking a shaft on the Ibera, about 50 feet from the Santa Juliana line, and will resume work on the tunnel.

#### Durango.

W. S. Benton of Inde says that camp is shipping between 300 and 400 tons of high grade gold-silver ore per month to the smelters. The principal shippers are La

Cruz, Terrible and San Carlos mines. The first mentioned belongs to E. Avila. He ships a carload per week of ore that runs three kilos of silver, ten grams of gold and 10% lead. The other two are owned by W. S. Benton, A. Bereyra and J. Silvayra. They are shipping two carloads of ore per week which runs fifty grams of gold, 300 grams silver, with lead values. The ores of the camp have to be hauled 60 miles to the railroad.

#### Sonora.

A. Patterson and P. Scott of Port Huron, Mich., operating placer mines at La Canada, Alamos district, report the Golden River Placer M. Co. organized, with Patterson as manager. The company owns forty-three hectares of placer ground on the Arroyo Canada, near the lines of Chihuahua and Sinaloa. They say the pay dirt averages 15 feet in depth. Most of the gold is in the form of nuggets and coarse gold, which can be caught on rifles, though there is some fine gold which can only be saved by amalgamation. It is intended to put in a dam and giants for hydraulicking. A dam 40 feet high and 60 feet long at the top will give them a head of 280 feet above the highest point on their ground. They also expect to put in four giants.—The Cenizas mine, 6 miles from La Canada, has extensive antigua workings. The vein is said to be 70 feet wide and to carry high gold values.—E. R. Tufts and others are operating a gold and silver mine near the Chihuahua line in same vicinity. They have a 10-stamp, amalgamating mill in operation.—Butterhoff Bros. of Denver, Colo., are developing a gold and silver mine 5 miles from La Canada. They are experimenting on a process of treatment for their ores, which are said to run \$200 per ton.—Bay Bros. of Baboyhua, Sonora, are developing a copper property adjoining La Canada placers. They have several veins of copper ore, one of which is 20 feet wide. The Kansas City, Mexico & Orient Railroad will pass a few miles east of the district.

La Bufo M. Co. at La Bufo in Sahuaripa district has started shipping matte from the smelter via Torres, says the company's agent, R. B. Cunningham.

### VENEZUELA.

United States Consul E. H. Plumacher at Maracaibo reports that the Government of Venezuela has decided to give no titles to coal mines in the future, but to exploit all such mines under its own supervision and ownership.

## Obituary.

W. S. BUCKLEY of Telluride died of consumption at Denver, Colo., on November 25th. He was manager of the San Juan G. M. Co. and Ophir Con. M. Co., and a State Senator.

C. W. SMITH, a pioneer mining man of Plumas and Trinity counties, Cal., died at Burke, Cal., Nov. 22. At one time he owned the Bailey and Chloride mines, now owned by the Chloride M. Co., near Dedrick, Cal. Deceased was born in New York, February, 1839, and was a graduate of Lawrence University, Appleton, Wis.

W. H. CLARY, a pioneer mining man of California, died at Stockton, Cal., Nov. 27th, in his eighty-third year. Deceased, who went to California in 1850, is said to have built the first mining ditch in the State. In 1864, in company with the late A. J. Moulder et al., he incorporated the mining stock board in San Francisco. He was for several years superintendent of the Sheep Ranch mine in Calaveras county, Cal.

## Commercial Paragraphs.

The New England offices of the Allis-Chalmers Co. were consolidated on Dec. 1st and removed to the State Mutual building, 50 Congress street, Boston. Geo. H. Berg is manager in charge of the consolidated offices.

W. P. SWART is the Oregon representative of Chas. C. Moore & Co. of San Francisco, Cal., with offices at 321 East Morrison street, Portland, Or. Chas. C. Moore & Co. also have branch offices in Seattle, Wash., Los Angeles, Cal., Salt Lake City, Utah, and New York City.

GAYFORD & CALLOW of Charlotte, N. C., have formed a copartnership with C. C. Morgan, M. E. and C. E., and C. C. Beddoes, C. E. The firm will be known as Morgan, Beddoes & Co., with temporary offices at 26 West Fifth street, Charlotte, N. C., the old office of Gayford & Callow.

## Personal.

W. H. BLACKBURN is manager of a group of mines at Goldfield, Nev.

F. L. SIZER is general manager of the Whitlatch M. Co. at Helena, Mont.

J. REDDING is superintendent of the Gum Tree mine at Idaho Springs, Colo.

J. D. HOSKING has resigned as superintendent of the Franklin mine at Hancock, Mich.

G. M. ROBERTS is manager of the Associated G. M., at Kalgoolie, Western Australia.

W. S. JENKINS has resigned as manager of the Idaho-Alamo mines, at Sandon, B. C.

H. D. CROWDER is superintendent of the Victoria y Anexas mine, at El Oro, Mexico, Mex.

J. THOMSON has resigned as master mechanic for the Daly-West mines, at Park City, Utah.

SUPERINTENDENT DOBLER has resigned from the Brown Bear M. Co., near Weaverville, Cal.

J. SUTHERLAND is superintendent of the Brown Bear M. Co., near Weaverville, Cal., vice Dobler, resigned.

JESSE SCOBEE is resident manager of the Cieneguita Copper Co., Distrito de Sahuaripa, Sonora, Mexico.

F. WAGNER, recently of Searchlight, Nev., is in charge of the Menifee mine at Perris, Riverside county, Cal.

O. H. FAIRCHILD is examining a mining property in the Sneffels district, Colorado, for Chicago investors.

F. W. SCHWELLENBACH is president and manager of the Spokane Placer M. Co., operating near Libby, Mont.

E. H. KRAUS has been appointed assistant professor of mineralogy in the University of Michigan, Ann Arbor, Mich.

A. R. MYNOTT has been appointed assistant manager of the San Albino G. M. Co., at Jicaró, Nueva Segovia, Nicaragua.

W. J. ADAMS, E. M., of San Francisco, Cal., has returned from an examination of copper mines at Nacozari, Sonora, Mexico.

S. A. GILMORE of San Francisco, Cal., is superintendent of the Julia mine for the Con. Nevada G. M. Co. at Nevada City, Cal.

F. BUTLER of Salt Lake City, Utah, has gone to Nicaragua, C. A., as superintendent of a group of gold mines, near Bluefields.

P. SHEEHAN, formerly superintendent of the Johnnie mine and mill at State-line, Utah, has removed to Salt Lake City, Utah.

C. A. SUTHERLAND is in charge of the mines of the Iron Springs M. Co., at Iron Springs, near Council, Idaho, vice C. F. Macey, resigned.

FREDERICK BUTLER of Salt Lake City, Utah, goes to Bluefields, Nicaragua, C. A., to assume the superintendency of the Bluefields G. M. Co.

C. LAWTON has been appointed general superintendent of the Bingham County M. Co. mines at Bingham, Utah, vice R. W. Rodgers, resigned.

HARRY A. LEE, ex-Commissioner of Mines for the State of Colorado, is now consulting engineer for the Maple Leaf mine, Gunnison county, Colo.

R. EDWARDS, formerly of the Osceola copper mine, is head mining captain of the Miswabick M. Co.'s mines, near Alouez, Keweenaw county, Mich.

MANAGER WELLS, late of the Nile Valley C. Co., Ltd., has been appointed by the Egyptian Government as inspector of mines at a salary of £1400 per annum.

R. W. RODGERS, for five years superintendent of the Bingham Con. C. Co. properties at Bingham, Utah, resigned and will be succeeded by C. L. Lawton, January 1.

C. F. MACEY has resigned as manager of the Iron Springs M. Co., near Council, Idaho, and will devote his time to mining interests at Landore, Idaho, and in Nevada.

A. A. BLOW has resigned from the Smelting & Refining Co. of Australia, Ltd., to devote his time to American and Mexican practice, with offices in New York City, N. Y.

E. H. BARTON has resigned as superintendent of the Yellow Aster mines, at Randsburg, Cal., and has gone to La Colo-

rada, Sonora, Mexico, as superintendent of the Zubiate mines.

W. G. ANDERSON, formerly manager of the Compania Minera de Guanajuatillo, S. A., Guanajuatillo, Zacatecas, Mexico, is now superintendent of the Redfield M. Co., White River, Cal.

R. M. EDWARDS has resigned as assistant superintendent of the Isle Royale mine, near Houghton, Mich., to take the position of superintendent of the Franklin mine at Hancock, Mich., vice J. D. Hosking, resigned.

DR. LOUIS DUNCAN has been retained by the Allis-Chalmers Co. as an expert in electrical patent work in connection with its electrical department, the Bullock Electric Manufacturing Co. of Cincinnati, Ohio.

Books Received.

One of the chief offices of the modern professor is to digest the vast amount of literature on the subject he is teaching and present it to his students in a systematic, clear and practical manner. To those desirous of obtaining the results of such work "Elements of Mechanism," by Peter Schwamb and A. L. Merrill, offers an excellent treatise on the motions and forms of the parts of a machine and the manner of supporting and guiding them. It comprises the revised course of lectures on this branch of applied mechanics as given at the Massachusetts Institute of Technology. It will be welcomed by the student of mechanical engineering as a valuable aid in his study of machine design. It is published by John Wiley & Sons, 43 East Nineteenth street, New York City. The price is \$3.

"Coal Mining," by T. H. Cockin, is a comprehensive compilation of the principles governing the formation, occurrence and winning of the coal deposits of Great Britain. It is intended as an elementary class book for those taking the British examinations for colliery managers' certificates. It will probably fill its purpose, but the treatment seems rather general for the specific requirements of this country on the same subject. An innovation is introduced by giving the principles necessary to the generation of steam and electric power, but here, again, the treatment is very short and not specific. It would form an admirable introduction to the subject, but should be succeeded and accompanied by much practical work and supplementary reading. It is published by N. H. Henley Publishing Co., 132 Nassau street, New York City, at \$2.50.

Students in manual training schools and apprentices wishing a knowledge of commercial mechanical drawing will find "Elements of General Drafting for Mechanical Engineers," by C. E. Coolidge and H. L. Freeman, to be a good working guide. The plates to be redrawn are representative of what is met in the practice of machine design, and at the same time are so presented as to give a progressive course in this work. The working directions are concise, minute and of great benefit in delineating the best order of procedure in copying the plates. A manual of drawing describing instruments and the technique employed in commercial drafting presents many valuable details of the method used in many of the largest concerns of this country. It would seem that the book could be improved by printing the directions for the execution of drawings with the plates to which they refer, instead of separating them so widely. It is published by John Wiley & Sons, 143 East Nineteenth street, New York City, for \$2.50. It is oblong, quarto, and contains 55 pages and 21 folding plates.

Copies of any of the above books will be sent postpaid by the MINING AND SCIENTIFIC PRESS on receipt of price.

Many books have been published on "electricity," but, being a complex subject, it has usually received a complex treatment, making it difficult of comprehension. Five years ago the Cleveland Armature Works, Cleveland, Ohio, published "Practical Electricity." The appearance of a revised fourth edition of this work is the best evidence of its value to the practical man. Its main object is to give proficiency in the calculation of wiring for all electrical purposes by means of simple explanations and examples. But in so doing it gives a good idea of the design and operation of dynamo electric machinery. This is presented in simple language that gives a working knowledge of much that is essential in electrical work. It gives an especially good explanation of the calculation of the number of ampere turns required in dynamos. It gives a clear idea of the lifting magnet,

what current and size are necessary to lift a given load. On the whole, it is a practical work on direct current utilization and control. It will be sent postpaid upon receipt of \$2 by the Cleveland Armature Works, Cleveland, Ohio, or by the MINING AND SCIENTIFIC PRESS.

Much is being published by various investigators upon the determination of the various constituents of cyanide solutions. A demand for the collection of the best of these determinations into compact form is well met by "The Chemistry of Cyanide Solutions," by J. E. Clennell. This gives a comprehensive review of well-known methods, together with critical discussions of their comparative values. Various modifications of the older methods are compared largely by the results of experiments made to test the accuracy of assumptions made. The logical and systematic arrangement of the work is commendable. To the man determining the various constituents of cyanide solutions both before and after use the book will prove invaluable as a laboratory guide. It is a working manual, not a theoretical treatise on reactions. It is published by the Scientific Publishing Co., 261 Broadway, New York City, for \$2.50. It will be sent postpaid upon receipt of price by the MINING AND SCIENTIFIC PRESS.

Under title of "Mineral Resources of the United States for 1903," the United States Geological Survey has issued: "Production of Steel-Hardening Metals, Including Nickel and Cobalt, Chromium, Tungsten, Molybdenum, Vanadium, Titanium and Uranium."

"The River Terraces of the Orleans Basin, California," is the title of Bulletin 22 of Vol. 3, Department of Geology, University of California, by O. H. Hershey. It may be obtained of the University Librarian, J. C. Rowell, Berkeley, Cal., for 35 cents.

Trade Treatises.

Catalogue No. 17 of Union marine engines for 1905, from the Union Gas Engine Co., San Francisco, Cal., in addition to a detailed, illustrated description of the specific features of the Union engines, contains engravings of the various types and sizes made, and is also profusely illustrated with engravings of successfully operated motor boats and launches.

"Spiral Riveted Pipe" is the subject of a treatise from the American Spiral Pipe Works of Chicago and New York, finely illustrated and full of exact information concerning spiral riveted pipe and fittings therefor. There are also tables of pump capacities, weir dam measurements, flow of water through nozzles and pipes, loss of head by friction, pressure of water, etc.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ILLUMINATING TILE CONSTRUCTION.—No. 775,626 Nov. 22, 1904. P. H. Jackson, San Francisco, Cal. This invention consists in an improved sidewalk, floor and roof construction, comprising flat metal bars supported vertically on edge, having horizontal slots cut in line, and flat transverse bars are horizontally disposed and extend through said slots. Tiles are supported upon the transverse bars, having their lower side edges substantially abutting the sides of the vertically disposed bars, and having their upper surfaces in planes higher than the upper surfaces of said vertically disposed bars, said tiles having grooves in their side edges. A body of cement fills said grooves and the space between the upper portions of adjacent tiles, and forms a saddle across the top of said bars.

HAY PRESS.—No. 775,612. Nov. 22, 1904. E. A. Smith, Warm Springs, Cal. The object of this invention is to provide a simple and durable means for quickly and positively closing the door to the baling chamber through the medium of the sweep and of again opening it automatically after compression. It consists in a baling press, the combination with a press box of a hinged door therefor and toggles connected with said door, a sweep, and means operable by the sweep for actuating said toggles to close the door. These means include a shaft, pulleys fast on said shaft, and flexible connections between one of said pulleys and the toggles, a connection between the other of said pulleys, and an actuating means in the path of the sweep.

ELEVATOR SAFETY STOP.—No. 775,608. Nov. 22, 1904. W. T. Robinson and John Casey, Mokelumne Hill, Cal. The object of this invention is to provide a simple, practical and effective means for checking the descent of an elevator cage or bucket in mines, buildings and the like, in the event of the sudden breaking of the rope or cable. It consists in the combination with an elevator cage of guide ways between which the cage is movable, vertical flanges on the cage engaging said guide ways and a series of hooks pivoted at one end to the cage and housed by said flanges. The hooks of each series are pivotally interconnected intermediate of their ends, with a suspending rope and connections between the latter and the hooks whereby the latter are normally retracted within their housings, and stop means engageable by said hooks on the release of the tension on the rope.

Latest Market Reports.

SAN FRANCISCO, December 2, 1904.

METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c, refined (1000 fine); San Francisco, 59½c; Mexican dollars, 47c San Francisco, 47½c New York.

COPPER.—New York: Standard, \$14.87½; Lake, 1 to 3 casks, \$14.87½@15.12½; Electrolytic, 1 to 3 casks, \$15.00; Casting, 1 to 3 casks, \$14.75; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: £67 3s 9d spot per ton.

Copper has taken another advance in London, but in New York prices remain about the same as last week. The market is quoted as less active, but there is no weakening in prices. It is now probable that no material advance in price will be made until after the first of the year, if then. It is not positive by any means that the highest prices have been reached, but no marked advance need be anticipated. At present prices every advance means so much more net profit to nearly every operating mine. There are many mines which, unable to pay with 12-cent copper, can make a handsome profit at 15 cents.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12½ San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £12 18s 9d long ton.

SPELTER.—New York, \$5.87½; St. Louis, \$5.00; London, £24 17s 6d long ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$29.75@29.95; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½@35c. London, £136 spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$42.00@44.00, large lots; London, £7 15s San Francisco, local, \$41.50@42.50 per flask of 75 lbs.; Denver, \$45.00. Export, \$41.50@42.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 8½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100 lb. lots, 16.75c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$15.85 @ —; gray forge, \$16.60; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$20.00 @35.00.

WIRE.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.70; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 13½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder

in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c, in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.20@1.40 per 100 lbs.; sks., \$1.05; chloride of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1½@2c per lb.; nitric acid, carboys, 8c per lb.

OILS.—Linseed, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 7½c; 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.75 per lb.

CHROMIUM.—90% and over, 80c.

PHOSPHORUS.—American, 70c.

SILVER.—Chloride, ½ oz., 90c@1.00; nitrate, 55c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—½ lb., \$2.75.

SODIUM.—Metal, ½ lb., 50c.

BISMUTH.—Subnitrate, ½ lb., \$2.10.

URANIUM.—Oxide, ½ lb., \$3.50.

MERCURY.—Bichloride, ½ lb., 77c.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOVEMBER 22, 1904.

- 775,440.—SANDAL—B. R. Bonney, Pasadena, Cal.
- 775,722.—VEHICLE TIRES—L. F. Paison, Golconda, Nev.
- 775,650.—BOTTLE—W. B. Hargan, S. F.
- 775,831.—BANK CHECK—M. A. Howe, Tacoma, Wash.
- 775,625.—TAPPET—W. E. Ingram, Stockton, Cal.
- 775,626.—ILLUMINATING TILE—P. H. Jackson, S. F.
- 775,827.—STEAM COOKER—A. J. Ketelsen, Seattle, Wash.
- 775,906.—CULTIVATOR—A. H. Kopperud, Byron, Cal.
- 775,870.—RAISING SUNKEN VESSELS—M. Lacey, Seattle, Wash.
- 775,831.—VEHICLE WHEEL—J. Leifer, San Bernardino, Cal.
- 775,838.—MANIFOLD BOOK—A. Levison, S. F.
- 775,756.—GATE—M. K. Lewis, Lompoc, Cal.
- 775,876.—BUSHING—J. Metzger, Tacoma, Wash.
- 775,476.—DRIVE GEAR—A. Mills, Ukiah, Cal.
- 775,578.—STITCH BOX—J. L. Porter, Mountain View, Cal.
- 775,608.—ELEVATOR STOP—Robinson & Casey, Mokelumne Hill, Cal.
- 775,502.—EXTRACTING OLEO-RESIN—E. J. Sheehan, Pasadena, Cal.
- 775,612.—HAY PRESS—E. A. Smith, Warm Springs, Cal.
- 775,883.—CARRIAGE TOP BOWS—C. H. Sooty, North San Juan, Cal.
- 775,410.—SANITARY CABINET—S. L. Stuart, Ventura, Cal.
- 775,711.—DRUMS—E. T. Turney, San Rafael, Cal.
- 775,712.—DRUMS—E. T. Turney, San Rafael, Cal.
- 775,616.—GRASER—F. W. Warren, S. F.
- 775,506.—ARTIFICIAL LIME—L. A. Weissner, National City, Cal.
- 775,483.—LEVEL—G. H. Whitehouse, Seattle, Wash.
- 775,882.—GARMENT SUPPORTER—M. P. Zindorf, Seattle, Wash.

## SITUATIONS WANTED.

The cost of advertising in this column is 10 cents per line of seven words per insertion. Answers forwarded to any address without extra charge.

**AN ALL-ROUND PRACTICAL MINER, TImberman and Tool Sharpener** wants position as foreman; also a good surveyor; successful in handling men; over twenty years' experience. Best of references. Address L. A. P., care of this office.

**COMPETENT ASSAYER, CYANIDE MAN AND Steam Engineer** desires position. Best of references. Address L., this office.

**COMPETENT ASSAYER, MILL MAN AND Cyanide Man** desires position. Technical education. Good references. Arizona or Mexico preferred. Address W.B., care of this office.

**CONSTRUCTING ENGINEER OPEN FOR ENGAGEMENT.** Experience in mills, mines, smelters. Address P. O. Box 2422, San Francisco, Cal.

**EXPERT MINE FOREMAN WANTS POSITION.** Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

**MINING ENGINEER AND SUPERINTENDENT** with 12 years continual practical experience in engineering and assaying. Have been superintendent of iron mine for last 5 years. Excellent references from reliable people. Age 31. Address J. Lancaster, M. I. M. E., 622A Placer St., Butte, Montana.

**POSITION WANTED AS MILL (CONCENTRATOR) Supt.** Nine years' experience. Best of references. Address Box 701, Salt Lake, Utah.

**SITUATION BY PRACTICAL ASSAYER AND Chemist.** Thoroughly understands mill work, cyaniding and smelting. Address W.D., this office.

**SITUATION WANTED BY THOROUGH, COMPETENT AND RELIABLE** mining bookkeeper. Four years' experience with large properties. Best of references. Address Box 52, care of this office.

**WANTED—SITUATION BY MILL MAN WHO** is thoroughly competent and reliable; seventeen years' experience in wet crushing, amalgamation and concentration; has had charge of eleven mills. Best of references. Address D.L.S., Box 133, Daggett, Cal.

**THE ENGINEERING AGENCY, CHICAGO,** furnishes free to reliable employers information leading to employment of Mining Engineers, Draftsmen, Mine or Mill Superintendents, Assayers, Chemists, Cyanide Men, Electricians, etc. In successful operation eleven years. Let us know your need and competent, high-grade men whose complete professional and personal records have been thoroughly investigated will be referred to you at once.

**YOUNG MAN OF TWENTY-ONE DESIRES** position as assayer's helper or some position which I could, if proving satisfactory, obtain desired position. Address W.A.C., care of this office.

## HELP WANTED.

**WANTED — FIRST-CLASS EXPERIENCED** Amalgamator and practical Mill Man. Must give good references and know how to handle very low grade free milling gold ore. Plant consists of five 6-ft. Huntingtons below crusher and rolls. Address, with references, L. S. Davis, Nogal, N. M.

**THE CALIFORNIA DEBRIS COMMISSION** having received applications to mine by hydraulic process from Esther Jackson and John M. Jackson, in Brown Bear Placer Mine, near New Mohawk, Plumas County, Cal., draining into Sulphur Creek, which reaches Middle Fork Feather River; from Shasta County Quartz & Placer Mining Co., in Murderers Gulch Mine, near Stella, Shasta County, Cal., draining into Clear Creek, which reaches Sacramento River; and from William Nicholls, Jr., in Duryea Placer Mine, near Red Dog, Nevada County, Cal., draining into Greenhorn Creek, which reaches Bear River, gives notice that a meeting to receive any protests will be held at Room 68 Flood Building, San Francisco, Cal., Dec. 12, 1904, at 1:30 P. M.

## WANTED TO BUY FOR CASH. TUNGSTEN ORES

(Wolframite, Huebnerite and Scheelite.)

MOLYBDENUM, BISMUTH AND VANADIUM ORE.

**PRIMOS CHEMICAL CO.**

PRIMOS, DELAWARE CO., PA.  
Telegraphic address, Philadelphia, Pa.

# FUZES

TRADE  
**LION BRAND**

MARK.

## Electrical Fuzes

ARE  
THE  
BEST.

Firing blasts by electricity is the safest and most economical method. If you wish to know why, send for illustrated booklet describing the Fuzes and their use.

MANUFACTURED ONLY BY

**The Aetna Powder Company,  
CHICAGO, U. S. A.**

SELLING AGENTS:

**CALIFORNIA CAP CO., 418 California St., San Francisco, Cal.**

**The Aetna Powder Company  
Chicago, U.S.A.**

## The One-Man Block.

The Yale & Towne "Triplex" Block is a wonder. With it one man can lift as much as a small engine.

This makes it a money-saving hoist. No need to call all the men within hearing to put a heavy load up. One man does it easily, quickly and safely with the "Triplex."

It often effects a saving by keeping things moving. Heavy repair jobs, setting new machinery, handling heavy masonry or timbers,—these are cheaply and quickly done with a "Triplex" Block.

Ask for a new folder. It tells what the "Triplex" can do.

**The Yale & Towne Manufacturing Company,  
9-11-13 Murray Street, New York.**

## Power Costs

all that it costs to produce it, plus what is wasted. You can lessen that cost by using a **HINE SEPARATOR** to keep water out of engine cylinder; a **SPENCER DAMPER REGULATOR** to keep steady pressure and consume gases; a **ROBERTSON-THOMPSON INDICATOR** to properly adjust engine valves, and **EUREKA PACKING** to reduce friction, save power and one-half the cost of any other.

**JAS. L. ROBERTSON & SONS, 204 Fulton St., New York.**

## DELINQUENT SALE NOTICE.

**GOLDEN WEST MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 17th day of September, 1904, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Am't.
T. W. Stone	115	20,000	\$200 00
T. W. Stone	116	20,000	200 00
J. P. Mundy	41	500	5 00
D. Berlin	44	500	5 00
D. Berlin	45	500	5 00
T. P. Moore	48	1,000	10 00
T. P. Moore	49	1,000	10 00
T. P. Moore	50	1,000	10 00
T. P. Moore	51	1,000	10 00
T. P. Moore	52	1,000	10 00
T. P. Moore	53	5,000	50 00
T. P. Moore	54	5,000	50 00
Joshua Reaves	99	600	6 00
Geo. E. McLeod	107	500	5 00
W. L. Dimock	108	200	2 00

And in accordance with law and an order from the Board of Directors, made on the 17th day of September, 1904, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 207 Battery street, Room 15, San Francisco, California, on **MONDAY, the 28th day of November, 1904, at the hour of 2 o'clock P. M.** of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

**CHAS. BOVONE, Secretary.**

Office—207 Battery street, Room 15, San Francisco, California.

## POSTPONEMENT.

By order of the Board of Directors, the sale day of the above delinquent stock has been postponed to **SATURDAY, the 17th day of December, 1904, at the same hour and place.**

**CHAS. BOVONE, Secretary.**

Office—207 Battery street, Room 15, San Francisco, California.

**THE ROESSLER & HASSLACHER CHEMICAL CO.,  
100 William Street, New York.**

## CYANIDE

Peroxide of Sodium.  
Hyposulphite of Soda.  
Chloride of Lime.  
Sulphide of Iron.

And Other Chemicals for Mining Purposes.

# WEALTH IN SIGHT.

The Territory tributary to the

## Santa Fe System

In INDIAN TERRITORY, TEXAS, COLORADO, NEW MEXICO, ARIZONA and CALIFORNIA, offers to limited investments of capital, backed by energy and brains, unusual opportunities for development of **GREAT MINERAL PROPERTIES.**

Deposits of the following are known to exist on and within a few miles of our lines:

Antimony, Alum, Asbestos, Asphalt, Barytes, Bauxite, Borax, Cement Rock, Coa Cryolite, Clays of all kinds, Copper, Gold Graphite, Gypsum, Granite, Iron, Kaolin Lead, Lithograph Stone, Manganese, Mica, Marble, Mineral Paints, Nitre, Nickel, Natural Gas, Onyx, Petroleum, Phosphate Rock, Pumice Stone, Pyrites, Quicksilver, Salt, Silica, Strontianite, Stone—Oolite, Lime and Sand, Silver and Zinc.

## Tin in the United States.

Tin mines are not numerous in the United States, although spasmodic efforts have been made from time to time to develop a paying tin mine here. The fields of operation here have been chiefly in the Carolinas, the Black Hills of South Dakota, southern California and more recently in Alaska. Tin stone actually exists in each of the localities mentioned, and each place has produced tin; but until lately the financial outcome of the operations has been of a discouraging nature. Many years ago an attempt was made to operate the tin veins in northern Riverside county, Cal., but the effort failed. Again, in 1890-91, these efforts were renewed and a large sum spent by an English company. The development of the mines did not justify the extravagant outlay and failure resulted, as might have been expected. In South Dakota there are two tin-bearing regions—one about Harney Peak, in Custer county, and the other 65 to 70 miles northwesterly from this in the Nigger Hill-Bear Gulch region, on the South Dakota-Wyoming line. Several attempts were made to work the deposits at various times since 1886 and mills were built in various localities; but up to the present time none of these enterprises have been placed on a paying basis. In the Nigger Hill district, however, much encouragement has been given the development of the industry by the production of payable tin ore. A bulletin just issued by the United States Geological Survey reports that the company at Nigger Hill—the Tinton Tin Company—has been operating on a small concentrating plant the past two years and has shipped a carload of concentrates to Europe for reduction, there being no suitable fur-

naces available at the mines. The average of ore run through the mill yielded 1.16% metallic tin, which, at present prices for the metal, makes the ore worth about \$6.75 per ton as it stands in the mine. The report states that two ore bodies, 150 by 50 feet and 90 by 6 feet, respectively, have been developed, which carry values equal to those

Sluicing Pit on Buck Creek, Alaska. (See Page 395.)

Tin Streaming in Alaska, Potato Mountain in Distance. (See Page 395.)

Dam and Ditch on Buck Creek, Alaska. (See Page 395.)

above stated. If this be true, and the information is from an authoritative source, the United States has at last a paying tin mine. The tin occurs as cassiterite in dikes of granite of very coarse crystallization. In some instances certain portions of the tin-bearing veins are also gold bearing.

Elsewhere herein will be found a description of the occurrence of the known tin deposits of Alaska, together with the present method of working. In the Carolinas tin stone occurs in pegmatite dikes and also in mica schists. Stream tin—the grains resulting from the disintegration of the rocks—also occurs. Most of the tin stone obtained in the Carolinas is sluiced from the gravels of the streams cutting through the tin-bearing rocks. The first production of tin in quantity from this district was in 1903, when nearly twenty tons of cassiterite were shipped to Europe. It is a matter of some satisfaction to know that, after so many years of search and endeavor, the United States has finally developed tin deposits which actually pay to work. It is true that the work of the Tinton Company in South Dakota has thus far been of an experimental kind, but they appear to have developed a property which has the elements of success.

Majiland Mill and Hoist, South Dakota. (See Page 397.)

AS an aftermath of the recent coal miners' strike in southern Colorado, a suit has been filed in the District Court at Trinidad by the Victor Fuel Company against the United Mine Workers of America, John Mitchell and others in the sum of \$491,000, for damages alleged to have been sustained by the plaintiff as a result of the strike. This suit will probably have the effect of demonstrating how far labor organizations are responsible for their actions and for the acts of the individual members of their associations in times of labor trouble.

## Economy in Mining.

It may be for the greater good of a community to have a mine worked steadily, but leisurely, for many years, but no one familiar with mining and metallurgical practice will contend that this procedure is of the greatest advantage to the mine owners. The policy of good mine management is to exhaust mines as rapidly as possible, while paying due regard to safety and while pursuing development at the same time, to extend the known resources of the mine even more rapidly, if possible, than they are being drawn upon. All mine managers know that there are certain unavoidable expenses all of which are charged against the output of the mine, whether it be gold, silver, copper, coal or iron. The surface crew comprises hoisting engineers, stokers, carpenters, machinists, blacksmiths, trammers, teamsters and numerous others about the mine, and in addition to these the clerical force at the offices. Then there are superintendence, taxes, insurance and other expenses which cannot be avoided, or perhaps, lessened. In view of this, mines must be operated vigorously, and as many men given employment underground as can be suitably employed. The greater the tonnage produced the less the cost per ton of surface and general expense. If a mine can output 1000 tons a day, it can probably be so handled as to increase this to 2000 tons per day, but the expense of outputting 2000 tons daily should be considerably below twice the cost of outputting 1000 tons daily. In the mill and smelter the same principle applies. Power and superintendence are often economized by increasing capacity and even by enlarging the plant in order to make this possible.

This is the reason why very large mining operations are conducted at so small a cost per ton. The Homestake mine is frequently referred to as an example of low cost in mining. The cost, due to the superior management, is very low—lower perhaps than that at any other mine similarly situated—and yet the cost at the Alaska-Treadwell is less per ton than at the Homestake, due entirely to physical conditions, and not at all to the difference in the efficiency of the management of these properties. Although the Homestake is now mining at depths from the surface to 1100 feet, the cost per ton is less than it was several years ago when a lesser—though still large amount of ore—was handled, owing to the more complete and extensive equipment. In addition to this, modern metallurgical science has made it possible to now save a higher percentage of values than in former years.

While it is desirable and more profitable to operate a mine to its fullest capacity, it does not follow that a mine having a small, rich pay streak in a large mass of ore, too low grade to pay if it were worked alone, can be made to yield a larger profit by working it on a grand scale, mining both the rich streak and the poor, because the cost per ton is less. It may be that the good ore is sufficiently rich to meet any deficiency in the output from the larger low-grade portion, but manifestly it is poor business to demand that the small, rich pay streak shall sustain the great mass of low-grade material, itself too poor alone to pay, and yet this is not infrequently seen in the management of large low-grade mines.

There are numerous instances where ore, too low grade to pay, has been kept in a mine and in after years it has been possible to mine this low-grade ore at good profit by reason of decreased expense for supplies, etc., and by the employment of labor-saving machinery, and also often by the fact that the ore can be so much more successfully and economically treated, with a higher saving of values. The West is full of such instances, but fortunately the kind previously referred to are not so numerous.

IN the State of Mexico, Mex., is an object lesson to those engaged in cyaniding gold ores. Several years ago a large tailings pile was treated by the cyanide process, successfully it was stated at the time, and the tailings were run to a lower level and reimpounded behind a wall of masonry, built for the purpose. Numerous assays showed the tailings to still contain values and an enterprising experimenter cut several holes through the wall and placed boxes in connection with these apertures. The boxes were

similar to sluice boxes, but were divided into compartments like zinc precipitation boxes, which, in fact, is what they are. In the several compartments were placed zinc shavings. When the rains fall the water percolates through the tailings and washing out the gold-bearing cyanide solutions the values are precipitated on the zinc. The solutions are strengthened by the addition of strong solution in small amounts at the head of the precipitation boxes. It is merely an illustration of the possibilities of modern metallurgy. Solutions and tailings too low to treat at a profit six or seven years ago are now being reworked in this inexpensive manner assisted by nature. Whether any chemical reactions of consequence had taken place in the tailings since their prior treatment, rendering them more amenable than before, is not known.

## Proposed Mining Legislation.

The convention of the California Miners' Association, which closed on the 8th inst. at San Francisco, Cal., was one of the most important in the history of that organization, the discussion of the several phases of the mining industry in that State and the numerous technical papers read were interesting and instructive. Among the many interesting topics which came before the convention was that of the proposed revision of the mining law, as explained at length by Mr. A. E. Belcher. In this connection the most important is probably the contemplated repeal of the extralateral right law and the substitution of a square location law with all rights bounded by the claim lines drawn vertically downward in its stead. If, however, it is the intention, as is suggested by Mr. Belcher, to make provision for a claim owner to take an additional side location at some later period when he has discovered that his ore dips into adjoining ground and he desires to follow it, complications result at once, and it were possibly better to continue with the old extralateral right law, as it is, than to start a new crop of litigation, which will certainly be the outcome of indiscreet tampering with the existing law. Mexico has apparently settled this problem satisfactorily by permitting the location of as many claims as the locator cares to pay taxes on. No discovery of "mineral-bearing rock in place" is required, but he must pay the uniform price demanded by the Government. This idea might be adopted in the United States with some necessary modifications. If we are to have square locations and no extralateral rights, let it be simply that and nothing more, for any attempt to make exceptions will involve the laws in a new period of litigation which would last for years. There is no longer need for experiment. The action and effect of the present laws are well known. There are precedents and decisions for almost every case to cover existing mining claims. Other countries where no extralateral rights obtain have furnished sufficient data upon which to base a new code, when it is desirable. The only thing in connection with square locations, some think is, perhaps, the number that one person may take. That this is material is not apparent, as the poor miner will not take more than he can pay for or represent, and the rich corporation would buy all it wanted anyhow.

Under existing laws one person may take as many claims as he cares to, and the same thing applies to corporations. The fear that the corporations would absorb all the available ground is without precedent.

LEGITIMATE MINING is the investment of money and brains in the development and equipment of promising prospects, whether these ventures be profitable or not. Because a mining venture fails is no reason to class it as illegitimate if the business has been carefully and honestly conducted. It goes without saying that the management of the operation must be in experienced hands, though unfortunately for the industry this is not always the case. Illegitimate mining is that class of mining where other people's money is obtained through the medium of misrepresentation and expended usually in an extravagant manner on a worthless proposition, and by men who have little knowledge of practical mining or just enough to enable them to hoodwink their dupes into the belief that their great expectations are just about to be realized.

THE report of another coal mine explosion—this time in Washington—in which a number of men lost their lives, goes to prove that miners and mine managers either fail to profit by experience or are willing to assume too great risks. Evidently the laws governing the inspection of mines in which there is gas are either insufficient or are lax in their enforcement.

THERE is a very noticeable rise in the Eastern prices of iron and steel, in some instances amounting to from 10% to 20%. Copper is also somewhat higher than last week; one quotation for Lake copper being 15.25 cents. The prices in the metal market are always a very fair index of the Nation's prosperity. Particularly is this true of iron and steel. The rapid fall in copper stocks on Wednesday in the Boston and New York exchanges is due to stock manipulations and not to a fall in the price of the metal, the quotations for which have not only remained firm, but actually advanced.

THE oil-producing companies of the Western United States are much interested in the recent development in the comparatively new oil fields of Santa Maria, Santa Barbara county, California, where within a week it is reported a gusher has been struck which is spouting 15,000 barrels of oil daily. The oil of that district is mostly refined and the price is somewhat higher than that of the other oil fields of California. As a rule, wells making such heavy production at the outset are comparatively short-lived and soon dwindle to ordinary pumping wells, as was the case with the Beaumont and Spindle Top wells of eastern Texas.

## CONCENTRATES.

A GOOD TRAMMER will push a loaded car at the rate of 3 miles an hour on a well graded track.

THE present price of carbons (black diamonds) for diamond drill work is about \$35 per karat.

NOT every copper mine having an iron gossan has a zone of enriched ore between the gossan and the normal sulphide ore below.

THE ore-bearing formation at Tonopah, Nev., is andesite and at Goldfield rhyolite. In both districts the ore occurs in zones of crushed rock. The ore deposits of neither Tonopah nor Goldfield bear any likeness to those on the Comstock lode at Virginia City, Nev., either as to minerals or as to geological structure.

THERE is a duty of 6 cents per pound on all catalogues, trade treatises, price lists or circulars sent to Australia, whether by post or otherwise. If the matter be weighed before sending, and the amount at 6 cents per pound be sent to the Postmaster-General at Melbourne, he will transmit it to the Australian custom house.

THE copper deposits now being developed and equipped in the Cerro de Pasco district of Peru, S. A., were originally silver mines, which were worked for years, producing a large amount of silver. A series of deep caved pits marks the line of the great lode where these mines have been extensively worked by the natives.

THE platinum which occurs in the ores of the Rambler mine in Wyoming is obtained in the form of slimes resulting from the treatment of copper ores and matte from that mine. The commercial value of platinum is about \$19 per ounce. The price varies with the purity of the grains. The Rambler mine is reported to have produced \$6000 worth of platinum in 1903.

WHERE canvas is used in filter presses, that of moderate weight (8 ounces) is generally better than the coarse heavy kinds, particularly for very slimy ores. In the coarse canvas where the grouped threads cross each other the material is so dense and firm that no solution can pass through, but in the interstitial spaces between warp and woof the slimes ooze through, rendering the process ineffective.

WHEN slimes in the form of finely divided sulphides float on the surface of settling tanks or the washing boxes of concentrating machines, and refuse to settle, if the overflow, by means of which these slimes are carried away, be conducted through a pipe and discharged under water, the result will generally be the settling of the slimes. This is sometimes accomplished by causing the slimes to flow beneath an inverted dam or partition in the settling box.

MINE fires sometimes smoulder for years, and break out violently whenever fresh air is admitted to the zone of fire. This is notably the case in some of the mines of Butte City, Montana, where the timbers burning have, it is believed, set fire to the ore, which cannot now be extinguished without flooding all the mines of the district, and this the management has not dared attempt, for fear of the consequences which would probably attend such an expedient.

DIAMONDS obtained with other minerals of high specific gravity in the diamond mines of South Africa by concentration on machines are separated from the accompanying minerals by passing the concentrates over a side-shaking table on which is a board covered with a grease of particular composition. The diamonds adhere to the greased board, while the garnets, chrysolite and other accompanying minerals pass on over the board to the tailings. The device saves within 2% of all the diamonds passing over it, and often the loss is less than 1%.

THE builders of cyanide plants should take particular pains to see that the foundations are firm and not of a character which will permit the tanks to settle unequally should the ground beneath them get wet, as often occurs. A stone or concrete foundation based on bedrock is the best foundation, but a well-arranged timber foundation will also answer for temporary use. Where the plant can be placed on exposed bedrock the expense of preparation of foundations is at a minimum. Coconut fiber matting is the most commonly employed material used for filter purposes.

ORDINARILY a shoveler will load a ton car in about forty minutes. If the material is large and requires much sledging it will require longer. Some material is much easier to shovel than others. It always pays to lay a floor of lagging for the muckers to shovel on as it greatly facilitates the work, thus saving time. Ordinarily two muckers will fill twenty-six to twenty-eight one-ton cars on a ten-hour shift, working in drift underground, where all the broken rock must be shoveled from the floor into a car about 4½ feet high. The cost per ton may be calculated from the wages paid in the

mine for this class of labor. Shoveling from the floor of open cuts, good shovelers will do rather better than this for the reason that there is more freedom of movement, better light and air.

A COLUMNAR STRUCTURE in volcanic rock usually indicates that the rock mass is a portion of a flow and not a vertical intrusion. Dikes are sometimes noticed to have a structure resembling the columns so common in basalt and other volcanic rocks, with the exception that the structure is horizontal and not vertical. This indicates the rock mass to be a dike. This structure in igneous rock is observed to always form at or near right angles to the walls of the mass. If the mass be a flat sheet, the columns will be vertical; if a dike, the columns will lie at right angles to the walls.

SHAKING amalgamated plates in amalgamation gold mills are seldom seen now, but were at one time popular in Colorado. It has frequently been demonstrated that the placing of a silvered copper plate on the spreader of a concentrator beneath the feed pipe extending downward from the launder will collect gold amalgam, thus showing that quicksilver and gold are constantly escaping from the apron plates and sluices. It is no uncommon thing to find mercury in the slimes boxes beneath concentrating machines, which is another evidence that quicksilver is escaping from both the plate and the machine.

THREE MEN are usually required to operate a diamond drill—an expert who thoroughly understands the drill and its work and two helpers. In a rock like limestone they should drill 20 feet in ten hours, and the cost for carbons will be about 30 cents to 35 cents per foot. The cost per foot for diamond drill holes varies greatly, depending on the motive power and its cost, wages, and particularly on the hardness and character of the rock bored through. The cost of twelve holes, ranging from 200 to 800 feet deep and aggregating about 6000 feet of boring, was \$2.50 per foot. In another instance, at a Michigan iron mine, the average cost of boring about 5000 feet of holes was \$2.60 per foot.

ASBESTOS is a variety of amphibole. Tremolite, actinolite, and some other varieties of amphibole, excepting those containing much alumina, pass into fibrous varieties, the fibers of which are sometimes long and silky, resembling flax. Asbestos fiber conforms to the direction of the inclosing rock. Chrysotile resembles asbestos, but is a fibrous variety of serpentine having a silky luster, and is also easily separable into fibers. It occurs in vein-like sheets in serpentine and the fibers arranged at right angles to the walls of the fissure, by which its field occurrence may be distinguished from asbestos. Chrysotile is a magnesian silicate, and asbestos is a metasilicate of calcium and magnesium.

INDIAN reservations as a rule are unsafe regions for the prospector to pursue his vocation. Many venturesome prospectors have lost their lives on reservations in Arizona, Colorado, Dakota, Wyoming and elsewhere in the West by prematurely entering Indian reservations in search of veins. As no official notice of the opening of the Navajo reservation in northeast Arizona has ever come to the knowledge of "Concentrates," it is safe to say it would be a good section for the prospector to avoid, notwithstanding the stories of fabulous richness, great copper deposits and gold veins. The Navajos are hostile to intruders, particularly to prospectors, and it is extremely risky to visit it for the purpose of prospecting.

MONAZITE is mostly obtained from placers, like gold. It occurs in regions of granite and other crystalline rocks. The concentrated mineral is of various colors and shades, as red, reddish brown, brown, yellowish brown, yellowish green and yellow, according to locality. Most of the monazite mined in the United States is from the Carolinas. It has not been reported in States west of the Rocky mountains. The monazite sands, as saved by the placer miner, contain about 60% of the impurities—thus, 1,900,000 pounds of crude sands mined in 1902 produced 802,000 pounds of clean sand. The miner received 2½ to 6 cents per pound for the crude sands, according to the percentage of thorium present.

It is reported that the nickel ores of Sudbury, Canada, contain palladium, as well as other rare metals. From 300,000 tons of nickel-copper ore treated, there were obtained 3000 ounces of palladium. This metal also occurs with certain Brazilian gold ores, where it constitutes several per cent of the ore, the metal being separated from the gold by fusing it, together with silver, and dissolving the granular alloy thus obtained in hot nitric acid, the palladium and silver going into solution. The gold is saved on a filter and the silver precipitated from the solution by salt solution or hydrochloric acid. This is also separated by filtration, and the palladium in the filtrate is then obtained by precipitation with mercury cyanide, as a yellowish-white precipitate of palladium cyanide, which, on ignition, leaves a residue of spongy, metallic palladium.

COPPER exists in solution in a condition depending upon the solvents used in its dissolution. It is present either as sulphate or cupric or cuprous chloride and may be precipitated from the solution by means of scrap iron, tin scrap, etc. The graphite present in the iron generally separates and forms a portion of the impurities

found with the cement copper. For the best practice in this process, that of precipitating copper from its solutions on scrap iron, it is desirable that the solution contain as little as possible of free acid, or iron oxide salts, or the result will be the solution of a large quantity of iron before the precipitation of the copper. Theoretically 88.8 parts of metallic iron are required to precipitate 100 parts of metallic copper from copper sulphate and copper chloride solutions, whereas but 44.4 parts of iron are necessary to precipitate 100 parts of copper from a cuprous chloride solution, but in actual practice from 200 to 300 parts of metallic iron are required to precipitate 100 parts of copper from sulphate and chloride solutions. The reason for this is that the ferric sulphate in the solution upon contact with the atmosphere decomposes into free sulphuric acid and ferrous sulphate; the sulphuric acid attacks and dissolves a portion of the iron and ferrous sulphate takes up more iron, becoming ferric sulphate.

SOME MINERALS exhibit a tendency to float like grease upon water when finely crushed. Molybdenite, graphite and many sulphides of the base metals, as well as silver sulphide and very fine gold, exhibit this property. It is supposed to be due to the aversion of the mineral particles to become wet, and if discharged into water with pulp, rise again to the surface, carried upward by small bubbles of air. It is this disposition of air bubbles to carry fine mineral particles to the surface that has been taken advantage of in the so-called "salt cake" process of concentration. It is employed chiefly at Broken Hill, N. S. W., to separate zinc sulphide from the other base metal sulphides. Salt cake is sodium sulphate, made by treating common salt (NaCl) with sulphuric acid. This salt is dissolved in water, producing a dense and buoyant solution. The mineral is discharged from a launder into a pointed box provided with an outlet at the bottom which may be varied in size to meet the conditions. All of the minerals introduced to the box with the exception of the zinc sulphide pass out at the spigot at the bottom, the zinc blende particles being carried upward by minute bubbles of gas—probably, hydrogen, resulting from the action of dilute acid on the particles of blende. These floating particles of zinc sulphide are floated off and collected for reduction.

THE usual estimate of power for the operation of 3-inch or 3½-inch rock drills is 10 H. P. per machine. At this rate, where power costs \$5 per month per horse power, the cost of operating a machine drill is not less than \$50 per month, if the drill is in constant operation, but as there is always a loss in the power delivered to the compressor in transmitting it to the machines, and as the machines cannot be operated constantly, the question of power charge is sometimes difficult to arrive at. Probably the best way to approximate this cost is to charge the monthly cost of power delivered to the compressor to the drilling cost. Divide this sum by the number of hours in the working month that the drills were actually at work in the aggregate. This will give the cost per "drill hour." Multiply this sum by the number of hours any particular drill was in operation and the result is the cost for power alone of operating that drill. Example: A compressor requires 120 H. P. for its operation; at \$5 per month per horse power = \$600 per month; there are ten drills at work in the mine which in thirty days are run in the aggregate 4800 hours; \$600 ÷ 4800 = \$0.125 cost per drill hour. A particular drill was run in twenty-six days 390 hours; \$0.125 × 390 = \$48.75 cost of power for running this one drill during the month. Each other drill on the mine may be figured out in the same manner, and a comparison of work accomplished with each observed. It is these details which make up mining costs and are to be looked after.

If the person locating a mining claim has made a mistake in his conception of the strike of a vein, or has taken too little ground, or there is any other discrepancy in his location, he may make an amended location correcting these defects if he can still do so without conflicting with the rights of others who have located claims adjoining him since the date of his original location. The States of Colorado, Idaho, Arizona, Montana, Nevada, New Mexico, North Dakota, South Dakota and Wyoming have passed laws in regard to amended locations. The provision of all these State laws, excepting of Arizona, are similar to the Colorado law, which provides: If at any time the locator of a mining claim, believing that his original certificate was erroneous, or defective, or that the requirements of the law had not been complied with before filing, or shall be desirous of changing his surface boundaries, or taking in part of an overlapping claim which has been abandoned, or in case the original certificate was made prior to the passage of this law, and he shall be desirous of securing the benefits of the act, such locator may file an additional certificate subject to the provisions of the act; provided, that such relocation does not interfere with the rights of others at the time of such relocation, and no such relocation, or record thereof, shall preclude the claimant or claimants from proving any such title or titles as he may have held under the previous location. The Arizona statute on this matter provides that location notices may be amended at any time and the monuments changed to correspond to the amended location; provided, that no change shall be made that will interfere with the rights of others. An amended location cannot be made to hold a claim upon which the assessment work required by law has not been done.

## Convention of the California Miners' Association.

The thirteenth annual convention of the California Miners' Association met on the morning of the 5th inst., in San Francisco, Cal., continuing on the 6th, 7th and 8th, there being present over 300 delegates from the various mining counties of the State.

After the usual address of welcome, C. M. Belshaw, president of the Association, delivered his annual address. The debris question is an important one in California, and one which has been the subject of much discussion, legislation and also of litigation. To this matter Mr. Belshaw referred. His address in full follows:

Gentlemen of the California Miners' Association: We are again met in annual convention for the purpose of promoting the interests of one of our greatest industries, and I trust that the deliberations of this body will contribute not a little to the welfare of mining in all its branches in the State of California. The good which may accrue to the industry here represented is incalculable, and I hope that the deliberations of this convention may add to the good work which has already been accomplished by our Association.

I desire briefly to call your attention to what has been done by the Association since our last convention. At a meeting of the executive committee which was held January 9, 1904, the attention of the committee was directed to the decision of the Supreme Court of the State of California in the case of the County of Yuba vs. Kate Hayes Mining Company, and particularly to the following sentence in that opinion:

"It is true that the evidence failed to show that defendants were mining by the hydraulic process, but admittedly they were mining by the ground sluice process, which, according to the evidence, produced the same effect in kind as the hydraulic process, only to a less degree."

It was the opinion of the committee that if this reason were carried to its logical conclusion, quartz mining and, indeed, all kinds of mining in this State were in jeopardy. Accordingly 3000 copies of this decision were printed and sent to the several mining companies in this State, accompanied by a circular letter calling attention to the above quoted sentence, with a request for an opinion as to whether or not this decision might not be made applicable to quartz and dredge mining. The universal reply in some 700 letters which were received by the Association was to the effect that there was danger that this decision might be used to the detriment of quartz and dredge mining.

While there has been no attempt made as yet to attack quartz or dredge mining under this decision, there is no assurance that it will not be made, and I am of the opinion that this Association should fortify itself so as to successfully combat any effort which might be made along the line suggested.

On March 3, 1904, a petition was received from the miners of the Tanana River district of Alaska requesting this Association to use its influence for the purpose of having Cheena, Alaska, declared a port of entry, in order that the miners of that district might receive better transportation accommodations. This matter was referred to Senator Perkins, who, upon investigation, informed the Association that it would be impossible to comply with the petition.

At a meeting of the executive committee held April 9, 1904, Messrs. Solinsky & Wehe most kindly offered to take the Polar Star case to the Supreme Court free of cost for attorney's fees, for the purpose of getting an adjudication as to the constitutionality of the Caminetti Act. Messrs. Solinsky & Wehe have already done considerable work in the case in the way of correspondence and getting it in proper shape to appeal to the Supreme Court, and are now ready to go ahead and take the appeal, and only await funds to get copies of the papers and also to print the record. It seems to me that it is of great importance to hydraulic mining that we have a Supreme Court decision on the Caminetti Act, and I hope that, since Messrs. Solinsky & Wehe have so kindly volunteered their legal services in the matter, the Association will see its way clear to provide for the necessary costs of conducting the suit.

In the early part of May, 1904, a call was made for a river convention to be held in San Francisco on the 22d of the month, and it was rumored that there might be some discussion on the evil effects of dredge mining. A special meeting of the executive committee was called and it was decided that the committee should go to Oroville and make an examination of the conditions there in order that the representatives from this Association to the river convention might be thoroughly posted on matters appertaining to dredge mining. A majority of the members of the executive committee and Colonel Heuer of the California Debris Commission participated in this investigation. We were shown every courtesy by the California Dredge Miners' Association of Oroville, and were given every opportunity to investigate the working of the dredgers of that district, both those that were working in the river and those that were working inland. It was the unanimous opinion of the committee that the dredgers of this district were doing no material damage to the river, and that dredge mining could be so conducted as to do absolutely no damage whatever.

Under date of May 16, 1904, this Association received an invitation from the California Promotion Committee to send delegates to the river convention. This invitation was accepted and our Association was represented during that convention. However, the matter of mining was not brought up in the convention, so our delegation was not called upon to acclaim or defend the mining industry.

A copy of the resolutions adopted by this Association at its last convention concerning desired Federal legislation was sent to our representatives in Congress, and the

Hon. J. N. Gillett, member of Congress from the First District, introduced the necessary bills in the House, copies of which were in due time received by this Association and are now on file in the secretary's office. We have the assurance of Mr. Gillett that he is using every effort to secure the passage of these bills, and we have no doubt that he will succeed. The Association, through its chairman of the committee on legislation, Hon. John F. Davis, has furnished Mr. Gillett with all the necessary data to show the necessity for the proposed legislation.

I desire to again call the attention of the Association to the matter of wildcat mining companies, and I earnestly urge the necessity for some legislation which will put out of business for all time these illegitimate schemes which have a tendency to cast a shadow on legitimate mining enterprises.

While the Association during the past year has had no active contests in behalf of mining on its hands, nevertheless it has been alert for the interests and welfare of mining in all its branches and has ever been ready to extend a helping hand when called upon to do so.

I am sorry to note a lack of interest in this Association by those who ought to be most interested and for whom the Association stands in a position to do the most good. I sincerely hope that this apathy will give way to an earnest, active interest in the work which the Association can do, and that the coming year will find all who are interested in mining throughout the State of California laboring hand in hand under the banner of the Association to promote our mining interests.

I desire to here publicly express my appreciation for the good, hard, faithful work which your secretary, E. H. Benjamin, has always done for this Association, and I wish to say to you, my fellow delegates, that whatever good the Association has done in the past few years has been through the untiring efforts of your secretary, and I now publicly thank him for his invaluable assistance to me.

In retiring from the presidency of this Association, I wish to thank you for the confidence which you have reposed in me and to say that I am fully aware of my many shortcomings; but, in returning my thanks, I do so with a full knowledge of the great good this Association has accomplished, and I stand ready, with all the rest, to put my shoulder to the wheel and do my best to assist in the furtherance of the mineral industry of the State of California.

R. H. Campbell read an interesting paper on working gravel mines with hydraulic elevators, by means of which deposits lying below the drainage level of the county are successfully worked.

W. C. Ralston addressed the convention, talking interestingly of his recent trip to Tonopah, Goldfield and other new mining camps in southern Nevada.

A committee on resolutions was appointed, comprised of one delegate from each county represented, as follows:

Charles G. Yale, chairman; A. H. Ricketts, Alameda county; R. C. Rust, Amador; L. J. Hohl, Butte; F. J. Solinsky, Calaveras; C. H. Dutton, El Dorado; H. Z. Osborne, Los Angeles; A. H. Ward, Mariposa; Fred Searles, Nevada; Z. J. Kendall, Placer; H. H. Yard, Plumas; J. B. Balcomb, San Francisco; Henry Chin-smith, Shasta; A. A. Tregidgo, Solano; J. W. Redden, Santa Clara; R. R. Smith, San Joaquin; W. A. Gett, Sacramento; F. R. Wehe, Sierra; John Daggett, Siskiyou; E. B. Preston, Sonoma; William Sharwood, Tuolumne; J. W. Bartlett, Trinity; F. J. Symmes, from the Merchants' Association; Rufus P. Jennings, from the California Promotion Committee; E. G. Heald, from the California Petroleum Miners' Association; F. H. Harvey, from the State Mining Bureau; John Ferris, from the River Improvement and Drainage Association.

A committee of seven was also appointed for the purpose of revising the by-laws and constitution of the Association. This committee was made up of the following: W. C. Ralston, C. G. Yale, A. Carrigan, W. P. Hammon of Butte, Thomas Clark of El Dorado, N. P. Brown of Nevada county and H. E. Bush of Shasta.

The report of the United States engineers of the California Debris Commission was read relative to the progress of work on the barriers now under construction on the Yuba river, near Daguerre Point. The report stated that the work is progressing in three sections; the first section rising 6 feet from the river bottom is completed. About one-half of the work at Daguerre Point is finished and 6000 feet of the bulkhead built by W. P. Hammon is completed. A wide cut has been about half completed at Daguerre Point for the purpose of diverting the entire flow of the Yuba river at high stages of water. On the third section, near Marysville easements on property have been largely secured and the surveying for a great settling basin has been performed.

A resolution was introduced on the necessity of good roads in the mining regions of the State.

The committee on credentials, consisting of C. H. Dutton of El Dorado, T. Rickard of Alameda, N. P. Brown of Nevada, E. C. Voorhies of Amador and W. L. Ashe of Alpine, reported the delegates present entitled to a seat in the convention were as follows:

Calaveras County—F. J. Solinsky, Harry East Miller, A. I. McSorley, George Sargent, M. W. Miller, J. S. White, D. P. Gray, Ira Hill Reed, F. F. Thomas, David McClure, J. F. Thompson, J. J. McSorley, Thomas Rooney, L. W. Shinn, Alex. Chalmers, W. C. Ralston, B. R. Prince, Otto Dolling, A. C. Harmon, C. Borger, J. C. Kemp Van Es, R. B. Parks, Alex. Brown, G. McM. Ross, Job M. Evans, C. E. Fenssler, W. E. Emery, W. H. Clay, Jr., G. Otis Pearce.

El Dorado County—A. Baring Gould, C. H. Weatherwax, M. Q. Meehan, W. F. Bray, Thomas Clark, D. H. Jackson, E. W. Chapman, Frank Mott, C. H. Dutton, W. P. Frick, H. S. Morey, H. C. Plummer, J. Snow, John Pearson, F. M. Phelps, J. H. Bradley, A. C. Mor-

rison, J. Q. Wrenn, W. C. Green, F. H. Hood, John Fern, Seymour Hill, Joseph Roylance, E. J. Crawford, H. E. Pickett, William J. Dinger, E. P. Colgan, O. R. Allen, C. M. Fitzgerald, N. W. Mountain, H. Larkin, H. N. Berger, Gee Norigesser.

San Joaquin County—J. Jerome Smith, Richard Russell Smith, Orrin S. Henderson, E. F. Cadle, S. V. Ryland, J. D. Peters, J. U. Castle, Charles Adams.

Butte County—John J. Hamlyn, F. S. Mayhew, L. J. Hohl, A. S. Grant, James H. Leggett, A. F. Jones, O. B. Perry, W. P. Hammon.

Sacramento County—W. A. Gett, A. C. Hinkson, William Schaw, Fred L. Martin, Thomas L. Enwright. Kern County—Tim Spellacy, C. A. Burcham, Robert Long.

Santa Clara County—H. R. Bradford, Thomas Derby, R. B. Harper, J. W. Reddin, R. R. Bulmore, Thomas W. Jones.

Solano County—A. A. Tregidgo, John M. Gregory, T. H. Woods.

Trinity County—J. W. Bartlett, L. M. Hoefler, George P. Ruddock.

Mono County—R. T. Pierce, R. F. Turner, R. Gilman Brown.

Tuolumne County—William Sharwood, W. J. Sharwood, John Neale, Fred Sutton, W. H. Storms.

San Luis Obispo County—Adolph Klaw, Victor Woods, J. H. Beckett.

San Diego County—Will H. Holcomb, Frank A. Salmons, M. Jacoby, George H. Clarke, A. J. Wauchope.

Mariposa County—C. C. Derby, A. H. Ward, Clarence King.

Plumas County—H. H. Yard, H. C. Langrehr, Sam W. Cheney.

Sonoma County—E. B. Preston, Alfred Abbey.

Sierra County—Frank R. Wehe, F. S. Moody.

Siskiyou County—John Daggett, F. H. Knight.

Los Angeles County—H. Z. Osborne, John Singleton, W. H. Holabird, George Kisingbury, M. H. Russell, Walter S. Maxwell.

Placer County—C. D. Akers, F. K. Devey, D. W. Lubeck, William Freeman, John Spaulding, M. L. Fulweiler, T. J. Nicholls, E. J. Kendall, M. Lebner, D. Faulkner, William Nicholls Jr., F. L. Schultze, Thomas James, A. F. Callenberg, G. W. Towle, G. G. Towle, J. B. Knapp, James A. Ferguson, A. W. McAulay, P. F. Hinst, Alfred Dixon, John Sutcliffe, B. Pelefa, J. L. Walker, William Grimmer, Thomas Hosmer, E. C. Kavanaugh, George McAulay, A. G. Read, L. Hutch, John McArrinch, H. F. Adams, B. F. Hartley, Charles F. Read, John C. Boggs, B. F. Manley.

Shasta County—Lewis T. Wright, W. L. Cole, H. O. Cummins, Grant Suider, A. H. Brown, M. E. Dittmar, Frederick Lyon, Fred King, Fred Hurst, John Fillius, Dan McCarthy, Harry E. Bush, James Sallee, D. B. Hunt, S. S. Stickley, A. A. Anthony, George Seamans, C. G. Bush, J. B. Keating, J. Sterling Wilson, L. A. McIntosh, J. O. Jilson, G. W. Scott, Luke McDonald, Ed Sanders, M. Oreweller, Henry Clinesmith, W. J. Gillespie, Almarin B. Paul, Dr. Garlick, A. J. Glass, James Gilbert, A. C. Halter, James Hulme, Dr. Heintz, Frank Panter.

Neff, Charles Champion, H. D. Phelps.

The session of the 6th inst. was devoted during the morning hours to listening to an address by S. B. Christy, dean of the mining college of the University of California. Professor Christy expressed the belief that the debris proposition could not be satisfactorily settled by the construction of levees along the Sacramento and San Joaquin rivers, confining those streams within the narrow limits of their channels, as although these dikes would have the effect of causing a scouring action in the channels themselves, thus deepening them, the sediment would be carried onward only to be deposited at the first opportunity in San Pablo bay, and probably eventually in the bay of San Francisco. He thought that the debris could be better controlled by constructing barriers at the mouths of torrential streams, behind which a large portion of the debris would lodge, thus failing to reach the navigable streams, and by providing these dams hydraulic mining could be resumed on a large scale. In furtherance of this idea, Professor Christy suggested that the aid of President Roosevelt be sought to the end that a portion of the funds appropriated to the use of the United States Geological Survey be devoted to this experiment. The speaker expressed the belief that in their long-continued opposition to hydraulic, and now other forms of mining, the anti-debris association has "killed the goose that laid the golden egg."

A. Caminetti, who framed the bill known as the Caminetti act, by the provisions of which hydraulic mining again became possible in California, was pres-

ent and emphatically denied that he favored the repeal of the law as had been stated at Monday's session.

A paper was read by Thomas H. Leggett on "Mining Methods in Johannesburg, S. A.," in which he said South Africa would, for the next few years, be the greatest gold-producing country on the globe, and yet her diamond mines belittled even her auriferous industry. The most interesting part of his paper was that part which dealt with the question of Chinese labor. He defended the action of the mine owners in the Transvaal in importing Orientals, saying that their policy was dictated by sheer necessity. The conditions in Africa were unique, he affirmed, and not at all parallel to those existing in this country.

There are two classes of labor, he continued, one for the white man and one for the Kaffir. A white man will, under no circumstances, engage in any kind of work which is usually done by the natives. Therefore, when Kaffir labor became scarce the operators were in desperation and had no choice but to do as they did.

Other papers were read by Mark B. Kerr on the "Formation of Ore Bodies on Intersections," and by L. J. Hohl on "Gold Dredging."

In the afternoon the delegates turned from discussions of gold and precious stones and gave their undivided attention to iron, there being an excursion to the Union Iron Works on the programme. About sixty took advantage of it, and boarded the steam tug Union at the foot of Mission street at 1:30 o'clock, enjoying a pleasant outing under the direction of W. C. Ralston. At the Union Iron Works the party was divided, half going with Superintendent Dickie and the others with John T. Scott on a thorough tour of the plant. Afterward the battleship Ohio and the torpedo boat Perry were inspected, and the party returned, reaching home about 4 o'clock.

The convention was called to order at the usual hour Wednesday morning and a paper by E. A. Belcher on the "Mining Law and Its Needs" was read. Mr. Belcher stated that a commission had in charge the revision of the Federal statutes providing for the sale of public lands and had already prepared its report on the pre-emption and homestead laws, and is now about to take up that portion of the statutes relating to public mineral lands.

Mr. Belcher has been in communication with Gifford Pinchot, secretary of the Commission on Public Lands, and has made a number of suggestions to the Commission, one of which, if carried into effect, would substantially accomplish the segregation of the mineral lands so far as may be done without the aid of a geological commission in the field. It will do away with the spoliation of unpatented lands covered by mining locations. It will accomplish a great part of the good intended to be accomplished by the "mineral lands bill," toward which there was such active hostility that it could not be enacted into a statute.

Among other things, Mr. Belcher suggests the advisability of a uniform code of Federal statutes, which will do away with the present local laws, rules and regulations of districts, and have the mining laws universal in all of the mining sections of the West. To accomplish this some existing laws must be repealed and some new ones passed. Concerning the Mineral Lands bill, he proposed a new method of recording mining locations, and said that if the suggestion could be embodied in legislation it would furnish a greater safeguard than the miners have had. "It will," he said, "connect their locations with the paramount source of title—the general Government—hitherto impossible under the system of recording in use, and thus give notice to the general Government that the land is claimed as mineral. A mining location so recorded would prevent the selection or location of the land under other laws without the knowledge of the miner. It would give the honest miner what he has not had. It would prevent the spoliation of his mine by others without notice to him."

Other suggestions were offered by Mr. Belcher as follows:

1—The extralateral right should be utterly abolished. It is a thing of evil. Within my reading no one statutory provision has been so productive of endless and costly litigation as this. No mine owner can say with assurance that his title is quieted for all time. At any stage some new development may start a new suit; at any depth his vein may intersect another and be lost to him if he chances to be the junior locator; at any point his vein is liable to develop into a complex fissure and involve him in endless controversy over the doctrine of underlap and connecting veins.

2—The rules for perfecting a mining location require radical changes; nevertheless, changes should be advisedly considered so as not to handicap too severely the honest miner.

3—The new Federal law should be comprehensive. It should provide for a record in the land office and should provide, negatively, that no other record be required. That, so far as concern mines not patented, would do away with the record of the county recorder and the record of the local mining district and their accompanying expenses and dangerous uncertainties. Such provision, of course, would not be retroactive, it would apply to future conditions and would not disturb the chain of any title already initiated.

The proposed legislation should also, in exact terms,

do away with that continuing source of infinite perplexity, the local rules and regulations of miners. The tenth census report contains Clarence King's compilation of the local rules and regulations of miners, but it does not contain all of them, for many exist only in tradition and can be proved only through that dangerous medium—parole. A matter so important as a rule that is to affect conduct ought not to be left to parole. Besides, there is no good reason why there should not be uniformity of procedure. The necessity for the uniformity of procedure is daily becoming more and more exigent in all affairs, particularly those of a legal nature. The proposed new system, therefore, should be a complete system and it should be exclusive. If a mine is worth working, it is worth patenting.

He also referred to the recent mining legislation relative to mineral lands in the Philippine Islands, where a mining claim is 1000 feet square with no extralateral rights. In discussion of the extralateral right, Mr. Belcher said:

It is easily perceivable that if a ledge should chance to run beyond the vertical planes of the boundaries at a depth still permitting work, then, as the only discovery possible would be by the owner at the place of crossing, he could make a side location based on his own discovery at the place of crossing and protect himself. His would be the only valid location as being the only location founded upon discovery. In almost any contingency the owner of the original location would be in a situation to protect himself against the "jumper," because the "jumper" could make no discovery upon which to found a valid location of the ground lying to the side of the original location into which the ledge projects on its dip after crossing the vertical boundary of the original location. The only possibility of any trouble accruing to the owner of the original location, where the ledge crosses his boundary and he desires to continue to work it, would be where a side location embraced an apex of its own from which to the lode of the original location there might, at the depth of the boundary crossing, be a crosscut. But such a contingency would be provided against by giving to the owner of the original location the right to make a side location calculated to embrace the dip of his original ledge at any feasible depth. Ordinarily, however, within the perpendicular planes of the location the vein could be worked as deep as would be desired or as practicable.

Referring to the conditions which have attended the patenting of mines, he said:

Save in the occasional instances where patents to mines have been obtained, as compared with the vast number of mining locations in which no land office proceedings looking to patent have been taken, there is no definite segregation of mineral lands from agricultural. The fault is that of the system. In no other land than ours would such a system be tolerated. Under the Federal law the mere location, together with the required expenditure for labor and improvement, gives permissive title for an indefinite period—that is, it is supposed to do so. The statute does not compel the locator to procure a patent. It does not even require him to record his location. Only State or mining district laws require a record.

As a consequence, under the Federal law, unless proceedings to obtain a patent are initiated, there is nothing to connect the mining location with the land office—the place provided by law for disposition of the public lands. In the absence of an application for patent no one can know anything about a mining location save the locator, those whom he has informed, those who may chance to be on the ground and see the stakes, and those who are constructively informed by the record of the location in the office of the recorder of the mining district or the office of the County Recorder.

Such record is supposed to give constructive notice, but its capacity in that direction is limited. Confessedly, it is no notice at all to the paramount proprietor—the United States. The United States knows of nothing relating to its public domain, the specific grants of the Congress excepted, save such matters as, under its laws for the disposal of the public domain, appear in the United States land offices where the public domain is sold. The land office is for the General Government the recording office. It knows what is there of record, but it does not know what is of record in the offices of mining recorders or the offices of county recorders, and does not, in the nature of things, cannot take any constructive notice therefrom.

As it is the owner of the land it cannot take notice of anything affecting the title save what is of record in the place it has provided for that specific purpose. The laws of mining districts and of some of the State require a record of mining locations, but the reason for requiring a mining location to be recorded in a local office antedating the enactment of the Federal mining law long since lost its force because Federal surveys of the public lands have since been widely extended. General withdrawals of wide regions supposedly mineral in character, such as the withdrawals in accordance with the report of J. Ross Browne in the seventies, have been set aside as conflicting with the policy of the Government for the disposition of the public domain as a means of increasing the national wealth and resources, and because the real policy of the Government, notwithstanding the imperfect provisions of the law, is that the mineral lands shall be sold as such and not reserved as such.

In instances known mineral lands have been returned as such by the deputy agricultural surveyors in the field and platted as of that character; but otherwise than as they are so platted from casual examination or information, and otherwise than as segregated by deputy United States mineral surveyors in patent proceedings, the Government maps give no information as to what are mineral lands. Some of the best mines have been discovered upon lands surveyed, returned and platted as being agricultural in character.

In places, public lands returned as agricultural in character, or at least as not mineral, are, in fact, covered by mining locations, duly recorded under local rules, of which the United States land offices have no

knowledge. This condition of fact is not merely bad; it is shocking. It is time the law was changed. Yet any change that would put too severe a burden upon the hardy prospector and honest miner would fall short of attaining the object desired.

The present system does not protect the honest miner. Where the land in which his mine is situated has been returned as agricultural, unless he initiates patent proceedings, he is at the mercy of the scripper, the purchaser from the State under school selections, and even from purchasers under the timber and stone acts.

In the matter of recording claims, Mr. Belcher said:

The Federal statute should require mining locations to be recorded in and noted upon the records of the United States land offices. Such a system would end many of the miners' troubles, because it would connect his location with the paramount source of title. Such a system would prevent any disposition of the land covered by a mining location without notice to the miner. A general mineral affidavit that certain land is mineral in character is of no practical efficacy, as has been clearly shown, because a notice to disprove mineral, published in some obscure newspaper, might never be seen by the miner.

His mine is frequently far removed from any post-office, and his means of information as to what is going on in the outside world scanty. His location, so recorded, would import certainly, would require a personal service upon him of any process affecting the title to his claim, and thus he would be given his day in court.

Where the location should be of a placer it would conform to legal subdivisions and be readily noted on the plat books, but where it should be of a lode claim, it would require a survey in the first instance to establish relation to subdivisional lines, so as to make a proper segregation from contiguous non-mineral lands. In the land office it would be merely a matter of bookkeeping.

There are other feasible means of segregating the public mineral lands. By the system of recording proposed they would be segregated, and the land office, the only place provided by law for the disposition of the public lands, would have precise and first hand knowledge of the status of the lands subject to sale. In Mexico and British Columbia nothing is left to chance as here. An official segregation of each mining location is made at the outset.

By the system proposed the plats of the deputy mineral surveyor of the district and of the land office would always agree, and conflicting locations, now so easy to make and so fruitful of litigation or blackmail, would not be permitted without a showing under oath, nor unless it should appear that the conflicting party had some substantial litigable interest not merely negligible.

Doubtless this procedure would reduce the number of locations recorded, but it would have a tendency to make prospecting more thorough and extensive, as is the case in Canada and Mexico. The statute could provide that a miner should have a definite time after discovery within which to make and file his location.

The law should also require a locator to procure a patent within a specified period, say, within five years after recording the location in the land office. If a mine is worth working it is worth patenting, and there is no reason why the owner of a mine should not be required to get a patent while the owner of a farm is. The period of five years is suggested by analogy to the homestead law.

Other papers were read by G. W. Kimble, "Prospecting Auriferous Gravel With Drilling Machines;" H. E. Miller on "Explosives," and Prof. A. C. Lawson of the University of California on "The Needs of a Geological Map of California." Other papers were read by title, among them one by W. H. Storms on "The Strength and Life of Mine Timbers."

A. A. Tregidgo of Solano county addressed the convention on his experiences in Alaska and the Klondike.

One of the most important matters coming before the Convention was a revision of its constitution and by-laws. Considerable discussion resulted over this proposed change, particularly in the matter of increase of dues, but the new constitution and by-laws were finally unanimously adopted, as follows:

#### ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

SEC. 2. The objects of this Association shall be to protect, develop and foster the mining and mineral industries of the State of California in all their branches and to particularly protect the mining industry in matters pertaining to legislation and to influence and develop scientific research.

#### ARTICLE II.

SECTION 1. The officers of this Association shall be a president, vice-president and treasurer, to be elected at the annual meeting, and a secretary, to be appointed by the executive committee, as hereinafter provided.

SEC. 2. All officers are to serve for the period of one year, or until their successors are elected or appointed.

SEC. 3. The president shall appoint an executive committee, to consist of seven members of this Association, which shall have full power to transact all business of the Association, except such as may be transacted at any general meeting of the Association. The executive committee shall appoint a secretary.

SEC. 4. The president shall appoint, subject to the approval of the executive committee, such committees as are prescribed by the constitution and by-laws of this Association and such other committees as may be authorized by the executive committee. The president shall be ex-officio member of all committees.

SEC. 5. The elected officers of the Association shall be ex-officio members and officers of the executive committee.

SEC. 6. There shall be an annual meeting of this As-

sociation held in San Francisco at a time to be fixed by the executive committee; and there shall be regular meetings of the executive committee on the second Saturday in the months of January, April, July and October of each year.

#### ARTICLE III.

SECTION 1. The president shall preside at all meetings of the Association and of the executive committee. He shall sign all warrants drawn on the treasury and perform such other duties as herein prescribed, or as usually pertain to that office.

In the absence of the president the vice-president shall perform the duties of that office.

SEC. 2. It shall be the duty of the secretary to keep full and correct minutes of all meetings of this Association and of the executive committee and to render annually to the Association a full report of all the transactions of his office, and to the executive committee when requested to do so by the president; receive all moneys of the Association, paying the same to the treasurer, and taking his receipt therefor, and perform such other duties as may be required of him, either by the Association or the executive committee.

The secretary shall give bonds in such sum as the executive committee may require for the faithful performance of his duties, such bond to be approved by the president.

SEC. 3. It shall be the duty of the treasurer to receive all moneys of the Association and deposit said money in a bank designated by the executive committee, and pay the same only upon warrant drawn by the secretary and signed by the president. He shall render an annual report to the Association, and upon request of the president or the executive committee shall at any time furnish to the committee a statement of the condition of the funds of the Association.

The treasurer shall give bonds in such sum as the executive committee may require for the faithful performance of his duties, such bond to be approved by the president.

SEC. 4. All accounts against the Association must be approved by the auditing committee before being paid.

SEC. 5. All warrants of this Association must be drawn by the secretary, and signed by the president and secretary.

#### ARTICLE IV.

SECTION 1. The headquarters of this Association shall be in the City and County of San Francisco.

SEC. 2. The president shall appoint an election committee to consist of five members who shall pass upon the name of any candidate for membership in this Association, and two dissenting votes of said committee shall prevent the election of said candidate. A majority of the members of the committee shall constitute a quorum for the transaction of business.

SEC. 3. All persons, firms or corporations engaged in, directly interested in or friendly to the mining industry are eligible to become members of this Association, provided their election is held in accordance with Section 2 of Article IV.

The annual membership dues of this Association shall be as follows, viz.: Individual membership, \$5.00 per annum; mining companies, \$25.00 per annum; mercantile or manufacturing firms or corporations in San Francisco and Los Angeles directly interested in the mining industry, \$50.00 per annum; mercantile or manufacturing firms or corporations in San Francisco or Los Angeles friendly to, but not directly interested in the mining industry, \$25.00 per annum; mercantile or manufacturing firms or corporations outside of the cities of San Francisco and Los Angeles directly or indirectly interested in the mining industry, \$25.00 per annum.

SEC. 4. Any County Association of Miners within the State of California shall be entitled to representation at the annual meeting or any special meeting of this Association, in proportion of one representative for each five members that it may have; provided that on or before the first day of October of each year such County Association shall notify the secretary of this Association of its desire for such representation for the ensuing year, and pay into the treasury of this Association five dollars (\$5) for each representative that it may claim; and provided further, that each delegate so appointed shall be an elected member of this Association.

SEC. 5. The Association year shall run from the first day of October in each year, and dues shall be payable in advance, and if not paid within three months shall become delinquent. Any member so delinquent shall be suspended from the Association and his name dropped from the list thereof. Any member so dropped may be reinstated by the election committee upon the payment of his back dues previous to the time of his suspension.

SEC. 6. Every member of this Association in good standing shall be entitled to vote at all meetings of the Association.

All mercantile or manufacturing firms or corporations, members of this Association in good standing, shall be entitled to a representative with power to vote at all meetings of this Association, provided, however, that said representatives must be furnished with duly accredited credentials from the mercantile or manufacturing firm or corporation that he represents.

No member or delegate shall be allowed to vote by proxy.

SEC. 7. This constitution may be amended at any general meeting of the Association upon a vote of the majority of those present.

#### BY-LAWS.

SECTION 1. The executive committee shall authorize the appointment by the president of an auditing committee to consist of three members of the executive committee; a finance committee to consist of three members, who need not be members of the executive committee.

SEC. 2. The executive committee shall fill all vacancies of the officers of the Association. They shall have power to remove an officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified

of the intended action of the committee and afforded an opportunity to be heard.

SEC. 3. All parliamentary questions shall be determined in accordance with Reed's Rules, unless otherwise ordered by the Association.

SEC. 4. Meetings of the executive committee may be called by the president whenever deemed advisable, and upon written request of any three members of the executive committee the president shall call a meeting thereof.

SEC. 5. At all meetings of the executive committee four members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of each intended meeting at least three days before said meeting.

SEC. 6. The secretary shall receive such compensation for his services and office expenses as the executive committee may from time to time determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of a majority of those present.

On Wednesday afternoon the delegates visited the large reduction plant of the Selby Smelting & Lead Co. at Vallejo Junction, Contra Costa county, escorted by Messrs. Ralston and Underhill, and were shown through the large establishment by Superintendent A. Von Der Ropp. This trip proved to be highly interesting and instructive.

On Thursday the convention reconvened and the report of the Committee on Resolutions was received and read by J. B. Balcomb. Following are the resolutions in full:

#### REPORT OF COMMITTEE ON RESOLUTIONS.

We, your Committee on Resolutions, submit the following report:

WHEREAS, The present and constantly increasing magnitude of the various mineral products of the United States entitles these industries to specific recognition by the National Government, and

Whereas, In our opinion the establishment of a Department of Mineral Industries, with its secretary a member of the Cabinet, will best subserve this end; therefore, be it

Resolved, That Congress establish such a Department, to be known as "The Department of Mineral Industries."

Resolved, That the president and secretary of this Association be authorized and instructed to transmit copies of these resolutions to the members of the California delegation in Congress, and respectfully urge their co-operation and request that a suitable bill be introduced to carry out such object.

Resolved, That the president and secretary of this Association be authorized and instructed to transmit a copy of these resolutions to every member of Congress, to officials of other States, kindred associations and interested individuals, and request their co-operation.

Resolved, That we urge that Section 1183 of the Code of Civil Procedure be so amended that, taken in connection with the other sections of the statute concerning miners' and material men's liens, the owner of a mine may bond it, or enter into agreements or working agreements with reference to the same, and still be able to protect himself and his property against liens for labor and materials for the contracting of which he is not personally responsible.

WHEREAS, The lapse of time frequently renders it difficult and sometimes impossible to prove with certainty the date of a mining location upon which a mineral land patent has been based, thus giving rise at times to expensive and vexatious litigation; therefore, be it

Resolved, That Section 2325 of the Revised Statutes of the United States should be amended by adding thereto the following words: "All patents for mineral lands hereafter granted or issued under or by authority of the United States shall contain a statement of the date of the location of the claim or claims upon which the granting or issuance of such patent is based, and such statement shall be prima facie evidence of the date of such location," and we therefore heartily endorse House Bill No. 8892, now pending in the Congress of the United States, and urge the California delegation to accelerate as speedily as possible the adoption of the bill. We also recommend that the said Legislature adopt:

"An Act Providing for the Admission in Evidence of Certain Statements of Facts Contained in Patents for Mineral Lands Issued or Granted by the United States of America.

"The people of the State of California, represented in the Senate and Assembly, do enact as follows:

"Section 1. Wherever any patent for mineral lands within the State of California, issued or granted by the United States of America, shall contain a statement of the date of the location of a claim or claims upon which the granting or issuance of such patent is based, such statement shall be prima facie evidence of the date of such location."

WHEREAS, There is an absolute, urgent and immediate necessity for the segregation of the mineral lands within the railroad land grants of the State of California in order that such mineral lands may be restored to the public domain, and thus be made available to the mining prospector, and

Whereas, These mineral lands were especially excepted from the railroad land grants and have never been granted by the United States Government to any railroad company, and were intended to be specifically preserved as a part of the public domain, open to exploration and purchase under the Federal mining laws, and to that end a bill was introduced in the last session of the Congress of the United States and is now pending in said body; now, therefore, be it

Resolved, That we heartily endorse House Bill No. 8893, commonly known as the Mineral Lands Bill, and earnestly request that the Senators and Representatives

from this State use all honorable endeavor to secure immediate passage of the bill.

Resolved, That, in addition to procuring a segregation of the mineral lands within the railroad land grants, the California Delegation in Congress be requested to propose and use all honorable means to obtain the necessary legislation to have a new segregation of the mineral lands of the public domain in this State, such segregation to be made under the direction of the Director of the United States Geological Survey, and that such classification shall be accepted as prima facie evidence of the mineral character of such lands in all cases appearing before the Land Department and Courts of the United States.

Resolved, That the California Delegation in Congress be requested to propose and use all honorable endeavors to secure the passage of a law providing that:

A true copy of the notice of a mining claim, which notice shall have been first posted upon the lands, as now provided by law, may be filed in the office of the Register of the United States Land District in which Land District the lands claimed are located, such filing to specify or be accompanied by a specific description of the lands claimed in such form that the same may be platted upon the Land Office records; and, that upon such filing being accepted, notation shall be made upon the records and maps of the said Land Office.

WHEREAS, The mining industry has, in common with other industries, suffered much and been greatly hampered by unjust exactions and discriminations in transportation charges; and

Whereas, The present laws do not give the Interstate Commerce Commission sufficient power to properly regulate such transportation charges; and

Whereas, It would be of manifest benefit to the mining industry to have an effective means for adjusting disputes and correcting abuses in transportation; and

Whereas, Congress is, at its present session, to take up the matter of enlarging the powers of the Interstate Commerce Commission; therefore, be it

Resolved, That we urge upon Congress the passage of a law as will provide that hereafter, when the Interstate Commerce Commission shall, in any case pending before it, under the Act to Regulate Commerce, approved Feb. 4, 1887, as amended or supplemented by other Acts of Congress, decide that a rate for the transportation of freight or passengers is unreasonable or unjust, it shall be the duty of the Commission to fix a rate in lieu of the rate it has found unreasonable and unjust.

WHEREAS, The Mining Bureau is the only duly accredited organization in this State for the accumulation of all data, records, maps and geological specimens for the general welfare of the mineral industries; therefore, be it

Resolved, By this Association, that we again earnestly urge the Legislature to make a sufficient appropriation to extend its scope and usefulness.

Resolved, That we are heartily in favor of any movement looking to the improvement of the navigable waters of California and the reclamation of waste lands, that may be accomplished without injury to the mining interests of the State.

WHEREAS, It is the sense of the California Miners' Association that the construction of a geological map of the State and the investigation of the various problems in economic geology, which the making of such a map involves, would greatly contribute to the development of the natural resources of the State; and

Whereas, The work of the United States Geological Survey, being spread over the entire territory of the United States, proceeds slowly in any one State; and

Whereas, Most of the State of the Union favored with geological formations of economic value have established State Geological Surveys without in any way duplicating the work of the National Survey, but rather in a spirit of co-operation with the National Survey; and

Whereas, Several of the more successful of these State surveys have been conducted through the Universities of such States; therefore, be it

Resolved, That this Association heartily indorses the making of such a geological map of the State, and respectfully suggests that the detail work be done by the State University through its geological department, in co-operation with the United States Geological Survey, and respectfully draws the attention of the Governor and Legislature to the desirability and propriety of making the necessary appropriation to carry out this important work.

Resolved, That we approve of all organizations to improve the forestry conditions and the conservation of the water supply throughout the State.

Resolved, That we approve of the efforts of the recent Good Roads Convention held at Glen Ellen, and the efforts of all similar organizations, to obtain proper legislation to the end that our present road system may be improved.

WHEREAS, The petroleum interests of California have become one of our great mineral industries with vast possibilities for the future; and

Whereas, The present National laws for the selection and location of mineral lands are insufficient for the protection of the petroleum miner; and

Whereas, Much of the oil territory of California is still Government land; therefore, be it

Resolved, By the California Miners' Association, in Convention Assembled, that they will co-operate with the Petroleum Miners' Association of California in urging Congress to act expeditiously in passing such laws as will remedy the present evils, and afford the citizen locating oil lands the same security and protection as is now enjoyed by the locator of lode and placer mining claims, and giving a reasonable length of time in which to make a discovery of oil.

Resolved, That we urgently request our representatives in Congress and in the State Legislature to secure appropriations for the purpose of building restraining dams and barriers for mining debris upon the tributa-

ries of the Sacramento and the San Joaquin rivers, viz.: upon the Bear, American, Cosumnes, Mokelumne and Calaveras rivers and their respective branches.

Resolved, That our thanks are hereby extended to the San Francisco Hotel Company for its many courtesies and kindness in gratuitously providing us with convention and committee rooms in the St. Francis Hotel during the session of this, the thirteenth annual convention.

Resolved, That this Association holds itself greatly indebted to the public press of San Francisco and the mining counties for the assistance it has given, not only to the Association, but to the mineral industries of California, during the past year.

Resolved, That a vote of thanks be extended to the Union Iron Works, United States Navy officials and the Selby Smelting & Lead Company for their many kindnesses shown the delegates on their various excursions.

Respectfully submitted,

CHAS. G. YALE, Chairman.

In accordance with the suggestion of Prof. Christy, the committee on resolutions prepared the following memorial, to be forwarded to President Roosevelt:

SAN FRANCISCO, CAL., December 8, 1904.

To the President of the United States, Washington, D. C.:

WHEREAS, The placer and hydraulic miner who originally developed the resources of California and opened them to the world obtained title from the Government of the United States to his placer lands, with the common understanding that they were to be worked and their gold content recovered in accordance with methods of sluicing and hydraulic mining publicly known to have been devised and used for the purpose from the earliest stages of placer mining;

Whereas, Many deposits of gold to the value of millions of dollars are now idly buried in the ancient river channels of California, under such conditions that they can be profitably worked neither by dredging nor by drifting, nor by any other process than that of hydraulic mining;

Whereas, The gold extracted by the hydraulic miner was generously poured into the treasury of the United States Government in the dark days of the Civil War, when the national currency was worth only fifty cents on the dollar, thus materially assisting in maintaining the credit of the Government and in saving the Union;

Whereas, The hydraulic miner has been restrained by the United States Courts from discharging boulders, gravel, sand, clay and other matter in suspension into the navigable waters of the State, whereby the industry of hydraulic mining has been destroyed and property to the value of over \$100,000,000 has been rendered idle and unproductive since 1884, the natural wealth of the State rendered unavailable, and a deadlock has resulted between the fundamental industries of agriculture and mining;

Whereas, While admitting the injurious effect of mining debris where not effectually restrained, the unavoidable effect of natural erosion and sedimentation has been ignored in the minds of the courts as well as of the farmers, and all the injury due to natural causes has been charged to hydraulic mining;

Whereas, Should hydraulic mining forever cease, to the injury of the miner, the natural process of erosion and sedimentation would still continue to the injury of the farmer and the navigable waters of the State;

Whereas, We are firmly convinced that by a rational application of the laws governing the deposition of sediment from torrential streams, the industries of hydraulic mining and agriculture can both be carried on in this region, not only without prejudice to each other, but to their mutual advantage; and

Whereas, This question is primarily a geological one and can be solved only by geologists who have devoted their lives to the study of erosion and sedimentation, in mountain as well as in valley regions; therefore, be it

Resolved, By the California Miners' Association, that we beg you, as President of the United States, to assist in the solution of this problem affecting all the interests of a great commonwealth, by instructing the Director of the United States Geological Survey, through the Secretary of the Interior, as part of his study of the storage of flood waters and the reclamation of waste lands, to undertake a particular study of those portions of the Sacramento and San Joaquin valleys affected by the detritus from torrential streams.

The points we wish particularly considered are:

First—The most favorable sites for reservoirs for water, whereby destructive floods may be averted and the waters stored and utilized for the benefit of agriculture, mining and other industries.

Second—The selection of suitable tracts of waste lands and of the most suitable means whereby the detritus from torrential streams may be deposited on such waste lands, so as to reclaim them and convert them gradually into lands suitable for forestry and other agricultural purposes, and at the same time to remove from such streams their burden of detritus so that they may cease to be a menace to the navigable waters of the State.

In view of the importance of this inquiry to the three great fundamental industries of agriculture, mining and commerce, we beg that this inquiry be undertaken at the earliest opportunity and pushed to completion as rapidly as consistent with thoroughness.

Chairman A. Caminetti of the committee on impounding dams read his report.

J. F. Davis, chairman of the Committee on Legislation, rendered his report, and the nomination of officers then being in order, Niles Searles placed the name of E. H. Benjamin in nomination as president of the Association for the ensuing year. The nomination was seconded by C. H. Dunton of El Dorado county and Mr. Benjamin was unanimously elected to the presidency.

C. H. Dunton was also elected vice-president by acclamation and S. J. Hendy similarly re-elected treasurer.

The convention then adjourned sine die.

## The Great Eastern Quicksilver Mine.

Written for the MINING AND SCIENTIFIC PRESS.

Mining for quicksilver continues to be one of the leading branches of the mining industry in California, and while the output of the metal is not so great as at one time the demand for it is not so great. Large amounts of mercury are employed in metallurgy, and in the arts, but the adoption of other processes than free amalgamation of ores has resulted in diminishing the requirements for quicksilver. At least, the demand is not in proportion to the growth of the mining industry, as in many districts amalgamation

southward. The sandstone is heavily charged with pyrite, and in some places fire damp is abundant in the mine and the danger of explosions is always imminent. The wall rocks are unusually hard and the stopes stand well without timbers. This is only possible owing to the fact that generally between the ore bodies and the serpentine is found a hard gray rock—silicified sandstone. Serpentine does not stand well, as a rule, and the conditions at the Great Eastern are considered a great advantage in the economy of mining there. The metallurgical equipment consists of a 12-ton coarse-ore furnace and a 16-ton fine-ore furnace. In October this mine produced 190 flasks of quicksilver. The accompanying engravings

Hoist Great Eastern Quicksilver Mine, Near Guerneville, Sonoma County, Cal.

has become of less importance than formerly, or is not practiced at all. While the demand for quicksilver is, therefore, out of proportion to the increasing magnitude of mining for gold and silver, still the amount used is large.

The principal producing quicksilver mines of the United States are confined to the Coast Range of California and to the mines of Terlingua, Brewster county, Texas. The most common occurrence of quicksilver in California is in the form of cinnabar and as native metal in sandstones at and near con-

illustrate the mine and furnace buildings at the Great Eastern.

A GREAT DEAL of the sulphur of commerce is obtained from mines in Sicily, of which there are nearly 300 in operation. The sulphur, as mined, contains a great amount of earthy impurities. The crude material is piled up in heaps, passages for air being provided. The heap is then covered with earth in the same manner as wood piled for making charcoal is covered, and the sulphur

Ore Furnaces of Great Eastern Quicksilver Mine, Near Guerneville, Sonoma County, Cal.

tact with serpentine. The Texas mines occur chiefly in limestone, accompanied by intrusive dikes, said to be phonolite. These Texas mines form a striking exception to occurrences of cinnabar elsewhere.

The Great Eastern mine is near Guerneville, Sonoma county, California, A. Abbey superintendent. The mines of this group are many miles from other known cinnabar deposits, and occur, as is usual with California quicksilver mines, at contact of sandstone and intrusive serpentine. The strike of the vein is easterly and westerly, dipping northerly in depth, but almost vertical at the surface, where is a bold outcrop, the foot wall sandstone having been eroded. The mine is opened by inclined shaft sunk in the foot wall sandstone, the vein being reached by crosscuts on each level. No serpentine has thus far been cut in the foot wall. One of the peculiar features of this mine is that of an isolated ore body in the foot wall sandstone, which has a pitch to the

fired. A portion of the sulphur burns, creating sufficient heat to cause the balance of the sulphur to melt and collect at the base of the heap, where arrangements have been provided to tap it and draw off the brimstone into moulds. If the pile of crude material were burned without the cover of earth, all the sulphur present would burn, passing off into the atmosphere as sulphurous anhydride. The crude brimstone obtained in the manner described is distilled and the refined product sold as roll brimstone and flower of sulphur. There are numerous sulphur deposits in the Western United States, but the most of them are situated at points too distant from the railroad to make them commercially valuable. These sulphur deposits are found about fumaroles and volcanic vents. Sulphur is sometimes found in mines as the result of the oxidation of pyrite, but it is rarely found in large amount under these conditions.

## Mineral Resources of North China.\*

Written by A. J. G. DENNEY, E. M.

Little has been written about the mineral resources of China, and to a large extent the information that has leaked through to the outside world has been through the medium of missionaries, whose source has been the unreliable native reports and their own inexperienced observations. The following pamphlet is not a missionary report, but has for its foundation the results obtained through personal experience, while inspecting mines and reporting on properties for various foreign and Chinese companies.

As the field is so large, I shall confine this article to the province of Chili. Up to the present time there have been no maps or plans published of the country outside the Great Wall. This district, however, bids fair to be the coming mining center of Chili Province, especially for gold. The outlook is not so promising for alluvial workings, but is exceptionally good for deep mining operations, of lode formations and quartz veins, for the development of which a large amount of capital is required.

Few locations are more favorably situated for successful deep mining operations than the mountainous region in the north of Chili. When the Chinese authorities have proper mining laws enforced, and protection guaranteed to foreign capital, this particular field will be the first to claim the investor's attention.

Heretofore the gold mines of this district have been very carelessly worked; so much so that only the most prolific mines could pay for working them in the primitive way of the native. In many places the mines have been worked to water level, which varies from 20 feet to 200 feet in depth, and, not having the necessary machinery to cope with the water, they have been abandoned. The geological structure of the country is similar to parts of Victoria and New South Wales, Australia. There are the usual igneous and metamorphic rocks, in all their varieties. These rocks are traversed by quartz beds and veins, but all of the lodes and quartz veins are not auriferous, for there are long stretches of barren reefs, besides those that are productive.

In many quartz reefs and lodes the gold is usually associated with iron gossan or pyrites, and passing through hornblende and porphyritic rocks, also schists and diorites. Some of these reefs and lodes have been productive to a depth of 300 feet or more, and are now abandoned owing to the want of capital and machinery.

**GOLD OUTPUT.**—In the absence of any authoritative statistics, it is impossible to state definitely the amount produced from each mine.

The following is the annual export of gold from the port of Teintsin, Chili Province, China:

1901—Gold bar—Hai-Kwan taels .....	†2,849,139
1902—Gold bar—Hai-Kwan taels .....	4,645,430
1903—Gold bar—Hai-Kwan taels .....	

†The Chinese tael is 13.30 oz.

The above table shows an increase of nearly double the amount from 1901 to 1902, but whether this is mostly in bars, leaf or coins, or whether they come from the Chili gold fields or from other provinces, it is impossible to ascertain, as no statistics are kept by customs or local authorities.

The table represents only what passes through the customs officials' hands, which can be safely estimated as only a small portion of the actual amount of gold produced. These bars as a rule weigh ten Chinese ounces.

**YIELD.**—From various mines at work in North Chili, the average yield, employing native methods, is about 7 dwts. (30 shillings) per ton, to make a profit; but, with up-to-date crushing machinery, the cost should not exceed 5 dwts. per ton on free mill-ing ores.

The Chili gold fields have lodes and reefs from 6 inches to 15 feet in width, varying in character and still more in richness, and a great majority will yield payable gold.

These quartz reefs or lodes cannot be classed amongst the largest in the world, nor can a rough estimate of ores in sight be given. In one district alone the auriferous belt extends a distance of over 20 miles, and numerous quartz veins carrying gold have been opened by small native shafts and open-cut workings. This is only a very small section of North Chili, which is hundreds of square miles in area, and it can be readily understood that until proper plans and surveys and practical development have been carried out to a sufficient depth, no proper estimates can be given of the value of the field.

Although several outcropping quartz reefs containing gold have long been known to exist, the natives are prohibited from working them by the local authorities. The high officials demand and export so much money from Chinese holders of mining rights, or small syndicates holding permits from the Imperial Government to work these mines, that Chinese speculators will not invest any money in machinery or to carry on development work.

In Chili there is a field awaiting exploitation which

may be expected to yield exceptionally profitable results.

Many a reader may enquire, "Why should this rich mineral country in Asia also be so poor? Why, in other words, has China benefited so little from her vast mineral possessions?" The question is pertinent, but it is not the "poser" that it may appear at first sight. As a matter of fact, China has never mined to her own benefit. From the earliest discoveries, the natives have only scraped on the surface for the much-coveted metal. At the same time they have been afraid to let the foreigner in with his capital and experience, unless they could gain something themselves. Chili is open to foreigners for mining purposes on the condition that the concession be half foreign and half Chinese. The principal terms on which concessions are granted stipulate that the application must first be placed before the Governor-General at Jehol, according to the Jehol mining rules and regulations, which are attached hereto, and the Chinese Government shall receive 6% of the amount of gold yielded. A local mining board has been established at Jehol, where all the mining business of that district is transacted.

Two concessions have been granted on the above basis. An American made an application conjointly with a Chinese subject for a concession named the Chang-tze-kou, in the Lan-ping-hsien district, North Chili. This was granted by the Way-wu-pu in July, 1903, and the proclamation was issued to the people by the Governor General in August, 1903. About the same time another concession, also in the Lan-ping-hsien district, was granted to a German and Chinese subject conjointly. Both concessions are governed according to the Jehol mining rules and regulations.

It is evident to those in this country that the long delayed interest in its mineral resources has set in, and it is with considerable confidence that one predicts an enormous boom in the industry, as soon as some of the gold-bearing districts are systematically exploited and regular returns forthcoming.

The native methods of working the reefs and lodes are primitive. Small shafts are sunk to a depth of 20 to 50 feet and overhand and underhand stopings are then commenced. The ore is carried to the surface by baskets on the backs of coolies. These shafts are nearly always sunk within 20 feet of each other, and little or no timber is used. Sometimes a 3-inch diameter prop will be found here and there in the workings, where it is utterly impossible to get up or down the stopes without some support; or a small pillar is left to support the ground. Most of the old workings, however, have caved in. This does not refer to mines that are under foreign management.

The ore, after it is carried to the surface, is picked and carried to a stone mill, or arrastra, for pulverization. The mill consists of a circular granite slab, 10 feet in circumference and 15 inches thick. In the center is an upright pole, to which is attached a roller of granite in such a manner that it revolves on the granite slab, and trams are attached to the roller in such a way that a mule can be harnessed to it for giving the driving power. The crushing is similar to grinding corn. After crushing to a certain fineness—no screens being used—the natives then wash the crushed ore on a small wooden apron or table, usually 5 feet long by 2 feet wide. About one hundred-weight of ore is washed daily when in full working order. No quicksilver or other chemicals are used to get a closer extraction—in fact, the use or knowledge of the latter is unknown here.

Prospecting will be comparatively easy in this gold field, as the outcrops in most cases can be traced to a considerable distance. So much indiscriminate digging has been done that in many places deep sinking will have to be resorted to.

The present condition of the mining industry outside the Great Wall offers unusual facilities for exploration and reduction. Progress in the past has been slow, with the result that the gold fields have achieved no prominence.

The earliest discoveries of alluvial were made in the drifts that fill up the valleys and cover the plains at the foot of the mountains, and a large proportion of gold is still derived from this source. In places the wash or gravel varies from 2 to 4 feet in thickness, the average contents yielding from 20 to 30 cents per cubic yard. Most of this alluvial has been worked for centuries, and it would not be profitable to work any old deposits, that have been already exploited by the natives, with foreign methods.

Considering the condition of the roads and rivers, transport in North Chili is exceedingly cheap. Native carts, capable of carrying over one ton, can be used at the rate of \$4 per diem. They travel on an average of 25 miles per day, and it is only in the rainy season that any delays occur. For river navigation flat-bottomed boats are readily secured, which carry over two tons and up to five tons, when the rivers are in flood. The cost per boat capable of carrying two tons is \$4 per diem. All machinery would have to be packed and boilers, etc., sent in parts. Boats going up stream make about 12 miles per day.

Chinese merchants who have obtained permits to open mines in North Chili, through the Governor General at Jehol, and who lack the necessary capital to develop same, usually let the mine or a part thereof out on tribute. The tributers have to pay all working expenses, and the gold yielded must be sold

at a fixed price to the concessionaires. The latter pay such a small price for the gold at Jehol and other places that the tributers sell only a small part of the yield to the owners and take the remainder to a market where they can obtain a higher price.

At Tientsin-Fu the Viceroy of Chili has his headquarters and governs the southern portion of Chili. Cheng-te-fu (Jehol) is the official residence of the Governor General, who governs the northern and eastern parts of Chili.

Coolie labor in North Chili is plentiful. The pay of an ordinary Chinese coolie varies from 20 to 30 cents a day and a miner or carpenter from 30 to 40 cents. No food or lodging is provided for any of the Oriental workmen. Under the supervision of foreign mechanical engineers, Chinese operate most of the hoisting and pumping engines in Chili, and no serious accidents have yet occurred. After overcoming the difficulties usually placed in the way of a foreigner introducing something new, the Chinese are as capable of receiving instruction as the European would be who had been brought up without any knowledge of our methods. A northern Chinaman is very conservative.

Coal is abundant in North Chili, but at present there are no markets excepting the towns and villages. Equipment and transport will exceed in cost the best coal to be obtained at the nearest port. However, this native coal will be very useful for the operation of gold mines. A small coal mine, sufficient for all purposes, can be opened and worked cheaply by native methods, and the cost landed at the mine over the most difficult routes should not be more than \$12 per ton.

The country outside the Great Wall is mountainous and barren, excepting the growth of a small scrub. It is, therefore, an easy matter for the prospector to locate the outcropping lodes and veins. When a concession is granted, and the company intend sinking shafts or building houses, etc., the land in question must first be bought, and, to save disputes, a price is fixed by the local authorities.

Water is abundant, and even in the depth of winter a supply can be had sufficient for all purposes.

Timber is scarce. The Wei-chang has a small belt, but in a few years this will be finished.

Mining costs in Chili may be roughly estimated thus: With a stoping width not less than 3 feet, and where there is not an excessive amount of dead work, the total cost of mining will be from \$3 to \$4 per ton. This will cover all ordinary costs, but will be exclusive of new crushing machinery, boilers, winding engines, etc.

## THE PROSPECTOR.

The rock specimens from Sanger, Cal., are: No. 1, a typical aplite (fine-grained micaless granite). It is an intrusive dike rock, sometimes is gold-bearing and often accompanies gold-bearing veins. No. 2 is apparently a true granite, that is, quartz, feldspar, orthoclase and biotite (black mica). No hornblende observed. If any ever existed in it, it has been removed by decomposition. No. 3 is a much-altered dike rock, probably syenite—too much decayed to make identification positive. It is not naturally a vein rock, but may accompany veins. No. 4 is a coarse quartz diorite in which are visible quartz, plagioclase (showing striation) and hornblende, the latter somewhat altered. No. 5 is a fine-grained greenstone, probably diorite.

The mineral specimens from Graniteville, Cal., are: No. 1, ankerite—an iron-bearing dolomite. It is decomposed, the iron carbonate having largely been altered to iron oxide. No. 2 is the same rock in fresher condition. It contains scales of green malachite—a chromium mica. There are a few grains of quartz present in both No. 1 and No. 2.

## Correction.

In the article entitled "Volumetric Standards for Technical Work," by W. J. Sharwood, which appeared in the issue of December 3d, in the tabulated scheme at the close of the article near the bottom of the table, "standard thiosulphate," etc., and "standard cyanide," etc., should have been grouped under "copper," while "standard ferrocyanide," etc., and "standard zinc sulphate" should have been grouped under "zinc," "standard ferrocyanide," etc., and "standard molybdate," etc., remain under the head of "lead," as they appear in the table.

A Boston dispatch says that two fifteen-year-old boys of that city have established a wireless telegraphic connection between their homes, half a mile apart. This recalls the fact that thirty days after the appearance of the first published accounts of Bell's invention of the telephone, two New York boys had built and were successfully operating an experimental telephone system of their own. These two boys have since achieved distinction in the electrical field, and have for many years been allied in business. They are Prof. Frank B. Crocker of Columbia University and Doctor Schuyler Skaats Wheeler.

\*Abstract Far Eastern Review. Manila, P. I.

### Private Rights in Forest Reserves.

The National Mining Congress at its session held at Portland, Or., August 22-25, adopted resolutions favoring "the conservative use of forest resources, and in particular the creation and management of forest reserves under practical, business-like rules and regulations." Early in August the National Live Stock Association, at its Denver meeting, was equally earnest for practical control and improvement of forest areas.

The permanent prosperity of nearly all the far Western States is threatened by the destruction of the forests on the watersheds of irrigation streams. Wasteful lumbering, excessive grazing and fires are unceasingly cutting down the efficiency of the forests as sources of water supply. Conditions are rapidly growing worse, and this is evidenced by the constant demands of citizens for the creation of new forest reserves. The great difficulty is to determine boundaries which will include only lands suitable for the purpose, and will avoid injury to local enter-

duct their several industries that the value of the forest in regulating stream flow will not be diminished. Indeed, under proper management it will actually be increased.

No authority exists for selling the timber standing on unreserved public lands. Its free use is being greatly abused, leads to numerous frauds, and has become an additional reason for reserve establishment for forest protection, as well as for the passage of a law permitting the sale of such timber. Lumbermen can buy this timber only by buying the land outright, and the law limits to 160 acres the size of the tract any one purchaser may secure. After the establishment of a reserve, however, the timber can be bought in large or small quantities. The cutting, removing and clearing must be done under contract with the Government, according to a definite plan, and with strict regard for the best welfare of the forest. Moreover the land, which remains in the Government's hands, is kept productive instead of going to waste after lumbering, as is too often the case when it falls to private ownership.

The vast public domain of the West has been given up to the stock business for pasturage in common.

Government to afford. Irrigation for the arid West cannot be successful unless the headwaters of all streams are kept under ample forest cover.

Reserves are for use, not for ornament. They are not private forest parks, but are open to all persons without distinction. Free transit across them is always allowed. Pleasure or health seekers and hunting parties are privileged to enter them at all times and enjoy their resources to the fullest legal extent. The most important injunction laid on them is that the greatest care must be taken to extinguish all camp fires, since fire is the worst scourge of the forest, and of all its enemies the most dreaded.

The temporary withdrawal of lands pending a careful inspection to determine their suitability for permanent reserves affects seriously no private right other than that of entry as a settler upon some claim. No entry can be made after such temporary withdrawal. If lands settled upon are finally included in the permanent boundaries, the rights of the owners are as has been set forth. If such lands are excluded from the boundaries, their status has not been affected, except as it is improved by being so near a forest that will now be protected and managed for

In the Redwood Forests of Humboldt County, Cal.—A Monster Tree.

prises. The interests of the settler, the cattle or sheep man, the miner, the lumberman, and the irrigator, often all dependent upon the same region, are always more or less conflicting. Seldom is a reserve created without opposition from one or more of these interests. Commonly the practice of the Government is to withdraw from settlement all the land involved until it can be carefully examined, after which the suitable portion is included in a permanent reserve, and that which proves to be open, agricultural, or largely under private ownership, is released.

A settler who has entered upon a claim which is later included in a forest reserve does not thereby lose it. He may return it to the Government and in lieu thereof select another equal portion of the public domain. Or, if he elects to remain on the claim, he is protected in all his rights of ownership, is allowed free ingress and egress over reserve lands, and is also permitted, without cost, to cut reserve wood for domestic and farm repair purposes. Residents in the neighborhood of reserves are granted a similar free use of wood.

Omitting actual settlers, four classes of citizens are directly and specially interested in reserves. Lumbermen, stock grazers and miners are concerned with the forest as a producer of timber and grass. Farmers have their direct interest in the highest water conserving power of the forests. It is not possible so to adjust the claims of these four classes as to provide for them all. Each of the first three can so use the forests as not to injure the rights of the others, and can at the same time so con-

The forests, forming a part of this domain, have been subject to this unrestricted pasturage. The result has been disastrous to the domain both open and forested, but the forests have suffered the most injury. Restricting forest grazing by means of reserve regulations and inspection will eliminate the danger from overgrazing, will ultimately greatly benefit the business, and will, most important of all, enable the forests to perform their highest function for all the people. A few grazers may have their rights slightly abridged or more closely regulated, but the business as a whole is conducted in a more orderly way.

Prospecting and mine development are not at all restricted by reserve establishment. Miners require in their work both timber and water. Their demand for timber is comparatively not great, and they cut it somewhat more carefully than lumbermen have done. Their interests do not suffer in the least by forest reserve establishment. On the contrary, in the long run they will be greatly benefited by the protection which assures their future timber supply.

The greatest industry affected by forest reserves is farming. In many parts of the West it depends absolutely on the water flow from the forest. If ill usage impairs its storage capacity, and the stream flow, in consequence, alternates between flood and drought, or is permanently lessened, all the dependent farm land suffers severely. Every farmer has the right to insist that his water supply be not decreased, and the industry as a whole, the foundation stone of our national prosperity, commands and will receive the highest protection it is possible for the

general welfare. The whole theory of reserve practice is, special injury or advantage to none, but the greatest good to the greatest number.

In this connection, the redwood forest in California is intensely interesting from several points of view: First, it is so intrinsically valuable as a source of lumber of unique quality and beauty; second, California has all there is of it in the world; third, the redwoods of the coast are a complementary species to that of the Sierra Nevada, famed as the "big trees"—and California has all there are of that species also. The accompanying engraving, kindly furnished by courtesy of the Times of Eureka, Humboldt county, shows that even if the big trees of the Sierra should sink their several thousand years of growth into the bowels of the mountains, California would still be well fixed for large trees in the coast regions. Redwood trees are found all along the coast from Humboldt to Santa Cruz county. Of this remarkable timber Humboldt originally had about 510,000 acres, or in round figures, 500,000 acres. From the date of settlement to the present time it is estimated that about 90,000 acres of redwood have been timbered off, leaving as a present holding 410,000 acres. This area would be somewhat reduced upon close estimation, as it embraces considerable quantities of spruce, fir, pine, hemlock and white cedar. The forest extends in an irregular belt 108 miles through the county from its southern to its northern limits, varying in width from 2 or 3 miles to 15 or 20 miles. The territory covered embraces level river bottoms, high table and rolling land, and steep

hills, generally covered with a dense tangle of undergrowth. The most competent timber experts reckon upon an average of 50,000 feet of merchantable lumber to the acre, besides which there must be taken into consideration the refuse—shingle bolts, railroad ties, fence posts, etc.—which yield nearly an equal value.

The bulk of sales of redwood lands two or three years ago was on a basis of from 30 to 50 cents a thousand for estimated standing timber. These figures have gradually been hardening, until at the present time no desirable holding of available timber can be had for less than 50 cents to \$1 a thousand for estimated standing timber. The choice holdings will command from \$1.50 to \$5 per thousand, and the upward tendency is very pronounced, with every indication of steady appreciation for several years, being stimulated by railroad projecting; that is to say, that hereafter deals will be made more closely, based on actual operating values. Where redwood stumpage is bought for operating purposes, it commands from \$1.50 to \$5 a thousand.

One remarkable feature of the redwood forests is its positive assurance and absolute immunity from destruction by fire. This immunity arises from two causes: The redwood is non-resinous, the trunks are covered with a soft, fibrous bark from 4 to 16 inches thick, according to age, and no forest fire seems able to affect a tree after it has attained 6 to 8 inches in diameter. And second, in the dense, tall, old redwoods the rays of the sun are so effectually excluded, so much moisture is retained in the soil and tangled undergrowth, and the trees gather so much moisture from the ocean fogs, which in turn they discharge in drippings to the ground beneath, that fires do not make much headway or produce much heat, as is the case in pine forests.

Nature has thus provided a positive assurance against loss by fire in such an investment. The writer of this once measured a fallen tree 14 feet in diameter. Over 100 feet from where its roots had been upturned was a redwood fully 10 feet in diameter, which had grown against the fallen log in such manner that it had partly grown over it. The standing tree could not have been less than 500 years old, and yet the fallen log had not been greatly injured by fire—it had many thousand feet of timber in it.

Such a thing as a destructive forest fire is unknown in redwood timber. In fact, it is impossible to burn a redwood forest. This is shown by the method of logging there, which arouses the greatest surprise among those accustomed to working in pine.

## The "White Precipitate" of the Precipitating Boxes.\*

Written by A. PRISTER.

A long series of analyses of this precipitate from the boxes of different mines will only settle definitely this most important question. The analyses brought forward by Whitby and G. W. Williams in support of their theory that the ferrocyanide and cyanide do not play the important part in the composition of "this white precipitate," as I suggested, are very interesting, but certainly cannot settle this question.

I will call the attention of the cyanider to this analysis of "a medium solution." The samples were taken at the "head" of the box (before the solution came in contact with the zinc) and at the "tail" of the box:

	Head.	Tail.
Oxygen.....	61	49 vol. %
Nitrogen.....	1.84	1.56 vol. %
Ferrocyanide of potassium.....	.147	.076 %
Sulphocyanide.....	.0232	.0247 %
Alkalinity.....	.3	.254 %
KCy.....	.110	.045 %

From these analyses it is evident that over 81% of the ferrocyanide present in the entering solution remained in the box. We know that the reducing process going on in the box is not destroying this ferrocyanide, but simply fixing it as "white precipitate" on the surface of the zinc shavings. This box was precipitating badly and, as was to be expected, the zinc was covered with white precipitate in the first compartments. From the analyses you will see also that the sulphocyanide passed through the boxes unaltered, a fact that can be easily explained if we remember the sulphocyanide of zinc is very soluble in weak cyanide solution.

You will note also the difference in per cent of KCy at the head and tail of the box. This fall of about 50% in free KCy from the head to the tail explains very well the precipitation of the ferrocyanide, as ferrocyanide of zinc in the box. Ferrocyanide of zinc requires a certain strength of free KCy to remain dissolved in the solution, and by lowering this percentage it must come down.

The fall in percentage in oxygen is explained by the joint action of the alkali and oxygen upon the zinc shavings and consequent formation of peroxide of hydrogen—in this case combined—with a subsequent re-solution of the gold precipitated on the shavings, and giving as a definite result bad precipitation.

The analyses indicate an increased alkalinity of 10% from head to tail, a fact contrary to the conditions required for an increased precipitation of zinc oxide, as the alkali is a solvent for it.

## A Modern Manufacturing Plant.

The recently completed plant of the Jeaneville Iron Works Co. at Hazleton, Pa., affords good example of a modern manufacturing plant, carefully engineered and arranged to obtain low shop cost and perfection in the product.

In 1852, James C. Haydon began the manufacture of mine pumps at Jeaneville, Pa. The business expanded as the merit of the pumps became known, and the plant was enlarged at intervals to accommodate the growing business. The result was a series of structures with numerous dark nooks and corners, a combination of buildings such as that in which old-established manufacturing establishments are conducted.

The management had long felt the need of new and larger quarters, but being engrossed in developing their pumps and establishing a demand for them, rebuilding was deferred. Two years ago, they finally determined to erect their new plant at Hazleton, Pa., which offered particular advantages for the

and, in the background, a side view of the casting-cleaning department, with the fire walls extending above the roof, forming a tower in which are located the water tanks and the heating apparatus.

The operation of the entire plant is primarily dependent upon the power equipment. The engineers chose as the motive power direct current electricity. With the exception of several pneumatic, ground operated traveling cranes in the casting-cleaning department, all the machinery in the shop is driven electrically.

A 300 H. P. turbine, connected to two 100 K. W. Crocker-Wheeler generators, furnishes power for the entire plant at present. Multiple voltage for securing the desired speed regulation throughout the shops is obtained by the introduction of a type D, Crocker-Wheeler balancer set, consisting of three units—40, 80 and 120 volts—each of these voltages being controlled by three field regulators. The compactness of the outfit and the small space required for the electrical power machinery is apparent from the illustration of the power house, Fig. 3. The adoption of a turbine without a condenser was governed by several important factors, not the least of

Fig. 1.—General View of the Jeaneville Plant.

manufacture of the mine pump to which the company still devotes their exclusive attention. Dodge & Day, the modernizing engineers of Philadelphia, were commissioned to engineer the equipment. Ballinger & Perrot, architects, co-operated in construction of the buildings. Within a year from the signing of contracts the new plant was in full operation.

As might be expected of an up-to-date plant, reinforced concrete was the principal material of construction. The new buildings, Fig. 1, present a pleasing appearance.

The raw material is received on a railroad siding,

which is the low cost of the steam generated, due to the fact that coal in this locality is obtained at about 90 cents per ton.

In the engine room there is also a 12x18x12x12 Ingersoll-Sargeant class H air compressor supplying air to the traveling cranes in the casting-cleaning department, jib cranes in the foundry, and the various pneumatic tools. Between the engine and the boiler rooms are located the artesian well pump, the boiler feed pump, the vacuum pump, the feed water heater and a 1000-gallon underwriter's fire pump, which receives its supply from a 200,000-gallon

Fig. 2.—Cross-Section, Jeaneville Iron Works.

dumped into receiving bins and carried to the foundry over an industrial railway, then raised to the cupola platform by an electric elevator. The sequence of operations from that point to the loading of the finished product on cars which run directly into the machine shop is never interrupted.

The new plant consists of six buildings. The main building comprises the foundry, 107 feet by 192 feet, the casting-cleaning department, 41 feet by 160 feet, and the machine and erecting shop, 304 feet by 107 feet. In the latter are a room for small stores and a blacksmith shop. The other five buildings are the pattern shop, pattern storage house, offices, power house and stable.

Fig. 2 is a cross-section showing the machine shop, engine and boiler house, pattern shop, coal trestle,

reservoir.

The clinkers from the boilers are thrown on a grating over an elevator boot located in the boiler house and are broken to the proper size, dropped through the openings and into buckets of a steel-encased elevator, made by the Link Belt Engineering Co., whence they are carried to a cylindrical receiving bin of five tons capacity. They are dumped into trucks through a gate in the bottom of the bin and carted away.

Fig. 4 shows the interior of the foundry. On the left, immediately in the foreground, is a cylinder pit, 12 feet in diameter and 9 feet deep. The plunger pit, which forms a third of a circle (28 feet outside diameter and 20 feet inside, 4 feet wide and 6 feet deep), adjoins the cylinder pit. The weight pit is 13 feet 4

inches wide and 5 feet deep. These pits are served by individual jig cranes operated pneumatically. In the right hand bay are a cupola, four core ovens, the blower room, moulding department for small castings and sand bins and sifters.

The cupola is of twelve to fourteen tons melting capacity per hour. Another similar unit is now being installed. The charging platform is served by

At the north end of the shop is erecting space where, also, each pump is tested to far above its rated capacity before being shipped from the plant on the railroad cars, which come directly into this part of the shop.

Throughout the plant the same care has been given in the selection and installation of the minor apparatus as in the case of the largest machinery, and the entire plant may well be considered a fine example of what progressive policy, combined with intelligent shop engineering, can produce.

James C. Haydon still remains president of the company, Vernon H. Rood is vice-president and general manager, while R. O. Jones is chief engineer.

### Tin in Alaska.\*

Written for the MINING AND SCIENTIFIC PRESS by  
R. L. BEALS.

In Alaska, at the present time, considerable attention is being paid to the occurrence of tin. There are a large number of reported occurrences, but the majority of these are unauthenticated. In the Seward peninsula there are three known deposits, and enough has been done the past summer to warrant further development. The three occurrences referred to are near the western end of the peninsula, in that part called the York region by the United States Geological Survey, and are Cape Prince of Wales, Buck creek and Lost river.

grade level, they are of comparatively recent date, the valleys being of the characteristic V shape. The hills separating the various streams are oftentimes less than 300 feet high and the valleys are narrow—from 1000 to 3000 feet wide.

The country rock lying between the York mountains and Cape mountain is chiefly a dark slate, usually of fine texture. Jointage and cleavage have been so highly developed that the original bedding cannot be seen. The fragments frequently assume a nearly perfect rhombohedral form and have been called the rhombohedral slates, because of this. These slates are traversed by a number of greenstone and quartz-porphry dikes. The greenstone dikes, in most instances, have been altered to serpentine. The quartz-porphry dikes may be traced along the summit of Potato mountain and have been prospected in a desultory way for tin, but so far nothing satisfactory has been found. Westward of the slates is a limestone area. This limestone is rather impure, containing considerable silica. Intrusive in it is a boss of granite which makes up the promontory of Cape Prince of Wales.

Of the three districts, that of Buck Creek is the only one which has so far produced tin commercially. The creek is about 4 miles long, heading at the base of Potato mountain and flowing into Grouse creek. For the first 3 miles it receives numerous small tributaries, most of them called "pups," a term well describing their size. Cassiterite is found from the head to the mouth of the creek in quantity, and in the tributaries flowing to it from Potato mountain. The pay tin occurs in the creek bed and flood plain deposits, from the surface down. Cassiterite is also found on the hills at the head and flanks of the creek.

This tin shows no evidence of water action, having been freed from the rocks by weathering. Creeks flowing to the Arctic from the hills about Potato mountain also give prospects for cassiterite, as do the hills themselves.

As has been said, the ore found on the hills and in the upper stream valleys shows little trace of water action—that on the hills none; only in the larger creeks, near their mouths, is it noticeable, and here the fragments are subangular rather than rounded. Nuggets have been found enclosing quartz and slate. A number of specimens showing cassiterite containing slate were found. Though no ore has been found in place in this slate area, and that is chiefly due to the extremely weathered condition of the rocks, it seems most probable that the ore occurred as small veins or vugs scattered through the greater part of this slate area. As the creeks heading in Potato mountain and the hills trending westward from it contain tin, while those to the east fail to do so, it would seem that these hills mark the line of weakness along which mineralization took place.

On Buck creek this summer mining was carried on in two places and considerable tin recovered. The ground was handled with horses and scrapers. The sluice boxes were fitted with deep iron riffles which proved very successful. (See engravings front page.) In the previous work on the creek pole riffles were used; made of wood they wore out quickly and took up a large part of the room in the box.

The ore found on these creeks is of exceptional purity. Concentrates from the sluice boxes, after rewashing, ran 67% to 63% tin and the impurities present are not harmful, being iron and silica—the silica in such small quantities as to cause no trouble in smelting. Wulfenite and the metals usually associated with tin have not been observed so far.

In the Cape Prince of Wales district considerable float tin has been found on Cape mountain, especially on the southeast side near the contact of the granite and limestone. The specimens of float show large crystals of cassiterite in a granite matrix. A number of parties are prospecting the mountain by means of cuts and drifts to locate the source of the float. One party is using a gasoline motor to develop power to run two electric drills. The drifts are in the granite near its contact with the limestone. The works at the time of the writer's visit was in an elementary stage and no systematic sampling and assaying had been done. Some stringers of cassiterite have been found running east and west—at right angles to the cut. The tin so far found as float and

Fig. 7.—Boring Mill Equipped With Individual Motor Drive.

a two-ton electrically driven elevator, provided with automatic stops at the top and bottom of the lift. There are two worm ladles of 8000 and 10,000 pounds capacity, respectively, with numerous smaller ladles. Due provision has been made for rapid economic handling of materials and ladles throughout the foundry.

Fig. 4 shows the casting-cleaning department, which is served by two 10-ton floor-operated pneumatic traveling cranes running its full length.

Fig. 5 gives a good idea of the interior arrangement and layout of the machine shop, the absence of shafting, belts and other overhead obstructions being in marked contrast to the old-time shop. A generous area of glass in the windows and roof affords a uniform distribution of natural light. The floors are entirely unobstructed by anything that will interfere with the free use of the valuable floor space. A typical example of the method of driving the larger machine tools by an individual motor is the boring mill shown in Fig. 6.

In the reports of the United States Geological Survey on this region, not enough stress is laid on the extreme flatness of the country. The York plateau is low and the streams cutting it have very light grades, seldom over 1 foot in 100 feet and often much less. The York mountains, a chain of low, steep hills, rise abruptly at the south end of the plateau and are separated from each other by low divides. The streams heading in them are broad and shallow, have very little grade and at their heads in the foot of the mountains are practically dry. The streams heading in the hills about Potato mountain, at the other end of the plateau, have a slightly better grade, otherwise they have the same characteristics. Creeks leading from Potato mountain north to the Arctic ocean are mere gullies occupying gentle depressions in hills and carry little water; their beds in many cases are only a few feet wide. Notwithstanding the fact that most of the streams have reached

\*See illustrations on front page.

that from the drifts differs from the Buck-creek tin in being less pure—considerable wulfamite being found in many of the specimens. Work at this place is to be prosecuted during the winter and the hope is that by the opening of navigation in the spring a workable body of ore will have been found. The deposit is near the sea and during the open season is readily accessible.

### Cyanide Method of Assaying Low-Grade Copper Ores.\*

Written by J. W. Howson.

Copper occurs in the United States distributed over a large area and in many forms. Although there are but five or six important centers of production, the working of ores on a small scale is carried on in many separate localities. These ores as they are handled are almost uniformly of low grade. So, whether he be an assayer in a large smelter or mine, or a chemist handling the ores of one of the small producing regions, the analyst will find that he often has on hand a large number of samples running low in copper, say, 5% and under. Not only is the chemist expected to develop considerable speed at this work, but he is also expected to attain a high degree of accuracy, duplicates being required to practically equal each other. For these reasons the writer believes that any aids to the perfecting of the determination of copper will be welcomed.

The methods chiefly used for analysis of ores of this character are:

1. The cyanide method, using a large amount of the sample for analysis.
2. The colorimetric method.
3. The electrolytic method.

In the cyanide method the amount of the sample used—two to ten grams—varies with the richness of the ore. In accuracy it leaves little to be desired, but in ores with a large amount of gangue the time required for the complete precipitation of the copper on aluminum is often too long for rapid work. This is commonly due to the large amount of iron present, which has all been oxidized during the solution of the ore by nitric acid, and which must all be reduced by the aluminum before the precipitation of the copper can commence. To allow of the rapid reduction of iron, it is very necessary, therefore, that all nitric acid be completely expelled with an excess of sulphuric acid. When there is a large amount of gangue present, or much calcium salts, this can not be accomplished except by prolonged heating, which is accompanied by the danger of loss of solution by "spitting."

In the cyanide method as used by the author, except on ores running under 0.25%, one or two grams only of the ore are used. Instead of varying the amount of sample used, the bulk of the solution in the titration is varied according to the richness of the ore. In addition to eliminating the danger and annoyance of excessive gangue and iron, this method presents the additional advantage that the analyst does not need to know the approximate richness of the ore before proceeding with the analysis.

Taking one or two grams of the sample, the analysis is proceeded with in the usual way, treating the ore with nitric, hydrochloric and sulphuric acids, and evaporating the ore to copious fumes of sulphuric acid. Remove from the heat and allow to cool slightly and add cold water, which will on contact with the sulphuric acid cause sufficient heat and ebullition to dissolve the soluble salts. Filter, wash and precipitate the copper on aluminum foil until the iron is all reduced and the solution colorless and foaming. Continue the heating for fifteen to twenty minutes longer. This is important in order to throw down the last few hundredths of a milligram or so of copper, neglect of which will often cause an error of several hundredths of a percent.

Filter off the precipitated copper, wash it well from all aluminum and iron salts in solution, and dissolve it in 2½ cubic centimeters of concentrated C. P. nitric acid, quite accurately delivered from a burette. Send the solution diluted with a little water through the filter paper and wash the latter several times with a small amount of water. Boil off the nitrous fumes, cool, and add from a burette 5 cubic centimeters C. C. ammonia. The bulk of the solution will now be about 25 cubic centimeters. If it is not, dilute up to that amount. For ores under 1% proceed cautiously but steadily to add the cyanide solution from a burette until the blue color has entirely disappeared. If the amount of cyanide solution being consumed indicates that the ore is running over 1%, dilute the solution according to the following ratio:

- 30 c.c. of solution for a 2% ore.
- 40 c.c. of solution for a 3% ore.
- 50 c.c. of solution for a 4% ore.
- 60 c.c. of solution for a 5% ore.
- 75 c.c. of solution for a 6% ore.
- 100 c.c. of solution for a 7% ore.

With practice this becomes a quick and easy operation, the analyst telling at a glance the proper degree of dilution. It must be borne in mind that to secure good results strict attention should be paid to the complete expulsion of the nitric acid used to get the ore in solution, to the complete precipitation of the copper on aluminum foil, and the addition of the

proper amounts of nitric acid and ammonia preparatory to the titration. Otherwise there may be a considerable discrepancy in results. This method has been tested hundreds of times with duplicates seldom differing more than one-tenth of 1% on the higher grades mentioned. The results also agree with the work of other chemists, and with each other as shown by the following table:

Sample No.	Modified Cyanide Method.	Cyanide Method Using 5-10 Gms.	Colorimetric Method.	Electrolytic.
A	2.73% 2.74%	.....	.....	2.70
B	0.45% 0.53%	.....	0.35	.....
C	1.68% 1.65%	.....	1.62	.....
D	0.67% 0.65%	0.66 0.65	.....	.....
E	0.99% 0.97%	0.98 0.97	.....	.....
F	3.57% .....	3.53 3.52	.....	.....

In working with a large number of samples, results by this method can be obtained at an average speed of from twelve to fifteen minutes per analysis.

For ores running under 0.25% take from 5 to 10 grams of the sample and proceed as above, paying special attention to the expulsion of the nitric acid with sulphuric acid and to the complete precipitation of the copper. Duplicates should agree within 0.01%. Following this method through on two low-grade samples, there were obtained the following results:

Sample G	Using 10 grams of ore, gave 0.142%.
	Using 5 grams of ore, gave 0.143%.
Sample H	Using 10 grams of ore, gave 0.168%.
	Using 5 grams of ore, gave 0.151%.

In standardizing any amount of copper may be used provided that the solution is made up to the proper volume of titration. In general it is found best to standardize with 0.20 gram of copper.

### Silver in Sandstone, Shale and Coal at Silver Reef, Utah.

TO THE EDITOR:—The foundation to this article was given the writer by J. Barbee, superintendent of the Barbee & Walker mine from 1876 to 1882.

This discovery of silver in calcareous sandstone at Silver Reef was made by W. Barbee, and is, I believe, the first of record of such occurrence. Its occurrence here was in the form of native silver and silver chloride. As explained to the writer, it would seem to have been in an anticlinal fold, with the apex cut away by erosion. The sandstone had been capped by an eruptive, most of which had been removed by erosion, leaving only small amounts in isolated patches.

The white sandstone stratum, about 70 feet thick, called the Tecumsee reef, was the one worked, the ore occurring in this in shoots, with a trend to the northwest and strike of reef almost east and west.

The thickness of the ore bodies sometimes reached 30 feet and the cropping of our shoot was about 900 feet long. After following this back 1000 feet they were but 12 feet from the surface. Beyond this the dip became about 35° from the horizontal. Sometimes in the ore would be found petrified trees. The heart of all these trees was rich in horn silver, in some instances almost solid and 2.5 inches in diameter. The small seams were also rich in silver.

Vertical faulting had occurred. In one instance

the down throw was about 125 feet. In all cases a streak of red clay showed the direction of throw, so that it was an easy matter to pick up the shoot. The values were deposited before the faulting took place.

In some places were boulders of red clay, called by the miners "red soap," 6 to 8 feet in diameter and carrying silver values of four to five ounces per ton. In the center of the boulder would be found a mass of several hundred pounds called "green soap," carrying values as high as 500 ounces silver per ton. No gold values at all appeared, though sometimes 5% copper would be present.

In one instance the trunk of a tree was found changed to coal. Three thousand pounds of this coal were shipped to Salt Lake and netted \$1100 silver at \$1.09 per ounce. Small seams of coal occurred at times about 1 inch thick, 2 feet long and several inches wide, always rich in silver. This coal was of a good blacksmith grade. The coal was not milled on account of the oil it contained, causing the loss of too much silver by flouring and sickening the mercury. No fossils were ever found in this reef so far as reported to the writer.

Some wood haulers had made a road across this reef between two large rocks. At this point had always been a mud hole of a black sticky substance. One day W. Barbee noticed it, took a sample and had it assayed, then shipped ten tons by wagon 24 miles to Salt Lake. This ten tons netted him \$7800 in silver.

The cropping of this reef made a fine building stone. Barbee built a house of it and later the house was torn down and milled, returning 32 ounces silver per ton.

Method of treatment was by crusher and stamps, followed by pan amalgamation, which gave a saving of 95%.

Seven hundred and fifty stamps dropping 100 times per minute gave an average of eight tons per stamp through a 30-mesh screen. This high stamp duty was caused by the cementing material being calcite, while the quartz grains were about 30-mesh in size.

About one and one-half pound of salt and one pound of copper sulphate was added to each ton of ore treated. The amount of mercury was governed by the assay value of the ore. The loss of quicksilver was about one pound per ton of ore treated.

This reef crops for about 30 miles, but in so far as the writer is aware, payable ore has been found only in the vicinity of Silver Reef.

At this point there is a record production of \$12,000,000, but of late years very little has been done.

Values in coal are reported from the Cambria coal field of Wyoming of from 1 to 2 pennyweight in gold, supposed to be in the iron pyrite. Also from South Africa in small seams of coal in the quartzite, quite rich in gold in places. Also in a vein of coal 2½ feet thick in Colorado in the Sangre de Cristo mountains, said to carry 10% copper with some gold—in this last instance the writer will "have to be shown." This may not be impossible, but seems highly improbable, for such a large amount of high-grade copper to exist in coal at the location claimed. There is no doubt but a great deal of coal has been burned that has had good metallic values, but to undertake to make it of value commercially would more than likely result in failure.

W. E. THORNE.

--	---	---

Chicago, Ill., Dec. 5, 1904.

Mining and Scientific Press,  
San Francisco, Calif.

Gentlemen:—

Can you give us the names and addresses of any one on the Pacific Coast who manufactures electrical machinery? By this we mean a plant for generating two to five hundred horse power, and convey same ten to twelve miles. We want to do business with a company that can furnish everything complete for a plant of this kind, and if there are any on the coast, will appreciate the matter very much if you will put us in touch with them.

Very truly yours,

CHANCELLOR GOLD MINING CO.

O. B. Brown, Sec. and Treas.

Cyanide Practice at the Maitland Properties, South Dakota.\*

Written by JOHN GROSS.

INTRODUCTORY.—The group of claims, comprising over 1100 acres, located at Maitland (formerly known as Garden City), in the Ida Gray mining district, Lawrence county, South Dakota, are now being developed and operated by Alexander Maitland, the owner.

Prior to the acquisition of this property two years ago (in 1902) by Mr. Maitland but little work had been done in this district, and little was known of the extent of the ore deposits. Recent development, however, has opened up some very promising ore.

The ores so far encountered are the so-called "siliceous ores," occurring in the flat formation which lies immediately above the Cambrian quartzite, which dips at this locality about 12° N. E. Both oxidized and blue ores are found, and the latter have proven particularly refractory to treat. No prospecting in the underlying slates of the Archean has so far been

the sands, and to treat the slimes by agitation and decantation.

Table I, containing the variations of analyses of these ores, gives a fair idea of their general character:

TABLE I.—ANALYSES OF MAITLAND ORES.

The ore, trammed from the shaft, 330 feet east of

able temperature, and during the coldest weather of last winter, with an outside temperature of 0° F., the temperature of the interior of the mill was from 54° to 62° F.

The water for the mill and boilers is obtained entirely from the mine workings, and is stored in a 50,000-gallon tank on the hill back of the mill.

MILL PRACTICE.—A ground plan of the mill building is shown in Fig. 2 and a cross-section through the center of the mill in Fig. 1. A legend of the metallurgical treatment at the mill is given in Fig. 3, which shows the passage of ore and solutions throughout the entire treatment.

The statistical data given in this paper are based on a daily tonnage of from 110 to 120 tons, which is the rate of treatment now maintained.

CRUSHING THE ORE.—The ore as it comes from the mine, carrying an average of 8% moisture, is delivered to the crusher bin of 150 tons capacity. The crusher bin has a flat bottom, and is 22 feet long, 10 feet wide and 12.5 feet deep; the inside is lined with double planking, and is protected at the points most exposed to wear by 0.25-inch steel plates. Upon the assumption that the ore will form its own slope, the idea of using a rectangularly shaped bin, in place of one having a bottom sloping to the discharge, seems, at first glance, to be economical, but this form is not as practicable as the 45° sloping bin, which practically discharges the ore cleanly. It is true that wet ore forms its own slope, but this slope is so steep that the working capacity of the bin is reduced to a very low point of efficiency. The ore for the breaker is passed directly from the bin to the breaker, no grizzly being intermediate; it is contemplated, how-

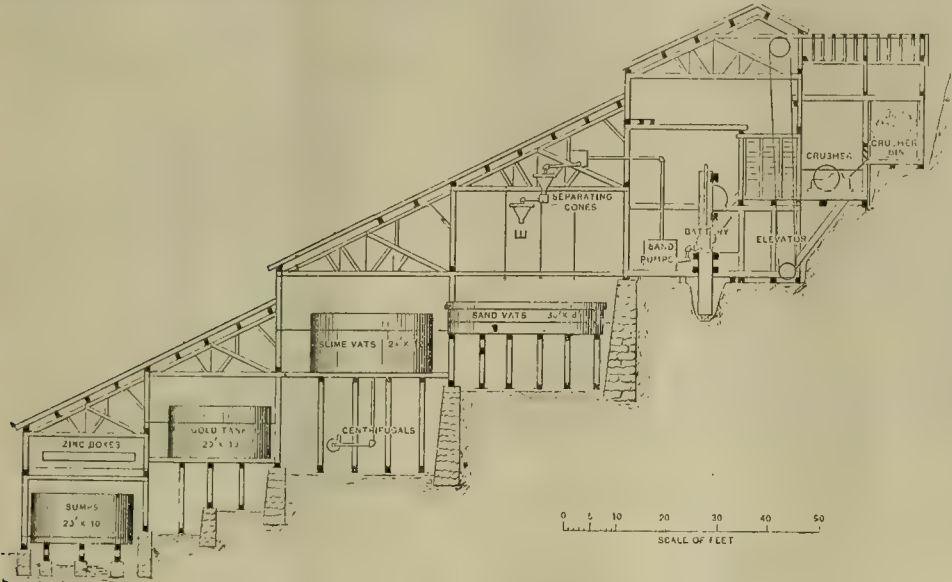

Fig. 1. Sectional View Maitland Mill, South Dakota.

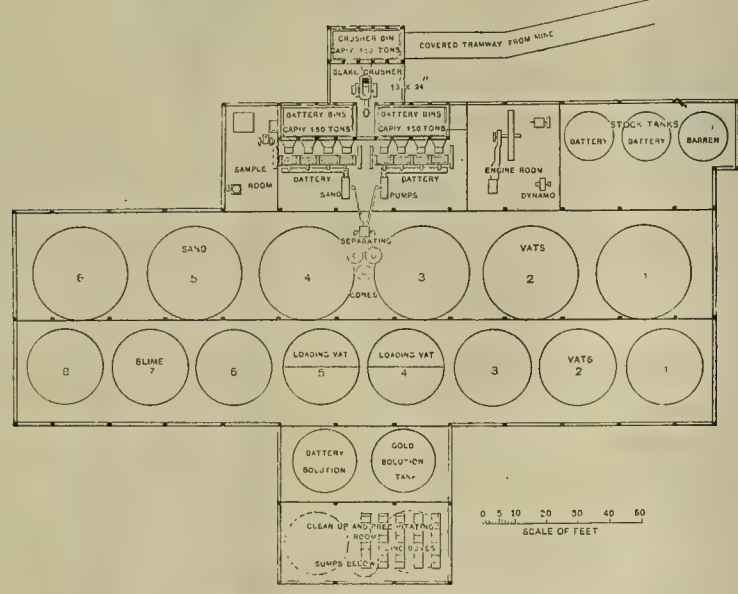

Fig. 2. Ground Plan Maitland Mill, South Dakota.

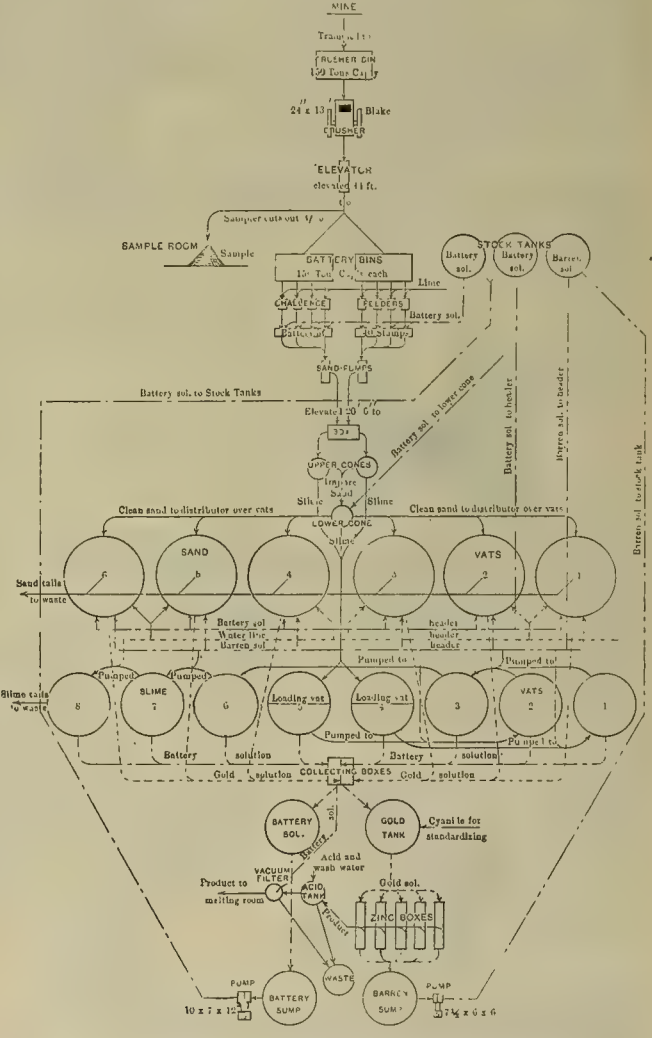

Fig. 3. Scheme of Treatment Maitland Mill, South Dakota.

attempted; but this work is one of the future considerations in the development of the property.

Small quantities of blue ores are unavoidably sent to the mill, but special care is taken to send only the oxidized ores for cyanide treatment. The ores, being close-grained and hard, have given considerable trouble in their treatment. Pyrrhotite and iron pyrite exist in about equal proportions; arsenic, copper, and traces of antimony and tellurium are found, and considerable quantities of bismuth have been found in the zinc-box precipitates. The silver in the low-grade ores is slightly greater than the gold, while in the high-grade ores the reverse is generally true.

Early in 1902, the building of a 40-stamp wet-crushing cyanide mill was begun, and it was finally placed in commission by January 1, 1903. The treatment, briefly, was to crush the ores in a cyanide solution, to separate the sands and slimes, to leach

the mill, through a covered tramway, is delivered to the crusher bin: hoisting being done only during the day shift, six days a week, which gives sufficient supply of ore to keep the mill running steadily.

The boilers are near the hoist, and the steam is carried to the mill through a 6-inch covered pipe passing through the tramway.

Convenient to, and connected with, the mine and the mill, by tram track, are a blacksmith shop and machine shop, the former containing two forges and trip hammer, and the latter a 20-foot lathe, a 31-inch drill press, a planer and a pipe-cutting machine.

The melting room is apart from the mill, and is situated near the office, thereby obviating the necessity of having any fires in the mill. The heating in the winter is done by a series of 8-inch galvanized iron pipes, in all about 1500 feet long, which take the exhaust steam from the mill engine, and causes practically no back pressure on the engine. Sufficient heat is obtained to keep the building at a comfort-

ever, to install a grizzly, not only to shorten the actual running time of the breaker, but as a beneficial aid in breaking very wet ores.

The breaker is a 24x13-inch Blake, running at 260 revolutions per minute, and set to break to a size that will pass through a 1.5-inch to 2-inch ring. The average time of running is seven hours per day, which gives a capacity of from sixteen to seventeen tons per hour. A set of jaw plates in the breaker lasted fifteen months, during which time 41,000 tons of ore were broken.

The crushed ore is passed through iron-lined chutes, inclined 45°, to the elevator boot, and is elevated 44 feet for delivery to the battery bins. In the original mill a bucket elevator of the continuous type, traveling 100 feet per minute, was provided; but was soon discarded after handling 9300 tons of ore, for the reason that the links wore out and caused it to fall into the pit on several occasions. A 14-inch, 8-ply rubber belt is now used, traveling 350

\*Abstract Trans. A. I. M. E.

feet per minute; and, in order to lengthen its life, it is reinforced between the buckets with old pieces of belt which take the roughest wear. One belt has so far been worn out after having handled 16,965 tons of ore at a cost of 0.91 cent per ton. The first rubber belt elevator received extremely hard usage during the first few months of its service; the second one, now in place, has handled a larger tonnage and is still in good condition.

The 12-inch buckets are spaced 18 inches apart on the belt. No. 10 sheet-steel buckets were first used and handled 16,965 tons of ore at a cost of 0.45 cent per ton. Malleable iron buckets proved too light for the work and handled 8080 tons of ore at a cost of 0.76 cent per ton. No. 6 sheet-steel buckets are now used, and the tendency is to use still heavier ones.

The stream of ore, in falling from the elevator head to the battery bins, is cut by an automatic sampler, consisting of two light endless-link belts carrying several buckets suspended between them; the chains, which travel at the rate of 100 feet per minute, cause one of the buckets to pass through the falling stream of ore every thirty seconds, cutting the full width of the stream and taking 2% of the ore as the sample and delivering it to the sample room, where it is cut down and quartered in the usual manner. The sample buckets are 5 inches wide, 14 inches across and 6 inches deep, and are ample for a capacity of twenty-five tons per hour. This sampling arrangement has proven satisfactory and reliable.

(TO BE CONTINUED.)

## Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 29, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF MAKING METALLIC CYANIDES.—No. 775,953; M. Voigt, Charlottenburg, and A. R. Frank, Berlin, Germany.

Process for obtaining metallic cyanides which consists in dissolving cyanamide from metallic cyanamides, separating solution from sediment, formed in dissolution of cyanamide, separating cyanamide from solution and heating separated cyanamide up to melting point in presence of inorganic substances containing base whose cyanide it is desired to produce.

DREDGING APPARATUS.—No. 776,049; O. Fruhling, Brunswick, Germany.

In dredging apparatus, combination of hollow head or drag provided with cutting or digging means and inlet or mouth through which material to be dredged enters head, walls of head forming exterior pocket in which material is initially received, shape of such pocket causing material therein to close mouth of drag and prevent passage of water therethrough as drag is drawn forward, means for disintegrating material forced into interior of drag from pocket, through mouth, as drag is moved forward, and means for removing such material from drag.

PROCESS OF SEPARATING METALS FROM SULPHIDE ORES.—No. 776,145; C. V. Potter, Balaclava, Victoria, Australia.

Herein described process of separating metals

from pulverized sulphide ores which consists in adding to same acid solution which is non-solvent of precious metals, then applying heat to same, and removing sulphides from surface of solution.

CONCENTRATOR.—No. 776,189; F. T. Le Strange, Syracuse, N. Y.

Concentrator comprising front and rear foundations, plates mounted on rear foundation, inclined concentrating table provided under its elevated end with transverse bolster having convex bottom seated in correspondingly shaped recesses in plates, metallic sockets mounted on front foundation, crossbar secured to under side of lower end of table and provided with screw threaded vertical holes, screws passing through holes and stepped in sockets and operative for adjusting table to different degrees of inclination, top of table provided with vents of escape of water, cloth cover spread over top, supply sluice extending along upper end of table, conductor leading from sluice to upper end of table and of gradually increasing width and entirely open across its wider end, main slime distributors and auxiliary slime distributors fastened to conductor, means controlling discharge from supply sluice to conductor, universally movable flushing device, concentrate box and waste sluice under lower end of table, and gate connected adjustably to end of table to communicate with either box or latter sluice.

ORE STAMP MILL.—No. 776,414; P. N. Nissen, Prescott, Ariz.

In ore stamp mill, combination of mortar, provided with anvil projecting upwardly from bottom thereof, removable interior lining therein having horizontal upwardly projecting flange surrounding anvil, and removable die within mortar resting upon anvil and overlapping horizontal flange of lining whereby lining is held in position.

ORE CONCENTRATOR.—No. 775,944; A. H. Stebbins, Little Rock, Ark.

In ore concentrator, combination of series of cylindrical chambers varying in size from end to end of series and each having at one end reduced connecting portion joined to larger end of next preceding chamber, means for introducing spiral or gyratory air currents into first of series of chambers,

discharge opening in wall of each of chambers and separate tangential inlet for each of cylindrical chambers.

GOLD SAVING APPARATUS.—No. 776,113; H. O. Clark, San Francisco, Cal.

In gold washer, combination of revoluble, foraminous cylinder; trough below cylinder and provided with parallel riffles arranged concentric with cylinder, and scrapers on cylinder each operating in one of spaces between adjacent mercury containing riffles and adapted to remove material from space for advancement to succeeding mercury containing riffle.

PRESSURE FILTER FOR SLIMES.—No. 776,084; W. A. Pritchard, Kalgoorlie, Western Australia, Australia.

In pressure filter, combination with receiving chamber having inlet for slimes in bottom, exits for filtrate solutions, outlet for undissolved residue, and filtering medium interposed between slime inlet and exits, of baffle blades longitudinally disposed in cylinder, and plurality of propeller blades acting in conjunction with baffle blades, for purpose specified.

SAFETY DEVICE FOR CABLE MINE HAULS.—No. 776,083; A. Palmros, Fairmont, W. Va.

In cable mine haul, combination with cable-driving mechanism having clutch, of buffer removably positioned in path of car and means connecting buffer and clutch operative only by impact upon buffer.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

The Oceanic M. Co. at Sumdum, W. Gans manager, has closed for the winter. They worked fourteen men throughout the summer, keeping the 5-stamp mill at work.

F. Cook & Co. have been developing the Devil Club lode at Echo Harbor.

T. Smith and others have completed the assessment work on the Rex group in Yankee basin. A 15-foot tunnel was run on the Rex ledge, showing a 4-foot vein of ore.

Work has begun at the Treadwell mines to connect all of the underground workings from the Ready Bullion to the old Treadwell.

A 10-stamp mill has been delivered at Eagle river for the Eagle River M. Co. by the Risdon Iron Works, San Francisco, Cal.

The following list of mining incorporations and agents in Alaska has been compiled by the Record Miner of Juneau: Alaska-Juneau G. M. Co.—Mines in Silver Bow basin; J. MacDonald, Treadwell. Alaska Development Co. (oil).—Mines at Kayak; W. R. Johnson, Chilkat Point. Alaska United G. M. Co.—Mines on Douglas Island; J. MacDonald, Treadwell. Alaska-Mexican G. M. Co.—Mines on Douglas Island; J. MacDonald, Treadwell. Alaska-Treadwell G. M. Co.—Mines on Douglas Island; J. MacDonald, Treadwell. Alaska G. M. Co.—Mines on Berners bay; B. M. Behrends, Juneau. Alaska-Snettisham G. M. Co.—Mines at Snettisham; J. N. Tisdale, Snettisham. Alaska Copper Co.—Mines at Copper river; S. Birch, Valdez. Alaska-Empire M. Co.—Mines on Unga island; F. R. Brown, Unga. Alaska-Atlin M. Co.—Mines in Atlin district; A. S. Lovett, Juneau. Alaska-Perseverance M. Co.—Mines at Silver Bow basin; C. H. Pierce, Juneau. Alaska Gold Mines Corporation.—Mines at Windham bay; Z. P. Burnhart, Sumdum. Alaska Gold Miners' Development & Guarantee Co.—W. W. Boughton, Skagway. Alaska-Washington G. M. Co. of Juneau.—Property at Yankee cove; H. R. Shepard, Juneau. Alaska Con. G. M. Co.—Controlling Douglas island properties; T. S. Nowell, Juneau. American G. M. Co.—Controlling Sheep creek and Silver Bow basin properties; T. S. Nowell, Juneau. Apollo Con. M. Co.—Mines on Unga island; F. R. Brown, Unga. A. B. W. M. Co.—Mines on Prince of Wales island; R. Allison, Ketchikan. Alma Con. M. & Dev. Co.—Mines at Dolomi; C. E. Buttrick, Dolomi. Auk M. Co.—Mines on Douglas island; C. E. Summers, Juneau. Boston Group M. Co.—Property near Juneau; A. S. Lovett, Juneau. Bessie G. M. Co.—Mines at Yankee cove; P. S. Early, Douglas. Brown-Alaska Co.—Property at Prince of Wales island; S. I. Silverman, Hollis. Berners Bay M. & M. Co.—Controlling the Kensington, Seward and Ophir group of mines at Berners bay; T. S. Nowell. Chittyna Exploration Co.—Property on Kuskalino river and Lorin; J. J. Rogers, Skagway. Chisna M. & Imp. Co.—Property at Chisna river; J. G. Heid, Juneau. Choumagin M. Co.—Property on Unga island; F. R. Brown, Unga. Cook Inlet Coal Fields Co.—Property at Cook inlet; A. Ray, Homer. Coronation M. Co.—Property at Coronation island; T. Donohue, Valdez. California-Alaska G. M. Co.—Property at Windham bay; J. F. Stewart, Windham Bay. Delaroff M. Co.—Property at Unga island; F. R. Brown, Unga. Detroit-Alaska G. M. Co.—Property at Windfall; J. A. Mays, Juneau. Eagle River M. Co.—Property at Eagle river; C. D. Mallory, Juneau. Elephant's Nose M. Co.—Property near Wrangell; G. Clark, Wrangell. Ebner G. M. Co.—Property in Silver Bow basin; W. M. Bibner, Juneau. Funtar Bay M. Co.—Property at Funtar bay; J. H. Fox, Juneau. Golden Fleece M. Co.—Property on Prince of Wales island; F. N. Chapman, Dolomi. Golden Coin M. Co.—Property near Ketchikan; J. W. Darling, Ketchikan. Greek Boys M. Co.—Property at Berners bay; C. H. Pierce, Juneau. Grindall M. & S. Co.—Property on Prince of Wales island; A. M. Butterfield, Sitka. Golden River M. Co.—Property at Windham bay; J. R. Winn, Juneau. Hilda M. Co.—Property near Ketchikan; C. H. Galbreath, Ketchikan. Helvetia G. M. & M. Co.—Property at Windham bay; J. R. Winn, Juneau. Jualin M. Co.—Property at Berners bay; B. M. Behrends, Juneau. International Con. M. & Brokerage Co.—Property on Prince of Wales island; C. E. Ingersoll, Ketchikan. Jualpa Co.—Property at Silver Bow basin; J. R. Winn, Juneau. Ketchikan Copper M. Co.—Property at Prince of Wales island;

J. R. Heckman, Ketchikan. Kasaan Bay M. Co.—Property at Kasaan bay; L. A. Babcock, Kasaan. Ketchikan G. M. Co.—Property near Ketchikan; J. H. Gilmore, Ketchikan. Khayyam Copper Co.—Property, Scowl Arm, Prince of Wales island; J. R. Heckman, Ketchikan. Lemon Creek Co.—Property on Lemon creek, near Juneau; J. R. Winn, Juneau. Laskawonda G. & C. Co.—Property at Ketchikan; C. E. Ingersoll, Ketchikan. Meilen M. & M. Co.—Prince of Wales island; G. Skeavington, Juneau. Monte Cristo G. M. Co.—Property on Baranof island; N. K. Foster, Sitka. Mongollon Exploration Co.—At Nome and Port Clarence; J. W. Griffin and S. B. Howard, Nome. Minnesota M. Co.—Property near Ketchikan; J. S. Bagg, Ketchikan. Mansfield G. M. Co.—Property on McGinnis creek, near Juneau; W. Jarrett, Juneau. Norton Sound Placer M. Co.—Property near Nome; R. F. Lewis, Juneau. Nugget Bar M. Co.—Property on Porcupine; C. G. Lewis, Haines. New York-Alaska Dev. Co.—Property near Hollis; S. I. Silverman, Ketchikan. Nowell M. & M. Co.—Controlling the Johnson mines at Berners bay; T. S. Nowell, Juneau. Northern Homestake M. Co.—Nevada creek, Douglas island; A. S. Lovett, Juneau. Olympic M. Co.—Property at Woodsy; J. R. Winn, Juneau. Pacific Lithograph Marble & M. Co.—Property, Mendenhall, Glacier Creek basin; J. B. Preiss, Juneau. Providence & Sitka M. Co.—Property near Sitka; C. O. Smith, Sitka. Pioneer Coal & M. Co. of Alaska.—Property at Coal Harbor, Unga island; H. S. Tibby, Coal Harbor. Roseland & Deer Park M. Co.—Property on Gravina island; I. I. Frohmann, Wrangell. Resurrection Creek-Alaska M. Co.—Property on Resurrection creek; G. W. Paswater, Hope. Russian-American M. & Exp. Co.—Property at Golovin and Omilak; H. W. Mellen, Juneau. Sitka Con. M. Co.—Property on Unga island; F. R. Brown, Unga. Sea Level M. & M. Co.—Property at Thorn Arm, near Ketchikan; E. C. Morse, Sea Level. The Setuok Co.—Property on Ankow river, near Yakutat; L. H. Jewell, Yakutat. Silverman Alaska Co.—Property on Prince of Wales island; S. I. Silverman, Hollis. Seandia M. Syndicate.—Property on Bourbon creek; A. J. Spute, Nome. South-eastern Alaska M. Co.—Property on Prince of Wales island; J. McFarland, Ketchikan. Sumdum M. Co.—Property at Sumdum; H. T. Tripp, Sumdum. Tyee Con. M. Co.—Property on Douglas island; C. M. Summers, Juneau. Turnagain Arm G. M. Co.—Property at Cooks inlet; L. R. Bellman, Sunrise. U. S. B. C. Corporation.—Property near Valdez; W. E. Crews, Juneau. Unik River M., S. & T. Co.—Property on Stikine river; J. W. Daily, Ketchikan. Victory C. M. Co.—Property near Ketchikan; B. Stevens, Ketchikan. Windham Chief G. M. Co.—Property at Windham bay; W. W. Lawson, Windham. Wales C. M. Co.—Property on Prince of Wales island; C. E. Ingersoll, Ketchikan. Windham Chief Con. M. Co.—Property at Windham bay; D. W. Yates, Windham. Yellow Jacket M. Co.—Property at Windham bay; J. F. Malony, Juneau.

## ARIZONA.

### Gila County.

The former production cost of copper of 12 cents per pound at the Old Dominion at Globe has been greatly reduced by the introduction of new machinery. It is the expectation of the present management to produce copper cheaper than any other Arizona company.

The Inspiration M. Co., 8 miles west of Globe, contemplate the erection of reduction works on the property and are negotiating for a new smelting plant.

General Manager J. D. Coplen of the Inspiration Co. will this season do considerable development work on the company's sixteen claims, 8 miles west of Globe. The plans embrace the erection of reduction works.

The McCallen-Schilling-Bates copper properties at Ray are reported taken by the Big Land M. Co. of Philadelphia, Pa., for development under a working bond. W. B. Twitchell is superintendent.

### Maricopa County.

(Special Correspondence).—A Texas company is working the Fleming group of claims in the Cave Creek district.

E. T. Stewart of Arlington visited his property in the White Tank mountains this week. He states that he is about to make a sale of his gold claims.

The Mormon Girl mill is in successful operation, under charge of Davies Bros. J. U. Creath is working his gold property, 7 miles south of Phoenix. He will arrastra the ore which he is taking out.

The Bowyer mill in Cave Creek district is running on ore supplied by C. E. Philes. Mr. Philes has recently discovered some tungsten, and he intends to do some work on the claim at an early date.

Work will be resumed at the White

Cloud mine, near Morrilstown, at an early date.

### Phoenix, Dec. 4.

L. L. White, of the White G. M. Co., Wickenburg, is awaiting the arrival of the machinery for the company's 20-stamp mill. Grading for the plant is now in progress, about twenty-three men being employed.

### Mohave County.

L. D. Godshall contemplates building a smelter at Kingman. He is now at the Twins mine, Cerbat.

C. G. Andrews of Los Angeles, Cal., states that the Gold Hill Reduction Co. will erect a 500-ton plant at Kingman, Arizona, to treat the zinciferous sulphide ores of the region.

### Final County.

(Special Correspondence).—The Silver Bell mine, 22 miles northeast of Florence, is again a producer. A considerable quantity of silver-lead ore has been shipped recently from Cochrane station on the Phoenix & Eastern. A wagon road was recently built from the mine to the station.

### Kelvin, Dec. 5.

(Special Correspondence).—The Mammoth mine at Schultz has recently been examined by an expert and it is stated that a sale of this former gold producer is pending.

Another large body of silver-lead ore has recently been struck at La Fortuna mine, north of the famous Silver King mine.

The Superior Co. is constructing an office building of adobe at Florence, near the Phoenix & Eastern Railroad.

### Mammoth, Dec. 5.

At Dudleyville the Saddle Mountain M. Co.'s smelter at the San Carlos group approaches completion.

### Yavapai County.

H. P. Anawalt of the S. F., P. & P. R. R. says that the railroad is now receiving and delivering freight for the Walker district, on upper Lynx creek, through the Poland tunnel, recently completed between Poland and Walker. The tunnel between the two towns is nearly 2 miles long and is slightly up grade from the Poland end. The cars are drawn through to Walker by mule power and returned by gravity. Plans for the installation of an electric line are being made.

T. F. Cole, J. Hoatson and D. E. Woodridge of Prescott, said to be acting for the Calumet & Hecla interests in Michigan, have purchased the Copper Chief group of claims, near Jerome, for \$3,000,000.

### Yuma County.

The Amalgamated G. M. Co. at Cholla, near Quartzsite, has completed grading for a 120-stamp mill and work will soon begin on the building. Plans for the mill have been drawn, but have not yet been approved. Sixty stamps only will be used at first, and the other sixty will be added later. Forty of the stamps are now on the ground. It is expected to have the mill in operation early next year. The company will use cement mortar blocks in the mill.

## CALIFORNIA.

The number of flasks of quicksilver of seventy-six and one-half pounds net produced in California by counties in 1903 were: Colusa, 510 at \$21,708; Lake, 2130 at \$85,520; Napa, 7859 at \$359,006; San Benito, 8150 at \$370,000; San Luis Obispo, 4592 at \$185,430; Santa Clara, 4658 at \$200,330; Sonoma, 2361 at \$97,766; Trinity, 266 at \$11,156. Total, 30,526 at \$1,330,916. This is an increase of 108,418 flasks and \$1652 over the total of 1902.

### Amador County.

At the Climax mine, 2 miles from Pine Grove, the 2-stamp mill is going, the monthly output proving so satisfactory that arrangements are being made to operate on a more extensive scale. A hoist of the Balliol mine has been erected on this mine and is now in running order. They have started sinking below the tunnel level and intend to go 150 feet. The management is now considering the erection of a 10-stamp mill.

At the Copper Hill mine on the Cosumnes river, owned by W. F. Detert, V. S. Garbarini is putting up hoisting works. Sinking is to begin when this is completed. The forty additional stamps at the Kennedy mill, making 100 in all, have been started and extra ore bins filled. New machines have been placed underground and it is supposed that the force of men will soon be increased.

### Butte County.

The Butte & Yuba Placer & Dredge M. Co. has bought land on the South Honcut. W. F. Gates is president, R. M. Green vice-president, Harry Tuggles manager. Preparations are being made for work.

J. E. Doolittle of San Francisco and Eastern capitalists have purchased 1600 acres from J. O'Brien, the P. George es-

tate, A. Eymard estate, H. D. Mitchell and D. Shay, lying along the north side of the Yuba river, 10 miles east of Marysville. The purchase price was more than \$350 an acre, or nearly \$600,000. Several large dredgers will be placed on the property as soon as possible and will be in operation within a year.

### Calaveras County.

Valley Springs report that a 100-stamp mill is to be put up at the California M. Co.'s property, 1½ mile from the town. Fifty men are at work sinking a shaft 500 feet deep. Five or six carloads of machinery have been received and thirty-six more will arrive soon.

The suit of the Lightner M. Co. against the Utica M. Co. and the Hobart and Hayward estates for \$120,000 damages has been decided in favor of the plaintiff, awarding \$54,000 damages. The plaintiff brought suit eight years ago, alleging that the Utica Co. had trespassed upon the Lightner property. The trespass was never denied and the suit was merely to determine the amount of damages. The mines adjoin each other at Angels Camp.

### El Dorado County.

At the Darling mine, Bear creek, near Georgetown, a dam has been put in preparatory to installing an electric plant on the property in the spring.

J. C. Newton of South Pasadena, Cal., is president of the Red Raven G. M. Co., which proposes to erect a 20-stamp mill at the Uncle Sam group.

### Nevada County.

The Empire mine will install another sand plant, working it in conjunction with the one now in use.

### Placer County.

A 5-stamp mill has been put up at the Bouk mine, near Auburn, on the Black Oak mine at Weimar, and there are fifteen men at work. A contract has been let to R. A. Davis and others to sink another 100 feet.

A full force of men are working at the Southern Cross mine, near Towle, and Superintendent W. R. Trimble has put in a compressor.

At the Golden West gravel mine, Canada Hill district, above the Hidden Treasure, Superintendent F. F. Armstrong says the gravel channel has been reached and pay dirt struck.

### San Diego County.

(Special Correspondence).—A 10-stamp mill is being installed at the High Peak mine at Julian. The Owens is being unwatered preparatory to sinking 100 feet further.

### Cuyamaca, Dec. 6.

### Shasta County.

The wagon road from Kennett to the smelter site and mine of the Mammoth C. M. Co. has been completed, and the company can now transport machinery and building material. G. Anderson is in charge of operations during the absence of Frederick Lyon, the chief engineer. The first machinery to be set up will be an air compressor plant, the mine terminal of the aerial tramway, and then the smelter terminal of the same line.

F. P. Primm of Redding has located on Oregon gulch, 3 miles south of Redding, two claims under the names Oregon Gulch kaolin mine and Oregon Gulch mining claim. He says the purpose of the locations is to secure the deposits of kaolin known to exist on the land. He wishes to organize a company to put up a pottery plant.

G. H. Bell has returned to Stella from San Francisco.

F. N. Cushman and H. P. Palmer contemplate the erection of a quartz mill at Horton's gulch, Dog Creek mining district, near Redding.

### Sierra County.

E. Westall of Sierra City has purchased the Northern Bell mine, bonded the Marguerite mine and will work them together and crush the rock in the Marguerite mill. He purchased from the Rosenfeld Co. the air compressor formerly used in their Gold Bluff mine at Downieville and will install it at the Marguerite mine.

### Siskiyou County.

A. Ball, superintendent of the Zedellia G. M. Co., on the East Fork of Methodist creek, near Etna, reports that in the spring the company intend putting in a stamp mill, cyanide plant and a sawmill and equipping the mines with good tracks and steel cars.

### Trinity County.

The Gold Hill group, 10 miles east of Trinity Center, has suspended operations owing to the approach of winter. Work will be resumed in the spring.

### Yuba County.

J. Martin and E. de Saba have secured 1200 acres of dredger land on the Yuba river, north of Marysville, from R. D. Cranston, and propose beginning work as soon as the necessary dredgers can be put in operation. Two dredging machines have been ordered and seven more are to be contracted for.

## COLORADO.

## Boulder County.

F. G. Shaffer of Denver has purchased the Cuba, or Good Morning group in Wall Street from Mrs. K. Hall for \$12,000.

## Chaffee County.

The Clinton group, in Taylor park, 20 miles west of Buena Vista, has been sold to J. Harrison of St. Louis, Mo., for \$50,000, of which \$5000 was paid down and the balance to be paid in quarterly payments. The new company will commence work immediately. The claims are adjoined by the Woods G. M. & M. Co. property. A large cyanide mill is being erected in the park by the Woods people.

Manager Fankhauser says that new machinery is being placed in the Pat Murphy property, near St. Elmo. A 6000-foot tram system has been installed to handle the ore from the mine.

At the Mary Murphy mine at Romley, R. G. Hinkson is manager and J. Taylor superintendent.

## Clear Creek County.

C. W. Miller and A. C. Rosser of Osage City, Kansas, and T. S. Hunsicker of Washington, D. C., intend to install machinery at the Little Jack vein of the St. Paul Co. property, near Georgetown, early in the coming year. The company will hold a meeting in Georgetown this month, when plans for future work will be laid out.

The Dives-Pelican Co., near Georgetown, has received a compound Corliss compressor with a capacity of 1700 cubic feet per minute, to be placed at the mouth of the Burleigh tunnel. The foundation is about completed for the company's mill and the construction of the building will commence soon.

## Custer County.

Lothrop of Chicago & Fueller of Denver have bought the Silver Bar mine for \$75,000. Under the terms of the deal, it becomes necessary for the new owners to construct a 200-ton daily capacity mill.

G. M. Laird is operating the Mackay-Burroughs mine on Quartz hill under a lease.

## Dolores County.

Operations on the Ophir-Consolidated properties, near Ophir Loop, have temporarily suspended. The thirty stamps of the 50-stamp mill which have been dropping steadily for months past have been hung up and the plant is idle.

The Durango Leasing Co. will overhauled the Enterprise mill, near Rico. Hydraulic sizers and slime tables are to be added.

## Gleichen County.

The Maine-Hamlet mine at Central City has started up. This property has been closed for the past eight months. It is the intention of the company operating the mine to do much development work. S. W. Brereton is superintendent.

The plant of the Western Reduction Co. on North Clear creek, west of the Forks of Creek, has been destroyed by fire. It was erected eight months ago to handle the slimes from North Clear creek. The loss is estimated at \$30,000, which is partly covered by insurance. F. A. Thompson of Forks of Creek is manager of the plant, and at this time it is not known whether the plant will be rebuilt or not.

## Gunnison County.

The Akron Co., at White Pine, whose buildings were destroyed by fire, will wait until spring before erecting new ones, when a modern concentrating plant is to be built.

## Lake County.

At the Manhattan M. & P. Co., O. P. De Ford of Twin Lakes manager, the new tunnel has been driven in 195 feet, and a new boiler, engine and air compressor have been installed.

## La Plata County.

In the La Plata district the May Day Co. is putting in a Crane washing machine to facilitate ore sorting and to save the finer values. Preparations are being made to build a tramway from the mouth of the tunnel to the county road to obviate the necessity of packing the ore down the trail on burros. Operations on the Bonnie Girl mine have been suspended, pending the arrival of the machinery plant.

## San Juan County.

At Galena mountain, R. W. Davis reports that the tram towers have all been framed and are being placed in line. The tram will be completed and in running order by the first of the year. This tramway is to supply ore to the new mill yet to be built.

When the road for the Green Mountain M. & M. Co., in Cunningham gulch, is completed, grading for the mill will be begun.

At Animas Forks, near Silverton, Chas. Dale has completed a contract for 2000 feet of flume for the Gold Prince M. Co. The flume is in two branches—one 16x16 inches and the other 24x24 inches. The flumes are to furnish power for the new

Gold Prince mill, which is to be built next spring at Animas Forks.

The Frank Wetzel del Mino group on Cement creek, near the foot of Dry gulch, was sold to Messrs. Ross, owners of the Galtie Boy.

## San Miguel County.

The following is the scale of wages which will be paid in the mills and mines of Telluride district after December 1:

## MINES—UNDERGROUND.

Miners.....	\$3.00	for eight hours
Machine men.....	4.00	" "
Trammers and shovellers.....	3.00	" "
Drivers, caring for horses.....	3.25	" "
Drivers, not caring for horses.....	3.00	" "
Timbermen.....	3.50	" "
Timbermen helpers and laborers.....	3.00	" "
Nappers.....	3.00	" "
Hoisters (engineers).....	4.00	" "
Station tenders.....	3.00	" "
Cage tenders.....	3.50	" "

## MINES—OUTSIDE.

Engineers.....	\$3.50	for eight hours
Engineers (if hoisting men).....	4.00	" "
Firemen.....	3.00	" "
Blacksmiths.....	3.75	" "
Blacksmiths' helpers.....	3.00	" "
Tool sharpeners.....	3.25	" "
Laborers.....	3.00	" "

## TRAMWAY.

Gr. men and loaders.....	\$3.00	for eight hours
Brakemen.....	3.75	" "
Linemen.....	4.00	" "

## MILLS, CYANIDE WORKS, ETC.

Crushermen.....	\$3.00	for eight hours
Batterymen.....	3.50	" "
Batterymen helpers.....	3.00	" "
Huntington and Chili mill men.....	3.00	" "
Concentratormen.....	3.50	" "
Concentratormen helpers.....	3.00	" "
Engineers.....	3.50	" "
Firemen.....	3.00	" "
Blacksmiths.....	3.75	" "
Carpenters.....	3.75	" "
Laborers and shovellers.....	3.00	" "
Cyanide plant employes.....	3.00	" "
Solution men.....	3.50	" "

## BOARDING HOUSE.

Head cook (if over 100 men), \$100 per month and board.

Night cook and baker (if over 100 men), \$90 per month and board.

If over 175 men, the head cook will be furnished with a meat cutter at \$80 per month and board. Second cook, \$65 per month and board. Waiters and dishwashers, \$60 per month and board.

This scale is the minimum, some, especially among the miners and machine men, getting more, many good miners getting \$4 and \$4.50 per day and machine men \$5 and \$6.

## Summit County.

At Kokomo the Willey mill is being enlarged and stamps, concentrating tables and slimes put in place. E. E. Byron is in charge of this and of men at the Wilfley mine, on Elk mountain.

At Breckenridge G. C. Smith and A. E. Keables of the Old Union M. & M. Co. are operating through two shafts 260 and 200 feet deep, with connecting levels and a crosscut tunnel from the level of the upper floor of the company's new mill progressing satisfactorily. A prospecting crosscut tunnel is being driven 200 feet east of the No. 2 shaft to disclose the size and course of the veins in the group ahead of the present workings. A 125 H. P. engine and two 80 H. P. boilers, with crusher, roller, screens and jigs, have been purchased and will be placed in the mill building. Concentrating tables will also be added to the plant, which is designed to handle from 50 to 100 tons of crude ore per day.

At the Morning Star on Mount Baldy, Conlon & Zerbe have opened up a pay-streak of lead-silver-gold ore in the tunnel 175 feet from its mouth. A coal boring machine, with a special bit, is used in driving the tunnel through the frozen ground.

The Washington-Joliet M. & M. Co. has started up its 20-stamp and concentrating mill. The track from the tunnel to the mill has been covered.

## Teller County.

C. B. Burch of Pony Gulch, southwest of Cripple Creek, has purchased cyanide machinery for the erection of a 50-ton mill, so constructed as to permit enlargement to 150 tons per day with little expense.

The El Paso Con. M. Co. at Cripple Creek will construct five additional ore bins, making fifteen bins in all.

## IDAHO.

## Idaho County.

A. Prader of the Union group, between Seigle creek and Red river, near Elk City, has sunk 85 feet on the vein, drifted and crosscut 350 feet, constructed a 3½-mile wagon road, built a shaft house, installed a hoist, a sawmill, and built a residence, and intends to sink to the 200-foot level and install a mill.

J. C. Garvin of Spokane, Wash., has an option on the French group, in Station district, south of Newsome, on the Clearwater, 15 miles west of Elk City.

G. V. Herrington of the Crooked River M. & M. Co. says a 300-ton cyanide plant is to be built on the property at Oro Grande. The vat building will be 100x100 feet. Four leaching vats, each 44 feet in diameter, two gold storage tanks, one sump tank, two solution tanks and two pumps will be required. The present

crushing capacity of twenty stamps will be reinforced by a 12-ton rock crusher.

## Shoshone County.

The official statement of the Federal M. & S. Co., in the Cœur d'Alenes, covering the year ended August 31, 1904, shows that the ore shipped was valued at \$4,908,926, and yielded a gross profit of \$1,690,524. Deducting from this sum \$219,625 for general and administrative expenses, and adding \$18,374 interest, and \$2810 from rents and dividends, makes the net income \$1,492,083. This amount has been still further reduced by the allotment of \$67,709 to the reserve for legal contingencies, and \$38,649 for incorporation costs, explorations, examinations, etc., which left \$1,385,725. From this there has been paid in dividends \$629,309, leaving a surplus for the year before charging depreciation of \$756,416. Mine labor cost \$1,056,207; mine supplies, \$379,379; mill labor, \$103,399; mill supplies, \$76,201; in all, \$1,615,186. This company controls the Wardner (formerly belonging to the Empire State - Idaho Co.), the Mace (formerly owned in part by the Standard Co. and in part constituting the Mammoth group), and the Burke (formerly the Tiger-Poorman group).

Near Wallace, the 16 to 1 mine is running its compressor by electric power from Spokane, Wash. About 50 H. P. is received. A raise is being made from the 400-foot to the 200-foot level, and when finished it is expected that the mill will be started.

The manager of the Monarch, near Murray, expects to have the 75-ton concentrator in operation by the first of the year. The frame work is completed and the machinery is now being installed. The company has a large amount of ore awaiting the completion of the concentrator. The Bear Top purchased the concentrating plant formerly used to treat the second-class ores from the Black Bear mine at Gem. The machinery has been moved to Murray and is being placed in position. The concentrates from both properties will be hauled to the railroad at Wallace and then shipped to the smelters.

## Washington County.

It is reported that the Werdenhoff M. Co., F. W. Hunt manager, will erect a reduction plant at Weiser.

## MONTANA.

## Deer Lodge County.

The Montana Zinc Co. has demonstrated the success of experimental tests of the zinciferous ores of the Alice mines at Walkerville and has leased the Alice 60-stamp mill for five years and arranged for a daily ore supply of 250 tons for that time. The mill is now being overhauled and will be ready by the last of December. Forty of the sixty stamps have been removed and two Blake rock breakers, three sets of Colorado Iron Works rolls, 16x36 inches, and one set of 27x14 Humphrey rolls have taken their place. The treatment will be by dry concentration, and the separation of the minerals in the zinciferous rock will be electrical. The plant will contain seven sets of separators and twenty sets of sizing machines or screens, also cyanide tanks for treating the siliceous residue containing gold and silver.

## Flathead County.

The Spokane Placer M. Co. has been organized at Spokane, Wash.; capital stock, \$1,000,000; F. W. Schwellenbach, president and general manager; R. H. Hoag, secretary. The company owns 1280 acres of placer ground on Standard creek in the West Fisher gold belt. The prospectus says this ground has been tested over an area of 1000 acres and that it will vary from 1 to 75 feet of pay dirt, and will yield 25 cents to the yard, and can be mined on an extensive scale. The company owns its own water right. The water will have a fall of 500 feet on the company's ground.

## Lewis and Clarke County.

The New Park mines in the Elkhorn mountains, 30 miles east of Helena, have been bonded by W. G. Paine for \$50,000 to a syndicate headed by A. C. Mason of Tacoma. The syndicate has a bond on the surrounding claims and is driving a 1400-foot adit tunnel through the rock to connect with all the ledges. The tunnel is in 440 feet, and about forty men are working on it, driving 10 feet a day. They will put a 100-ton concentrator on the claims.

## Madison County.

A 10-stamp mill is being erected at the Black Hawk M. Co.'s property near Norris. The mill will be ready for operation in February.

## Park County.

At Cooke, the Eagle M. & M. Co. has been organized to develop claims in the New World mining district. A. Gassert is superintendent and secretary at Cooke.

## Powell County.

The new concentrator at Emery, work-

ing over the tailings dump of the Emery mine, is a success. Some improvements are to be added as soon as possible and grading has been begun for the installment of another Huntington mill in the spring. C. N. Loring is in charge of the concentrator. The company are figuring on adding a cyanide plant to work the tailings from their concentrator.

## Silver Bow County.

The Eva May mine in Cataract district is to be again operated. It is owned by the Montana Mineral Land Dev. Co., of which Thos. C. Kelly is president. J. Hume of Butte, a mining man of ability, is now the manager of the property. Thirty-two men are employed.

## NEVADA.

## Esmeralda County.

The shaft on the Tonopah-Wilmington at Gold mountain is down 100 feet and crosscutting will be commenced in both directions. The new shaft is following the hanging wall. A 15 H. P. gasoline hoist will be put in.

The Florida mine was recently bonded for \$75,000. The company is now building a stamp mill and putting in concentrators. The Wisconsin mine has been sold to Tacoma men for \$20,000.

## Lincoln County.

The Siegel Con. M. Co. is shipping to the Salt Lake, Utah, smelters ore running 45% manganese, 150 ounces silver and \$2 gold per ton from Siegel.

## Nye County.

T. Fleming is manager at the Florence Extension, near Liberty.

Manager C. F. Maunders of the Utica mine at Liberty will increase his force and push development work.

J. W. Riggle has bonded the Grasshopper group of five claims, southeast of the Jumbo, to H. Dibley of San Francisco for a year for \$35,000. A force of men will be put on to develop the property.

The shaft on the Portland mine is down 120 feet and will be sunk 200 feet before crosscutting. The 34 H. P. engine and hoist from the Montana-Tonopah will be erected on the Portland mine.

Operation on the Golden Gate group, 1½ mile west of Tonopah, will be resumed. H. T. Bragdon, A. C. Eisen and H. H. Clark propose to equip it with a steam hoisting plant to sink from the 160 to the 500-foot level.

J. P. Brissell of Jefferson canyon reports that there is ample wood and water in the district and every probability that a mill will be erected on his properties there soon.

The N. Y. M. Co. have bought the steam hoist and building from the Stranger mine at Austin, and are moving it to their property.

## Storey County.

At the C. & C. a building, 60x22 feet, will house the largest air compressor on the Pacific coast—a 200 H. P. Ingersoll-Sargeant, 28½x16½x24, set on a concrete foundation 7 feet in depth and 18x12 feet in width. This will supply the air needed in the underground workings, and the lowest levels will be made cool and comfortable for the men to work in. It is to be driven by an electric motor.

At the Alta mine good progress has been made in repairing the shaft, and Superintendent Sharon is now inaugurating active work.

## NEW MEXICO.

## Grant County.

The reduction plant of the Comanche M. & S. Co., at Silver City, is nearing completion. Work is being pushed on the blast furnace building and when finished the capacity will be 300 tons daily. In addition to the working of the Burro Mountain properties, the company has purchased the Hearst mines at Pinos Altos, which have been developed extensively. In order to handle the output of this property, the company is going to build a narrow gauge road from Silver City to Pinos Altos, a distance of 9 miles. The company headquarters are at Milwaukee, Wis. S. S. Curry, Ironwood, Mich., is president and treasurer; T. G. Atkinson will go to Grant county and assume personal management of the Hearst properties, making his residence at Pinos Altos.

## OREGON.

## Baker County.

The Chicken Creek placer mines, known as the Weatherby mines, together with the water rights, were sold for \$22,000 cash, according to a deed filed for record. The deed is from J. N. Malsberger, who purchased the property a year ago from the Weatherby estate, to G. F. Frey, representing a syndicate of Eastern capitalists. The new owners will purchase other property adjoining and make arrangements to work the mines on a more extensive scale than ever.

The new roadway from California mountain into Big Limber and Bull Creek

sections has been completed. A short extension will bring it close to the Golden Rule, Storm King and La Bellevue mines and make Sumpter the supply point.

L. V. Swiggett, of the Constellation group in Big Lumber district, intends to install a hoisting plant and sink a double-compartment shaft and to open the Lucky Kid shoot and install a concentrating plant large enough to treat ores from the surrounding properties.

The Imperial mine at Cableville has been bought by the Imperial G. M. Co., Ltd., and extensive development will be at once started. A. L. McEwen will be manager, K. O. McEwen metallurgist and J. Arthur will continue as superintendent of mill operations. The new company will install a hoist to prosecute deep sinking on the Imperial vein, put a force developing the Eagle ore bodies and increase the milling capacity.

#### Douglas County.

The Osgood placers on Illinois river, near Glendale, will be worked this winter with three giants, which are now being placed in condition. F. H. Osgood of Seattle is owner.

At the Hall mine, 10 miles from Myrtle creek, owned by James and John Hall and J. Rice, the ore is being hoisted 75 feet to the surface by a whim, but the increasing output will necessitate the erection of heavier machinery to handle it.

#### Josephine County.

At the Millionaire mine, Gold Hill district, machinery will be placed to facilitate development and, if the ore body warrants, a stamp mill will be placed next spring. M. Ward of Portland is manager.

J. F. Reddy and P. Clark of Spokane propose the installation of a 40-stamp mill before long at the Opp mine, near Jacksonville. Ten stamps are now dropping.

The Rogue River Courier gives the following list of producing quartz mines in southern Oregon: Greenback mine, Grave Creek district—Two mills, one of ten, one of thirty stamps; 100-ton cyanide plant, output \$40,000 monthly; C. W. Thompson, superintendent, Greenback. Gold Bug mine, Mt. Reuben district—Five-stamp mill, 30-ton cyanide; supposed production, \$5000 monthly; R. Jones, superintendent, Glendale. Ajax mine, Mt. Reuben—Three-stamp mill; superintendent's address, Glendale. Kremer & Palmer mine, Mt. Reuben—Ten-stamp Parker mill; W. Kremer, superintendent, Myrtle Creek. Granite Hill mine, Louse Creek district—Ten-stamp mill; ten more will be added by July; L. Y. Wickersham, superintendent, Grants Pass. Gopher mine, Jump Off Joe district—Five-stamp mill and equipment; superintendent, Dean, Grants Pass. Baby mine, Jump Off Joe district—Undergoing development; 2-stamp mill operated; C. C. Higgins, superintendent, Grants Pass. Vulcan mine, Grave Creek district—Five-stamp mill and concentrators; superintendent's address, Placer. Yellow Horn mine, Grave Creek—Uses Vulcan's mill; superintendent's address, Placer. Eureka mine, Soldier Creek district—Ten-stamp mill and splendid equipment of boilers, engines, hoists and compressor; H. C. Nelson, superintendent, Grants Pass. Rising Star mine, Williams district—Five-stamp mill and plant; superintendent's address, Williams. Boie of Contention mine, Williams district—Eight-stamp mill; manager, F. J. Catherine, Grants Pass. Mountain Lion mine, Williams district—Five-stamp mill; C. E. Harmon, Grants Pass. Braden mine, Gold Hill district—Ten-stamp mill and plant; more stamps to be added soon; R. C. Ray, Tolo. Bill Nye mine, Gold Hill district—Five-stamp mill and plant; Bill Nye M. Co., Gold Hill. Golden Wedge mine, Galice district—Three-stamp mill; cyanide plant and other equipment to be added; Thien Bros., Golden Wedge, Galice. Harth & Ryan mine, Wards Creek district—superintendent, H. Harth, Grants Pass. Golden Standard mine, Gold Hill district—Five-stamp mill; Kubli Bros., Jacksonville. Hammersley mine, Jump Off Joe district—Five-stamp mill, concentrator; F. H. Osgood, Grants Pass. Ida mine, Louse Creek district—Two-stamp mill; L. Y. Wickersham, Grants Pass. Comstock mines, Baldy district—J. M. Layman, Grants Pass. Mule mine, Rogue River district—Five-stamp mill; superintendent's address, Gold Beach. Oregon Belle mine, Forest Creek district—Four-stamp mill; Foster & Gunnell, New York & Western M. Co., Grants Pass. Oro Fino, Jump Off Joe district—Forty-ton cyanide, with Sturtevant rolls, ore crushers; manager, S. Chase, Grants Pass. Opp mine, Jacksonville district—Ten-stamp mill, concentrators; manager, J. F. Reddy, Medford. Takilma Smelter, Waldo district—One hundred-ton copper smelting plant, Takilma Smelting Co., Colorado Springs, Colo.; manager, C. Tutt.

A rich strike has been made at the old Free and Easy mine, on the Illinois river, near Kerby. The property was recently purchased by the Siskiyou Sunset M. &

Dev. Co. of Grants Pass, who are planning to install a cyanide plant.

The center of interest in platinum mining in the United States has shifted from Shasta and Trinity counties, Cal., to southern Oregon, where, in the neighborhood of Grants Pass and Kerby, considerable platinum and iridium are found in the placer gold. In collecting this material another heavy mineral has proved commercially profitable—that is, the natural alloy of iron and nickel called josephinite, which is found associated with the platinum and gold. The quantity of pure platinum contained in the platinum sand, obtained in 1903, amounted to 110 ounces of refined metal, worth \$2080.

### SOUTH DAKOTA.

#### Lawrence County.

The Clover Leaf M. Co. at Deadwood is attempting to remedy the wet condition of the mine due to seepage from Elk creek. An addition to the mill is being considered and also an additional forty stamps. O. B. Amsden is superintendent. Stockholders in the Columbus Con. Co. at Deadwood understand that the present need is money in order that a large amalgamation and cyanide mill can be erected. J. H. Mayham is president, M. Thompson general manager.

### UTAH.

#### Carbon County.

It has been determined by Manager Williams and Superintendent Smith of the Utah Fuel Co. that the new coal camp up Willow creek, northeast of Castle Gate, is to be opened up, being run by power from the electric plant at the Castle Gate workings.

The creation of the new camp means the building of 100 coke ovens at Castle Gate and 2 miles of railroad to reach the new mine by the Rio Grande Western Railway.

#### Salt Lake County.

The Ohio Copper Co. has purchased the Winnemuck group of mines at Bingham for \$50,000. The property is equipped with a mill which the purchasing company has been operating under lease. This will be enlarged so as to provide for the handling of an increased tonnage.

#### Summit County.

Classifying tanks will probably be put in the mill of the California mine, near Park City, as considerable values are carried off in the waste.

#### Utah County.

J. H. Wootton, manager of the Utah Co. Light & Power Co., says that an auxiliary power plant is to be put up 1½ mile above the present plant and will probably furnish power to the Utah C. Co.'s mill at Bingham. The construction of the plant will cost about \$150,000.

Articles of incorporation of the Knight-Roberts M. Co. have been filed at Provo by N. and J. J. Knight, B. M. Roberts, H. G. Blumenthal and A. Nelson, with B. M. Roberts secretary and treasurer. The company owns the Roberts mine in Rock canyon. A tunnel 1500 feet long to tap the vein 1700 feet below the surface will be driven.

Manager G. H. Dern of the Con. Mercur reports that the December ore output is approximately 20,000 tons. The mill at Manning has been operating since September 26th. The new sampling mill is almost completed.

### WASHINGTON.

#### Ferry County.

Five men, under Superintendent Case, at the California mine are unwatering the mine and repairing the shaft. The shaft has been cleaned and retimbered as far down as the water in it would permit. The removal of the dirt and old timbers which caved from the roof has revealed less damage from the caving than was expected.

R. L. Boyle, president of the Keller & Indiana Con. S. Co., has purchased a 150-ton smelter, sampling plant, turbine water wheel and an electric plant for the new works at Keller.

The Washington S. & R. Co. has organized to erect a smelting plant for the ores of the Belcher M. Co., the Midnight and the Jupiter-Ammon. The plant will be erected near West Fork, about 15 miles south of Republic, on the San Poil river.

#### Stevens County.

The Five Mile concentrator, 5 miles above Trout Lake City, on the south fork of Lardeau creek, is working double shift and handling the ores from the Nettie L. and Silver Cup, with which it is connected by aerial trams. This plant is preparing to increase its capacity to handle custom ores. The additional stamps will probably be installed this winter.

The Frisco-Standard M. Co., 8 miles east of Boundary, has completed a wagon road from the mine to the county road, along Fish creek, and is shipping ore to the railroad at Boundary. Superintendent

J. Keogh is considering the installation of a jig, having demonstrated the value of concentration.

### WYOMING.

#### Laramie County.

The Globe M. & M. Co., owning the Hecla mines at Silver Crown and the stamp mill at Hecla, proposes to erect a \$100,000 smelter at Hecla to treat the ores of the Silver Crown district and the mines in northern Laramie, Converse, Natrona and other counties. T. E. Swartz of Denver is mentioned in prominent connection therewith.

### FOREIGN.

#### AFRICA.

##### Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports the gold output for October, 1904, of the Witwatersrand mines at 313,928 fine ounces. The return for the outside districts is 11,697 ounces. The following table gives the output in fine ounces for 1904 to November, compared with 1903:

Month.	Rand.	Outside.	Total.
January.....	278,867	9,957	288,824
February.....	282,436	7,066	289,502
March.....	299,625	8,017	308,242
April.....	297,470	8,475	305,945
May.....	306,586	7,894	314,480
June.....	299,913	8,306	308,219
July.....	298,825	8,015	307,840
August.....	301,113	11,164	312,277
September.....	301,131	11,155	312,286
October.....	313,928	11,697	325,625
November.....			
December.....			
Totals.....	2,979,894	93,347	3,073,241
		1903.	

Month.	Rand.	Outside.	Total.
January.....	192,935	6,345	199,280
February.....	187,977	5,536	193,513

#### BRAZIL.

Diamonds are mined to a limited extent near Franca, Sao Paulo; Tibagy, Parana; Bagagem, Agua-Suja, and various points in southwestern Minas Geraes and Goyaz. Hyaline quartz (Brazilian pebbles) and citrine quartz (false topaz) are mined at the Serra dos Cristoes, in Goyaz.

### BRITISH COLUMBIA.

#### Boundary District.

The output of the important mines of this district can be judged from the weekly shipments: Granby mines to Granby smelter, 11,370 tons; Mother Lode to Greenwood smelter, 3808 tons; Brooklyn-Stemwinder to Boundary Falls and Trail smelters, 2170 tons; Sunset to Boundary Falls smelter, 360 tons; Emma to Greenwood and Nelson smelters, 891 tons; Senator to Granby smelter, 165 tons; Mountain Rose to Greenwood smelter, 66 tons; Athelstan - Jackpot to Boundary Falls smelter, 90 tons; Skylark to Granby smelter, 20 tons; total, 18,940 tons; total for year to date, 744,631 tons. Granby smelter treated 11,650 tons this week, or 533,381 tons for the year to date. Boundary Falls smelter treated 2120 tons, or 20,260 tons since starting operations.

The first electric locomotive to be used in any copper mine in British Columbia is to be put in at the Granby mines. A Baldwin-Westinghouse direct-current locomotive, driven by two 35 H. P. motors, will be operated at the No. 3 tunnel level in the mine and out to the new ore crusher and ore bins. The crusher will be operated by two 75 H. P. electric motors, and the two 3-ton ore skips, running in balance, will be driven by a 35 H. P. motor.

J. P. Graves, manager of the Granby mines and of the smelter at Grand Forks, announces that the company will increase the daily smelting capacity 700 tons and will put in the necessary blowers for handling the ore, motors for driving them and engines and cars for moving the slag. Blowing engines will also be added to the smelter to increase the converting capacity. We have six furnaces and two more will be put in this year. The ten shells in the converters will be increased to fourteen when all the improvements are in. At the mines new bins, crushers and motors will be put in to take the ore from No. 3 tunnel. Electric haulage engines will be used to land the ore at the railroad.

#### East Kootenay District.

It is reported that the Eva G. M., Ltd., will shortly install a compressor to facilitate work on the Eva. John Knox, Jr., is local manager and superintendent at Camborne.

#### Nelson District.

For October the Ymir mine at Ymir re-

ports that twenty stamps ran twenty-nine days and crushed 1700 tons of ore, producing 412 ounces of bullion; estimated realizable value of the product, \$4925; ninety tons of concentrates shipped, of a gross estimated value of \$2250; cyanide plant treated 1150 tons of tailings, producing bullion of an estimated gross value of \$550; 38 tons of crude ore shipped, \$1950; sundry revenue, \$220; total revenue, \$9875; working expenses, \$9780; profit, \$115. There has been expended during the month on development \$403.

#### Yale District.

Manager M. K. Rodgers of the Daly Red. Co., Hedley City, has taken a working bond of \$160,000 on the Maggie group in Aspen Grove, Nicola Valley mining division, and will equip the mine with machinery.

### CANADA.

#### Yukon Territory.

The Dominion Government has established a temporary office for recording claims on Buntz creek. The discoveries in the Tanana country have decreased the population of Dawson 2404.

The postoffice department have made arrangements with the northwest mounted police by which the latter will carry mail this winter to outlying points; for this service policemen will receive additional remuneration.

### MADAGASCAR.

Mining districts are being opened up in Madagascar and the local Government is doing what it can to favor the movement, says La Quinzaine Coloniale. The director of the mining service reminds prospectors that in applications for a license, after staking claims, the registration of the application at the chief town of the circumscription gives a priority of claim. M. de Floris has been working alluvial deposits. In a single claim which he started to work last year, he has already obtained 250 kilogrammes (4 hundred-weights 103.2 pounds) of gold, and the yield increases every month. At present it is 35 kilogrammes per month. He employs 2000 to 2500 miners. The richness of the placer led him to examine the higher districts of the locality, and he found a gold-bearing quartz outcrop. M. Colson of La Reunion is also interested in companies being organized to develop these fields.

### MEXICO.

D., M. and S. Guggenheim, of the Guggenheim Exp. Co. and the American S. & R. Co., have been in Mexico making a tour of the mines and operations of those two concerns. S. W. Eccles of the company says of the new Velardena smelter that the capacity of the plant and its exact location will not be settled until they return to New York. The old one is worn out. They have abandoned the Descubridora copper mines in Durango. At San Gil, 30 miles east of Aguascalientes, they have been opening up the Santa Francisca mines, and have built a railroad 12 miles long to them from San Gil station, on the Mexican Central. These mines will be producing by May 1.

#### Chihuahua.

The Evanston M. Co. is shipping ore to the Torreón smelter from the Purisima mine, in the San Juan del Rio district. The company is erecting a hypsulphite lixiviation plant to handle its low-grade ore and to be in operation Dec. 1.

Manager Coleman, of Lluvia de Oro mines of western Chihuahua, plans the erection of ten more stamps in the mill, making twenty in all.

A. V. Garcia and R. Emerson have purchased from Dale Bros. and F. McDonald the Inglaterra mine of thirty-five pertenencias in the Santa Eulalia camp.

P. H. McDermott of Los Angeles, Cal., and H. N. Cannon of San Diego, Cal., have commenced work on the Americano at Terrazas camp. The present pumps have a capacity of 1350 gallons per minute, but if heavier ones are necessary they will be put in.

J. C. Brooks has resigned as superintendent of the Granadina M. Co., Santa Barbara. Mr. Brooks says that a 75-ton concentrating plant is to be built 1600 yards from the mine. An air compressor for four drills has been installed and an 85-foot galloways frame has been put up. J. W. Pender is general manager.

It is reported that the Torreón Smelter is to put up a 75-ton concentrating plant on the San Diego mine at Santa Barbara. J. W. Pender is manager.

#### Durango.

H. W. Higley of the Santo Nino mine at Tepehuanes, will put in a 25-ton cyanide plant.

Superintendent H. W. Higley, of the Santo Nino mines at Tepehuanes, has ordered a 25-ton cyanide plant for that property.

The Monterey News reports that C. C. Codman of Monterey has a concession for

customs smelting plant to be erected in Durango. A. B. Callender of Monterey has been gathering data for such a plant.

#### Sonora.

(Special Correspondence).—The success of the gold dredger in central California directs attention to similar possibilities elsewhere, and in this vicinity W. C. Greene is spending some of his copper profits to develop hydraulic gold mining here on a large scale. He has chosen the Santo Domingo river bed, which here passes through a canyon, the walls of which rise in places 2000 feet. Preliminary prospecting shows that there is about 30 feet top gravel and clay which pans about 30 cents gold per cubic yard. Below is the ancient river bed, indurated cement, much like that found below the lava in Placer county, Cal., drift mines; this latter yields an average of \$3 per cubic yard. It is Mr. Greene's intention to use steam shovels and sluices for the loose top gravel, the lower and harder to be dug out and carried by aerial tramway. A dredger is now being put in at La Busca canyon.

Magdalena, Nov. 20.

President W. C. Greene of the Cananea Con. Co., at Cananea, says they are producing 3000 tons of copper, 40,000 ounces of silver and 2000 ounces of gold per month. The gross valuation of this output is \$900,000 gold, monthly. There is one ore body 600 feet wide. The Greene placers at La Bresca, in Magdalena district, are in operation, and by January 1 they expect to be producing \$350,000 gold per month, says Greene. The method of handling the dirt is by overhead cables. These cables handle skips into which steam shovels dump the placer dirt and the skips dump it into the sluices. The pumps handle 6000 gallons of water per minute, handling all the water in the box canyon, leaving it dry to work.

### Books Received.

The Department of the Interior has issued a series of statistical bulletins extracted from David T. Day's report on "Mineral Resources of the United States." "Production of Quicksilver in 1903," "Production of Precious Stones in 1903," "Production of Platinum in 1903" and the "Production of Tin in 1903" have been received.

Catalogues of the periodical publications in the library of the American Institute of Mining Engineers and of the American Institute of Electrical Engineers may be had by applying to the secretaries thereof. They give a complete list of technical journals and reports now in the library and enumerate the missing numbers required to make complete sets, inviting members to remedy this want. Members living at a distance may write to the librarian of the Institute asking for information, extracts or abstracts of literature upon subjects in which they are interested.

Architects will welcome "Locks and Builders' Hardware," by H. R. Towne, as a valuable aid in designing and estimating building construction. The author is president of the Yale & Towne Mfg. Co. and the past president of the American Society of Mechanical Engineers. The volume includes a historical review of its subject, technical descriptions of the leading facts of locks and their component parts, a detailed enumeration of the articles included under the term "builders' hardware" and a discussion of the subject of architects' specifications relating to the selection and furnishing of builders' hardware. W. W. Kent writes on the "Schools of Ornament," describing the origin and characteristics of the recognized schools into which architectural design and ornament have been classified. It is published by John Wiley & Sons, New York City, at \$3.

### Trade Treatises.

The important question of magnetic treatment of iron-zinc lead ore is the subject of a special treatise issued by the United Iron Works of Springfield, Mo., describing and illustrating in detail the Cleveland-Knowles electro-magnetic separator.

#### Dividends.

The Bunker Hill & Sullivan M. & C. Co., Idaho, dividend No. 86 of \$7500, payable Dec. 5th; total paid since Jan. 1st, 1904, \$738,000; total to date, \$2,271,000.

### Personal.

THE address of Henry G. Catlin is wanted.

T. BRADFORD has left Cripple Creek for Montana City, Nev.

C. M. CLARK of Phoenix, Ariz., is in charge of the Union mine.

JAS. CHYNOWETH is now superintendent of the Miskwabik M. Co., Keweenaw, Mich.

C. C. LEAVITT, superintendent of the Monumental mine, Waldo, Or., has resigned.

W. F. FREMERSDORF is now mining engineer at the Stonewall mine, Cuyamaca, Cal.

A. W. HARE of San Francisco, Cal., is at the Crown Deep mine, Johannesburg, S. A.

HENRY DAHL is superintendent of the Ophir mine on Raven hill, near Cripple Creek, Colo.

C. H. SHERMAN of San Francisco, Cal., is operating in the Magdalena district, Sonora, Mex.

JAMES WILSON is superintendent of the Alps mine on Quartz hill, near Central City, Colo.

B. M. ARMITAGE is manager of the Yellow Jewel mine at Myrtle creek, Douglas county, Or.

SUPERINTENDENT HENRY KALER of the Grey Eagle mine at Maybert is in San Francisco, Cal.

THOS. YERKES has returned from Philadelphia, Pa., to his mines at Santa Ana, Sonora, Mex.

G. C. SMITH is superintendent of the Old Union mine, on Mineral hill, near Breckenridge, Colo.

A. C. JESKEY is superintendent of the Golden Star mine, below Nelson Point, Plumas county, Cal.

R. A. THOMAS is superintendent of the Esperance drift mine, near French Corral, Nevada county, Cal.

R. M. EDWARDS succeeds J. D. Hosking as superintendent of the Franklin mine, Calumet, Mich.

J. E. SPURR is at Goldfield, Nev., conducting investigations to supplement his report on that region.

GEORGE MORRISON is superintendent of the Golden Wave mine, 3 miles south-east of Congress, Ariz.

MARK R. LAMB of the Cal. H. E. & S. Co. has returned to San Francisco from Minas Prietas, Mexico.

A. F. KROHN is assistant superintendent of the Greene Con. Co. at La Brisca, Sonora, Mexico.

O. H. FAIRCHILD, who has been examining the Atlas mine at Ouray, Colo., has returned to De Kalb, Ill.

R. A. KILPATRICK, formerly shift boss on the Portland mine at Cripple Creek, is in Goldfield from Alaska.

F. KEFFER is manager of the Mother Lode mine, near Greenwood, Boundary district, British Columbia.

C. P. HALTER is superintendent of the Las Vegas copper mine, near Coyame, in eastern Chihuahua, Mexico.

SENATOR W. C. RALSTON will succeed D. B. Hinkley as president of the Fulton Iron Works of San Francisco, Cal.

S. A. R. SKETCHLY is managing the development of the oil fields of the Mexican Oil Corp. at Tuxpan, Vera Cruz, Mexico.

C. J. JOHNSON has returned to Spokane, Wash., from examining the Scandia tunnel and the Climax group in eastern Oregon.

W. D. CLAIR is superintendent at the mines of the Sylvania Co., in the Palmetto range, 40 miles southwest of Goldfield, Nev.

PAUL COULDREY, who has been superintending operations on the Le Roi No. 2 of Rossland, B. C., has left for Sydney, Australia.

A. E. CURRY, of the X-Ray M. Co., is investigating the company's properties at Cottonwood lake, near Buena Vista, Chaffee county, Colo.

S. H. LUCAS has resigned as superintendent of the Cuyamaca M. Co., Cuyamaca, San Diego county, Cal., and is located at San Diego.

E. GEE, formerly manager of the Pride of the West M. Co., Washington Camp, Santa Cruz county, Ariz., is now at Via Guaymas, Lower California.

JAMES EARLS has resigned as superintendent of the Bullion-Beck mine, and has gone to Salt Lake City, Utah. Foreman Anderson succeeds him.

JOS. RANDEL, underground manager at the Nanaimo collieries, British Columbia, has been succeeded by Thos. Mills, the present assistant manager.

W. B. SALE, president of the St. Louis White Lead Co. of St. Louis, has been in Prescott, Arizona, negotiating for the lead output of Yavapai county.

E. J. STOCKFELDT, formerly chief electrician for the Sheep Creek mines, Alaska, is installing an electric plant at the Eagle River mines at Eagle, Alaska.

WM. HANAN of the Bradley Eng. Co. of Spokane, Wash., is at Republic, taking an inventory of the machinery of the Republic Power & Cy. Co.'s mill.

J. M. BELL, an instructor in mining at Harvard University, has been appointed official geologist of the government of New Zealand, to succeed James Hector.

W. THOMPSON has left the Velvet-Portland mine at Rossland, B. C., to act as general manager of the mines of the Waterson Gold, Ltd., at Ocampo, Chihuahua, Mexico.

A. N. GOULD, civil engineer, is superintending the work of surveying and leveling for a large mining ditch being constructed for the Commander mine at Eckley, Curry county, Or.

J. T. GRIBBLE of Grass Valley, formerly superintendent of the Reward mine, has left San Francisco for the Island of Luzon, in the Philippines, where he will assume charge of a mine.

THOMAS RUSSELL who was foreman at the Moody mine, Groveland, Tuolumne county, Cal., will take charge of property belonging to W. A. Nevills, in Amador county. He is succeeded by R. Barrett.

RALPH FINDLAY, formerly superintendent of the Portland mine, has been made general manager of the Elkon properties at Cripple Creek, Colo., succeeding E. M. De La Vergne, the newly elected Senator.

J. C. BROOKS, Chihuahua, Mexico, has resigned as superintendent of the Grenada mine at Santa Barbara to take a similar position at Avino, Durango, with the English company of that camp, which is managed by W. B. Jeffery.

### Commercial Paragraphs.

THE Westinghouse Electric & Manufacturing Co., through their agents G. & O. Braniff & Co. of Mexico, has been awarded the contract for all the electrical apparatus to be installed at the El Oro Mining & Railway Co., El Oro, Mexico. This contract amounts to nearly \$100,000.

THE general offices of the Stromberg-Carlson Telephone Co., which were formerly at Chicago, have been moved to Rochester, N. Y., where the main factory is located. A Western salesroom and stock will be maintained at Chicago as heretofore. The factory at Rochester is a modern one in every way and admirably adapted to the careful work necessary for the construction of telephones. The buildings are of one story and with skylights covering the entire area. They are situated alongside the New York Central Railway tracks, which gives facilities for loading direct into cars. The mine telephones made by the Stromberg-Carlson Telephone Co. are coming into general use, as they have demonstrated that a great saving of time and labor is possible where they are installed.

#### Some November Mine Dividends.

Silver King, Utah, Nov. 10, \$100,000.  
Natividad M. Co., Mexico, Nov. 10, \$12,000.  
Dos Estrellas, Mexico, Nov. 15, \$13,800.  
Daly-West, Utah, Nov. 15, \$72,000.  
Central Eureka, California, Nov. 11, \$19,921.  
Annie Laurie, Utah, Nov. 12, \$12,500.  
United Copper Co., Montana, usual dividend on preferred stock of \$150,000.  
Gold King M. Co., Colorado, Nov. 15, \$9369.  
Montana Ore Purchasing Co., Montana, Nov. 14, \$2 a share, \$162,000.  
Amalgamated Copper Co., Montana, Nov. 28, 50 cents a share, \$769,420.  
Bunker Hill & Sullivan M. Co., Idaho, Nov. 4, 25 cents a share, \$75,000.  
Great Central M. Co., Utah, Nov. 20, 5 cents per share, \$12,000.  
Mammoth M. Co., Tintic, Utah, Nov. 15, \$20,000.  
Anaconda M. Co., Montana, Nov. 18, 50 cents a share, \$600,000.  
St. Eugene Con. M. Co., at Moyie, B. C., declared a dividend of 2 cents a share.

### Latest Market Reports.

SAN FRANCISCO, December 9, 1904.

#### METALS.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c, refined (1000 fine); San Francisco, 59½c; Mexican dollars, 47½c San Francisco, 48c New York.

COPPER.—New York: Standard, \$14.87½; Lake, 1 to 3 casks, \$14.67½@15.25; Electrolytic, 1 to 3 casks, \$15.00; Casting, 1 to 3 casks, \$14.75; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: £66 spot per ton.

LEAD.—New York, \$4.75; Salt Lake City, \$3.50; St. Louis, \$4.12½. San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £12 17s 6d long ton.

## Undeveloped Resources.

Every mining State and region of the West has undeveloped mineral resources, no matter what their previous history may have been. The gold and silver mines are always first to be developed it would seem. This is due largely, if not wholly, to the fact that gold and silver are in demand; there is no competition in their production; the product is readily disposed of and at the highest price to those eager to buy. Moreover gold and silver, generally speaking, are more easily obtained than most other metals and minerals, and their treatment more simple than most other ores, and there is an immediate and constant demand for them. For these reasons gold and silver mines are the first to be developed in the mining regions of the West, but their development and operation at once creates new needs, and many of these must be supplied by the mines of other metals and minerals. Cities spring up as a direct result of the operation of the gold and silver mines. Buildings require stone, lime, bricks and terra cotta in their construction, and these are taken from the neighboring hills where they can be found. Quarries are opened, lime kilns are built and operated, brick yards

none of which are at present in operation, but the day is not far distant when this great basal industry

material advantage of the West.

In addition to these undeveloped resources there are still in the forest-clad mountains of Oregon, Washington, Montana and Idaho; in the Sierras of California; in the rugged desert hills and valleys of Nevada, Utah and Arizona, and in the heart of the Rocky mountains in Colorado, many undeveloped and even undiscovered deposits of gold, silver, copper, lead and zinc which in future years will be the basis of a great industry. There still remain deposits of borax, soda, gypsum and marble, and many other minerals as yet untouched.

The reason for this is largely due to lack of transportation—a factor in the mining industry of paramount importance, and particularly as related to base metal mining and the production and marketing of the earthy minerals and structural materials, but time will change this and means of transportation will be provided which will make all that are now known available, and will aid in the discovery and development of those the existence of which is, as yet, unsuspected.

THE State of Illinois has a law which has been sustained by the appellate court of that State making it a misdemeanor to employ boys under the age of 16 years at any hazardous occupation, including mines. There are said to be over 2500 boys under the age of 16 years who have found employment in the coal mines of that State. There are 973 coal mines in that State.

and potteries spring into existence. Soon sulphide ores are developed in the gold mines and the chlorination process is often turned to. This demands manganese oxide from the mines and salt from the marshes. Sulphuric acid may be made as a by-product of the roasting of the rebellious pyrite. Fuel must be had to furnish heat and steam for power. Coal mines and oil wells supply this need better than any other fuel, and often less expensively.

In time copper mines are also developed, though in some instances these are the first to attract attention, because the product is available and the metallurgy of these ores is more simple. Every Western State has large deposits of iron ore, and although this—the iron industry—is the foundation upon which all industrial life is built, yet, strange to say, it is usually the last to receive attention. This is, of course, owing to economic causes. In the United States the mines of the Lake Superior region, Pennsylvania, Alabama and Missouri supply iron and steel cheaper than they can be made, apparently, west of the Rocky mountains. But this is gradually changing, for to-day large iron mines are being developed and operated in Colorado, Wyoming and Arizona, and even in Mexico great iron and steel plants are projected to replace the smaller affairs already in existence. Utah, Montana, Nevada, California, Oregon and Washington all have great iron deposits,

of our national prosperity must be equipped and operated in the West at a profit, and to the greater

## Production of Gold and Silver in 1903.

An advance sheet of the statistics of annual production of gold and silver in the United States in 1903 has been received from the United States Geological Survey, which contains the surprising statement that in that year Nevada's output of the precious metals, due chiefly to the shipment of rich ore from Tonopah, "made Nevada the leading State in the Union in the production of gold and silver in 1903." According to the "Mineral Resources of the United States" for 1902, issued by the United States Geological Survey, the production of gold in Nevada in 1902 was \$2,895,300, and \$1,985,486 (commercial value) silver—a total of \$4,880,786. As the advance sheet states that the increase in production of gold and silver in Nevada during 1903 was \$492,700, the total output for 1903 for that State should have been about \$5,373,000. As there are several States which in 1902 are known to have produced considerably in excess of this amount, and in which the falling off, if any, in mineral production has been comparatively slight, it is clearly evident that Nevada, although increasing production rapidly, is still far from leading in the output of precious metals. In 1902 Alaska produced over \$8,000,000, which was increased in 1903; California produced over \$17,000,000 in 1902 and nearly the same in 1903; Colorado over \$36,000,000 in 1902 and about \$30,000,000 in 1903; Montana produced over \$11,000,000 in 1902 and nearly as much in 1903; South Dakota in 1902 produced over \$7,000,000 and nearly the same in 1903; Utah's production in 1902 was over \$9,000,000 and exceeded this in 1903, and Arizona produced \$5,725,143 in 1902 and showed an increase over this in 1903.

These figures merely indicate that, although Nevada is rapidly increasing her output of precious metals, and that while the statistics for 1904 will probably show a still further increase over 1903, that State is not in the lead as stated by the bulletin of the United States Survey, but really is number seven in the list.

Naturally the United States Geological Survey is looked to as a source of reliable information, but such

statements as these, bearing the names of the director of the Survey and of the director of the Mint, are not only misleading, being absolutely incorrect, but tend to throw a shadow of doubt over all of the official figures of the Survey. These bulletins are prepared in Washington and sent throughout the world for the purpose of giving advance information. Doubtless the official report will, when issued, be found correct, but there seems no good excuse for the advance sheets containing so flagrant an error as that above referred to.

## An Interesting Report.

The annual report of Stratton's Independence mine at Cripple Creek, Colo., recently issued from the London office, for the year ending June 30, 1904, shows that during the year 43,758 tons of ore were shipped to mills and smelters at a cost of \$24.29 per ton, the gross value of the ore being but \$21.695 per ton, resulting in a loss to stockholders of \$2.595 per ton. The cost of mining per ton seems high—\$5.182—but this is due to the fact that the values occur in a zone of reticulated rich seams, and a large amount of ground must usually be broken to secure a ton of payable ore. The cost of blocking out ore is stated to have been \$4.131, and this, with other expenses of practical operation, is considered as not extraordinary in a mine of the character of the Independence.

There are, however, expenses which seem unusually heavy and which represent the difference between success and failure, if they could be eliminated. The item of foremen, for instance, is \$0.265 per ton, or over \$11,500 per year for underground superintendence; that of watchman on the surface is about half as much—nearly \$6000. The cost of hoisting, tramming, sorting and loading ore is over \$2 per ton; but this again is due to the character of the mine and of the ore. The combined salaries of manager and consulting engineer were nearly \$40,000 for the year and the expenses of the London office exceeded \$17,000, in addition to which over \$5000 was expended on a special expert examination of the property. Over \$10,000 was spent in settlement of claims on account of the accident at the mine, when a number of men lost their lives as a result of overwinding.

As the total loss on the year's operations is stated by the report to be only about \$11,000, a casual study of the report indicates that there are several items of extraneous expense which, if omitted, would change the balance from the loss to the profit side of the account.

The mine report furnishes a fair illustration of the topheavy organizations occasionally formed abroad (and sometimes at home), for the management of mining properties. Mines, greater in extent and of greater intrinsic worth, are successfully operated in the United States without expensive and unnecessary attachment of such costly management, and where watchmen do not cost so much, nor the head office expenses absorb so large a portion of the gross output of the mine. It is such flotations that often do harm to the advancement of legitimate mining, for those who would ordinarily become investors look with suspicion upon any mine promotion, after having been a stockholder in a concern run on apparently extravagant management.

That the mine in question had the elements of success within it during the fiscal year covered by the report is self-evident, but the result of even such magnificent management must prove unpalatable to stockholders, for they cannot help making a comparison between the result and the eminently satisfactory outcome of working numerous mines in Cripple Creek district under other systems clearly applicable to this mine.

SOME of the niceties of discrimination in the classes of work and pay made by trade unions cannot fail to have a reactionary and disastrous effect upon themselves. As an instance, a man who is listed as a particular kind of an artisan is allowed to work a stated number of hours daily at his trade receiving a stipulated daily wage. He cannot work as a helper at this trade, for a less rate of wages, even though he be otherwise unable to obtain employment. Each man is placed in his particular class and there he must remain, no matter what the result to himself and others associated with him.

## Water Rights.

A subject of great moment to miners of the Western States is that of water rights, and yet this is a subject upon which there has been comparatively little legislation. Contests over the appropriation and use of water have been numerous enough, it is true, and as an outcome of these many causes we have a large number of court decisions which take the place of laws enacted by legislative bodies. This judicial legislation covers many phases of the appropriation and use of water in the Western States. In the early mining days in the West a new code of rules and regulations was evolved, differing materially from the common law covering water in the East and in England. In those days mining was the most important industry, overshadowing every other, but with the development of the country other industries came into existence, and the miners' law of water appropriation and use began to receive criticism and, finally, opposition. As previously stated, many suits at law resulted, and it is largely these decisions which constitute the law of the West in all matters appertaining to water. Elsewhere herein is the first of a series of papers on "Water Rights in California," considered from a legal standpoint, and is the first extensive treatment which this important matter has received outside of the pages of law books. For reference these papers will become valuable to all those interested in the law of appropriation and use of water in California, and also to some extent, in other Western States outside of Nevada, where mining is still the paramount industry, and where all judicial decisions in water cases favor the miner.

## A Boston Enterprise.

Many and devious are the ways of wary men who work the unwary with meretricious mining schemes, though seldom is much notice given herein, as our readers are of the intelligent class who need no exposure of dubious measures. But a case just to hand deserves brief notice, as illustrating the brazen nature of such creatures. In Challis, Idaho, is published a creditable local paper, the Messenger, which tries to have a good word for legitimate mining development and has justly earned a good reputation for accuracy. A Boston concern, trading in the truthfulness of the Idaho paper, has issued a facsimile of the Challis Messenger, reading matter, advertisements and all, calling it the Messenger and purporting to be published at Challis, Idaho, but with "booming" notices of sundry mine prospects of alleged value, that would not find place in the paper that is thus so flagrantly counterfeited. The Challis paper proposes to prosecute the enterprising Boston gentlemen. Probably that is what they want; anything for notoriety. It certainly is natural for a reputable paper to seek some vindication in such case, but its proprietor cannot get any substantial judgment for the manifest injury done him, and suit would only give them further advertising. The United States postal authorities could probably be of most assistance in such a case.

THE progress and improvement of the past ten or fifteen years in mining methods is due, not to the effort of any particular mine manager, or set of managers, but comes from every corner of the world. The mining practice of the Comstock Lode during its best days was taken to every corner of the world where these methods could be applied, and they have been improved upon ever since, until today the mine methods of Australia are as well known in the United States as those of the United States are known elsewhere. The best of the various methods are applied in each case and the result is improvement. At first large stopes were timbered by the square set method; as a matter of necessity the filling method was adopted. Now, where permissible, the square set method has been modified in such a manner that a large portion of the system can be dispensed with, filling alone taking its place, and in some instances large stopes are extracted and filled without any timber being employed at all. This latter method is applicable to many mines, but the cost of labor is likely to prohibit its use in any county except where unskilled labor is extremely cheap, which is not likely soon to be the case in the United States.

## CONCENTRATES.

THE oil process saves the finest slimes in tailings from Wilfley or other concentrating tables. For close work it is necessary that sulphides have a fresh surface; oxides cannot be treated.

\*\*\*\*

It is not an uncommon thing for structural materials in gold-mining camps to carry appreciable amounts of gold. The mortar and bricks often are made from gold-bearing clay and tailings.

\*\*\*\*

WHERE crude oil is used for fuel under boilers, the oil may be kept fluid by carrying the exhaust steam from the engines in a pipe placed in contact with the oil pipe line leading from the oil tank to the burners.

\*\*\*\*

THE possibilities in an idle mine, presumed to be worked out, cannot be estimated by comparison with what it has already produced. It must be developed and new ore bodies sought in unexplored ground.

\*\*\*\*

CRUDE PETROLEUM is successfully used in reverberatory furnaces in the reduction of ores at various places. A furnace of this type built for wood can be easily fitted with oil burners. It is usually found necessary or desirable to heat the oil for the best results.

\*\*\*\*

It would be difficult to determine the probable cost of driving a tunnel without knowing something of the character of the ground other than the statement that it is soft. Soft ground, if wet, often gives more trouble than that which is hard and requires no timbering.

\*\*\*\*

TIMBER can best be lowered into a vertical shaft beneath a skip, cage or bucket suspended by means of a rope and large clevis and bolt. In the bottom of the timber a dog, with rope attached, should be driven to facilitate landing when the timber has reached the station where it is to be taken off.

\*\*\*\*

MANY of the largest mines of the Cripple Creek, Colo., district have veins or zones of rock through which the values are irregularly scattered in bunches and small bands or veinlets, and all such ore must be washed and sorted before shipping to the smelters or mills for treatment, making the mining cost unusually high per ton.

\*\*\*\*

SEVERAL mining States have laws making it unlawful and a misdemeanor to use a metal bar of any description for tamping a blast. It is believed that metal is so rigid as to communicate too great a shock to nitro powder, rendering its use dangerous. Where black powder is used there is danger of a spark prematurely discharging the blast.

\*\*\*\*

PRODUCER GAS is an inflammable gas made in a closed chamber called a "producer." It is accomplished by passing a mixture of steam and air through a bed of incandescent fuel (coal, charcoal, etc.). The fuel is converted into fixed combustible gases, only the ash remaining. Producer gas is used in gas engines and for heating, also in some metallurgical operations.

\*\*\*\*

VEINS have been known which had two outcrops or apices, as a result of a fold. Where separate owners have located on each apex, the vein in event of contest goes to the older locator. Such occurrences are rare. There were several such instances in Leadville, Colo., in the early history of that district; but, as the law of extralateral right never obtained there, there was never any controversy over this structural peculiarity.

\*\*\*\*

WHEN a tailings pile has not been tested by the cyanide process it is decidedly an unknown quantity. It may have the appearance of sands which will be easily leachable and yet there may be present sufficient slimes to render percolation slow if not impracticable. Some tailings consist of sands and slimes which together are an unleachable material, but which when properly sized results in two products, easily leachable sands, and readily leachable slimes. This demonstrates that the cyanide process in its application is always a matter for experiment, and a determination of the adaptability of the process is often a matter of difficulty.

\*\*\*\*

WHERE the physical conditions will admit, it is an advisable practice to break ore in stopes faster than it is drawn away into cars at the chutes, the men engaged in stoping standing on the broken ore, only sufficient being drawn away to make working room—usually about one-third of the amount broken. In this way a large tonnage of ore becomes available which may be drawn upon in the event of any unforeseen circumstance which may necessitate the stoppage of stoping operations. The ore is stored in the stopes in the same manner as in bins on the surface and only needs trammers to draw it off to send it to the surface.

\*\*\*\*

SOME States have laws which impose a penalty for keeping nitro powder and caps together. The powder is rarely known to explode without the aid of caps, although a heavy concussion is usually sufficient to explode the powder alone. Shooting into nitro powder with a pistol or rifle will almost invariably result in an explo-

sion. Powder should always be handled with care, and new cases opened with caution. A few months ago a miner attempted to open a box of powder with a pick in much the same manner as wooden barrels of lime and cement are opened. He was killed by the explosion which resulted.

\*\*\*\*

WHEN charging a hole with nitro powder the powder cartridge should be slit with a knife on 3 or 4 sides so that it may yield readily to the pressure of the tamping stick. The tamping should be firmly but carefully rammed, avoiding excess of shock, particularly when introduced to the hole. The detonators should be at least XXXX, and XXXXX and XXXXXX are better. The more complete the detonation and blow of the primer the more complete is the explosion of the powder, and consequently the more effective is the blast. The placing of a blast requires as much good judgment for the best effects as the placing of the hole.

\*\*\*\*

WHERE an incline shaft is small and it is desired to run a skip of largest possible capacity, the skip may be built deeper than those usually constructed. Capacity may also be gained by placing the skip wheels on lugs solidly bolted to the sides of the skip, which permits the body of the skip to sink between the wheels to the level of the rails or below them. It is unwise to place air, ventilating and other pipes in a shaft compartment which is also used for hoisting, as they take up much room that could be used to greater advantage otherwise. Bell wires should be placed within easy reach of men riding on skip or cage in each compartment of the shaft used for hoisting.

\*\*\*\*

WHERE a mine is developed but has no plant for the treatment of the ore, the cost of such plant is charged against the ore, and if the amount of ore in sight be comparatively small, the charge per ton for such installations must be correspondingly high. Those intending to place their property on the market for sale will do well to bear this fact in mind, as in some instances all that the miner has figured as profit may be charged to equipment by a prospective purchaser. A mine with \$200,000 worth of net ore in sight—ore which should pay this amount in profit over reduction costs, may require the expenditure of this sum or more in plant, which leaves only the possibilities of the future as an asset to the mine.

\*\*\*\*

AN innovation was made some time since at the Ferreira mill at Johannesburg, S. A., when the use of concentrators was discontinued. The belts were taken from the machines, the end travel thrown out of gear, and copper plates placed on each machine frame, to which the vibratory motion of the machine was imparted, and over these the pulp from the batteries was run. On these shaking copper-amalgamated tables, between Nov. 1, 1903, and Aug. 31, 1904, was secured 4342 ounces of amalgam, which retorted 1302 ounces fine gold, and this after the pulp had passed over the silvered-copper amalgamation apron plates in front of the battery. It is claimed the most of this gold was obtained from the so-called black sands, which, in the cyanide treatment, yielded only 45% of their value.

\*\*\*\*

THE life of a hoisting rope depends largely upon its usage. If it be kept well lubricated, and no acid waters attack it, and if it be not wound over sheaves and drums of too small a diameter it should outlast one where these precautions are not taken. A rope which is run at slow speed will undoubtedly last longer than if it were run at a high rate of speed under otherwise the same conditions. The number of trips a rope makes is an important factor also. It would seem that this is the real test of the durability of a hoisting rope, rather than the number of months or years the rope will last. A rope will deteriorate even if it is not used at all, for rust is almost certain to attack the interior stands, weakening the rope and in time destroying its capacity for usefulness.

\*\*\*\*

It is stated by authority that the expense of transporting and putting up an aluminum line for electrical purposes is less, the durability greater and the cost of maintenance below that of a copper line of equal current carrying capacity. The advantages are in a measure offset by the greater difficulty in making joints and to the great sag in long reaches, due to the large coefficient of expansion of aluminum and lack of strength of aluminum wires of the size ordinarily employed for electrical purposes. The specific gravity of aluminum is 2.68, that of copper 8.93; conductivity of aluminum 62, copper 97; tensile strength of aluminum 28,000 pounds per square inch, of copper 45,000; cross section for equal resistance—aluminum 1.56, copper 1; diameter of equal resistance—al. 12.5, cu. 1; weight for equal resistance—al. 0.47, cu. 1; tensile strength for equal resistance—al. 0.96, cu. 1. The best joint for aluminum wires smaller than No. 0000 (B. & S. gauge) is made by inserting the two ends into a piece of flattened tube and the tube given 2½ twists by means of two pairs of wire connectors. Larger wires can be joined by the usual dovetail splice by means of terminals compressed on the ends at the factory, or by placing the ends into a cast sleeve and compressing them in a portable press.

\*\*\*\*

PURE GRAPHITE is pure carbon, but most natural graphite is contaminated by the presence of various

earthy impurities. When considering the possible value of a deposit containing graphite there must be noted whether it is crystalline or amorphous (without crystalline form); the percentage of graphite in the ore; the character of the impurities present—as quartz, mica, clay, iron oxide, etc.; whether or not these impurities can be successfully and cheaply eliminated; for what purpose the cleaned graphite can be employed; and it must be determined before any plant is built whether or not the graphite can be cleaned so as to make a merchantable product. Graphite is produced artificially by heating to a very high temperature amorphous carbon in the electric furnace; by dissolving an excess of carbon in molten metal, when, on allowing the metal to cool, the carbon separates out as graphite. Another method, the one employed at Niagara Falls, N. Y., is to heat in the electric furnace carbon in association with one or more oxides (iron) to a temperature so high as to cause a chemical reaction between the constituents, and then continuing the heating until the combined carbon separates in a free state.

\*\*\*\*

THE tin mines on the Rancho San Jacinto, about 7 miles south of the town of Corona, are opened on veins in granite. The tin occurs as oxide (cassiterite) in quartz associated with a large amount of black tourmaline, which occurs as a mass of fine black short needle-like crystals. Some of the ore is rich in tin, being nearly pure tin oxide, but ordinarily it is disseminated in grains and small veinlets through the gangue. The mines were opened nearly fifty years ago, but after a brief career were abandoned and remained idle until about 1890-91, when an English company reopened the works, sunk new shafts, and spent a large amount of money in surface equipment. Some tin was produced, but the expenses were so heavy that no profit resulted from the operation, and the mines were not sufficiently developed to maintain production. The plant was closed down in 1891 and remained idle until recently when work was recommenced by leasers, who it is reported have undertaken the development of the several tin bearing veins. One of the outcrops on the property is about 25 feet wide, but as the showing of tin at the surface is very low only superficial development has been done at that point. The greatest amount of development work is on a small vein carrying the rich ore.

\*\*\*\*

ANNUAL assessment work may be done on one claim to hold a group of claims, but it must be clearly shown that the work so done at one point is for the benefit of all the claims of the group. It is not sufficient that the claims are contiguous, though this latter condition is a pre-requisite. The Idaho court has recently decided a case where a portion of a group of claims was relocated for failure to perform the assessment work as required by law. The claims were placers, were contiguous, and sufficient work was done on one of the claims to hold all, but the owners could not show that the work so performed was of actual benefit to the remainder of the claims of the group, while the other side to the controversy had no difficulty in showing that the work done, although exceeding \$5000 in amount during one year, was of benefit only to the claim where the work was done, and of no advantage whatever to the remainder of the claims of the group. It is unlikely that any court would find against a locator owning several adjoining claims on one stream, who did all of his assessment work on the lowest claim on the stream, as that is the natural way to work placer ground—the lowest ground first—as this is essential to the proper drainage of the claims higher up on the stream. The same applies to quartz locations. If it can be shown that the work done on a single claim is an advantage to the adjoining claims that is all that is necessary if the amount of work is sufficient to represent \$100 worth for each claim.

\*\*\*\*

FIVE or more persons may form a corporation to carry on mining business in the State of California, and a majority of the incorporators must be residents of the State. Articles of incorporation must be drawn which shall contain the name of the corporation, the purpose for which it is formed, the place where its principal business is to be transacted, the term for which it is to exist, not exceeding fifty years; the number of its directors or trustees, which shall not be less than five, and the names and residences of those who are appointed for the first year; the amount of its capital stock and the number of shares into which it has been divided; if there is a capital stock, the amount actually subscribed and by whom. The articles of incorporation must be signed by five or more persons, a majority of whom must be residents of the State and acknowledged by each before some officer authorized to take and certify acknowledgements of real property. As a prerequisite to filing the articles of incorporation there must be paid in for the benefit of the corporation, to a treasurer elected by the subscribers, 10% of the amount subscribed. Upon the filing of the articles of incorporation in the office of the county clerk of the county in which is situated the principal place of business, and a copy thereof certified by the county clerk filed with the secretary of State, the secretary of State must issue to the corporation, over the great seal of the State, a certificate that a copy of the articles containing the required statement of facts has been filed in his office, and thereupon the persons signing the articles, and their associates and successors, shall be a body politic and corporate by the name stated in the certificate and for the term mentioned in the articles of incorporation.

## Water Rights in California.

Written for the MINING AND SCIENTIFIC PRESS by  
SAMUEL C. WIEL.

**HISTORICAL.**—The law of water in California is built in two parts. One part came with the general body of the law from the older States, and to them from England—the common law of riparian rights. The other part had its birth in California and was developed on the western slope alone—the law of appropriation. At the outset the latter took a strong hold, and was intended to replace the other system completely. That was because the law of appropriation grew out of the customs and necessities of mining, and mining in those days in California surpassed everything else in importance. To-day it is somewhat different, because California is now a great commercial and agricultural as well as a mining State. The law of appropriation is still applied, but, in fact, to a less extent than the law of riparian rights.

The law of appropriation arose in the early days when the pioneers were, perhaps, aided in drifting into it by the Mexican law which they found there. The Mexican law regarded the use of water as a common right, to be taken advantage of by any inhabitant of neighboring pueblos. The pioneers had to have water to work their mines, and this common right must have encouraged them to take the water wherever they could find it. Certainly that is what they did. Later comers, among themselves, grew to regard that as proper. The principle of "first come first served" became a firmly established custom in the use of waters. It served its purpose well—in fact, in Nevada, where mining remains of predominating importance, it is still the only rule. The miners in California pressed this custom upon the courts very early. Lawyers in mining regions depend more on their own reasoning and originality than on precedent. It was forced upon them partly by the rough and ready spirit of mining camps and partly by the lack of books and of facilities for reference. As early as the third volume of California Reports the matter was before the Supreme Court of California, but the court was not ready to declare this custom lawful. In the year 1855, however, the universal acceptance of it was so clear that the Supreme Court declared it the law of the State. (Irwin vs. Phillips, 5 Cal., 140.) It was not done by statutory legislation, but by a decision of the Supreme Court, entirely hostile to what was and still is known as the common law rule, which the Supreme Court was supposed to declare. True, the courts said they were in true harmony with the common law, because of the deeper seated rule that established customs will always be taken into consideration by the judges, but it has since been acknowledged that the decision was actually hostile to the common law—a proper decision, however, because the old law was not suited to existing conditions, and only such law is brought with settlers into new communities as are suited to their conditions. The principle of appropriation was affirmed by the Supreme Court of the United States (Atchinson vs. Peterson, 87 U. S., 507, and later cases).

Thereafter California grew into a settled agricultural and commercial community, resembling more and more the older States and needing more and more the older law that had been replaced. Riparian rights were mentioned occasionally in the cases, but the understanding had become general that riparian rights were entirely out of favor in California. The early legislation was strongly in that direction. An Act authorized a miner to enter upon agriculturist's land and, if he paid for it, actually take the water, ditches, etc., for his own use, though he was not the first comer at all. It was enough if he was the first miner. But this was held unconstitutional (16 Cal., 154; 23 Cal., 452). The law of riparian rights was, however, firmly established again in 1886 by a decision of the Supreme Court mainly independent of legislation. A case arose out of the use of the Kern river for irrigation, the case of Lux vs. Haggin, 69 Cal., 255. The defendant, J. B. Haggin, having organized an irrigation company, claimed the right to divert the waters of the Kern river by an appropriation to that effect, denying that any rights which under the rule of riparian rights would have prevented this could be recognized in California. It is probably the most extended opinion in California reports. The previous cases had almost all arisen out of mining, but here was one in the San Joaquin valley, and it showed how the law must consider water rights of immense value, though where mining was in no way concerned. Among other things the Supreme Court said: "The doctrine of appropriation, so called, is not the doctrine of the common law," and, deciding against Haggin, held that the doctrine of appropriation and the old rule of riparian rights existed in California together, in a way that, as will appear hereafter, makes the latter really overshadow the former. At the time of this decision C. C. 1410 read, "The right to the use of running water flowing in a river or stream or down a canyon or ravine may be acquired by appropriation," and C. C. 1422 read, "The rights of riparian proprietors are not affected by the provisions of this title." But the decision was reached on common law principles, of which the latter section was said to be merely declaratory, so

that the result would have been the same had C. C. 1422 never been enacted. This had been forecasted in "Pomeroy on Riparian Rights" before Lux vs. Haggin arose. In other States this restoration has been urged also. But in Nevada, for example, they refused to have anything to do with riparian rights and would not follow Lux vs. Haggin, though that case was commented upon. (20 Nev., 269.) In "Farnham on Waters" the Nevada court is sharply criticised for this action.

The law of appropriation is still of first importance to the miner, however. Its practical interest to the readers of the MINING AND SCIENTIFIC PRESS is relied on to justify this attempt to collect and state the rules which California decisions leave us to-day. In some respects there have been important modifications from the early law.

**WHERE AN APPROPRIATION CAN BE MADE.**—1. An appropriation can be made only on unoccupied public lands of the United States, or of the State. As to public lands: Of federal lands the National Government is the owner, and has full power to dispose of them as it sees fit. Congress has made the rule of appropriation apply to them, first, by tacit acquiescence in early customs of miners (whose operations were, of course, almost entirely upon public lands), now by express provisions in Sections 2339, 2340, Revised Statutes.

"The principle of prior appropriation of water on the public lands in California, where its artificial use for agricultural, mining and other like purposes is absolutely essential, which has all along been recognized and sanctioned by the local customs, laws and decisions, was thus expressly recognized and sanctioned by the Supreme Court of the United States,

sions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purpose herein specified is acknowledged and confirmed; but whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Revised Statutes, Section 2340—All patents granted, or pre-emption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section.

Of State lands likewise the State is the owner and the State has likewise made the law of appropriation apply to them, by Sections 1410-1422, Civil Code. (Lux vs. Haggin, 69 Cal. 255.)

(TO BE CONTINUED.)

## Derrick for Handling Placer Boulders.

Written by DENNIS H. STOVALL.

The derrick is becoming a fixed feature in the equipment of many southern Oregon and northern California placer mines, at least, in those diggings where huge boulders are encountered. The most disagreeable, annoying and expensive part of placer mining, in some channels, is "bucking" boulders. They are too large to be juggled by the giant, and even though moved in this way will later cause trouble by choking the sluice. The old way was to turn

A Placer Mine Derrick in Oregon.

and also by the act of Congress of 1866. And in keeping with this policy, Congress further provided, in Section 17 of the amendatory act, approved July 9, 1870, (Copp's Mining Decisions, 1873-74, p. 296), "that all patents granted or pre-emptions of homesteads allowed, shall be subject to any vested and accrued water right or rights to ditches and reservoirs used in connection with such water rights as may have been acquired under or recognized by the ninth section of the act of which this is amendatory, to wit, the act of July 26, 1866." The above words were used in Osgood vs. Water Co., 56 Cal. 571.

The provisions of the Statutes of 1866 and 1870 there referred to are those now incorporated in Sections 2339 and 2340, Revised Statutes, and are as follows:

Revised Statute, Section 2339—Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized by the local customs, laws and the deci-

aside the giant, drill a hole in the big stone, put in a stick of dynamite, and the explosion did the rest. But this was an expensive method.

A derrick, similar in construction to those used in stone quarries, is found to solve the problem completely. The main mast, which is made of tough, yellow fir, is from 35 to 50 feet high and is fitted by a revolving pin to a steel plate at the base. It is guyed by cables which are easily adjusted, and the whole affair can be quickly moved to accommodate the placer operations. The jib, or boom, is fitted with a joint at the foot of the mast, with block and pulley at the end, and the whole can be lifted and swung around when the load is raised. Loads of four or five tons are easily handled by the crane platform of this derrick.

Donkey engines are used in some diggings to supply power, but the most economical method is to use a water motor when the supply and pressure are adequate enough to permit. The motor is sometimes attached by a fire hose to the main pipe line.

## Cyanide Practice at the Maitland Properties, South Dakota.\*

NUMBER 11.

Written by JOHN GROSS.\*

**STAMPS.**—The two battery bins, each of 150 tons capacity, are situated one behind each set of twenty stamps. The ore falls through chutes to suspended Challenge feeders, one for each battery of five stamps. The mortar is narrow, of single-discharge type, 12 inches wide at discharge, and a 6-inch discharge is maintained, crushing the ore to 26 mesh. The screens used are 26x13-mesh, No. 26 wire; this screen having a longer opening does not clog so readily. The screens used are also rolled, which helps to keep the holes open. The life of the screens now installed is about fifty days. Two sizes of screen frames are used, the larger size taking a 12-inch clear height of screen, and, after it has become worn at the top and bottom, it is removed, cut down and placed on the smaller frame, taking an 8-inch clear height of screen. This arrangement increases the life of the screen almost one-half.

The weights of the various parts of a new stamp are: Shoe, 150; boss-head, 250; stem, 375; tappet, 135; total, 910 pounds.

Ten cams are on one shaft; the cam shafts revolve in babbitted boxes without caps, which simplifies the re-babbitting and lubrication. The stamps drop ninety-seven times per minute, from 7 to 8 inches, the order of drop being 1, 3, 5, 2, 4.

At present chrome steel shoes and dies are mainly used, but other materials also have been used, both in practice and for experiment.

Comparative results of work of the shoes and dies are being obtained.

The battery solution is kept at a strength of from 1.2 to 1.3 pound of KCN and a protective alkalinity corresponding to from 0.8 to 1 pound of NaOH per ton of solution. Two solutions only are used in the mill—the battery solution, as noted above, assaying about 50 cents in gold per ton, and the barren solution with a strength of from 1.5 to 1.6 pound KCN and a protective equivalent of from 1.0 to 1.2 pound of NaOH per ton of solution.

The lime, which is fed with the ore in the battery, has an average composition of: CaO, 92.5; MgO, 0.5;  $Al_2O_3 + Fe_2O_3$ , 2.0; insoluble, 1.5; and  $H_2O + CO_2$ , 2.5%.

The stamp duty per day was not high, averaging 2.66 tons during the latter six months of 1903 and 2.80 tons for the first five months of 1904. During May, 1904, the stamp duty was increased to 2.96 tons per day. The quantity of solution going to the battery was between four and five tons to one ton of ore, which, in connection with the hardness and compactness of the ore, accounts largely for the small stamp duty.

The stamps deliver a product carrying about 60% of sands and 40% of slimes, the latter being that portion of the ore the addition of which to water will render it muddy; sands, no matter how fine, leave the water clear; and, because of this sharp line of distinction, the separation of these two products in the laboratory can easily be made in a gold pan.

The losses of time in running the battery during the past ten months, working with a full shift, were: Extraneous causes 4.20%, general mill repairs 0.41%, engine shutdowns 0.07%, sand pumps 0.16%, cone system 0.06%, general battery repairs 0.35%, short of iron 0.30%, renewing iron 0.18%, total 5.73%. Of this total loss it is seen that but 0.83% of the full running time was due to the stamps proper, which is equivalent to about six hours' shutdown per month.

**SEPARATION.**—The separation of the slimes from the sands is one of the most, if not the most, vital factors in the wet crushing process. Several systems were formerly tried, but they proved to be inadequate. This present method of separation differs from the classification made in concentration in that only a single separation of sands and slimes is made. The system used and elaborated by C. W. Merrill at the Homestake mill, of using successive cones for throwing off the slimes, and finally using an upward stream for producing a clean sand, seems to be simple and efficient, and is now in use, in a more or less modified form, in all of the wet crushing mills in the Black Hills.

We have found it to be advisable in the separation to make a clean sand rather than a clean slime, a charge of sand with 5% or more of slimes giving us a low leaching rate. Therefore, we are making this clean sand at the expense of throwing some sands into the slimes. These sands are, however, very fine and cause no trouble in the slime department and assay after treatment the same as the slimes proper.

The pulp that the battery delivers flows to two sand pumps, 54 inches by 10 inches, making nineteen revolutions per minute, and is raised 20.5 feet to a regulating box, 3 feet by 6 feet by 3 feet deep, for delivery to two upper cones, and is intended primarily to take care of the intermittent discharge of the sand pumps, and is provided with a screen to catch any foreign substance, thus avoiding the choking of the cones.

These two upper cones are simple in construction,

being 42 inches diameter at the top and having vertical sides for 12 inches down, at which point the cone starts at a 60° slope, ending in a 6-inch diameter sorting column with a 2 inch discharge at the bottom provided with a cock.

The partially cleaned sands, containing from 25% to 30% of slimes, discharge at the bottom of the two upper cones, then combine and flow to one lower cone, of the same size and pattern as the upper ones, but provided with an upward current of solution. This upward current is taken, after partial settling, from the battery solution stock tank under a variable head of from 5 to 20 feet. While an absolute head is preferable, the fact remains that the head is kept fairly constant at about 15 feet above the overflow at the cone and gives practically no trouble. At rare intervals only does this head vary more than 1 foot either way.

The sands, discharging at the bottom, contain from 1% to 2% of slimes and pass direct to sands vats.

The slimes overflow from the three cones contains from 15% to 25% of sands, of which only a small portion will stay on a 150-mesh screen.

The products going to sands and slimes vats from the cones amount each to approximately 50% of the original ore. The average since the cone system was installed eleven months ago has been 49.03% to the sands and 50.97% to the slimes vats.

**TREATMENT OF THE SANDS.**—The clean sands from the lower cone, issuing with from 2.5 to 3 parts of solution to 1 part of sands, flow through a launder, having a grade of 7 in 100, to the distributor over the sands vats. The quantity of solution with the sands coming from the cone is not sufficient to carry them through the launder and keep the distributor open and running, and in order to overcome this hindrance enough solution is added in the launder to bring it up to at least 5 parts of solution to 1 of sands. The distributor is of the Butters type, having six arms, ball and roller bearing.

The sands vats, of which there are six, are 30 feet in diameter by 6 feet deep, having a lattice filter frame. Eight-ounce duck cloths are used on top of cocoa matting. The eight-ounce duck has a life of from eight to ten months and has been found to be more satisfactory and economical than the heavier grades. The sands vats hold 140 tons and are filled in about sixty hours.

The method of filling the sand vats through a vat full of solution has been discarded in favor of "dry filling"—that is, the vat contains no solution when starting to load, and all solution coming in with the sands is allowed to drain off as rapidly as it enters, thus keeping practically a dry surface on top of the sands. This method of filling gives a better leaching product, since the slimes with the sands are evenly distributed through the charge, an effect which does not occur in filling through a vat full of solution. It also gives a more porous charge, the average weight of 1 cubic foot of sands, as filled into the vats, being 93 pounds (calculated from eleven months' run). The specific gravity of the original ore averaged 2.7.

As soon as the vat is filled it is leveled with a stream of solution from a hose under a low head, and battery solution is run on for a period of ten days on the average. The small amount of slimes in the battery solution forms a thin coating on top of the charge and requires an occasional light raking in order to maintain a satisfactory rate of leaching. The battery solution is followed by barren solution for about six days more. The vat is then allowed to drain and 15 tons of wash water are passed through. The sands, now ready for sluicing, require from 100 to 150 tons of water for this purpose. The sand launder has a minimum grade of 8 in 100, which is necessary in order to keep it open.

An average of a large number of sand vats gives 900 tons of battery solution and 450 tons of barren solution for one sands vat treatment, exclusive of the solution filtering through the charge during the filling, which amounts to approximately 700 tons. This large quantity of solution, being nearly 10 tons to 1 of sand, together with a total treatment time of about sixteen days, is by no means excessive, for the reason that experiments show as large a volume as possible of weak solution should be kept constantly leaching through the charge.

**TREATMENT OF THE SLIMES.**—The overflow from the cones passes to two loading vats, which are filled alternately. There are eight slimes vats—including the two for loading—24 feet in diameter and 12 feet deep, all connected to two No. 4 centrifugal pumps, provided with hard iron linings, which can deliver to any one of the slimes vats. The centrifugal pumps have a 4-inch suction and a 4-inch discharge, running at 550 revolutions per minute, and handle 50 tons of wet pulp per hour. The stuffing box of the centrifugal pumps is supplied with solution or water under pressure to avoid undue wearing of the shaft and the cutting out of the packing.

The loading vats are provided with a partition through the center of the vat, extending to within 30 inches of the bottom, thus allowing the slimes to settle sufficiently so that the clear solution may be decanted from one side of the partition while the vat is being filled on the other side. The time of filling one of the vats is twelve hours, the stream being then turned into the other loading vat.

The slimes passing into the loading vat have 12

tons of solution to each ton of dry slimes, and during a loading of twelve hours about 150 tons (or one-half) of the incoming solution are decanted sufficiently clear to render objects visible through a distance of 2 or 3 feet. The loading vat, just filled, is decanted as closely as possible and transferred by the centrifugal pump to vat No. 1, forming one-half of a charge, barren solution being added at the same time. The material in the second loading vat, after decantation, is transferred to vat No. 2 as one-half of the charge with barren solution, and upon the decantation of these two vats the contents are combined, now constituting the full charge, are pumped to a third vat. Two more transfers and dilutions are then given with barren solution, and, finally, one with water. After each transfer and dilution several hours of agitation are given by pumping out from the bottom and discharging into the top of the same vat. For the past eleven months the average time of agitation for each charge was thirteen and eighty-seven one-hundredth hours during solution dilution and one and ninety-seven one-hundredth hours during wash water treatment.

It will be noted that the two largest dilutions are obtained on the half charges when the contained solutions are the richest. A charge of 60 tons of dry slimes from a twenty-four-hour run gets practically the following dilutions with barren solution:

First half charge .....	30 tons, 1 dilution of 100 tons
Second half charge .....	30 tons, 1 dilution of 100 tons
Full charge .....	60 tons, 3 dilutions of 65 tons

This treatment makes a total dilution of 395 tons, or a little more than 6.5 tons of barren solution to 1 ton of dry slimes, the actual figures for the past eleven months being 6.57 tons of barren solution and 0.93 ton of water per ton of dry slimes. Theoretical calculations on this amount of dilution, on the assumption that the total extraction has taken place before the first decantation, and taking the value of the barren solution at 10 cents per ton, the dissolved gold passing out with the slimes-tails should assay from 12 cents to 20 cents per ton solution, starting with a head solution of a value of from \$1 to \$2. However, the extraction has not all taken place, but continues slowly throughout the entire treatment, and for a period of six months the solutions finally going out with the slimes-tails showed an average value of 46.1 cents per ton, with an average value of \$1.80 for the head solution, and a value of 10.6 cents for the barren solution. During a period when precipitation was giving us trouble, the value of barren solution averaging 26.7 cents, the value of the head solution averaged \$1.48, and that of the solutions passing out with the slimes averaged 49.8 cents per ton.

The decantations are brought down to a pulp containing from 55% to 60% of moisture, 50% moisture being equivalent to equal weights of dry pulp and solution. After the decantation of the wash water the top layer of the thinner slimes is drawn off and thrown back to the charge next following. In this way we obtain dryer slimes going to waste, averaging for the past ten months 47% of moisture.

While the decantation process is far from ideal, it is the simplest one at present at our command. The results we have obtained from it have proven more satisfactory than experimental tests by other systems, yet it has openings for improvements, and we are now contemplating several changes by which we hope to decant to a drier pulp, by giving more agitation, which will not only bring the final loss of soluble gold to a lower point but will simplify the system as well.

**BATTERY SOLUTION.**—This solution, of which 1100 tons per day are used, is pumped by a 10x7x12-inch duplex pump to two stock tanks, 16 feet in diameter and 16 feet deep, at top of mill, and is distributed approximately as follows: Battery, 500 tons; sand vats, 350; cones, 150; launder, 100.

**PRECIPITATION.**—Only the richer solutions from the sand vats pass to the gold tank for precipitation, the balance of the sand vat solutions and all the decantations from the slimes passing to the battery solution sump.

All standardizations of solutions are made in the gold tank, thereby obtaining the benefit of the higher strength solution for precipitation—an arrangement which accounts for the higher strength of the barren solution above noted.

Four 8-compartment iron zinc boxes, of a total capacity of 224 cubic feet, and one 8-compartment iron box, of a capacity of 76 cubic feet, are used; hand cut zinc is used for the reason that it offers a better precipitating medium than machine cut zinc. It is, however, true that the consumption of zinc is heavier with machine cut than with hand cut zinc. This statement is based upon the actual results of working the two kinds of zinc side by side under precisely the same conditions—and we attribute this result to the hand cut zinc offering an easier escape for the hydrogen (thus avoiding polarization) than does the machine cut zinc, because the latter has a smoother surface.

(TO BE CONTINUED.)

A TAILINGS FLUME in the Black Hills of South Dakota, where the temperature goes very low in winter, has been given a grade of 8 in 100 which was found satisfactory.

\*Abstract Trans. A. I. M. E.

## Britannia Mines, Howe Sound, B. C.

Written for the MINING AND SCIENTIFIC PRESS BY  
WM. M. BREWER.

Situated about 30 miles from Vancouver by water, on the east shore of Howe sound, is the site on which are being built the concentrating plant and other buildings for the treatment and shipment of ores and concentrates produced at the Britannia mines, situated about 3½ miles in a southeasterly direction from the shore.

The development of these mines is the most important piece of work being carried on to-day in western British Columbia. The management of the work is under the direct personal supervision of G. H. Robinson of Utah, and the capital being invested is practically all being drawn from the United States.

These properties have a history, the parallel of which has not been often met with in many of the older mining camps. Although so comparatively close to the city of Vancouver, it was not until the autumn of 1899 that the occurrence of the ore bodies was generally known, but some years previous pieces of "peacock" copper ore had been picked up by men engaged in trapping in the neighborhood, which, however, excited but little interest, except in the minds of a few prospectors.

During 1898, when the first serious interest was being shown in lode mining on the coast of British Columbia, some trappers staked the Jane and Fairview mineral claims, which to-day are included in the group of claims which comprise the Britannia property.

The locators showed some of the samples they took from the outcrop to Mr. Turner, a fur buyer of Victoria, when they were selling him their season's catch. This gentleman in turn interested L. Boscowitz to such an extent that a visit was paid to the prospects and an option obtained. Later men were put to work to cut a trail and do some preliminary work. An open cut was made on the mountain side on the Jane claim, which exposed a body of bornite, carrying high values in copper. As a result of this work several mining men visited the locations, but it was not until the late autumn of 1899 that a deal could be made to sell the property. At that time, though, H. C. Walters, who had previously carried through the sale of the Snowshoe mine near Libby, Mont., had his attention called to the prospects on Howe sound, and succeeded in securing a bond from Mr. Boscowitz for seven-tenths of the property.

Mr. Walters interested several Montana mining men, who, together with two or three British Columbians, organized a syndicate to take over the property and carry on the prospecting work which had previously been commenced.

Each one of the original members of this syndicate subscribed for shares at the rate of \$125 per share, each member originally subscribing for ten of these shares. A little later more money was required, when each member doubled his subscription, which brought the actual paid-up capital of the syndicate up to \$35,000. As work progressed, and the possibilities of the property were realized, it became apparent that instead of its being a proposition of ordinary extent, carrying high or medium grade ore, it was a proposition of extraordinary extent, but carrying low-grade ore. The working capital necessary to equip and thoroughly open up a proposition of such extent was estimated at about \$500,000, and as the carrying on of the prospecting work alone, together with paying Mr. Boscowitz for the property, was costing a considerable amount, it was decided by the members of the syndicate to organize a company, capitalized at \$250,000, divided into 400 shares, each having a par value of \$625, and to open up the mine sufficiently to negotiate a sale to some company possessed of ample capital to properly equip and develop it. The stock of this company was issued to the original members of the syndicate on a basis of one share of new stock for one share of old stock, which required 200 shares. Of the remainder of the stock of the new company, twenty to thirty shares were sold at par, and the remainder retained in the treasury for future use.

So successful had been the management that there was a strong demand for Britannia stock, and within a short time after the new company was organized the shares could be readily sold for from \$500 to \$1000 each.

During 1900 representatives of nearly all the leading copper companies in England and the United States visited the group of claims and attempted to secure bonds on them. The purchase price named by the directors was \$1,250,000. Although several times it appeared that negotiations would be concluded, and the property sold, such did not occur until the winter of 1901-02, when G. H. Robinson, the present manager of the company, carried through a deal for the property by securing a majority of the issued stock, for which he paid at the rate of \$1500 per share. Later he purchased the three-tenths interest which Mr. Boscowitz had retained, and the entire property came under the control of one company. In order to purchase the three-tenths interest and carry on the work as it has been done since Mr. Robinson and his friends secured control,

the remainder of the treasury stock had to be sold and the capital increased to \$650,000.

The necessary action to accomplish this was taken a few days ago at an extraordinary general meeting of the shareholders, at which it was stated that Henry Stearn of New York had agreed to underwrite the entire increased capital at par, besides subscribing to a large block of the stock himself.

It is not often—in fact, is very rare—in the history of mining to find a property that has been handled so successfully and profitably that the original shareholders have been enabled to realize twelve times the amount of their investment before a ton of ore has ever been shipped, and that within two years from the time the investment was first made.

**GEOLOGY.**—Owing to the dense forest, the quantity of fallen timber and the abundant growth of sallow and other brush and ferns, it is very difficult to make a thorough geological survey of any of the country adjacent to the coast line.

Howe sound is one of those deep, fjord-like indentations or bays which are so common along the mainland coast of British Columbia. Glaciation, as well as eruptive action, are responsible for the formation of these sheets of inland water, and Howe sound is no exception to the rule—in fact, it presents all of the characteristics possessed by other bays and inlets along the coast. The mountain ranges reach high altitudes within a comparatively short distance from the shore lines. As an illustration, the work being carried on to-day at the Britannia mine is at an altitude of about 4000 feet, while the distance in a straight line from the shore is less than 3 miles.

The summits of the mountains in the near vicinity reach an altitude of about 2000 feet higher than that at which the mine workings are situated, while within 30 or 40 miles can be seen enormous glaciers which reach still higher altitudes.

The rock formations in the vicinity of the Britannia mine are apparently all of igneous origin, although the ore bodies occur in a schistose country rock, which at first sight might be taken for a metamorphosed sedimentary rock; but it is more probable, in the writer's opinion, that it is of igneous origin, and that the schistosity has been produced by shearing movements. As no attempt has ever been made to classify this rock by an expert petrologist, and it is evidently very much altered, it has always been known locally as the "Britannia" schists.

In width the extent of this belt of schists in several places must be fully 1 mile. While its length has never been explored to any great distance beyond the Britannia mines, towards the southeast, yet in the opposite direction the same character of schist has been found across Howe sound, but to what distance it extends is not known at present.

The line of strike of this belt of schist is north 70° west, magnetic. The dip is nearly vertical, the incline being towards the southwest.

On both the northwesterly and southwesterly sides the schist is bounded by granite. This rock apparently occurs as intrusive masses of very considerable extent.

The writer has examined the belt of schists nearly the entire distance from the beach to the Britannia property, and for a considerable distance on that property. It is noticeable that a very large proportion of the schist carries mineral, chiefly iron pyrites, and that there occur at irregular intervals very extensive lenses of highly siliceous ore, carrying copper and low gold values, as well as smaller bodies of higher-grade ore, a considerable proportion of which is bornite. The most extensive of these ore bodies, so far as development has determined to the present time, occurs on the Britannia property, but between its northwestern boundary and the beach there are several occurrences of ore bodies of considerable promise, but up to this time none of these have been developed to any extent beyond the regular assessment work.

From a casual examination it would appear as though the shearing movements which had produced the schistosity had been accompanied by a great, deep-seated lateral pressure, that had caused the formation of enormous fissures of lenticular form, and that these had subsequently been filled with siliceous material, and that probably the mineralization took place contemporaneously with the filling of the fissures. The mineralization of the schist itself can be readily accounted for as being accomplished through the agencies of mineral charged solutions, which percolated through the interstices of the schist. The most pronounced mineralization of the schist itself is always found to occur in the vicinity of the siliceous ore bodies, where it often reaches to a width of nearly or quite 100 feet beyond the confines of the ore body itself.

As this material will pay to concentrate and as the mineralization gradually grades off into barren schist, it is very difficult to say anything about either foot or hanging walls, especially as the ore bodies all lie en echelon to each other.

**CHARACTERISTICS OF ORE BODIES.**—One of the most noticeable characteristics possessed by the ore bodies proper throughout the zone of schist is that several of the most extensive occur as enormous bluffs in the mountain range itself. The largest of these, so far as is known at present, is that designated as the Mammoth Bluff, on the Britannia property. The ap-

proximate dimensions are about 600 feet long and from 200 to 250 feet high above the flat on which the mine buildings have been erected. The northerly side of this bluff is very precipitous and, this face being free from timber, at the first glance shows its character, which is that of a wall of slightly decomposed and very much altered quartz. In order to test the material, shots were put in every 20 feet in a diagonal line along the face of the bluff, starting at zero for elevation, and carried to the top where the elevation is 250 feet. As each one of these shots broke back to ore it was considered advisable by the management to drive a crosscut tunnel into the bluff and ascertain the character of the material of which it is composed. This tunnel has been driven about 200 feet, the entire distance being through a highly siliceous ore, which carries low gold, silver and copper values, but as the gangue is almost pure silica and the values held in iron and chalcopyrite, the material is all susceptible to concentration by water without excessive loss.

When the dimensions of this bluff are taken into consideration, together with the fact that this 200-foot tunnel, which is almost a crosscut, has been driven through ore the entire distance and that its face is still in ore, it must be presumed that this bluff alone will produce an enormous tonnage of ore. While, of course, no actual measurement of "ore in sight" is warranted with only two sides exposed, yet it would seem safe to say that there is in the neighborhood of 1,000,000 tons of what may be termed "probable ore" in this one body, and that amount can be mined before it is necessary to sink 1 foot.

This is not the only ore body on the Britannia. A short distance southwesterly from the northwestern limit of the Mammoth Bluff there occurs another, and although its face does not bear the same appearance as that of the Mammoth Bluff, yet it was on this one that the outcroppings were first prospected by an open cut of considerable extent, in which was found a body of high-grade copper ore, chiefly bornite. In order to prospect this occurrence of ore at greater depth, Mr. Boscowitz started a crosscut tunnel in the schist country rock, which was laid out to intersect the ore body exposed in the open cut, at a depth of 120 feet. This tunnel had been run but a short distance into the face of the mountain, when it was noticed that the schist through which it was being driven was highly mineralized with iron pyrites, and that the material carried low values.

But little attention was paid to this fact at the time, because in the first place the operators were eager to cut into the high-grade ore body they had exposed on the surface, and in the second place because at that time low-grade ore of any description situated only 3 miles from salt water had absolutely no value, owing to the high freight and smelter charges. However, from tests and assays since made, it has been determined that for a width of about 100 feet all the material through which this tunnel has been driven will pay to mine and concentrate.

When the property was taken over in the winter of 1899-1900 this work, which was designated as the "Jane" tunnel, made up the extent of the attempts to develop the property. It was nearly 300 feet in length, and at a point about 200 feet from the portal a drift had been started along the line of strike of the schist which, although it was run in better grade material than the ordinarily mineralized schist, was not run on what might be termed the "ore body proper," as was later determined, when by crosscutting a well-defined body of ore was exposed, that proved to have a width of about 26 feet and to carry values varying from about 4% to 12% copper, with gold values running from \$1 to about \$6 per ton.

Apparently this bluff in which the "Jane" tunnel has been run encloses a separate and distinct ore body from that developed in the Mammoth Bluff, and to what distance the ore body extends behind or southwesterly from the Mammoth Bluff ore body no attempt has yet been made to determine. The grade of the ore exposed by the Jane tunnel is considerably higher than that in the Mammoth Bluff, and will stand smelting without being concentrated. The development work done on this ore body has not yet been sufficient to measure up tonnage of "ore in sight."

Surface prospecting work along the line of strike southeasterly from the Mammoth Bluff exposed other occurrences of the same character of ore as exposed by the open cut above the Jane tunnel, and recently, at no great distance from the southeastern limit of the Mammoth Bluff, and situated in a northeasterly direction, is still another bluff of considerable magnitude, and having nearly all the characteristics of the Mammoth Bluff.

Whether development work will determine that these various bodies of ore are connected with each other, or whether they are disconnected lenses, as they now appear, occurring in the zone of schist, is a question that will probably not be solved for some time to come, because the enormous tonnage that can be mined from either one without drifting from one to the other will require a long time, judging from all the data at present to hand, even at the rate of 1000 to 2000 tons per day—that is, when concentrating ore is considered at the same time as shipping ore.

While the country to the northwest from the Brit-

annia mines has been considerably prospected, and the occurrences of ore are so situated that they should be as easily worked as the Britannia group, yet southeasterly from that group it would depend very materially on the grade of the ore whether or not they could be worked successfully, because as the distance increases from the beach the elevation also increases, and consequently the minimum cost at the Britannia for installation of tramway and for transportation would be proportionately increased.

**PROPOSED METHOD OF MINING.**—Mr. Robinson proposes to adopt the "Glory Hole" method of mining the ore body in the Mammoth Bluff. In order to do this raises will be made from the tunnel and the workings gradually widened out in every direction, the material stopped being dropped into chutes fitted with gates on the tunnel level.

In mining in the Jane tunnel, it is probable that the same method will be adopted, unless it be found that the body of shipping ore cannot be mined safely without the stopes are timbered with square sets.

Judging from the appearance of the material in the Mammoth Bluff, little, if any, timbering will be required, as it is hard and compact and will stand well without timber, but the material through which the Jane tunnel has been run, or at least the mineralized schist in the vicinity of the ore body proper, will probably require timbering as stoping is carried forward.

As soon as the development of the Mammoth Bluff will permit long churn drills will be used, and it is proposed to put in exceptionally deep holes in order to shoot down as large a tonnage with each round as can be done with safety, thus minimizing the cost of mining.

From the foregoing descriptions of the occurrence of the ore bodies on the Britannia property, it would appear at first sight as though quarrying by benches and the use of steam shovels would be the cheapest method of carrying on mining operations, but the climatic conditions along the coast line make it not only very unpleasant, but almost impossible to work out of doors every day in the year. At the altitude of the mine workings (4000 feet above sea level) of this property the snowfall is heavy during the winter months, while during the spring and fall there is considerable rain. With either of these elements to contend against it is much more advisable to mine under cover, and in the end will prove very much more profitable.

**CONCENTRATING AND MINING PLANTS.**—On August 10th last the first stump was removed from the site chosen for the concentrating plant, on the beach where is located the Britannia townsite; but previous to this the right of way for the aerial tramway, which connects the mines with the concentrating plant, had been cleared. A visit recently paid by the writer gave him an opportunity to compare the present conditions surrounding this property with those which existed previous to commencement of operations under the management of Mr. Robinson. The virgin forest which had occupied the townsite had been attacked in such a strenuous manner, and buildings for the concentrating plant, company's offices, residences for officials, hotel for the accommodation of travelers and wharf have been erected with great rapidity, and to-day the picture presented to the traveler, as the beach is approached on the steamer Britannia, which makes daily trips from Vancouver, is that of a growing, progressive town.

In order to describe the plant in course of construction intelligently, and show clearly the connections between each portion, it is necessary to start from the mine itself, situated about  $3\frac{1}{2}$  miles from the beach, and follow the construction of the various parts or units, which, when connected, will comprise an aggregation that will make it the largest and best designed plant of its character in British Columbia, and, for that matter, on the Northern Pacific slope.

The ore to be transported to the beach and treated in the concentrating plant, preparatory to being shipped to a smelter for final treatment, will for the present be mined from the Mammoth Bluff and the tunnel on the Jane mineral claim, which have already been referred to.

Bunkers have been erected at both these locations, from which the ore is carried in cars having a capacity of ten tons each to the storage bunker, having a capacity of 3000 tons, built at the mine terminal of the aerial tramway.

From the Jane tunnel the ore is carried along an automatic incline tramway, 690 feet long, and from the Mammoth bluff it is carried along a horizontal tramway about 500 feet long, both of which are built on trestles. These tramways form a connection on the summit of the mountain, where are located the crusher, storage bunkers and mine terminal of the aerial tramway.

From this point the ore is dumped into a Sturtevant ore crusher (which will take in rocks as large as 13x26 inches), and crushed to a size convenient to be handled on the traveling sorting belt, to which the ore is delivered from the crusher. As the material from the crusher passes along the conveyer, or sorting table, any waste is picked out by ore sorters and the ore conveyed into a bunker, from which it is discharged into the buckets on the aerial tramway. All of the discharge gates, through which material passes from the chutes in the mine, and from the

bunkers outside, are opened and closed automatically by air pressure, instead of by manual labor, which insures not only greater speed and regularity in loading into cars and buckets, but also a minimum of labor on the part of the employees engaged on such work.

The aerial tramway, which is constructed on the Riblet design, has a maximum capacity of 100 tons per hour. It is built in two sections, the first extending from the mine to near the junction of Jane and Britannia creeks, at about 1900 feet lower altitude than the terminal at the mine. This section is about  $\frac{1}{2}$  mile in length, while the second extending to the beach is about  $2\frac{1}{2}$  miles in length, with a difference in altitude of about 2000 feet between the junction of the creeks and the beach.

An ore bunker has been built at this intermediate station, into which the buckets on the first section discharge their contents, and from which the buckets on the second section receive their loads. This bunker has a capacity of 2000 tons. Each bucket on the tramway has a carrying capacity of 1100 pounds.

At the beach terminal of the aerial tramway is situated another bunker, having a capacity of about 3000 tons. Into this is discharged the contents of the buckets. The total storage capacity between the mine and the beach is 8800 tons, which ensures continuous operations of the concentrating plant, and provides against delays which might arise from accidents to any portion of the tramway or to the machinery at the mine.

From the bunker at the beach terminal the ore is delivered into three high-speed crushers, which will take pieces 10 inches by 20 inches in size and break them into pieces small enough to pass into the high-speed Gates rolls. A class, manufactured by the Allis-Chalmers Co. of Chicago. From the rolls the ore is discharged in pieces about of  $\frac{1}{4}$  inch into Huntington and Chilian mills, of which there are two of each pattern. The former are 6-foot mills of the Anaconda type, and the latter 6-foot mills.

The finely crushed material discharged from the mills passes through trommels and sizer, where it is sized delicately and carefully to prepare it for the concentrating tables. This sizer classifies the material into four sizes. From these the pulp is then discharged into sizing boxes, where it is classified into eight sizes, from a 10 mesh down to slums.

All the material oversize—that is, between  $\frac{1}{4}$  inch and 10 mesh—goes to the jig, a machine of a new type, the "Australian," which has been used successfully at the British Broken Hill works in Australia, but has never before been used on this continent. This machine is manufactured by the Allis-Chalmers Co., and its capacity is estimated at 350 tons per day. When this machine begins operation the work done by it will be watched with great interest, especially by concentrating specialists, because of the new features introduced, especially that relating to sizing, for the reason that it is claimed that when using this jig no sizing is necessary, but that its work is satisfactory with material of various sizes. No tailings will be discarded from the material which passes through the jig, but all such material will be conveyed back to the Huntington mills, where it will be ground finer and again passed through the sizer.

The next operation to which all the pulp which has been crushed to 10 mesh or smaller will be subjected is its passage through the concentrating machines, of which there is a total number of seventy. Fourteen are tables of the Wilfley pattern, thirty-eight are Frue vanners, and eighteen are Overstrom tables.

The roughs, or larger sizes, which come from the sizer will be treated on the last-mentioned tables, while the "fines," or smaller sizes, will be conveyed to the other concentrating machines, among which this pulp will be distributed according to its fineness, and treated as dry as possibly can be done, in order to minimize sliming. Each machine acts as a unit, and no material will be passed from one to the other, or, in other words, each will deliver its own finished product and its own tailings. The finished product, or concentrates, will be automatically delivered from the machines into tanks, from which the material will be automatically drawn into cars of ten tons capacity each, and from these discharged into barges or vessels for shipment to the smelter.

The concentrator building is 134 feet square. The machinery at the mines will consist of a 12-drill air compressor and receiver, together with three electric motors. One of these is to be used in running the compressor, another the crusher, and the third a sawmill, the machinery for which will also be installed at the mine.

**POWER AND WATER PLANTS.**—All the power to propel the machinery, and for the lighting plant, will be furnished by electricity generated through water power. The supply of water will be taken from Britannia creek at a point 13,000 feet distant from the works on the beach, to which point the water will be conveyed through a pipe line, a portion of which is installed with iron water pipes 18 inches in diameter, and the remainder with pipes 12 inches in diameter. The pipe line is connected with three Pelton water wheels having a total capacity of 1000 H. P. The water power developed from Britannia creek has an effective working head of 1857 feet and a total static head of 1900 feet.

The water after doing service on the Pelton wheels

will be carried into the concentrating building, where it will again be utilized for concentrating the ore.

The electricity generated by this power will be transmitted to the various points at the mine, as well as the works on the beach, where it will be distributed among the several motors, four of which will be located in the works on the beach, the other three at the mine. The total horse power required for these motors is 600.

The construction of buildings and installation of machinery is progressing as rapidly as possible, about 250 men being employed continuously at this work, and, unless something unforeseen occurs to delay its completion, the plant will be in full operation by about the first of May, 1905.

## Tungsten: Its Use and Value.

Energetic prospecting, due to an increased demand and high prices, has proved the existence of deposits of tungsten-bearing minerals in the United States, Canada, Australia, New Zealand, Great Britain, Saxony, Bohemia and Spain, says the American Manufacturer. But not all of these deposits are productive of good mineral, a fact that partly explains the maintenance of remunerative prices for tungsten. The chief sources of the metal are wolframite, hubnerite and scheelite, in association with which are often found cassiterite, auriferous pyrite and other substances from which the tungsten must be freed to be of value industrially. By hand sorting, crushing and jigging, and magnetic concentration it is possible to eliminate the impurities and enrich the tenor of tungsten in the ore. Not infrequently the ore as mined will contain only 5% to 8% of metallic tungsten, and to be marketable it must be brought to an average of 50% to 70% tungstic acid, the unit basis of selling price. It is essential that ore be free, or nearly so, from phosphorus and sulphur, but the presence of carbon and silica will not be considered injurious. At present an ore averaging 60%  $WO_3$ , and containing not more than 0.25% phosphorus, and 0.01% sulphur, can be sold in New York at \$7 per unit of tungstic acid, equivalent to \$420 per long ton. For higher grade ore, up to \$7.50 per unit is quoted, because just now the demand exceeds the supply. It is customary to contract for ore on a basis of 90% cash on delivery f.o.b. New York, the balance of 10% being retained for a month to allow time for a comparison of assays and adjustment of possible differences between buyer and seller.

Tungsten as a metal of 95% to 99% purity, or alloyed with iron in the proportion of 37% up, finds its greatest consumption in the steel industry, notably in Europe, where the demand is about eight times as large as in America. The world's consumption amounts to something like 700 to 800 tons per annum, which is a relatively large quantity, when it is considered that usually only 5% to 8% tungsten is needed in the mixture of so-called self-hardening steel. A typical ore, used by German steel works, analyses from 60% to 76%  $WO_3$ , 8% to 10%  $FeO$ , 9% to 12%  $MnO$ , and 0.4% to 1%  $CaO$ . Exports from America have been made to Europe, and the ore has been so satisfactory that further inquiries are being received. The annual production in the United States is between 3000 and 5000 short tons of crude ore, which will yield from 200 to 360 tons of 50% to 65% concentrate.

For a long time only a comparatively small part of the domestic ore output was consumed locally, but with continued expansion in the manufacture of metallic tungsten, a marked change has taken place. In 1902 the United States made 82,000 pounds tungsten metal, 14,000 pounds ferro-tungsten, and 3500 tungstic acid and tungstate of soda, all of which products will probably show further increase. Tungsten metal made in the electric furnace, and analyzing 99%, sells at \$1.25 per pound in New York; ferro-tungsten, 37%, at 45 cents per pound. Metallic tungsten has a specific gravity of 18.7, is practically free from carbon, can be welded and filed like iron, and when used in tool steel the alloy preserves its hardness, even when heated to temperatures that would rapidly draw the temper from ordinary high carbon steel. In the manufacture of permanent magnets, used in the construction of electric meters, the steel employed contains approximately 5% to 6% tungsten. An alloy of 5% tungsten and 6% steel will make a shell for lead bullets that has much higher penetrating power than ordinary lead. Tungsten steel may also be used for armor plate. Metallic aluminum can be hardened advantageously with tungsten, its resistance to oxidation making it much superior to copper. A small percentage of tungsten will also greatly increase the carrying power of spring steel. Tungsten steel is employed in the sounding plates of pianos.

Vegetable tissues are rendered incombustible by the use of tungsten compounds. Usually the material to be treated is coated with tungstic acid and glue, or with tungstate of soda and muriatic acid in a thick solution of glue.

In figuring percentages of tungsten ore it must be noted that the atomic weight is very high, 184, so that the difference between the tenor, quoted as metal and as oxide, is not as great as in the case of iron.

## Automatic Excavator for Placer Mining.

Written by JOHN A. YEATMAN.

These plants are designed to meet the conditions of the particular location where they are used, but in a general way the plants are of two kinds:

First—Where they deliver into a sluice, this type being employed where there is a tailing dump available.

Second—The plant is constructed with screens and tailings stacker, for use where it is necessary to "back fill" with the tailings.

The accompanying illustrations are of a plant

The Bucket at Work in the Gravel.

H. P. locomotive type boiler. The hoisting engine has two drums in line on one shaft, each controlled by frictions. The engine has two cylinders, 7½x12 inches, good for nominal 30 H. P. loads, an 8-inch centrifugal pump and a 9x12-inch center crank engine to drive the pump. This pump delivers water into the hopper for washing the gravel and sluicing same away.

For digging the gravel there are two specially constructed excavator buckets, each of these buckets being operated by cable, which is attached to each drum on the hoisting engine and led over sheaves above the upper deck. At the rear end these buckets are yoked together by cable which passes through sheaves at the rear or opposite side of the excavation from the head frame.

These sheaves are attached to a spreader which keeps them spaced a given distance apart, and to each end of the spreader is attached a tackle which runs back at an angle to dead men to which they are securely anchored.

In practice the buckets are operated alternately; as the loaded bucket is drawn up, the empty bucket returns. The capacity of these buckets is about 1½ cubic yard, and they will load themselves as they are drawn towards the head frame, in from 8 to 12 inches, and they discharge automatically into the hopper. Both the head frame and the back hauls are moved by lines which lead to the winding drums of the hoisting engine, so that the entire operation of the plant is under the direct control of the engineer. The crew required to operate the plant consists of three men on each shift.

The capacity of the plant depends somewhat upon depth and character of the ground, and the special condition under which it is being operated—the capacity being somewhat less in deep ground than it is in shallow, but in a general way the capacity of a

## The East Lode of California.\*

Written for the MINING AND SCIENTIFIC PRESS.

There are several mineral belts in the Sierra Nevada and its foothills in California. These belts are usually distinct, lie several miles apart and have geological, structural and mineralogical characteristics which distinguish each. The most westerly lode occurs in the low foothill region, and in the southerly portion this lies out on the plains of the San Joaquin. This belt carries copper and gold ores. Eastward, at a distance of about 10 miles and approximately parallel to the copper lode, is the mother lode. Between these is a region in which occurs many pocket gold mines and a few milling mines. One of the most noted of these was the Washington mine, near Hornitos, in Mariposa county, worked to a depth of 1500 feet. The Golden City mine near La Grange is another.

From 6 to 10 miles east of the mother lode is the east lode, and between these is a second region of pocket mines and also milling mines. Noted among the pocket mines are the mines on the Bonanza dike at Sonora and the pocket mines of Bald mountain in Tuolumne county. Among milling mines in this area is the Golden Gate, near Sonora. East of the east lode are a number of other belts in which occur ores of gold and silver, usually associated by abundance of base metal sulphides. Often these ores are difficult of treatment—more so as a class, at any rate, than any of those lying to the westward. These zones of mineralization occur in nearly parallel lodes and are found even to the crest of the Sierra, as at Tioga and Lundy.

The east lode is the most persistent of these lodes, with the exception, possibly, of the mother lode. The veins of the east lode occur in clay and mica

Centrifugal Pump for Washing Plant.

Terminal and Sluices.

Bucket Carrying Gravel Up to Sluices.

erected for the Klamath River Gold Mining Co., and is of the first described type.

This plant consists of a movable head frame, about 18x24 feet, which is mounted on a track parallel with the excavation. The head frame consists of a lower deck, on which the machinery is mounted, and an upper deck which is about 20 feet above the ground in which is the hopper. From this deck there is suspended an apron at an angle of about 40°, the lower end resting on the ground on the side next to the excavation. There is also a platform on this deck for the operator. The hopper is connected by an adjustable chute with the main sluice, which is in the rear end parallel to the traverse of the head frame.

The power equipment in this case consists of a 50

double-bucket plant of the kind here described will be from 1800 to 2500 cubic yards per day of twenty-four hours, and the cost under ordinary conditions it is believed will not exceed 4 cents per cubic yard. The plant permits the use of any gold-saving device which may be best adapted to the character of the ground. The accompanying engravings illustrate the various parts and method of operating a plant of the character here described.

These plants will operate to considerable depth, the capacity, of course, being somewhat less on ground of great depth than on shallow ground, and on any kind of bedrock, soft, hard or ragged. As the bucket is more or less flexible, it is not endangered by bedrock or large boulders.

slates, in mica and hornblende schists, in granite and occasionally in greenstone schists. The ores are for most part unlike those of any of the other lodes mentioned and carry characteristic minerals. In the mica-schist and mica-slate areas the veins when conforming to the formation are lens-like, uncertain and pockety as to values. As a rule the ores, if of value at all, are rich. In the hornblende schist the veins are usually fissures of greater persistence than those in the mica slates. In the clay slates the veins generally (though not always) conform approximately to the strike and dip of the enclosing rocks. The Buchanan mine in Tuolumne county is an important exception, the principal ore shoots occurring in a

\*See illustrations on front page.

fissure striking E.-W. from a N.-S. zone of mineralization. The ores occurring in the clay slates are uniformly more free milling than those in the other formations mentioned, consisting principally of banded quartz with auriferous iron sulphide, little copper, lead or zinc sulphide being observed.

Where the veins in mica schist and slate and hornblende schist cut across the strike and dip of the formation—not an uncommon occurrence—arsenical ores, often of high grade, are of common occurrence. These ores are more expensive to treat, of course, than the lower grade of less rebellious ores, but their richness usually offsets the metallurgical difficulties.

In the granite region of the east lode the ores show a remarkable similarity wherever they occur for a distance of 200 miles. The gangue is chiefly quartz, often accompanied by a greater or less amount of calcite. The minerals are pyrite, chalcopryrite, galena, zinc blende and characteristically pyrrhotite, which latter is found rarely in the other lodes, with the exception of the copper deposits, where it is usually abundant. In the granite the values are, usually comparatively high and galena and zinc blende have come to be recognized as good indications of high values in gold. Silver also occurs, but in relatively small amount.

Among the mines of the east lode the Black Oak, near Soulsbyville, is one of the noted properties, having now been in continuous operation for many years. The veins occur in granite (grano-diorite) and are characteristic of the ore occurrence on the lode. There are in this mine, however, two distinct classes of ore—one a heavily mineralized ore carrying the sulphides of the base metals in abundance, though arsenical and antimonial ores are rare. Pyrrhotite is abundant. These sulphides are high grade—\$100 to \$300 per ton. Telluride of gold also occurs sparingly in the ores of the east lode and is usually mistaken for galena by the miners. The other ore characteristic of this mine is a large vein of white quartz carrying little sulphide mineral, and that, generally finely disseminated in small grains throughout the rock. There is abundance of calcite present in the small fissures which abound in the rock, so that the quartz disintegrates rapidly upon exposure into coarse sandy grains which is ideal material for the stamp mill. In places the Black Oak vein is upward of 30 feet wide. The heavy sulphide ores occur in smaller shoots, but have been sufficiently persistent to admit of shipment of a large tonnage of this class of ore to smelters for years. The low-grade ores are stamped, amalgamated and concentrated, the tailings being cyanided and the concentrates shipped. Two of the illustrations on the front page show the hoist and mill of the Black Oak Co.

The Providence mine is also on the east lode in Tuolumne county and is entirely unlike the Black Oak. This vein occurs in black clay slate. The quartz is of the ribbon variety and the values often higher, several valuable pockets having been discovered in the past ten years. It also supplies a large amount of milling ore. The mine is situated on a steep mountain side and is reached by a road graded at an expense of over \$5000, from the bottom of the canyon of the North Fork of the Tuolumne to the mine—a distance of 1½ mile. The vein is about 5 feet in width and carries chiefly iron sulphide, with occasionally galena.

These two mines represent a large number of mines on the east lode, whose mineralogical and structural characteristics are similar to the two classes thus briefly described. The third engraving shows the Providence property and its surface equipment. Ores of the kind encountered in the Providence are usually treated by amalgamation and concentration, with occasional treatment of tailings by cyanide.

### Quicksilver Production in 1903.

California, Texas and Nevada are the only States in the Union that produced quicksilver during the year 1903. California mines yielded 30,526 flasks, worth \$1,330,916. The production of quicksilver in Texas amounted to 5029 flasks, valued at \$211,218. Nevada could claim only 65 flasks as the year's output. The total production for the three States was 35,620 flasks of 76½ pounds each, valued at \$1,544,934. This was an increase in quantity of 1329 flasks, and in value of \$77,086, as compared with the 34,291 flasks, valued at \$1,467,848, which constituted the production of 1902.

A notable instance during the year was the publication by Professor W. B. Phillips, director of the University of Texas Mineral Survey, of a carefully prepared statement in regard to considerable extensions of the area in Texas where quicksilver is found. It is evident that quicksilver mining in Texas should increase for several years before reaching the maximum.

The average price of quicksilver per flask in San Francisco during the year 1903 was \$45.29.

During each of the last ten years the amount of quicksilver imported into the country has been small. The quantity imported during 1903 had a value of \$1065. The quicksilver exported during 1903 amounted to 17,577 flasks, valued at \$719,119, of which 10,722 flasks, worth \$446,845 were shipped from the port of San Francisco.

The above figures are taken from a brief report on

the production of quicksilver in 1903, which is embodied in the volume entitled, "Mineral Resources of the United States, 1903," published by the United States Geological Survey. The report is also pub-

### The Opening of a Quarry.

In the mineral industry the business of mining or quarrying structural materials is a large and impor-

Quarry Site Being Prepared for Quarrying.

The Quarry After Stripping.

Spheroidal Weathering of Grano-Diorite at Nevada City, Cal.

lished in pamphlet form and may be obtained, free of charge, from the Director of the United States Geological Survey, Washington, D. C.

tant factor. In some States the value of structural materials—granite, sandstone, marble, slate, bricks, terra cotta, onyx, etc.—greatly exceeds the value of

the metallic substances or coal mined. Quarries, like mines, must be made, and their site is not always a matter of choice any more than in the location of a mine. The prospector takes up his claim where he finds the most promising surface indications, whether on the summit of a great mountain or in the bottom of a deep and rugged canyon. It may be in the midst of a great forest, near beautiful streams, or in the middle of a barren desert many miles from water. So with the quarry, the locator begins operations at a place where the material sought is apparently abundant and of good quality, and so situated as to be readily marketed. The latter is, of course, a desideratum, but is usually less important. It is rarely that the stone can be quarried with advantage at the surface if the rock be in place, a greater or less amount of stripping being required. The accompanying engravings illustrate this fact. The first picture shows the outcrop of beds of sandstone, near San Jose, Cal., where a quarry has been opened. It gives an idea of what is usually found essential in opening a sandstone quarry anywhere, though often the amount of surface debris is much greater than in this instance. The second illustration shows the debris removed and the strata of sandstone exposed ready for channeling. In the instance here illustrated the jointing planes of the rock are coincident with the bedding planes, but often by metamorphism, the latter have been nearly or entirely obliterated.

In granite there are no bedding planes, the planes of jointing being the only ones to which the quarrymen can work. In some of the most important granite quarries, like those in Madera county, Cal., the granite lies in great concavo-convex lenses, a sort of concentric or shell-like structure, and but one of these shells or layers is quarried at a time. At the Raymond quarry one of the great shells was exposed for a distance of 360 feet, over 60 feet wide and from 4 feet minimum to 25 feet maximum thickness.

In some regions the granite in situ is too soft and too much decayed to be made available as structural material, and yet the region is strewn with boulders of granite which are worked up into fine structural material. The region about Prescott, Ariz., is an instance in point. Here granite boulders from 3 or 4 feet to those 20 feet or more in diameter are strewn over the surface of the rotten bedrock granite. These have been extensively worked up and employed in the construction of buildings.

There are many instances of this kind in the granite regions of the West. This peculiar weathering of massive rocks is well illustrated in the third accompanying engraving. It is known as "concentric decomposition" or "spheroidal weathering" of massive rocks. It also occurs to some extent in sandstones, as shown in the second illustration.

In the case of granite, these boulders strewn on the surface are identical with the underlying bedrock, of which they originally formed a part, but for some reason the meteoric agencies have been unable to effect them in the same manner as the main mass of the rock. Often these hard unaltered granite boulders are found lying on a bedrock of granite in which a shaft may be sunk with pick and shovel to a depth of 50 or 60 feet.

## THE PROSPECTOR.

The mineral specimens from Quartzsite, Ariz., are as follows: No. 1 is quartz carrying chalcocite (copper glance) and small amount of malachite (green carbonate of copper), with limonite (brown iron oxide); the free gold occurs in a small fissure or crack between brown iron ore (limonite) and quartz, and also in the quartz; why the gold does not appear in the copper glance is a question difficult to answer; the small purple spots are bornite (copper sulphide); neither the bornite nor glance are normal ores, but are due to a process of enrichment from low-grade copper-iron sulphide ore; free, visible gold is rare in copper ores. No. 2 consists of brown and red iron oxides and a little chrysocolla (copper silicate). The free gold in this specimen occurs in the brown iron oxide (limonite). No. 3 is fibrous malachite (green copper carbonate); on one side it is incrustated with calcium carbonate, an infiltration from percolating water. No. 4 consists largely of quartz and brown iron oxide, in which is disseminated chalcopryrite (copper-iron sulphide); occasional flakes and grains of copper glance, copper oxide (cuprite) and malachite are observed in the specimen; it is probably also gold bearing, though no gold is seen. No. 5 consists largely of iron carbonate, silica and lime, with brown and red iron oxides and a little green carbonate of copper; also some white talc. No. 6 is largely iron oxide from which all, or nearly all, the copper has been leached, leaving the iron, altered to oxide, behind; this is the "gossan" of the copper miner. No. 7 is quartz; the dark portion is also siliceous and looks like altered hornblende. No. 8 shows similar conditions; it also shows scales of mica and is due to the alteration of country rock; these numbers (7 and 8) also carry a small amount of copper. No. 9 is mostly specular iron, a variety of hematite with a micaceous structure; it shows also a small amount of copper carbonate (malachite). No.

10 (two pieces); the larger piece is made up chiefly of crystallized quartz with iron oxides, both limonite and hematite; it shows no copper minerals; the white incrustation is carbonate of lime; the smaller piece consists of quartz which has been crushed by pressure and recemented; it contains brown iron oxide and a small amount of malachite. No. 11 is a quartz rock, seemingly an altered dike rock or a quartz schist; it is filled with minute scales, grains and dustlike particles of hornblende, or its alteration product chlorite, which gives it a slightly greenish color; no sulphide mineral was observed in this last rock, though one would expect to find such in the rock; "quartzite dike" is a misnomer; dikes are intrusive and can not be properly applied to metamorphic sedimentary rocks like quartzite; none of the rocks or ores of this lot contain mercury (cinnabar); the bright red mineral in each instance is hematite (red iron oxide); the appearance of crystal quartz in these ores can not be considered as particularly significant; in some gold regions veins carrying quartz crystals are apt to be pockety in the distribution of the gold.

The rock from White River, Tulare county, Cal., is aplite, a type of granite.

## Deep Hoisting on the Mines of the Rand.\*

Written by J. B. CARPER.

The question of hoisting on the mines of the Rand is working its way to a satisfactory solution along the lines advocated by those who favored the tandem sheave and endless rope with a tail rope attached, to balance the weight of the working parts, commercially known as the Whiting system.

Since 1900 this system has successfully overcome on the Geldenhuis Deep, Ltd., City & Suburban Gold Mining Co., Robinson Gold Mining Co. and the latest installation at the Robinson Central Deep, Ltd., all the obstacles which Hans C. Behr attributed to it in his valuable contribution on "Winding Plants for Great Depths." The Whiting system, however, exercises no monopoly over the field here for hoisting plants, for there is scope for the other types advocated, such as the conical drum, the tapering rope and the parallel drum types, and the men behind these systems have the ability to work them successfully.

The Whiting hoist, from the standpoint of economy in first cost of boiler plant, attendance in the boiler house, first cost of the engine and appliances required for hoisting from 1000 to 3000 feet or over, stands in a class alone here to-day, which I will endeavor to prove to be true also in regard to the costs of operation.

First, we will review the conditions existing at the City & Suburban Gold Mining Co., where a Whiting system has been in constant service since 1899. Dimensions, 16 and 38 by 60; 16 and 28 by 60; horizontal compound tandem Corliss engine, direct-connected to the rear sheave and by side rods to the forward sheave, run condensing, and controlled by a centrifugal governor.

Load of reef, 7600 pounds.  
Weight of skips, 6500 pounds.  
Diameter hoisting rope, 1½ inch.  
Diameter of balance rope, 1½ inch.  
Depth of shaft, 1450 feet.  
Running time per diem, 11 hours.  
Number of skips hauled in 11 hours, 200.  
Tons hoisted per month (waste and milled), 22,700 tons.

The cost of coal for power on this property to mine, hoist, sort, crush and mill, and treat the sands and slimes, is 9.77d per ton handled. The average cost of coal for power purposes on the Rand is 27s per ton, and a consumption of 285 pounds of coal to extract and treat a ton of reef.

Hennen Jennings, in his comprehensive discussion before the South African Association of Engineers in 1902, on the subject of "Winding From Depths," gave data from which he estimated the cost per ton for "hoisting reef down as deep as 1000 feet as 7.04d per ton mined and 8.53d per ton milled." These figures were principally compiled from high-pressure cylindered hoists, non-condensing, non-governed. With the modern appliances attached to the City & Suburban hoisting plant, the costs for hoisting are 2.2d per ton mined and 2.6d per ton milled—a saving of 4.84d and 5.93d, respectively, per ton.

At the Geldenhuis Deep, Ltd., it is operated in a combined vertical and incline shaft with the balance rope.

The conditions of operations are:  
Depth of vertical shaft, 800 feet.  
Depth of incline shaft, 446 feet, ultimately.  
Load of reef, 5200 pounds.  
Weight of skips, with chains, etc., 3986 pounds each.  
Diameter of hoisting rope, 1½ inch.  
Diameter of balance rope (old winding rope), 1½ inch.  
Loads of reef per diem, 280.

\* London Min. Jour.

Velocity in the shaft in feet per minute, 2500 feet. Capacity of 200-stamp mill, 1000 tons per diem.

Dimensions of engine, 16 inches and 28 inches by 60 inches; 16 inches and 28 inches by 60 inches; twin comp. horizontal tandem condensing governed.

The conditions as fulfilled at the Geldenhuis Deep, Ltd., are raising of a load of 5200 pounds up an incline shaft 446 feet at an angle of 35° around a bend whose radius is 75 feet from the incline to the vertical shaft, thence 800 feet on the vertical to the automatic tipping arrangement (where the reef is dumped for crushing without cessation of speed from the box at the level to the tip-in the headgear). The starting momentum required for the Whiting system is also appreciably less than that required by any other type of winder, with possibly the exception of the flat rope reels, which are proven to be too expensive in the wear and tear of ropes to justify further use here. Hence the fundamental requirements for hoisting, viz., (1) minimum initial expenditure of capital, (2) minimum running costs, are being fulfilled at the Geldenhuis Deep plant.

The Whiting hoist at the Robinson Central Deep embraces all the improvements which the past five years' experience with the Whiting system have taught us, of which the following are the most noticeable: Sixteen feet diameter sheaves from 10 feet diameter. Five grooves per sheave instead of three. Surface condensing plant of 3000 square feet cooling surface. Post and crank-disc brakes operated by steam and foot levers. Indicator of the dial type constructed with a slip motion, to permit engine to automatically correct its reading once for each run, if necessary; diameter of dial, 6 feet.

A safety brake, by means of which pressure is applied to the rope between the sheaves; it consists of two strong V clamps, having brass faces grooved to the rope, and operated by toggle joints by means of a foot lever and screw-down wheel. The engineer's platform has its level such that the engineer can easily see over the top of the drums, and is located between the engines; upon this platform all hand levers, foot steps and gauges used in the operation of the plant are mounted. The main brakes are applied by means of dead weights and released by a direct-acting steam engine, equipped with the oil-cataract cylinder. The reversing gear is of the Allan type, with straight link, and is operated by means of a direct-connected steam engine designed with the oil cataract and floating levers. The cut-off is effected entirely by the Corliss cut-off gear, under control of a standard centrifugal governor.

The hoisting engine is to raise 8000 pounds of ore from a vertical depth of not more than 5000 feet, the skips to weigh 4500 pounds each; steam pressure at throttle, 140 pounds per square inch. A tail rope is used to fully counterbalance the effect of the working rope. Every engine of this type is of the same cylinder dimensions, which minimize the amount of extra parts carried in stock, especially when one group of mines have nine Whittings working, and another twenty to thirty on order or awaiting Chinese laborers before the full number is placed.

The cross-compound hoisting engine in use since 1899 at the Catlin shaft of the Jupiter Gold Mining Co. has given general satisfaction in hoisting from a vertical depth of 3907 feet.

The particulars of this plant are:  
Dimensions, 28 inches and 50 inches by 72 inches.  
Cylindrical drums, 14 feet diameter by 4 feet 3 inches wide.

Load of reef hauled in pounds, 2000.  
Weight of cage and car, 3820 pounds.  
Size of rope, 1½ inch diameter.  
Depth of shaft to lowest developed working, 3907 feet.

Maximum velocity of winding in feet per minute, 3150 feet.

Minimum velocity of winding in feet per minute, 2400 feet.

Non-condensing on governor.

This engine was designed to work a depth of 3000 feet only, and will be replaced by an engine designed to haul from 4400 feet depth. As this engine was installed more for the purpose of getting the shaft sunk to the reef as quickly as possible, questions of economy in steam consumption had to be of a secondary consideration.

Taken as a whole, the mining industry here suffers materially from the want of initiative to scrap the obsolete machinery equipment and its replacement with economical power and maintenance-saving appliances. For instance, I have in mind a mine where a high-pressure winding engine is using up winding ropes at the rate of two every four months at a cost of £1200 per year. The cost of ropes alone in three years would buy and install a cross-compound condensing governed hoist.

The hoist which suits best the working conditions of the shaft and the mine, with the minimum of cost and maximum of economics, and the fulfillment of the necessary requirements of safety to life and limb of the employes hauled, and freedom from smashing up of the shaft timbers, is the hoist the engineers in this country are anxious to install and maintain. I believe that the output demanded from even the very deepest mine does not require the lift to be made in two stages, because with one stage located on the surface 2000 tons per diem can be hoisted through two compartments of a shaft.

## Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 6, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF TREATING GOLD AND SILVER ORES.—No. 776,424; C. H. Rider, St. Louis, Mo.

Process of treating gold and silver-bearing ores, which consists in placing charge of approximately five hundred pounds crushed ore in each of four receptacles, adding in each receptacle solution composed of one hundred gallons of water, three to five gallons of commercial sulphuric acid, and fifteen to twenty gallons of commercial nitric acid, and after silver is dissolved removing resultant solution to new receptacles, adding fresh solution to undissolved ore in first receptacle, solution comprising forty gallons of water, five gallons of nitric acid, and ten gallons of hydrochloric acid, dissolving gold in first receptacle, then combining two solutions and precipitating silver.

STAMP MILL.—No. 776,159; D. I. Whiteside, San Francisco, Cal.

Combination with reciprocating stamp or like stem, of cylinder axially in line therewith and having valve face provided with inlet and exhaust ports, piston fitting cylinder, to which piston stamp stem is secured, valve chamber, valve, means for reciprocating valve, rotatable means for imparting reciprocatory movement to valve, valve having recess in lower face and curved port extending around recess and adapted to bridge space between first-named ports, first-named ports connecting above and below piston and one of ports entering cylinder near middle thereof to provide relative large chamber into which expansion from opposite end of cylinder may take place, valve adapted to first admit elastic medium to cylinder to impel piston in one direction, then portion transferred to opposite end of cylinder and por-

tion remaining in first-named portion of cylinder exhausted to enable transferred portion to return cylinder to its first position.

DRY SEPARATOR.—No. 775,965; T. A. Edison, Llewellyn Park, N. J.

In dry separator, combination of blast tube substantially uniform in cross area, means for producing air blast through tube, screen pressure equalizing diaphragm across whole area of tube, second and finer screen diaphragm placed farther from blast inlet and at distance beyond first-mentioned diaphragm sufficient to form in tube pressure equalizing chamber, feed opening in top wall of tube immediately in rear of finer screen and extending across tube, means for feeding pulverulent or granular material in thin, uniform, vertical sheet falling across whole area of tube, and receptacles for grades produced.

CONCENTRATOR.—No. 776,662; H. E. Horn, Denver, Colo.

Concentrator provided with endless traveling belt or apron, and adjustable means engaging belt or apron from above to form transverse valley or depression therein, comprising shaft, vertically adjustable boxes in which latter is journaled, and number of separated wheels mounted on shaft and engaging upper part of belt from above between head and tail extremities of belt, latter being mounted to give its upper portion downward inclination from head of machine and actuated to cause it to travel upwardly.

ROCK DRILLING MACHINE.—No. 776,613; L. S. Pfouts, Canton, O.

In rock drilling machine, combination of support, turntable carried by support, motor connected thereto and carried thereby, support provided with upright members spaced from each other, drill frame pivotally connected at right angles to pivotal connection of motor turntable, sliding carriage and drill

frame carrying operating mechanism, and drill operating mechanism driven from motor pinion having common center with pivotal connection of drill frame and motor supporting turntable.

MINING COLUMN.—No. 776,881; R. L. Ambrose, Tarrytown, N. Y.

In device of character described, combination with casing containing longitudinal bore and enlarged chamber, of threaded rod fitted to longitudinal bore of casing, worm wheel fitted to chamber and engaging upper and lower walls thereof, worm wheel internally screw threaded and fitted to threaded rod, operating worm engaging teeth of worm wheel and located in recessed portion of chamber, chamber provided at another part with side opening through which worm wheel and worm may be removed and replaced, cap or closure for opening and operating stem for worm passing through from recessed part of chambered portion of casing to exterior thereof, bearings therefor being in an integral portion of casing.

LINING FOR SUBTERRANEAN PASSAGES.—No. 777,013; A. Fernandez, Pachuca, Mex.

Lining for subterranean passages, having base sills, upstanding side beams, cross beams connecting upper ends of side beams, and transverse braces engaging opposing side beams intermediate their ends.

DAM.—No. 776,799; F. H. Reed, Claremont, Cal.

Dam comprising rubble interlaced with metal bars of greater specific gravity than rubble, embedded in and resting on rubble, bars arranged horizontal, but at angles with respect to one another.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

Capital has been secured for the construction of the Tanana Mines Railway from Fairbanks to the mines on Cleary, Pedro and other gold-producing streams, and several thousand tons of rail are now at Hootalinou and Dawson, while orders are in for enough to complete 30 miles. Two locomotives have also been ordered.

### Yukon Territory.

No newspapers are being carried in the mails this winter from Dawson or other points to Yukon river points above or below Dawson, except points on the overland trail from Dawson to Whitehorse. This new ruling bars all papers mailed for the Fortymile country, Eagle, Circle, Rampart, Fort Yukon, Fairbanks, Nome, St. Michael or any other points north of Dawson. The only way by which papers can be delivered to those points is to have them placed in envelopes and first-class postage paid on them.

## ARIZONA.

### Cochise County.

The South Bisbee mining suit has been settled and the local stockholders will receive \$525,000. G. Neale represented the local stockholders in their endeavor to make the original directors of the old South Bisbee Copper & Townsite Co. show what had become of 1,800,000 shares of the stock for which no accounting had been made. The suit was brought in May, 1902, and tried in Tombstone first, and then carried to California. The defendants effected a compromise by agreeing to pay the full amount demanded by the appellants.

The Tombstone Consolidated are pumping 3,000,000 gallons a day and are sinking steadily. Part of the old tailings that have been worked over four times by Chinamen and whites by various processes are now being treated again by cyanide. The company is sinking a shaft, 10 by 24 feet outside timbers, to mine heavily when ore is opened. This company is a consolidation of most of the Tombstone companies, which abandoned the ground many years ago. Their ores ran into base at water level and there was nothing with which to treat them, as the former process was futile. Tombstone, which dwindled into a deserted village, is now a thriving camp of 6000 people.

### Graham County.

During the month of November the Shannon Co. produced 1,020,000 pounds of copper. The Arizona Copper Co. shipped 1231 tons of Bessemer copper.

### Maricopa County.

(Special Correspondence).—G. W. Guise has out several tons of free milling ore which he will have milled at the Union mill, north of Phoenix. A custom mill would undoubtedly pay if it was erected in the Union district.

Brashear Bros. encountered considerable water at a depth of 65 feet while sinking a shaft on the Lone Jack claim, south of the old Union mine.

Phoenix, Dec. 10.

(Special Correspondence).—John Montgomery and William Waddington have a force of men at work on their property, south of Mullin's Well, 70 miles west of Phoenix. About 125 feet of work will be done. The ore carries good values in copper, gold and silver.

Considerable prospecting is being done in the mountains south of Phoenix. George McCarthy is developing a claim in that section which he located some time ago.

Charles Rampf is down from his claims near the head of Lime creek. He has done considerable work on his property during the past summer.

Hurley Brothers have let a contract for sinking 100 feet in a shaft on their property, near the Red Rover mine, north of Phoenix.

Phoenix, Dec. 10.

(Special Correspondence).—James Boyd has two men at work on his property, 18 miles north of Phoenix. The ore is of a good quality and Mr. Boyd intends to ship several carloads of it.

John Maddox is up from the White Tank mountains. He reports an increased activity in the mining industry in that vicinity.

The Palace G. M. Co. have put a force of men at work on the Union property, north of Phoenix.

Coyle Bros. have a force of men at work on their property, 8 miles south of Phoenix.

Phoenix, Dec. 10.

### Santa Cruz County.

F. Cox, superintendent of the Black

Mountain M. Co., owning the Cerra Prieto, near Magdalena, was a visitor in Nogales, and reports that work has been resumed, under the management of N. Banks of Pittsburgh. Machinery will be installed.

### Yavapai County.

(Special Correspondence).—The White G. M. Co. of Yavapai county, Ariz., have contracted with Allis-Chalmers Co. of Chicago for a 20-stamp mill, with power for a 40-stamp mill, also cyanide equipment for same. They are at present employing fifty men in grading millsite and road from Wickenburg to Congress Junction, at which point machinery will be received, and expect to have the mill running not later than May 1, 1905.

Wickenburg, Dec. 11.

The Lincoln mine is to have a 20-stamp quartz mill. The Burlington G. M. Co. is installing a hoisting plant with a capacity of 800 feet, on its mine near the McCabe mine in the Big Bug district. A 4-drill air compressor has been put in. This company is planning to pump water from the Big Bug creek, and machinery for the plant is on the way. The White mine on the Hassayampa river, 12 miles above Wickenburg, has been sampled and machinery for a 20-stamp mill has been ordered as a result of the examination. The mill will have 1000-pound stamps. Forty men are now employed at the mines.

Engineer Merritt is making a survey for a wagon road from Crown King station to the properties of the Colonel (formerly Cadillac) M. Co., a distance of 1½ miles. The expense is shared by the Wildflower group—F. M. Murphy and J. R. Liston—and the road will probably be extended to the latter properties.

The Tiger G. M. Co. is using oil for fuel.—A. P. Anewait is president of the Baumann Copper Co. of Prescott, and J. Baumann is general manager and secretary. Development machinery will be placed on the mines.

## CALIFORNIA.

### Amador County.

(Special Correspondence).—The Pioneer Reduction Works at Sutter Creek, owned by E. C. Voorhies, is being overhauled, gasing tanks being repainted, filter bottoms being renewed, etc., preparatory to handling auriferous sulphides.—The 2000-foot drift of the Lincoln is advancing rapidly southeasterly toward the Mahoney shaft. During the month ending Dec. 7th 180 feet were driven with one machine drill, with two shifts during the first part and three shifts during the last part of the month. This drift will be continued until under the Mahoney shaft when a raise will be made to the bottom of the shaft. After this a similar connection will be made to the Wildman shaft.

Sutter Creek, Dec. 12.

(Special Correspondence).—One hundred stamps are now dropping at the Kennedy mill. The vertical shaft is now down 2700 feet and is to be sunk deeper. A new level will be run at 2700 feet and another at 2850. It is estimated that the vein is 500 feet west of the shaft at the 2700-foot level. Two veins about 100 feet apart are being worked and are designated as the hanging wall and foot wall veins respectively.

Jackson, Dec. 14.

### Butte County.

There are twenty-seven dredgers now at work near Oroville, and one new one is being built. These dredgers require 130 electric H. P. per day. Each boat digs from 1500 to 2500 cubic yards a day, or a total of about 54,000 cubic yards a day.

### Calaveras County.

On the Stanislaus river below Collier, 6 miles east of Murphys, the Bourbon M., M. and Electrical Co. have acquired water rights along the river and intend to transmit power into Sonora and other Tuolumne points by July, 1905. Beach Thompson is the general manager. Peter Copella of Douglas is local superintendent. Fulcher of Sonora is making a preliminary survey of a 2-mile ditch and flume.

The Etna King M. Co. of Stockton has put a hoisting plant upon the Zeigler property in Angels Camp, and will sink a three-compartment working shaft for the development of two shoots of ore. F. D. Cobb of Stockton is president. F. F. Ames is superintendent at Angels Camp.

The Union Copper Co. at Copperopolis is hauling lime to build a smelter. A pole line leading from Telegraph City to the mine has been completed to supply the power. Forty men are at work at the mine.

### El Dorado County.

The Crystal mine, near Omo, is being reopened.—A. P. Grasser will place new machinery in the Smith Point mine, near the Zantgraf, preparatory to the reopening of the mine.

—The Stillwagon mine has been sold to the company operating the Eagle mine. There are six men at the Eagle and the tunnel is being driven.—The large cribdam on the American river, below Josephine, is completed, and the Eagle Bar Co. will commence piping.

### Fresno County.

(Special Correspondence).—Near Trimmer, on Hughes creek, the Eliza Jane mine, formerly the property of V. F. Moore, is being developed by the Hughes Creek M. Co., who are putting in a 5-foot Huntington mill, air compressor, etc.

Trimmer, Dec. 10.

### Kern County.

At the Yellow Aster a new cone has been installed in the rock crusher at the 100-stamp mill. Nearly all the ore now going through comes from the glory holes and is let down to the Rand level. A new crusher is soon to be installed at the 30-stamp mill. The company have decided to work the tailings pile and a 100-ton cyanide plant has been ordered and will soon be in operation. This will work about one-fifth of the daily accumulation.

### Nevada County.

L. Rosenfeld and F. R. Webe of San Francisco have ordered sinking on the Inkmarque ledge at Grass Valley to commence at once.

At the Idaho-Maryland mine the old shaft has been cleaned out and retimbered to a depth of 300 feet. It has been found necessary to put in new sets all the way down. When the 500 level has been reached it is expected that the vein at that point will be worked while the re-opening continues. In the mill new mortar blocks and timbers are being put in. The old floor in the concentrator room has been torn up and will be replaced with new material.

### Placer County.

(Special Correspondence).—The Tadpole Con. G. M. Co., near Westville, Canada Hill mining district, has been prospecting the ledge during the past season by shafts from 4 to 12 feet deep. They have purchased nine claims traversed by two canyons having water sufficient to run a mill. A tunnel has been driven 255 feet. The company intends to install power drills and a 50-ton mill. H. M. Morton is superintendent.

Westville, Dec. 14.

### Plumas County.

C. Standiford, at Quincy, in the employ of H. H. Yard of the North Carolina M. Co., has charge of extensive assessment work at Humbug valley and Rush creek; 150 men are at work. The Plumas Independent reports that orders have been given for 200 M feet lumber, to be used in the construction of houses and flumes on the claims. Roads and trails will be built to make the claims more accessible, then will follow tunneling and ditching.

J. N. Gable of Bucks ranch has bought the Gravel Range gravel mines, 8 miles southeast of Bucks ranch, from J. L. Blevins.

### Trinity County.

The Yellowstone mine, 25 miles from Weaverville, comprises sixteen locations. The water right is ample to furnish power for a 20-stamp mill throughout the year. The property is equipped with a 10-stamp mill. In the spring Superintendent Manley will install a sawmill with a capacity of 5000 feet a day, and an electric plant. The main ledge lies between slate and porphyry, is free milling and easily worked.

### Tuolumne County.

Men at the Green Jumper are running a tunnel to cut the ledge and if the ore is found as good as it is on top a mill will be erected. Wm. Conn is superintendent, under the management of John Ryan, at Sonora.—About 250 men are employed at the Eagle-Shawmut, near Chinese.

## COLORADO.

(Special Correspondence).—If plans do not miscarry, the new United States mint at Denver will be used as a coinage mint the coming year. Congress has been asked to appropriate \$200,000 for operating same. This is considerably in excess of what has been used heretofore, but if they make it a coinage mint it will require a large force of assistants and machinery.—The leasing system inaugurated at the Stratton's Independence, in the Cripple Creek district, has proved a success financially. Since the adoption of this system the profits have been satisfactory and a dividend has been declared to the stockholders.—The American Mining Congress, with headquarters in Denver, and some of the prominent mine operators of the State will endeavor to have a cabinet position created and called a department of mines and mining.

Denver, Dec. 14.

### Boulder County.

(Special Correspondence).—The Moxon G. M. Co., in sinking a shaft on Gold Hill,

has opened up 22 inches of telluride ore. The 115-foot shaft will be sunk deeper. They expect to start shipping shortly.

Rowena, Dec. 12.

### Clear Creek County.

F. F. Reed, manager Bonieta mill in Idaho Springs, has leased the dump of the Saratoga mine, and the Bonieta mill will be run exclusively on the material. It has been recently remodeled and enlarged by the addition of rolls and jigs to one section. The mill now has ten stamps of the slow-drop pattern used for amalgamation, the other fifteen stamps being used for regrinding for the concentrating section.

### Chaffee County.

The Liberty Bell M. and D. Co. at Salida contemplate erecting a concentrator. D. J. Cramer is president.

### Fremont County.

The old National mill tailings dump, near Florence, is to be cyanided by W. G. Brown and associates, who are erecting a mill for that purpose. The dump contains now about 12% of the original values in the ore. The entire dump is to be worked over.

### Gunnison County.

At the Cortland mine, Ohio City, a steam hoist has been put in, and it is reported that a mill for handling the dump will be put up in the spring. G. Brant is manager of the company.

F. H. Neff of South Pass, Fremont Co., Wyoming, has been experimenting with a cyanide process on tailings of the Mineral Hill mill dump near Iris, and expects to treat the ores of the Continental mine on Beaver creek.

### Park County.

(Special Correspondence).—The London Twist M. & M. Co. has leased the Hard to Beat and Venture claims, adjoining the London mine. The tunnel is in 1200 feet, being driven by electric drill.

Alma, Dec. 12.

### San Miguel County.

At Ophir ten stamps of the Suffolk 40-stamp mill are crushing ore belonging to G. Smith, L. Sears and E. P. Hathaway, leasing the Wilson vein of the Suffolk.—Twenty-five men are employed working at the Carribeau, operated by the Yellow Mountain M. Co. O. Erickson has charge of the mine and mill.—The Tidal Wave, under the management of G. B. Pickett, is working a small force. F. E. Trumble is operating the Morning Star, on Sunshine mountain, under lease.—The Carbonero is shipping two carloads, of 20 tons each, per month.

### Summit County.

At the Excelsior mine, near Frisco, manager Calcord has recovered the vein which was lost in a fault and work has been resumed. The big bore of the North American Mines Co. is being driven into Peak 1, under the management of J. A. Parker of Memphis, Tenn. The Achmal tunnel is in 1400 feet, having crossed a number of veins. J. J. Deminy, Charles Brown and E. C. Gard have leased and bonded the Juno tunnel and are preparing to put a force of men to work on the property on January 1. The Troublesome mine is being worked under the direction of M. W. Palmer of Memphis, Tenn.

### Teller County.

R. P. Russell and W. G. Rice of Cripple Creek have leased 50 mining blocks of the Stratton estate, including the Badger Boy, Pride of the Rockies, part of the Lady Smith, the north end of the Proper, and part of the Durham, at 10% royalty. The lessees will erect a large cyanide mill on the ground for the treatment of the lower grades.

The new 25-ton cyanide plant at the Santa Rita property, near Victor, is now operating under lease to Denslow & Hopkins.

## IDAHO.

### Boise County.

V. Thorne of Idaho City will purchase a mill for his property, 6 miles northeast of Idaho City.

### Idaho County.

About 80 miners are at work at Hump, many having gone out to spend the winter, but with the determination of returning in the spring. The ground is covered with about 18 inches of snow, but the weather continues cold, which is not calculated to increase the water supply. The Jumbo, the Atlas, the Mother Lode and the Big Buffalo are all working.

A postoffice has been established at the town of Logan on the Big creek flats. W. A. Edwards is postmaster. During the winter, mail will be supplied twice a month via Warren. Two routes have been surveyed for wagon roads—one from Johnson creek, to connect with the Roosevelt road, and the other from Warren. These roads will probably be completed during 1905. At Logan S. L. Edwards is developing the Sunday.

### Latah County.

The board of regents of the Idaho State University at Moscow propose to

tory, to cost \$35,000, including the cost of a building already completed. The equipment proposed consists of a plant for crushing, screening and sizing of ores for dressing and concentration. The concentration plant will consist of jigs, vanners and Wilfley tables, along with elevators, trommels, settling tanks, and hydraulic classifiers. A small stamp mill, with plates for amalgamation, is included in the plant, and also a set of roasting furnaces, a leaching plant for work in chlorination and cyanidation; a pan and settler for the handling of silver ores and for working of the cyanide method where agitation is required. The plant will also contain a magnetic separator for magnetic concentration. All machines are to be made working size and capable of handling from 500 to 1000 pounds.

#### Owyhee County.

The Trade Dollar Extension M. Co. have discharged all the men working on that property, near Silver City, leaving only a caretaker in charge.

#### Shoshone County.

J. S. Brice has written an account of the Snowstorm mine, near Mullan, Idaho, for the Idaho Press, from which the following is condensed:

The Snowstorm has proven the existence of economic copper deposits in the Cœur d'Alenes, at present sending to the smelters ore at the rate of 160 tons per day. Between September 15 and October 10 the lessees, J. C. Heward & Co., shipped 155 cars, or approximately 3000 tons, from the upper workings. The shipping ore is in the form of oxides and carbonates, malachite predominating. Much of the oxide is a hydrated cuprite. Colors are brick-red, brown and black. All the commercial ores of copper, with the possible exception of the silicates, make their appearance. The ore is an impregnation of quartzite between stratification planes and on either wall bodies of slaty quartzite. The gangue of the ore is a true quartzite with little or no alumina or magnesia.

Fifty farmers have brought suit in the U. S. Court at Boise against the Bunker Hill & Sullivan M. & C. Co., the Federal M. & S. Co., the Gold Hunter G. M. & S. Co., the Hecla M. Co. and Larson & Greenough for \$800,000, alleging that the companies dispose of their refuse matter in the Cœur d'Alene river, causing the water in the river to back up and wash over the banks of the river and overflow their land, and that by reason of the chemicals and other poisonous matter used in their works the water of the river and the Cœur d'Alene lake has become poisonous, causing the death of their stock.

#### Washington County.

In the Seven Devils district the Idaho-Gold Coin M. Co. is working thirty men at its mine and a full crew at the 100-ton cyanide mill. The Iron Spring Co., since the reorganization, has resumed activity, and twenty-six men are employed. The mill at Council will be brought in when spring comes.

The \$33,000 wagon bridge across the Snake river, at Weiser, has been completed.

### MONTANA.

#### Jefferson County.

F. T. Morgan, near Basin, is developing the East Hiawatha in the Cataract district. C. Cochran is operating the Deer Lodge under lease from R. McCaffery. H. W. Bagley has resumed work on the E. F.

#### Powell County.

As a result of an injunction order obtained by State Coal Mine Inspector Welsh, the Gebo coal mine at Red Lodge has been closed. It is claimed that the Clark Ford Coal Co. is disobeying the State laws by failing to provide a proper ventilation and in not having a manway for the use of miners independent of the regular haulage way. About 300 men are affected.

### NEVADA.

#### Esmeralda County.

A postoffice is established at Gold Center, Nevada, 80 miles from Goldfield. B. E. Burger is postmaster.

B. Shear, developing the Homestake mine at Silver Peak, says that they have nine claims on the Drinkwater and Homestake vein. The vein dips at an angle of 35° and is made up of a series of quartz lenses carrying free gold and sulphides of lead and iron. A 5-stamp mill is now being built with Wilfley table, belt machine, canvas tables and cyanide tanks, which will be running by the first of the year. The present cost of mining, milling, etc., is estimated at \$8 per ton, which will be reduced to \$3 when the tunnels on the lowest level cut the ore bodies.

P. J. Somers and M. D. Kelly, of Milwaukee, have bought the White Cloud group, 1 mile northeast of the Black Buttes, and the White Rose claim on the north slope of Vindicator mountain, from

W. J. Hurley and M. Rankin. J. Mack install a complete metallurgical laboratory has charge of their interests at Goldfield.

The Bullfrog Mine Syndicate is developing with ten men. J. W. McGalliard has charge. A road from Goldfield to Bullfrog will soon be completed, making 50 miles from Goldfield to Bullfrog. H. H. Clark, manager of the Bullfrog M. Co. and the Amargosa townsite, is building a telegraph and telephone line between Goldfield and Amargosa.

A part of the Red Top claim, near Goldfield, has been leased to Harrison, Atteaux & Lazard, who are planning a 200-ton milling plant.

A. W. Broughton, manager of the Florida, south of Goldfield, has twenty men working on the property. A steam pump is keeping the mine clear of water, and a \$3000 steam hoist and steam drills will soon be put in.

#### Lincoln County.

Morris & Schultz of San Diego, Cal., have purchased the Golden Eagle group of gold claims from Boyd & Larned for \$15,000. The twelve claims are between the Muddy and Virgin rivers, south from Moapa.

#### Nye County.

The west drift from the 540 level of the Silver Top shaft at Tonopah is in good ore on the Valley View vein. The 22 H. P. gasoline hoist is being replaced by the 44 H. P. hoist which was used in sinking the Belmont shaft on the east side of Mt. Oddie, and the Tonopah City engine house has been removed and is being built over it. The developments in the Tonopah Extension of the east and west drifts on both veins are in ore. The west drift on the 270 foot level of the south vein is now out 310 feet and the east drift on the 400 foot level of the north vein is out 205 feet. Shipments amount to about one carload a day, but to increase this, a new 100-ton ore crusher has been ordered, and will be installed as soon as received.

### OREGON.

#### Baker County.

W. L. Vinson of Baker City has leased the Magnolia mine in Granite district, with an option to purchase, and will reopen the property at once. Ten men are employed and the force will shortly be doubled. The 10 stamps will be dropping within 10 days. A standard concentrator will be added to the present battery of two Wilfley tables, and two vanners. The product will be shipped to the Sumpter smelter.

The Uncle Sam M. & M. Co. in Mormon Basin district is erecting a hoist and intends erecting a 20-stamp mill.

W. L. Vinson of Baker City has leased the Magnolia mine. The mill is being overhauled and additional concentrating tables are being installed, it being the intention to ship the product to the Sumpter smelter. Development of the mine will be under the supervision of A. P. Jones; E. P. Torrey will have charge of the mill.

H. T. Hendryx of Sumpter says that the Geiser-Hendryx Co. intends to open up the Golconda mine, treating the ore removed in development in the mill and after paying operating expenses the remainder of the proceeds are to go into a sinking fund to pay the interest on bonds issued to proceed with development.

The Mayflower mine, near Cornucopia, is shipping ore to the smelter at Sumpter. G. W. Boggs is general manager.

N. J. Sorenson & Co. of Sumpter have contracted for a testing plant to handle fifty to seventy-five tons daily, and will install it at the Highland mine.

The Highland, of the Rock Creek district, under control of the N. J. Sorenson Co., is shipping from 150 to 160 tons of ore to the smelter at Sumpter each month. High-grade ore has been struck in the Glasgow tunnel. The tunnel is now in 900 feet, giving a depth of 400 feet. They are now driving a crosscut tunnel below the Glasgow. This will give a depth at contact with the vein of 600 feet and also enabled underground mining clear across the mountain on which the property is located. The Highland now has 3000 tons of ore on the dump.

The Golden Chariot Co. has purchased the mining and milling plants of the Golden Wizard Co., consisting of two Nos. 7 and 9 pumps, a 7x10 hoist capable of sinking 1000 feet, a 12-stamp mill and 750 feet of wire cable, for \$15,000. The mill has never been operated. Both the Wizard and the Chariot are flooded, but it is the intention of the latter company to install the pumps immediately and get the mine free from water, when the hoist and mill will also be erected.

#### Josephine County.

J. F. Wickham, manager of the Alameda mine, is building a wagon road from Leland station, on the Southern Pacific, to the mine, which will be the main road to Galice. Merlin has

been the point at which travel and traffic for Galice were diverted from the railroad, but to reach the Alameda property by that route required twice ferrying Rogue river, which at some seasons of the year is difficult and always consumes some time. Grades on the old roadway are heavy. The new road will have a maximum grade of 3%, will be 6 miles nearer to the railroad than by the present road, and will avoid crossing the river.

R. Sinden is operating a small quartz mill at his mine on Kanes creek, near Grants Pass. H. W. Reynolds has the Henry Wines placer mine, on Jump-off Joe, adjoining the Cook & Howland mine, in order and ready for piping as soon as there is water in the creek. He will operate two giants, No. 2 to work on the bank and No. 1 to handle the tailings.

A new strike in copper has been made in the Butcher Knife, of the Josephine County mountains, in Deer Creek district. Seventeen claims have been taken up, some of which are already under development. The Improved Minerals Smelter Co. of British Columbia agrees to install a smelter on the ledge as soon as required. The owners of several adjoining claims are considering signing a contract with the smelter company for the installation of a plant.

### SOUTH DAKOTA.

The mines of South Dakota have produced \$7,090,481.71 in gold bullion for the twelve months ending Nov. 1, 1904. The following schedule shows the production by companies:

Alexander Maitland	\$ 315,078 16
Black Eagle	6,000 00
Clinton	317 98
Clover Leaf	166,290 00
Cochran	3,500 00
Columbus Consolidated	36,000 00
Dakota	90,955 84
Extreme	2,500 00
Golden Crest	32,875 00
Golden Reward	414,190 61
Hidden Fortune	168,000 00
Homestake	4,800,538 48
Horseshoe	356,121 28
Imperial	235,000 00
Lundberg, Dorr & Wilson	125,000 00
Monarch	2,208 84
National Smelting	45,056 00
Placer (estimated)	5,000 00
Portland	3,619 72
Spearfish	230,000 00
Wasp No. 2	111,000 00
Total	\$7,090,481 71

In his annual report the State Inspector of Mines states that Branch Mint M. Co. is building mill of 120 stamps and 3 miles of narrow gauge railroad in Bear Butte district. Golden Reward M. Co. is operating only its cyanide plant in Deadwood. Ore is taken from the northerly mines of the company's group. Some shipments have been made to outside smelters. At the Hidden Fortune G. M. Co. the new mill has been running the greater part of the year, with gradually increasing capacity. The ore is taken from the flat, siliceous formation and from the tunnel in the vertical. Clover Leaf G. M. Co. is operating sixty stamps and adding \$200,000 worth of new machinery. The shaft is being deepened from the 700 to the 1000-foot level. Ventilation is good, produced by connection with open cut and circulating water. At the Gilt Edge-Maid M. Co. a new mill is to be run by electric power. At the Homestake mine steady production has been maintained throughout the year. One hundred stamps have been added to the Amicus mill, giving a total of 1000 stamps. The deepest shafts are 1250 feet deep, from the bottom of which development is under way. Portland & Clinton M. Co. are mining on the old workings and making shipments to the cyanide plant of Lundberg, Dorr & Wilson, and to outside smelters. They are under one management. At Wasp No. 2 M. Co. the mill is receiving additional crusher and rolls, to avoid loss of time from closing down when repairs are necessary. An improved system of mining has been inaugurated.

### UTAH.

#### Beaver County.

Hoisting works are to be put up at the mine of the Frisco M. Co. of Salt Lake City, D. P. Rohlfing, manager.

#### Juab County.

The Gemini and Godiva M. Cos., J. I. Packard, president, L. S. Hills, secretary, have decided to install pumps at the 1600-foot level in the Gemini as soon as possible. J. C. McChrystal is superintendent at Eureka.

#### Piute County.

The Alta St. Louis M. Co. has filed articles of incorporation. W. J. Craig is president, and G. O. Ellingwood, secretary. The company owns claims in Little Cottonwood mining district. The capital stock is \$300,000.

The Golden Star M. & M. Co. has filed articles of incorporation at Salt Lake City. They own the Grasshopper, Blue Bird, Rio Bird and Last Chance claims in the Gold Mountain district, Piute county.

W. P. Belding of Salt Lake City is president, and S. D. N. Bennett of Salt Lake City, secretary.

#### Salt Lake County.

H. M. Atkinson, manager of the New England G. and C. Co. at Bingham, Utah, contemplates putting in machine drills and air compressor.

#### Summit County.

T. F. Danaher is president, Forest City, Iowa; A. M. Spooner, Salt Lake City, is secretary and superintendent, and A. H. Elftman is consulting engineer of the Mount Masonic M. Co., developing ground adjoining Park City, Utah. As a result of the surface work, it was determined to run a 1200-foot tunnel on the vein from the base of Mount Masonic. This tunnel has been driven 400 feet.

### WASHINGTON.

#### Stevens County.

The Washington Powder Co., J. B. Tuttle, Jr., of Seattle, treasurer and manager, has been successfully tested a silicate of aluminum, analyzing 69% silica and 20% alumina, as an absorbent for nitro glycerin, finding no difficulty in making dynamite carrying 70% nitro glycerin. The test was made under the supervision of E. H. Rothrock. This deposit is 3 miles west of Blue Creek station on the S. F. & N., and is closely akin to the German kieselsuhr. The company owns water power on Wright's creek not far from the deposit, and the powder mills will be at once erected there. The company expects to make its own nitro glycerin by nitrating raw glycerin.

#### Whatcom County.

The Eureka mine, in Slate creek district, has been purchased by C. H. Ballard, superintendent of the neighboring Mammoth property. The price is reported at \$420,000. Arrangements are under way to operate the Eureka extensively next season. The deal includes a 10-stamp mill and sawmill plant.

### FOREIGN.

#### AUSTRALIA.

##### New South Wales.

At Broken Hill the new machinery in connection with the magnetic zinc separation process at the Junction North is being put in. It comprises two ball mills and automatic percussion feeders. One mill is already in place. The mine continues to make from 20,000 to 25,000 gallons of water daily, which is being pumped to the British mill. The foundations for the Wilfley tables are laid; and, as the plans of the ball mill are to hand, preparatory work is being commenced. Initial arrangements for unwatering the New White Leads have been completed. At present the water is just at the back of the 120-foot level.

##### Western Australia.

The Mining Journal reports that interesting experiments are being made in the Kalgoorlie mines by the State Mines Ventilation and Sanitation Commission. In several instances the faces of the drives are being heavily charged with as many as sixteen shots. Immediately after the firing, the experimenters, wearing respirators, visit the face and test the fumes, the idea being to determine the effects occasioned by undercharging and overcharging holes. It is stated that no instance of miners' phthisis originating in the State has been discovered. Every sufferer examined had contracted the disease before arriving in Western Australia. An investigation to determine the shape of the sulphide rock dust particles and their effect on the lungs is being carried on.

##### Queensland.

The fire at the Brilliant P. C. mine, Charters Towers, is being extinguished, and work resumed at the New Queen, Queen Cross Reef, Victoria & Queen, Victoria & Caledonian Block and others. The mines thrown idle will be the Brilliant P. C., Brilliant Block, Brilliant Extended, Brilliant & St. George United, Brilliant Central, Phoebe, Brilliant Freeholds and East Mexican. The Brilliant P. C. is one of the oldest mines on the field and has been worked for about eighteen years. It covers an area of twenty-five acres, but the known reefs have been practically worked out. Operations have lately become considerably restricted and confined mostly to tributers, who have obtained fair results. The company consists of 260,000 shares of £2 each, all fully paid up; the value of the gold obtained aggregated £1,382,000, from which about £677,186 has been paid in dividends.

### BRITISH COLUMBIA.

#### Atlin District.

Dredging for gold has become an important industry, though a large number of men still find employment in drifting, sluicing, etc., on their individual claims.

On the larger holdings suited to dredger operations considerable "bore hole" prospecting has been done as preliminary to the installation of dredgers. A dredger has been placed on a group of claims on Gold Run creek and a 500 H. P. electric power plant installed on Pine creek near the falls by the British-American Dredging Co. They also constructed 1½ mile of ditch, laid 1800 feet of 30-inch steel pipe, built 400 feet of flume, set up 6 miles of pole line, put in other equipment and made improvements at the dredging camp.

An effort is again to be made to employ Asiatic labor in the Atlin hydraulic mines. Two years ago a number of Japanese were taken into the country, but the white miners drove them out. The opposition of the whites was so determined that the mine owners considered it was best to defer introducing the unpopular Asiatics. According to H. W. Ebbs-Canavan, there is to be a second attempt made. The mine owners urge that conditions have changed considerably, there being far fewer white miners in the district than formerly, and that it is not possible to operate many of the Atlin hydraulic properties without largely reducing the cost of labor. At the same time, they say, they will increase the wages of the white miners now in the district by employing them as foremen or overseers.

#### Trail Creek District.

The Trail smelter has a daily capacity of 900 tons of silver lead ore; the lead refinery can produce 25 tons of pig lead per day; 500 men are necessary to run the plant. Electric power is transformed 30 miles from the Bonington Falls power plant at 20,000 volts and is transmitted at the smelter to 550 volts, furnishing 1000 H. P. to 16 motor units for handling ore and running machinery. The furnaces are charged automatically from cars on a track beside the furnaces. The contents of each car are mechanically fed into the furnace so as to evenly spread the charge.

#### Rossland District.

At a meeting of the Rossland Board of Trade it was resolved that in view of the great disadvantage which gold-copper mining is laboring under in that province, and the vast revenue derived from it by the Dominion Government, the Rossland Board of Trade take steps to petition the Dominion Government to grant a bonus on copper, as it has done on lead and iron.

The concentration and reduction plant of the Rossland Power Co. at Trail has closed. The mill company has been engaged for several weeks in its trial run. The tailings, all below ½ inch in size, were pulverized in Chilian mills to 50 mesh for cyaniding. The test runs showed that the coarse concentrates were low in grade and under smelter rates prevailing they yielded little return. The finely disseminated sulphides remaining with the jig tailings were of very much higher grade than the rest and contained the bulk of the values. This unexpected peculiarity of the ore impoverished the coarse concentrates and carried high-grade sulphides worth \$100 to \$200 per ton into the cyanide treatment, thus making its operation impossible. It has, therefore, become necessary to add a plant of concentrating tables sufficient to treat the pulverized product of the Chilian mills before it goes to the cyanide plant and thus extract its rich sulphide contents. It will require several months to secure and install this plant, together with some additions to the slime settling facilities. It has therefore been decided to suspend operations until these improvements have been made and the smelting rates for concentrates have been determined.

### CANADA.

#### Ontario.

A deposit of corundum has been found on the farm of J. T. Vosper, Methuen township, Peterboro county. An analysis showed specific gravity to be 3.99, while that of good corundum is 3.85. The value of the mineral is \$390 per ton.

### MEXICO.

The "Free Zone" is a strip of Mexican territory 12 miles broad, extending along the entire frontier between the United States and Mexico. It was first established as far as Matamoros in 1855, when goods were admitted free of duty. In 1885 it was extended along the entire border, and duties, amounting to about 11% of the national duties, including fees for certificates, were assessed. A reduction of 89% in duties admits of considerable importation of goods from Europe, which cross the United States in bond and then come into direct competition with American goods in the stores of the Free Zone. Goods manufactured within the Free Zone when shipped across the Free Zone line into Mexican territory must pay the full national duty the same as foreign goods. The very low

tariff rates charged on goods entering the zone—almost no duty—apply only to goods consumed in the Free Zone, for which reason there are no factories therein.

The secretary of the treasury announced that in accordance with the law of November 25, 1902, the rate of exchange for liquidating import duties on merchandise entering the maritime or frontier custom houses during the month of December will be 220%, and that the commercial value in silver coin of one kilogram of gold at which to calculate the 3% stamp tax and the 2% coinage dues during December will be \$1,432.35.

#### Chihuahua.

The Minas Almoloya S. A., D. W. Shanks, general manager, and N. O. Bagge of Los Angeles, Cal., the principal owner, is working its property at Cerro Almoloya, between Jimenez and Parral. Eleven hundred feet of sinking, 600 feet of tunneling and 360 feet of drifting have been done. A telephone line is being built from Dorado station, on the Parral branch of the Mexican Central, 5 miles to the mines.

The Parral Miner says that during November there were 8500 tons of ore shipped from the Palmilla, Refugio, Quebradillas, Descubridora, Clarines, San Francisco del Oro, Santa Barbara and Inde mines.

#### Sonora.

Nogales, Ariz., Oasis says the Dewey mine, near Hermosillo, has shipped a carload of graphite to Hamburg, Germany, via Galveston, Texas, and also a carload of copper ore. A market for both has been offered, with a lower freight rate through from Hermosillo to Hamburg than to New York, where hitherto the graphite has gone; and, if the trial shipments prove satisfactory, both graphite and copper will be shipped regularly. The Dewey has also a large deposit of fine fire clay, a shipment of which is to go to Zubiarte for lining roasting furnaces.

The Golden River Placer M. Co. of Port Huron, Mich., is preparing to ship in hydraulic machinery to work forty-three pertenencias of placer ground on the La Canada branch of the Badoyhu, a branch of the El Fuerte river. It is expected that this machinery will be on the ground by February 1. General Manager Patterson and Scott have gone to the States to buy the machinery. Four giants are to be placed on the property. The machinery is to be shipped to Topolobampo, thence by the Orient Railroad to El Fuerte, thence by wagons to the mines.

The Sonora G. M. Co. of Battle Creek, Mich., is prospecting placer ground and three or four quartz mines and is shipping ore to El Fuerte. The company is capitalized at \$2,000,000 gold and is under the management of Mr. Clapp.

Below the Golden River Co. on the La Canada the Sonora Gold Placer M. Co., R. D. Hughey, manager, is working 100 men on fifty-seven pertenencias on pure placer ground. Manager Hughey has gone to the States to buy hydraulic machinery.

### PHILIPPINE ISLANDS.

The Philippine G. M. Co. has purchased a 10-stamp mill for erection in the Benguet district. J. Kelley at Antinook, Benguet, will order two 3-stamp batteries to work in connection with a cyanide plant.

At Masbate the Orion G. M. Co. are installing a 10-stamp mill from the Joshua Hendy Co. of San Francisco. Mr. Kimball of New York is superintending the erection of a Risdon bucket dredger of 3000 cubic yards daily capacity for the Masbate G. M. Co. M. A. Clarke of Manila proposes to erect a 10-stamp mill on his claims in the Benguet region.

### Trade Treatises.

"Worthington Pumping Machinery, Catalogue W-30," from Henry R. Worthington, New York City, is a typographic gem. The illustrations are types of fine pictorial portrayal.

Special Gear Catalogue No. 10, from C. O. Bartlett & Snow Co., Cleveland, O., illustrates and describes spur, angle, miter, bevel and worm gears, it being supplementary to their general catalogue No. 11.

Standard size (6x9 inches) bound in red and bound to be read, the 1904 manufacturers' catalogue of the American Well Works, Aurora, Ill., (Chicago office, 45 W. Randolph street) is a good epitome of well sinking and prospecting machinery. Its 160 pages contain much of interest and value on these subjects and also concerning compressed air pumping machinery, gasoline and steam engines, drilling tools, pipe and cylinders.

### Personal.

E. A. WILTSEE is in San Francisco from Denver.

W. J. RICKELL has started an assay office at Sodaville, Nev.

G. GILLET is manager of the Quebradillas mine in Parral, Mex.

C. C. JONES of Salt Lake City, Utah, is East on professional business.

F. E. HIGSON has charge of the Bullion-Beck assay office at Eureka, Utah.

H. C. NEWCOMB is superintendent of the Buena Vista M. Co., operating at Hancock, Colo.

FRANK CAPP is superintendent of the Florence G. M. Co. at Sugar Loaf, Boulder county, Colo.

ERNEST LEVY has succeeded P. S. Coudrey as manager of the Le Roi No. 2 at Rossland, B. C.

DOANE MERRILL is vice-president and manager for the Southwestern S. & R. Co., at Benson, Ariz.

C. B. NEIL of Helena, Mont., is manager of the Buckeye mine, near Basin, Jefferson county, Mont.

L. S. COTES has been appointed superintendent of the Boston Consolidated mine at Bingham, Utah.

A. M. ROCKWELL is superintendent at Wickenburg, Ariz., of the White G. M. Co. of Yavapai Co., Ariz.

W. J. WALTERS is manager of the Smuggler G. & C. M. Co., Index district, Snohomish county, Wash.

WILLIAM SCHWARTZ is general manager of the Santa Cruz M. Co. at Patagonia, Santa Cruz county, Ariz.

A. JACKSON, superintendent of the Rocco-Homestake mine, Hamilton, Nev., is in San Francisco for the holidays.

L. C. DOTY, formerly superintendent of the Eureka Hill M. Co., has charge of the Bullion-Beck mine at Eureka, Utah.

E. F. BRADT, of Hibbing, Minn., is superintendent of the mines of Pickands, Mather & Co., on the Mesabi range.

R. S. NORRIS, manager of the York-Alaska Tin Co., operating in the York district, Alaska, is at Brandon, Wis.

W. G. PAGE is manager of the Red Elephant group of mines at Hailey, Idaho, belonging to the Quincy, Jr., M. Co.

HENRY WENCHTLAND, who is interested in mining properties at Alamos, Estado de Sonora, Mex., is in Chicago.

C. E. WOLFF of the Zarina M. Co. is operating the Snoozier mine, on Russian creek, near Etna, Siskiyou county, Cal.

JOHN MCKELVEY, operating the South Fork mine, near Graniteville, Nevada county, Cal., has returned to the mine.

J. FARRIN, superintendent of the Glasgow M. Co., accompanied by D. Bailly, has been examining the mines in Rocky district, Utah.

F. H. METTS of Youngstown, O., president of the Ouray Chief M. Co., has been examining the company's property in Ouray, Colo.

T. T. HARDING, manager of the Gladstone M. Co., operating the Macedonia and Arizona mines north of Nogales, Ariz., is in Pittsburgh.

W. J. SANDO has been appointed manager of the Allis-Chalmers Co.'s pumping machinery department, with his headquarters in Milwaukee.

W. WEARNE, late superintendent of the Winifred Iron M. Co., of Minnesota, succeeds E. F. Bradt as superintendent of the Leonard mine, near Hibbing, Minn.

J. W. MESSNER is general manager of the Indiana copper mine, near Medical Springs, east of Baker City, Or., and of the Prairie Diggings mine in Grant county, Or.

R. E. HANLEY of San Francisco has an office with E. A. Sessions & Co., in the Canterbury building, Portland, Oregon. He is now examining Levens Ledge property of Douglas county, near Riddles, and also the Goldbug for T. T. Burkhart.

R. H. PASCOE of Rossland, B. C., who has had charge of the Standard mine, has been made superintendent of the Standard and Mammoth mines, owned by the Federal M. and S. Co., having been recently consolidated as the Mace mine.

E. H. STROUD of E. H. Stroud & Co., Chicago, Ill., manufacturers of the Cyclone pulverizers, addressed the Association of Portland Cement Manufacturers

on the subject of the Cyclone system of burning powdered coal, at their annual meeting at the Hotel Astor, New York City, December 14.

### Book Reviews.

"Geology of the Bitter Root Mountains," by Waldemar Lindgren, forms professional paper No. 27 of the U. S. G. S. The Bitter Root mountains, together with the Clearwater mountains, are in Montana and Idaho, bordered on the south by the Salmon river and on the north by the north fork of the Clearwater. The Bitter Root range, which attains an elevation of 11,000 feet, merges into the great dissected high plateau of the Clearwater mountains. These descend rather abruptly to the plateaus of Camas prairie and Cold Springs prairie, which form part of the Columbia river lava plateau. This plateau has a general elevation of 2500 to 3000 feet, and it is built up of horizontal lava flows. From great glacial cirques in the western slopes of the Bitter Root range the Salmon river and the several forks of the Clearwater river find their way westward through canyons from 3000 to 5000 feet deep. The canyon of the Salmon is especially remarkable for its great length and depth. The area indicated forms a wild and very sparsely populated mountain region, which is heavily timbered except on the highest ridges. The main Bitter Root range and the larger part of the Clearwater mountains consist of a massive biotite granite, or a quartz monzonite, which is the northward continuation of the great batholith of the same rock that occupies so large an area in southern central Idaho. A very remarkable fault of exceptional length and displacement separates the eastern slope of the Bitter Root mountains from the valley of the same name. The valuable minerals contained in this area are confined chiefly to the western slope of the Clearwater mountains. The most important are the gold deposits, which occur as fissure veins and gravels. At the foot of the Bitter Root mountains, some 12 miles north of Hamilton, Mont., is the Curlew mine, where a body of galena was found on a fissure that had limestone and quartzite as its footwall and the gravels of the Bitter Root valley as hanging wall. On the upper south fork of the Bitter Root river prospects of copper, silver and silver-lead ore have been worked. Hughes creek, in the same vicinity, contains gold bearing gravels which have been worked for many years. Elk City, where mineral deposits were discovered in 1862, is the center of the gold mining industry on the west slope. Gold to the value of several million dollars was extracted here from late Tertiary bench gravels, and placer mining is still prosecuted on a small scale. Quartz veins have also been opened in this old mining district. The well-defined quartz veins of Buffalo Hump, discovered in 1897, are actively worked, though not on a very large scale. These deposits occur in granitic rocks, accompanied by contact metamorphic slates. Florence, located 40 miles southwest of Elk City, is another of the old placer camps, discovered about 1861. The gravels were rich and the camp has yielded gold to the value of many million dollars. At present a few placers and quartz mines are worked there also. Pierce City, on Orofino creek, about 50 miles north-northwest of Elk City, is also a well-known placer camp, discovered in 1861, and worked continuously since then. The present yield from these placers is probably about \$30,000 per annum. The gravels occur as creek alluvium and as benches up to 500 feet above the present drainage level. Quartz veins have also been found near Pierce, and many of them now are worked on a small scale. The veins occur on gneisses and schists. The total production of this gold-bearing region is at the present time probably about \$160,000 per annum. Coal of fair quality has been found on the upper South Fork of the Bitter Root valley, and the beds are here associated with rhyolite. The developments have not yet shown the extent of this occurrence. Lignite of fair quality also occurs on Orofino creek below Pierce, and is associated with basalts, but the beds are probably not thick enough to make development work profitable.

### Obituary.

W. P. HARLOW, associated with W. H. Green of New York in copper mines in Arizona and New Mexico, died at St. Luke's hospital Dec. 6, 1904, as a result of an operation for appendicitis.

## Commercial Paragraphs.

ELLIOTT & DRESCHER of Prescott, Ariz., have finished plans for a 120-stamp mill for the Amalgamated G. Co., Quartzsite, Ariz.

THE Denver Tank Co., Denver, Colo., has recently furnished the following cyanide plants: 100-ton plant to Magnolia, Colo., 50-ton plant to Arizona and 50-ton plant to Silver City, N. M.

MR. PARK of the Park Gale Mfg. Co., Chicago, Ill., manufacturers of the Park automatic loading machine, is visiting the Pacific coast. This company is making an automatic loader which is creating some interest. Their offices are at 34 W. Monroe street, Chicago, Ill.

RECENT sales of second-hand machinery from the stock of the S. H. Supply Co., Denver, Colo., have been one 50-ton concentrating mill to Arizona and one to Boulder, Colo., 100-ton concentrating mill with crushing plant to Washington, and 50-ton crushing plant with gasoline engine to Tonopah, Nev.

JEANESVILLE IRON WORKS CO., through their Denver branch, late shipments of two electric driven power station pumps, 1000 feet lifts to Camp Bird mine, Ouray, Colo.; one station pump, compound condensing, to Parral, Mex.; one station pump to Nevada; one sinker to Central City, Colo.; five Wyoming steam separators to Bisbee, Ariz.; one to Crested Butte, Colo.; and one to Parral, Mex.

THE Lawrence Pump & Engine Co., Lawrence, Mass., is organized to make centrifugal pumps and vertical steam engines. H. L. Mellor is president of the company. Their line of pumps and engines are to be built from new patterns, and are designed to embrace new features. The company has just shipped a centrifugal pump of 3,000,000 gallons capacity, to be operated by an electric motor, to the Ticonderoga Pulp and Paper Co., Ticonderoga, N. Y., to be used in connection with their water filtration system.

THE Stow Flexible Shaft Co. of Philadelphia, while not desirous of making any forecast for the future business conditions, express themselves as being perfectly satisfied with the existing conditions. Among orders received during the past month they report the following: A Halsey portable drill for a firm in Vancouver, B. C.; an 18-foot flexible shaft, and a large crank pin turning machine from their St. Louis agent, together with three complete electric hammer outfits, shipped to Italy, for use in the government navy yards.

THE Brown Corliss Engine Co., Corliss, Wis., have a contract from the city of Milwaukee to furnish and erect complete one triple expansion high duty crank and fly wheel 20,000,000-gallon pumping engine. The amount of contract is \$64,500. They write that the contract was awarded after a thorough inspection of their plant by City Engineer C. J. Poetsch and the Milwaukee board of public works, finding that the concern is amply able to execute the contract with efficiency and dispatch. They are extending their foundry 60 feet to take care of the large amount of work on hand and in view.

THE California Gas and Electric Corporation of San Francisco, Cal., has a contract to supply the United Railroads of San Francisco with electric power for the operation of its entire street railway system and has let the contract for the generators of the new plant to the Crocker-Wheeler Co., through their Pacific coast manager, the Abner Doble Co., of San Francisco. The three machines will have a capacity of 4000 kilowatts each, and will be directly connected to gas engines. The generators will deliver twenty-five cycle, three-phase alternating current.

## Books Received.

In "The Black Hills Illustrated" the Black Hills Mining Men's Association has published a terse but complete description of conditions in this region. The attractive appearance of this large 200-page book cannot fail to give a favorable impression of the region. The good illustrations and printing enhance the value of the descriptive matter. A general description of the various resources and improvements is followed by descriptions of important mines of Lawrence, Pennington and Custer counties.

"Annual Report of the Chief of the Bureau of Steam Engineering" from the Government Printing Office at Washington.

## Latest Market Reports.

SAN FRANCISCO, December 16, 1904.

### METALS.

SILVER.—Per oz., Troy: London, 28d (standard ounce, 925 fine); New York, bar silver, 60c; refined (1000 fine); San Francisco, 60c; Mexican dollars, 49c San Francisco, 48c New York.

COPPER.—New York: Standard, \$14.87; Lake, 1 to 3 casks, \$14.67@15.12; Electrolytic, 1 to 3 casks, \$15.00; Casting, 1 to 3 casks, \$14.50; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: \$66 spot per ton.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12; San Francisco, \$4.50, carload lots; 4c 1000 to 4000 lbs.; pipe 6", sheet 7", bar 5c; pig, \$4.85. London: £12 17s 6d long ton.

SPELTER.—New York, \$5.87; St. Louis, \$5.00; London, \$25 per ton; San Francisco, ton lots, 6c; 100-lb. lots, 7c.

TIN.—New York, pig, \$29.12@29.60; San Francisco, ton lots, 29c; 500 lbs., 29c; 200 lbs., 30c; less, 31c; bar tin, \$32@35c. London, £136 spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@82c per gram.

QUICKSILVER.—New York, \$40.00@41.00, large lots; London, £7 15s San Francisco, local, \$39.00 per flask of 75 lbs.; Denver, \$45.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6c; extra, 17c; genuine, 31c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100 lb. lots, 16.25c.

ZINC.—Metallic, chemically pure, \$3.50, 50c; dust, \$3.10; sulphate, \$3.10, .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

### STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$15.85 @16.10; gray forge, \$16.60; San Francisco, bar, 3c per lb., 3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, 1c per lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, 1c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

COAL.—San Francisco, coast, yard prices: Wallington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

### GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8c; 100-lb. lots, 10c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15c; less than one ton, 17c. No. 1\*, 60%, carload lots, 13c; less than one ton, 15c. No. 1\*\* 50%, carload lots, 11c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9c; less than one ton, 11c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$8.50@6 per 1000; 4x, \$6.50 @7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet; double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 23@24c per lb.; carloads, 23@24c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3c per lb.; caustic soda, in drums, 3@3c per lb.; Cal. s. soda, bbls., \$1.10@1.20 per 100 lbs.; sds., 90c@1.00; chlorate of potash, 12@13c; nitrate of potash, 6c@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 23@24c; powdered sulphur, 2c@2c; flour sulphur, French, 2c—c; alum, \$2.00@2.25; California refined, 1c@2c; sulphide of iron, 8c per lb.; copper sulphate, 5c@5c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66c, B, 1c@2c per lb.; nitric acid, carboys, 8c per lb.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, \$3.50, 7c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, 2 over 75c per lb.

CHROMIUM.—90% and over, \$3.50, 80c.

PHOSPHORUS.—American, \$3.50, 70c.

SILVER.—Chloride, \$3.50, 90c@1.00; nitrate, 55c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—\$3.50, \$2.75.

SODIUM.—Metal, \$3.50, 50c.

BISMUTH.—Subnitrate, \$3.50, \$2.10.

URANIUM.—Oxide, \$3.50, \$3.50.

MERCURY.—Bichloride, \$3.50, 7c.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRAVELING HARVESTER.—No. 776,167. Nov. 29, 1904. Daniel Best, San Leandro, Cal. This invention comprises mechanism by which the thrashing and cleaning mechanism of the apparatus may be maintained substantially level while the machine is traveling upon side hills or inclined ground which would otherwise throw the mechanism out of level. It also comprises a novel means for preventing twisting strains upon the frames, means for more equally dividing the weight carried upon each of the main bearing wheels, and in dividing the power transmitted from said wheels.

JAR CLOSURE AND FASTENER.—No. 776,162. Nov. 29, 1904. E. Abramson, San Francisco, Cal. The object of this invention is to provide a simple locking means applicable to a variety of jars and bottles, but especially to fruit or preserve jars, which fastener can be quickly and easily put on or entirely removed from the jar, which will serve to hold the cover tight, and which will enable the jars to be piled one on top of the other, if desired.

SUCKER ROD GRABS.—No. 776,749. Dec. 6, 1904. O. A. Mann, Oil Center, Cal. This invention relates to improvements in means for recovering broken sucker rods, or other and similar obstructions from oil wells. It consists essentially of a hollow cylinder having a hinged bifurcated member arranged to bridge the opening and of guide means on the cylinder for engaging the sides of the bifurcated member to prevent the latter from spreading, the object being to render the device practicable in case the couplings have become badly worn and tapered, and where there is a heavy strain to contend against.

COIN BOX.—No. 776,768. Dec. 6, 1904. John Williams, Oakland, Cal., assigned to Security Coin Box Co., San Francisco, Cal. The object of this invention is to provide a light, compact and convenient receptacle in lieu of the usual bags and trays which are used in banks, treasuries and other depositories. The advantages of this construction are that the capacity of a vault may be nearly eight times as great when these boxes are used as compared with the usual system of sacking coin, while the boxes, being of metal, are practically indestructible. When the box is sealed all the coins in the box may be simultaneously seen, touched and counted, and when the cover is removed the box may be used as a counter tray and any particular stack or number of coins may be instantly and easily removed without disturbing or interfering with any part of the remainder of the coin in the box.

MEANS FOR OPERATING WATER GATES.—No. 776,727. Dec. 6, 1904. A. J. Collar, Yreka, Cal. This invention comprises the combination in a water gate of a casing having a rectangular valve chamber, a valve in said chamber, said valve having a tiltable disk or plate on one side adapted to close over the inlet to the chamber, and transverse rollers on the opposite side of the disk, said rollers being arranged to bridge the outlet from the chamber, said disk or plate having a limited up and down movement independent of the valve.

EYEGLASS.—No. 776,739. Dec. 6, 1904. R. R. Hall, San Francisco, Cal. This invention comprises in eyeglasses the combination with lenses, posts and guards of a spring having a central horizontal portion bendable in a plane parallel with the plane of

the lenses but arranged in advance of the plane of the lenses and having short lateral substantially vertical portions engaging the posts and made substantially rigid, said central horizontal portion concaved on its inner edge to accommodate the nose when the glasses are in position on the wearer. With a pair of glasses of this type in position on the wearer very little metal is visible, simply the posts, the edges of the guards, and a straight, narrow line indicating the spring across the nose.

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING DECEMBER 6, 1904.

776,637.—STEAM ENGINE—G. A. Aldrich, S. F.  
776,689.—SAWING MACHINE—N. Blair, Buell, Or.  
776,690.—GRADING MACHINE—S. B. Bloomer, Seattle, Wash.  
776,726.—BELT TIGHTENER—H. E. Clark, S. F.  
776,727.—BELT TIGHTENER—H. E. Clark, S. F.  
776,727.—WATER GATES—A. J. Collar, Yreka, Cal.  
776,649.—CIGAR PACKAGE—Dumont & Sentegnan, Los Angeles, Cal.  
776,628.—PRUNING SHEARS—J. Earnhart, Santa Paula, Cal.  
776,635.—PUMP—T. R. Goth, S. F.  
776,739.—EYEGLASSES—R. E. Hall, S. F.  
777,031.—Pliers—L. Hanson, Seattle, Wash.  
776,615.—LOCOMOTIVE—Kelly & Plough, Spokane, Wash.  
776,746.—CABINET—D. R. Kinsey, Sedro-Woolley, Wash.  
776,599.—PREVENTING RAILWAY HOLDUPS—S. A. Kitchener, Stockton, Cal.  
776,760.—TOBACCO POUCH—E. G. Lundquist, Los Angeles, Cal.  
777,040.—COUPLING—A. L. Malone, S. F.  
776,748.—SUCKER ROD GRAB—O. A. Mann, Oil Center, Cal.  
776,536.—TELEGRAPH KEY—McKinsey & Nelson, Susanville, Cal.  
776,544.—PENCIL SHARPENER—C. Payne, Los Angeles, Cal.  
776,665.—DRILL AND REAMER—L. C. Preston, Weston, Or.  
776,799.—DAM—F. H. Reed, Claremont, Cal.  
776,627.—GARMENT SUPPORTER—E. J. O. Rother, San Diego, Cal.  
776,619.—THRESHER—B. W. Salmon, French Camp, Cal.  
776,553.—GREASE CUP—F. Soler, San Bernardino, Cal.  
776,764.—BRACKET—G. E. Squire, Bellingham, Wash.  
776,700.—SPARKING DEVICE—C. E. Sterne, San Diego, Cal.  
776,625.—SPACING RACK—E. A. Stickney, Sacramento, Cal.  
776,812.—GROCERY BIN—J. Strine Sr., Downey, Cal.  
776,663.—LOAD LOADER—E. E. Thomas, Portland, Ore.  
776,664.—BAND SAW MILL—E. E. Thomas, Portland, Ore.  
776,668.—FENCE POST—W. L. Vestal, Redlands, Cal.  
776,975.—WINDING CABLES—A. F. Wheaton, Menlo, Wash.  
776,768.—COIN BOX—J. Williams, Oakland, Cal.  
776,879.—WIRE GRIP—J. M. Wolfe, Seattle, Wash.

## DELINQUENT SALE NOTICE.

GOLDEN WEST MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 17th day of September, 1904, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Co.	No. Co.	Assess.	Am't.
T. W. Stone	115	20,000	\$200 00	
T. W. Stone	116	20,000	200 00	
J. P. Mundy	41	500	5 00	
D. Berlin	44	500	5 00	
D. Berlin	45	500	5 00	
T. P. Moore	48	1,000	10 00	
T. P. Moore	49	1,000	10 00	
T. P. Moore	50	1,000	10 00	
T. P. Moore	51	1,000	10 00	
T. P. Moore	52	1,000	10 00	
T. P. Moore	53	5,000	50 00	
T. P. Moore	54	5,000	50 00	
Joshua Reaves	69	600	6 00	
E. E. McLeod	107	500	5 00	
W. L. Dimock	108	200	2 00	

And in accordance with law and an order from the Board of Directors, made on the 17th day of September, 1904, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 207 Battery street, Room 15, San Francisco, California, on MONDAY, the 28th day of November, 1904, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHAS. BOVONE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

### POSTPONEMENT.

By order of the Board of Directors, the sale day of the above delinquent stock has been postponed to SATURDAY, the 17th day of December, 1904, at the same hour and place.

CHAS. BOVONE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

## WANTED.

WANTED—EXPERIENCED AND ESTABLISHED Mining Machinery House or person, recently located practical Mining Engineer to handle a first grade Air Compressor in certain districts. Address H. Baxter, care of 45 W. Randolph Street, Chicago, Ill.

## WANTED!

A deposit of white tale or soapstone, also mineral deposits of metallic, non-metallic and rare minerals. Can use or sell mineral deposits of any kind or their ores. Send samples prepaid only and put your name on package. Manufacturers who want raw mineral materials or deposits of any kind, can secure them by writing me. ROY RAVONE ROGERS, Technical Analyst & Manufacturer of Chemicals, Address 1701 Steiner Street, San Francisco, California.

## TANKS

Wood tanks of every description, Pine, Cypress, Redwood.

In stock or made to order, any size. Stock, Water and Cyanide Tanks.

SEND FOR PRICE LIST.

**THE DENVER TANK CO.**  
MANUFACTURERS OF WOOD TANKS EXCLUSIVELY  
2209 Larimer St., DENVER.

## WANTED TO BUY FOR CASH. TUNGSTEN ORES

(Wolframite, Huebnerite and Scheelite.)  
MOLYBDENUM, BISMUTH AND VANADIUM ORE.  
**PRIMOS CHEMICAL CO.**

PRIMOS, DELAWARE CO., PA.  
Telegraphic address, Philadelphia, Pa.

## ATTENTION, ENGINEER!

Let us solve the problem for you, as to which machine to buy.

## THE POWELL AUTOMATIC INJECTOR

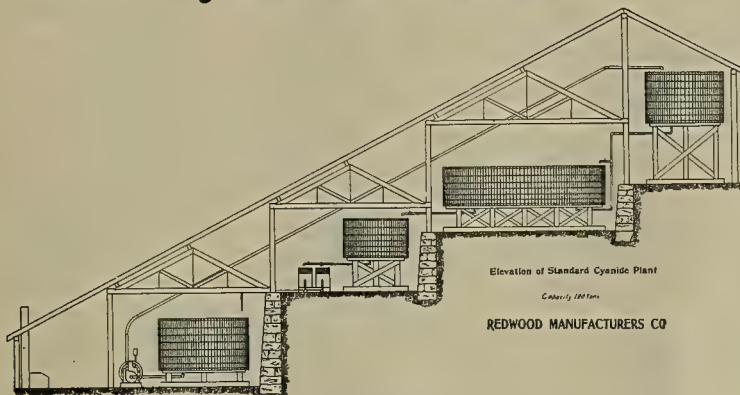

stands alone.  
Works from 25 lbs. to 200 lbs. on 2 ft. lift.  
Will send one on trial. Let us convince you. (No charge for delivery.)

Pacific Coast Jobbers.

Address Dept. "H"

**THE WM. POWELL CO.,**  
CINCINNATI, OHIO.

## Cyanide Plants.

Elevation of Standard Cyanide Plant

Capacity 100 tons

REDWOOD MANUFACTURERS CO

## We Manufacture Complete Plants.

If you are going to install a cyanide plant write us and let us figure with you.

We Are the Largest Manufacturers of Cyanide Plants in the United States.

## Redwood Manufacturers Co.

8 California Street,

Send for Catalogue.

San Francisco, Cal.

## FUZES

TRADE

## LION BRAND

MARK.

## Electrical Fuzes

ARE  
THE  
BEST.

Firing blasts by electricity is the safest and most economical method. If you wish to know why, send for illustrated booklet describing the Fuzes and their use.

MANUFACTURED ONLY BY

**The Aetna Powder Company,**  
CHICAGO, U. S. A.

SELLING AGENTS:

CALIFORNIA CAP CO., 418 California St., San Francisco, Cal.

**The Aetna Powder Company**  
Chicago, U.S.A.

## U.S. Automatic Injectors

## OUR SAY SO

doesn't make our U. S. Injectors the best. Ask any engineer who has used them; he knows. Once a user of the

## U. S. Injector

the engineer takes no chances, and he sticks to the Injector that he knows is right. We have converted over 200,000 engineers in twenty years to the use of our Injectors. Send for our little "Engineers' Red Book." It won't cost you anything, and there is a world of useful information in it for the engineer.

**AMERICAN INJECTOR CO.,**  
DETROIT, MICH.

**DEWEY, STRONG & CO. Patent Agents,**  
San Francisco, Cal., and Washington, D. C.

## LUNKENHEIMER REGRINDING VALVES

ARE the embodiment of perfection and represent the best value in valve quality. On the market for almost half a century. Quality always uniform. Liberally used and in continuous service in the United States Navy, locomotives, lake and river boats and high pressure power plants. No pressure too high or service too severe for a Lunkenheim Valve. If you want absolutely reliable valves, specify "Lunkenheim" and order from your dealer. Write for catalog.

**THE LUNKENHEIMER COMPANY**

Largest Manufacturers of  
Engineering Specialties in the World,  
CINCINNATI, Ohio. Branches { New York, 26 Cortlandt St.  
London, 35 Great Dover St.

## PORTABLE BUILDINGS.

NO. 33—STOCK SIZE.

9 feet 8½ inches by 9 feet 8½ inches.

ONE DOOR, ONE WINDOW, ONE ROOM.

Weight 2300 pounds packed for shipment.

This house can be set up by two men in two hours.

Send for illustrated catalogue and price list.

**Burnham-Standeford Co.,**  
OAKLAND, CAL.

## Power Costs

all that it costs to produce it, plus what is wasted. You can lessen that cost by using a HINE SEPARATOR to keep water out of engine cylinder; a SPENCER DAMPER REGULATOR to keep steady pressure and consume gases; a ROBERTSON-THOMPSON INDICATOR to properly adjust engine valves, and EUREKA PACKING to reduce friction, save power and one-half the cost of any other.

**JAS. L. ROBERTSON & SONS, 204 Fulton St., New York.**

## Life in the Yukon Basin.

The impression which most people have of Alaska is that of a vast wilderness, great mountains and desolate valleys, buried beneath a mantle of eternal snow. In midwinter this idea is not far from correct, but in summer the snow disappears, excepting from the mountain tops, and the valleys are bathed in the warm sunshine of the long Arctic days. The Forty Mile section is tributary to the Yukon, which it joins in the Northwest Territory, about 30 miles above the international boundary. The drainage of Forty Mile lies wholly within what is known as the Yukon plateau. The Forty Mile river is lined in its upper portion by high, flat terraces, 400 feet above the bed of the river, giving to the scenery a picturesque effect. The river flows through a narrow canyon the greater part of its way, leaving it about 20 miles from its confluence with the Yukon, and from there to the latter river it flows through a broad, open valley. The name Forty Mile was given the stream and town in 1886 by the miners, from the fact that it was 40 miles below Hudson Bay Co.'s post, old Fort Reliance.

The climatic conditions on the coast of Alaska and those of the interior are widely different. On the coast the rainfall and snowfall are abundant. At Sitka, for instance, the annual rainfall for a period of seven years, during which careful record was kept, was 111.7 inches, and at Juneau 94 inches.

The temperature on the coast rarely falls much below zero, but this is due to the warm water of the Japanese current, which greatly modifies the temperature along the coast, and also induces the heavy rain and snowfall on the coast. In the interior, however, beyond the great range of mountains, conditions are very different, almost as different as those of the California coast as compared with the climate of the Great Basin beyond the Sierra Nevada mountains. The climate of the interior of Alaska is dry and the range of temperature is much greater than on the coast, but the intense cold of winter is not so great a drawback to a comfortable existence as may be supposed, owing to the dryness of the air. In this respect it is not very unlike the winters of Montana, the Dakotas, Wyoming or Colorado. The accompanying illustrations indicate that a home in the Yukon basin on Forty Mile can not only be made habitable, but as comfortable, attractive and homelike as in any other mining camp isolated from

A Yukon Home—Taken Nov. 19, 1904. (See Page 426.)

metropolitan centers. It is true that few people go to Alaska with the expectation of remaining there the rest of their days, but for the purpose of accumulating a fortune in a few years, by taking advantage of the unusual opportunities presented. As a result, houses are usually built of logs, like the cabins here illustrated, sometimes hewn, as in this instance, but often without attempt at unnecessary display or ornamentation. That a log cabin can be made a comfortable place to pass a few years is clearly indicated by the interior of the cabin shown. Many of the household necessities and even luxuries are seen to have been taken into that far north region, showing that one who determines to make Alaska their home for a time need not be compelled to live in a house of ice, the interior of which is

reached by crawling upon hands and knees through a low passage, such as the Esquimaux are supposed to inhabit beyond the Arctic circle. Windows are conspicuous by their absence.

The miners of Forty Mile were among the first to introduce the thawing methods practiced in recovering the gold from the frozen gravels of the basin. Owing to the intense cold of the long winter, the ground is frozen for seven or eight months of the year. To sink a shaft, the miner waits until winter has set in and then sinks a shaft in the frozen gravel by alternately thawing and removing the ground. The shafts and drifts stand without timber. The pay dirt is raised to the surface during the winter months and washed in the spring, when water is available, and the gravel is thawed out by the warmth of the sun. Sometimes these underground excavations are made of considerable size. One on Miller creek, in the Forty Mile district, measured 64 by 32 feet and was 19 feet in height; it was carried to within 8 feet of the surface. With the coming of spring this stope caved, but the gravel was all available for washing.

As has been the case with other countries, those who first visited the Alaska region gave little attention to its mineral resources. Captain Raymond, who first took charge of Fort Yukon, Alaska, for the United States, after the purchase of the Territory from Russia, said in his official report, "No valuable minerals in workable quantities have been found up to the present time." The repeated discoveries of payable gravel in widely separated districts has done more to make known and develop the resources of the country than anything else could have done, although the difficulties in the rapid development of the great north are numerous. The summer season—that is, the season when outdoor work can be economically done—is short, while the winters are long and cold. In ordinary years the ice in the streams of the interior breaks up by the middle of May, and by June 1 the floods are mostly over and miners promptly begin work. By the last of September the winter gives warning of its rapid approach. The ground first freezes, then the streams turn to ice, and outdoor mining is at an end for that season. From that time on the thawing and mining process is employed.

FOR the forty-fifth time the MINING AND SCIENTIFIC PRESS wishes its readers, the world over, a pleasant Christmas and a prosperous New Year.

SEVERAL mines of southern Nevada outside of Tonopah and Goldfield section have been enabled recently to declare a dividend to their stockholders, which is the surest indication of prosperity that a mine can give. There are without doubt many other places in the great Southwest which only require the stimulus of a Tonopah or a Goldfield to bring them into prominence as producers. The unqualified success of one district lends encouragement to all in the region about it. Since the discovery of Tonopah, Goldfield, Lone Mountain, Gold Mountain, Crater, Hanapah, Bullfrog and a number of less prominent new districts have been discovered and opened, and without doubt others will follow. There still remains a large territory between Goldfield and El Dorado canyon in southern Nevada in which the prospector is almost certain to find new mineral fields. Several old camps—Reveille and some others—have also taken on new life, exemplifying in the most pronounced way that nothing succeeds like success.

THE students of the Mining College of Washington State University have embraced an opportunity to extend their knowledge by practical experience during the holiday vacation, it being the intention to carry out all the varied operations of practical mining in a copper mine at Index, Snohomish county. The property has been idle for some time; but it affords an opportunity for the students which could not, perhaps, be had at a going concern. Net profit is not the object aimed at in this instance, but practical experience, which means more to them than the intrinsic value of the output. This idea is along the line of that adopted by several of the Eastern universities, which jointly leased a mine in Colorado last summer and carried on the work of mining, to the great advantage of the students who were fortunate enough to enter the class. In the mining States of the West there are opportunities of this kind, or, if such do not exist, they can be created.

## Certificates of Competency.

In many mining States and Provinces mine managers, hoisting engineers and others who would hold positions of trust and responsibility are required to pass an examination as to their competency. In many instances and along some lines, this is undoubtedly of advantage to the best conduct of the business, but in others it seems not only unnecessary, but an absurdity. The questions usually asked of candidates for mine management are partly of a practical kind, and partly are theoretical, and if not immaterial to success of a competent man, are at least not of paramount importance. Still, these questions are asked and, failing in giving satisfactory answers, the applicant is disqualified and is denied a certificate. There are many men who have had the management of mines for years, whose success is the best index of their knowledge and ability, and yet who could not, to save their lives, pass a technical examination such as is usually required, without abundant coaching, and were it demanded, the man of years of hard, practical experience—the man on whose accurate, practical knowledge the whole fabric of technical education is based—would fail. The college graduate, fresh from the university, would take this examination with flying colors, and would secure the much-desired certificate and then, in many cases, would have to fall back on a practical man (such as the one he has just defeated in examination) for aid to successfully manage the business he was apparently fully able to handle unaided.

It is true, in some instances, large percentages are allowed for "previous experience," which usually serves to make the average of the applicant whose technical education is not finished, sufficiently high to enable him to pass, and thus secure the coveted certificate. Men who may be able to pass the examinations with credit often lack business and executive ability, and a knowledge of men and affairs. These are all as important as the possession of technical knowledge.

In the case of hoisting engineers a certificate of competency seems desirable, but here, too, are found many men whose competency has never been questioned—and still they would be unable to pass the examination in that branch. With the hoisting engineer the personal equation is a large one, but accidents which occur to hoisting plants are usually of a character which could not have been anticipated by the engineer or they would not have occurred. It is true that some men under excitement lack that important requisite in one in this position—presence of mind. Cables part, brakes suddenly refuse to work, engines get beyond control, and then the practical engineer and technically educated engineer stand alike at their brakes absolutely helpless and unable to avert the catastrophe they know must happen in a few seconds. They see what the difficulty is, but are unable to remedy it. An engineer may hold his position for many years, and have no accident, but some unfortunate day he may hoist a load of men into the sheave, or a rope may part, the cage rushing to destruction at the bottom of the shaft, if the "safeties" do not hold. These are trying situations which years of experience nor volumes of technical knowledge can neither obviate nor alleviate.

WITHIN the past year a great deal has been said in reference to a new and deeper drainage tunnel for the Cripple Creek region of Colorado, and recently it was announced that the preliminary arrangements, surveys, etc., were being made to start a new tunnel which when completed would be 3 miles in length and be driven about 1500 feet lower than the El Paso drainage tunnel. Realizing the vast benefit to be derived from the driving of this proposed new tunnel, it is hard to believe that there are those who would vigorously protest and obstruct the work; but such, nevertheless, is the case, and unless some special legislation or congressional action can be enacted, as was done in the case of the Sutro Tunnel, which was run to drain the Comstock Lode at Virginia City, Nev., it is doubtful if the proposed new Cripple Creek drainage adit will become an accomplished fact. Mining is not recognized as a public utility, and, such being the case, the law of eminent domain can not be depended upon. The condition at Cripple Creek is much like that at Virginia City be-

fore the Comstock was cut by the Sutro Tunnel, except in the fact that water in Cripple Creek mines is more abundant than in the Comstock Lode; for it is a fact that several of the larger shafts on the Comstock had sunk far below the level of the Sutro Tunnel before the tunnel reached the Lode. Such, however, is not likely to be the case at Cripple Creek, for the proposed tunnel will cut 1500 feet below the present lowest drainage of those mines, where about 5000 gallons of water are now flowing every minute. As the drainage area is extended by working at greater depth, the flow of water is likely to increase, though in some mining regions the flow decreases with great depth—below 2000 feet—until at 3000 to 5000 feet the mines are practically dry. That this will also prove to be the case at Cripple Creek there is at present nothing to suggest. Thus far the quantity of water has increased with depth. When the Sutro Tunnel proposition was obstructed in its early history, relief was sought in Washington, and on July 25, 1866, the Sutro Tunnel Act was passed by Congress.

EACH early winter there are numerous mines in Colorado which are obliged to suspend operations due to shortage of water. This is a misfortune which it would be difficult to avoid unless storage reservoirs were built, and the water taken from the lower portion of the reservoir and conveyed in buried flumes or pipes to the several points of use. In the high mountain regions of Colorado winters are long and usually severe, and the streams freeze early in the winter, thus depriving the mines of the needed water. In California, for the greater part, there is usually no shortage of water due to frozen streams, but in the late fall the snows on the Sierra have either all melted or the warmth of the sun is insufficient to thaw what remains in sufficient amount to supply the requirements of the mines. In the latter State this loss could be obviated by the impounding of the abundant waters of summer in numerous reservoirs, which would insure a continuous supply throughout the year. In the Black Hills of South Dakota the winter season lasts from December 1st to April 1st, a period of four months, but during this time there are many warm pleasant days when the weather may be likened to spring, but there are weeks at a time when the thermometer remains many degrees below zero and running waters freeze. Still there has never been reported a serious shortage of water in that region. During summer, when the melting snows of the Rocky mountains supply Colorado, and that on the Sierra supplies California and western Nevada, there are frequent rains in the Black Hills, which afford to every canyon and gulch a living stream throughout the year. In the mining regions of the West no two States have the same climatic conditions, and as a result the water problem in each must be handled differently, but there is a laxity generally to take full advantage of what nature has provided. The reason may be found in the fact that it is usually too large a proposition for one mine to handle alone, and there is a lack of unity on the part of mine owners looking to their common interest.

ONE of the marked features of the copper mining industry is the steady price of copper at above 15 cents per pound, while some of the most important stocks show weakness of a marked character. There is said to be no surplus of ingot copper on the Lake, and the Western production is apparently absorbed as fast as it is offered. It is stated on reliable authority that for the past two or three months the demand has exceeded the supply, although above 15 cents the tendency of consumers to wait for lower prices is always noticeable. In view of the existing relative condition of the copper consuming and producing factors of the industry, there is little likelihood of a lower price, and this being the case copper shares should seek and reach their normal level, but under the strenuous manipulation which has recently been such a sensational feature of the business it could not be expected, and it is difficult to predict the immediate future of the copper stock market. Strangely, the price of listed mining shares is determined to a great extent by the desire of the public to buy and hold them rather than by the intrinsic value of the mines they represent.

## CONCENTRATES.

A TWO-COMPARTMENT shaft can be enlarged at one end, or the work may be done at each end, depending upon the requirements of the case.

A PLACER claim of 160 acres, owned by a company, only requires \$100 worth of assessment work, the same as the 20-acre claim of a single individual.

WHEN connecting levels the work may be hastened to advantage by sinking and raising at the same time. The more quickly the connection between the levels is made the sooner will natural ventilation be secured.

THE static pressure upon the pipe of water under 1950 feet head, as at Electra, Cal., is 854.32 pounds. There is no reduction in pressure upon opening the gate at the bottom of the line, if the head is kept at a constant level.

THE superficial area of a sphere is ascertained by multiplying the square of the diameter by 3.1416. The volume of a sphere of given diameter is only a little more than half as great as the volume of a cube one of whose edges equals the diameter of the sphere.

MINING claims located in 1904 require no assessment work during that year, unless there are local or State laws which demand it. The Federal statutes fix the minimum requirement, to which States may add such additional legislation as they see fit, so long as it does not conflict with the Federal statutes.

THE Calumet & Hecla copper mine is said to have about 200 miles of workings. Its deepest vertical shaft is only a few feet short of a mile, and one incline shaft, sunk at an angle of 37°, is down 8100 feet. Next to this the Quincy mine has the most extensive development, among the mines on Lake Superior.

THE price of black diamonds, used in drilling, has advanced the past thirty years from \$8 or \$10 per carat to \$45 or \$50 at present. The price in 1895 was \$18.50; this nearly doubled in 1896, the lowest price that year being \$28 and the highest \$36. In 1898 they were sold as high as \$60 per carat and as low as \$35.50. Since 1900 the price ranged from \$45 to \$50.

WHEN an ore is to be tested by amalgamation the tests should be made along lines similar to the conditions under which the ore will be milled. Thus a gold ore which is carefully ground in an iron mortar with mercury, and the amalgam carefully collected, is not a fair representation of the conditions under which amalgamation will take place in a stamp mill.

MOLYBDENITE occurs in a great many kinds of rock—in limestone (marble), in mica schist, in granite, in veins of quartz, in various schists, sometimes in veins with other sulphide minerals and gold, sometimes with copper ores. It is associated with many minerals. It is usually recovered by crushing the ore in rolls and passing product over magnetic separators.

MAGNETITE is one of the commercial ores of iron and also one of the most universally distributed of minerals. It occurs in grains scattered through a large number of rocks, often in crystals too small to be seen without a microscope. It is the principal constituent that gives some black aphanitic rocks, like black diorite, its dark color, the remaining minerals being feldspar and hornblende.

CYANOGEN, HYDROCYANIC ACID AND ALKALI CYANIDES in aqueous and alcoholic solutions all absorb free oxygen slowly, and this action is accelerated by heat and also by direct sunlight. This absorption is stated to be most noticeable in potassium cyanide, and most feeble in hydrocyanic acid. When the experiment is carried on over mercury, a small amount of that metal is dissolved.

THERE occur from time to time in the older copper mines of the Lake Superior region what are locally termed "air blasts," caused by the fall of large areas of hanging wall country in the old and abandoned workings of the mines and the slipping of the hanging wall downward. These air blasts are at times so pronounced that the country in the vicinity is shaken as by an earthquake. The most noted disturbances of this kind occur in the Quincy mine.

ALKALI lakes and marshes as understood in the West are drainage basins with no outlet, where the waters accumulated from rains evaporate, leaving the mineral salts carried into the basins by the water as residuary deposits. An alkali is a compound of hydrogen and oxygen with either of the elements, potassium, lithium, sodium, rubidium, or cesium, or with the radical ammonium. These substances are very soluble in water, and have the property of neutralizing acids.

THE size of 1½-inch machine powder is, diameter 1½ inch, length 7½ inches. There are 100 sticks, more or less, in a 50-pound box. This varies somewhat, the

manufacturers weighing out 50 pounds net for each box. A 50-pound box of 1-inch sticks contains 135 sticks and of 1½-inch, 180 sticks. There is a Federal law requiring that "any person or persons shipping explosives without delivery notice at the time of shipment, a note in writing expressing the nature and character of such merchandise, shall forfeit to the United States \$1000."

TWO GOOD machine men should set up a column bar, mount their drill and begin drilling in from fifteen to twenty minutes after arriving at their place of work, and in many cases it can be done more quickly than this. Where it is necessary to use a large number of blocks, it will usually require longer than where a minimum of blocking is required. When setting up on the upper floor of a square-set stope, the drill runner must look to the probable effect of his shots in anticipation of the next round of holes.

GILSONITE and ELATERITE are hydro-carbons found in Utah. Gilsonite is a variety of asphalt, color black, hardness about like gypsum. It has a brilliant lustre, like pitch. It burns with a bright flame, like sealing wax. Elaterite is elastic bitumen—soft, and resembling India rubber; occasionally hard and brittle; usually dark brown. Ozocerite is what is known as mineral wax, and resembles wax in appearance and consistency. It is colorless to white when pure. It is also a hydrocarbon, and is essentially paraffin. It also occurs in Utah.

SEVERAL attempts have been made to treat auriferous pyrite by direct cyanidation, but the success of the process depends upon fine grinding. Cyanide solutions will not extract high percentages of the values from even comparatively fine sulphides. The material must be almost in the condition of slimes to make high extractions possible, which shows how impervious is the thin film of iron sulphide enveloping the minute particles of gold. When the gold is exposed to the direct attack of the solution, then extraction may be expected to be high, but not otherwise.

CRUDE PETROLEUM has not been successfully employed as a substitute for coke in blast furnaces, so far as known to "Concentrates," though oil is successfully used in reverberatory furnace work. The use of fuel in a reverberatory is entirely different from its use in a blast furnace. In the latter the fuel, usually coke or charcoal, comes in direct contact with the charge of ore and flux. In the reverberatory the flames from the burning fuel—oil, coal, gas, wood, or other fuel—passes over the charge of ore, which is usually in a pulverulent condition. The intensity of the flame is often such that the charge is smelted, as in matting reverberatory furnaces.

THE trend of an ore shoot is sometimes indicated by striations on the vein walls, but this indication is not reliable, as in some instances two or more sets of striations are found striking in different directions, indicating more than one period of movement, and that the stresses producing the movement were exerted in different directions. Rolls or grooves in the walls, rather than mere striations, are a better and more reliable indication of the trend of the ore shoot. Shoots may be hundreds of feet in length and depth, but they usually have limits which may be reached by mine workings. All ore shoots do not come to the surface, many shoots having their apices many hundred feet from the surface.

MAGNETIC separators have been in use for many years in the concentration of iron ores, but it is only within the past two years that separators of the electromagnetic type have been largely employed in the separation of zinc blende from the associated sulphides. In the case of iron ores magnetic separators are used to recover the magnetic oxide from the associated sulphide, which cannot be readily accomplished by water concentration, owing to the slight difference in specific gravity of these two minerals. All iron minerals are more or less magnetic, their relative susceptibility to magnetic attraction being in about the following order: Magnetite, franklinite, ilmenite, pyrrhotite (sulphide), hematite, siderite (carbonate) and limonite.

IN order that assessment work or improvements on one of several mining locations owned by one person may be of benefit to all of the claims, these several claims must join each other. If there are, say, seven claims in all, and four of them are adjoining in one group and three in another group, if extensive improvements have been made on one of them, it can be claimed that these improvements were made for the benefit of the larger group (four claims) and the assessment may then be done on the remaining three claims. If the expenditure has been in the nature of machinery, buildings, etc., some of these might be credited to one group and the remainder to the other. A resumption of work on the claim upon which no assessment work has been done, and continuing the work into 1905, will save the claim against any other person who may attempt to relocate them.

THE statistics of mining in Great Britain, where such things are more carefully kept than in the United States, shows that the number of men injured and killed by explosives resulting from thawing nitropowders is more than one-half the number killed and injured by accidents from other causes. Among the many convenient methods resorted to by miners for thawing dynamite, all of which are extremely danger-

ous, are placing powder on the top of steam boilers; in cook stove ovens; in cans over stumps of lighted candles; on shovels held over a fire; laid on an inclined board before an open fire; holding a stick in the hands over a fire; placing on a blacksmith forge; carrying in the back pants pocket and in the boot leg, and plunging sticks in hot water. Any one of these methods of thawing powder is a source of imminent danger, and should not only be discouraged, but prohibited by mine superintendents and others responsible for the conduct of mine operations. Some of the most careless among the miners are they who have been engaged at it longest.

A BUCKET may be prevented from swaying from side to side in a shaft and the tendency to spin around almost obviated by the use of a crosshead running in guides above the bucket. It will pay to put in temporary guides, if it is not desired to use them permanently, when sinking is discontinued. The crosshead should be about twice as high as it is wide; be provided with iron shoes which enclose three sides of the guides, and be strongly built. It can be kept at any desired point above the bucket by securing a clip to the rope which will prevent its coming lower than desired. By allowing the rope free play blocks may be placed at the lowest set of timbers upon which the crosshead will rest while the bucket is lowered to the bottom to be filled. The length of free rope—generally not over 20 feet—does not admit of the bucket swinging very much when hoisted. Upon the clip on the rope reaching the crosshead, the clip carries the crosshead upward with it. There are several ways in which the bucket may be dumped at the surface with which the crosshead will not interfere.

IN order to determine the height of a column of water which has found an outlet into the mine workings, it would be necessary to confine the water, so as to produce a static pressure, which may be measured with an ordinary pressure gauge. To do this the drift or other opening must be bulkheaded, a pipe fitted with a valve being securely anchored in the bulkhead, the valve being left open during construction of the bulkhead. When finished the valve may be closed, the pressure gauge having been placed back of the valve. When the water fills the drift the pressure will begin to show on the gauge, rising until the maximum is reached. Each pound pressure indicated by the gauge equals a head of 2.3 feet. Should a pressure of 100 pounds be indicated, the column of water would be 230 feet in height, but this is no index of quantity. It would be impossible to determine the height of such a column by the force with which the water issues from a crack or drill hole. In the case of the latter, a pipe provided with the gauge as described might be inserted in the hole and a measurement made without constructing a bulkhead.

At the Hidden Fortune mill, near Deadwood, S. D., is the only place known to "Concentrates" where amalgamation and cyanidation are practiced simultaneously. At that mill the ore is crushed in cyanide solution in double discharge mortars having five stamps each. The pulp passes from the battery to launders or sluices, in the bottoms of which are arranged a series of riffles similar to those used in placer mining. These are intended to catch the coarser particles of gold, too coarse to be dissolved by the KCy solution. From these sluices the pulp passes to separators, the sands going from the bottom of the sizer to one set of leaching tanks and the slimes flowing from the top of the separator to other tanks. The coarse particles of gold not saved by the riffles pass out of the separator with the coarse sands, and this gold is not acted upon by the solution and would be lost were not the tailings from the leaching tank passed over amalgamated copper plates. The gold caught in the sluices is sent by launder to a cleanup pan and there the further separation of sands and gold is carried out. This cleanup pan is similar to the arrastra, and is said to be very effective for the purpose. Attempts have been made to amalgamate in cyanide solutions in South Africa and elsewhere, but is not the regular practice, as far as known, except in the case above cited.

THE appearance of foul air in mine workings is not always easily accounted for. Thus a shaft 100 feet deep had to be artificially ventilated when the wind was from the north, but required no artificial ventilation when the wind was from the south. Another shaft in the same vicinity was nearly 200 feet deep and no trouble was experienced with bad air. One shaft, the first, was sunk through sandstones, limestone and quartzite, the other in trachyte. It may be that the gas issued from the rocks. Foul gas may sometimes be displaced in a shaft by rapidly hoisting and lowering a bucket in the shaft a number of times. Showering water down the shaft also sometimes starts a fresh air current. In a drift from a shaft in Tuolumne county, Cal., several men worked from 7 A. M. until noon without inconvenience, when they came to the surface for lunch. At 1 P. M., on going down into the shaft—100 feet deep—a candle could not be made to burn, and, not having means of ventilating at hand, the work had to be temporarily abandoned. The morning's work had been in cleaning out a caved drift and retimbering the ground. The face of the drift was still obstructed from floor to back with rubbish—rocks, dirt and old timbers—and in all probability the foul air from the open space beyond the working place had been able to penetrate into the drift, and rendered it an impossible place for men to work without artificial ventilation.

## Water Rights in California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
SAMUEL C. WIEL.

WHERE AN APPROPRIATION CAN BE MADE (CONTINUED).—As to private or occupied lands: No appropriation can be made on or injuriously affecting any private or occupied lands whatsoever. The point of appropriation must be itself unoccupied, and all lands affected injuriously in their use of water by another's appropriation must also be unoccupied. If the point of appropriation is on lands already occupied any acts done on them without the occupant's consent are unlawful, just as trespassing on any private property. (42 Cal. 339, 106 Cal. 660 at 670). If other occupied lands, though the point of appropriation is not upon them, are affected injuriously in their use of the water the appropriation is likewise unlawful, because it has been held that the Government impliedly grants to all prior occupants at least the riparian rights of the common law. This was the first great cutting down of the law of appropriation. A later appropriator cannot take away an occupant's riparian rights, though he goes on vacant lands to do it. (*Lux vs. Haggin*, 69 Cal. 255).

Every bona fide settler is protected as an occupant in this riparian right. He need not be the absolute owner of the land. If he has made an entry under the homestead or pre-emption laws it is enough. Even, it is held if he has made no entry, so long as he bona fide intends to make one. (*Sturr vs. Buck*, 133 U. S. 541). Those holding patented mining claims are within the protection given to occupants, since they are absolute owners of the land; and even unpatented mining locations have riparian rights. (8 Cal. 136, 8 Cal. 323).

In this way agriculturists and others in the neighborhood are protected first, without any formalities of appropriation at all on their part. It remains true, however, that the occupant will not be protected against appropriators if he is a mere intruder or squatter not intending to settle (113 Cal. 142), or if the land was known to contain mineral at the time he entered, since in neither case he would be a bona fide settler. (115 U. S. 392).

No appropriation can be made on or interfering with private or occupied lands as thus explained, because an appropriation cannot be initiated by a trespass, and cannot interfere with established riparian rights.

2. An appropriator must not interfere with prior appropriators. (C. C. 1414). There may be several appropriators on the same stream; but the later comers can only take the surplus left by those who came first. Whether the prior appropriator is himself a miner or not makes no difference. "No partiality for one pursuit over another has been evinced." And so, while a miner prior to a sawmill was protected in 6 Cal. 548, on the other hand, the sawmill being prior was protected in 5 Cal. 395 and 13 Cal. 33.

3. The larger part of the lands in California being occupied or privately owned to-day no appropriation can be made on or affecting them injuriously, and hence it is that the law of appropriation is to-day overshadowed by the other rule of riparian rights, which rule governs land so occupied or privately owned. In the mining regions there is still much land unoccupied, or land staked out for mining claims that will be in the future abandoned, or land subject to water rights of appropriation before they become private, in all of which the law of appropriation applies. But in the State at large most land is privately owned, not subject to appropriation, and the law of riparian rights is applied instead.

WHAT CAN BE APPROPRIATED.—1. Water flowing in watercourses is the usual case. (Civil Code, 1410.) Close questions arise as to what is and what is not a watercourse. In *Sanguinetti vs. Peck*, 136 Cal. 466, at 471, the court says:

"A watercourse is defined to be a 'running stream of water'; a natural stream including rivers, creeks and rivulets. (Black's Law Dictionary, title Watercourse.)' Further defining the term, this court said: 'There must be a stream, usually flowing in a particular direction, though it need not flow continually. It may sometimes be dry. It must flow in a definite channel, having a bed or banks, and usually discharge itself into some other stream or body of water. It must be something more than a mere surface drainage over the entire face of the tract of land occasioned by unusual freshets or other extraordinary causes. It does not include the water flowing in the hollows or ravines in land which is mere surface water from rain or melting snow (i. e., snow lying and melting on the land) and is discharged through them from a higher to a lower level, but which at other times are destitute of water. Such hollows or ravines are not, in legal contemplation, watercourses.' The evidence does not bring the depression, or swale, in question within this definition. This so-called watercourse is nothing more than a local drainway to a limited amount of land which has neither a definite beginning nor ending and is like hundreds of similar swales found in land whose surface may be called generally level."

In *Lux vs. Haggin*, 69 Cal. 255 at 419, it is said

that a channel is necessary to the constitution of a watercourse, and also a tendency of water to flow in it, more or less regularly. This second requisite is not fulfilled by a chance flow in a channel usually dry all year round. (Ib.) It is a question depending on the facts of each case whether water from freshets and melting snow is mere surface water flowing irregularly in hollows and ravines, as said in 136 Cal. 372, just quoted, or is water feeding its own channel under a tendency to a more or less regular flow.

2. Diffused surface water from rain and melted snow, and not in a watercourse, cannot be appropriated, as the cases just referred to point out. Its presence and movements are too capricious to found any right upon, distinct from the land where it is gathered. In fact, the question that usually gives difficulty is not who can use it, but how to get rid of it, some courts calling it a common enemy; but that is another question.

Whether waters of a lake or pond can be drawn off by appropriation is seldom discussed. The cases almost invariably speak only of "flowing water," "running streams," "water in watercourses," and likewise C. C. 1410. However, riparian rights attached at common law to lakes and ponds as well as streams, and the law of appropriation was assumed to apply to them also, before the Code, in 15 Cal. 271, involving three lakes above the Yuba river. It may be that lake water can be appropriated, though not mentioned in C. C. 1410, for that section is not exhaustive of the kinds of water that can be appropriated (141 Cal. 116).

Swamp or overflowed lands are owned by the State, unless already passed into private hands, and are dealt with by special statutes and rules of their own. The law concerning them is discussed in *Lux vs. Haggin*, 69 Cal. 255.

3. Underground water is the kind concerning which the law has undergone its greatest of all changes in California. It may be said tentatively that underground water is to-day in California treated like water on the surface.

The first class of underground waters is water flowing in a definite underground stream. It can undoubtedly be appropriated (53 Cal. 578), for such streams have always, even by the common law, been treated on the same principles as surface streams (69 Cal. 217).

The second class is water seeping underground from beneath definite surface streams. Such water is as much part of a stream as the surface flow, for it is a scientific fact, that below every river bed, not absolutely impervious, there is a more or less deep substratum of flow, seeping along with the stream through the soaked soil, the drawing off of which results in a tapping of the stream itself. Whether this subflow of a stream can be appropriated depends on whether the stream itself could be appropriated, and that, as we have seen, depends on whether there are already occupants or appropriators whose use of the stream would be interfered with. For example, in 126 Cal. 486, the appropriation of the subflow by means of a tunnel was upheld, as against later claimants. On the other hand, in the recent and much talked of case of *Montecito Water Co. vs. Santa Barbara*, 28 Cal. Dec. 405, the city was denied the right to withdraw water by means of a seepage tunnel from a surface stream already appropriated by the water company. At the same time it was pointed out that it is a difficult matter to prove just how much the company's stream was, in fact, tapped by the tunnel, since water must have seeped into the tunnel from all directions. To the extent which, on proof, it is shown that the tunnel tapped the surface stream, however, it was held unlawful.

The third class is water percolating underground, diffused, without connection with any definite channel. In 126 Cal. 486, it is said that "percolating waters" is a phrase of well-defined meaning within the law, adding:

"It is essential to the nature of percolating waters that they do not form part of the body or flow, surface or subterranean, of any stream. They may either be rainwaters which are slowly infiltrating through the soil, or they may be waters seeping through the banks or the beds of a stream which have so far left the bed and the other waters as to have lost their character as part of the flow."

The law in this wide class of underground water may be said to be now in the making, both as respects appropriation and as respects riparian rights, if that term may be applied to this new subject. There have been seven cases in our Supreme Court dealing with or discussing percolating water within the last two years. In this place it is enough to say that it seems well established that percolating water is subject to appropriation. It was so directly held in *Cohen vs. La Canada Water Co.*, 142 Cal. 437. There the first comer had appropriated, on vacant public land, water percolating in springs, by means of pipes. The springs were not fed by any known stream running in any defined channel—it was purely diffused percolating water gathered underground from rains, etc. A later comer drove tunnels nearby, which caused the springs to dry up. Judgment was given against him for doing this. That is the only California decision holding directly that mere percolating water can be appropriated; the other cases deal with the appropriation of it only incident-

ally, being chiefly concerned with the so-called riparian or landowner's rights therein. The leading case of *Katz vs. Walkinshaw*, 141 Cal., 116 was of that kind; but, taking occasion to speak of the rights of appropriators, says that they will come within the same rules here as in other kinds of water; that is, prior occupants of overlying land, or prior appropriators of the percolating water, must be protected first.

This treatment of percolating water is entirely novel. In the old law no rights whatever were recognized in diffused percolating water as a separate thing; it was regarded as a mere ingredient of the soil—one of the constituents of the soil—just as feldspar and mica are constituents of granite. The man who owned water-soaked soil had a right to do with it what he wanted, and he could dig out the soil, carrying the water with it, or he could leave the soil and take out only the water; and to look into any change resulting in the constituents of his neighbor's soil was deemed beyond the province of the law. So long as the percolating water stayed in the soil, the owner of the soil could take it, and take all that came there; likewise his neighbor, who could hence drain it all away. This old rule of diffused underground water is somewhat like the law of diffused surface water, already mentioned; both were too uncertain in their movements to found any right upon distinct in itself. It still remains the rule in California as to diffused surface water. Until the case of *Katz vs. Walkinshaw* (141 Cal. 116), two years ago, it was thought firmly established by several decisions as the law of percolating water also (e. g., 42 Cal. 303); but the recent cases have now settled the new rule.

This new rule was fixed purely out of public policy. The old rule was unsuited to conditions in California at large where, with its large extent of arid land, the widest prosperity depends on putting the land under cultivation by making the underground water serve the largest number of people, and lands, and uses. It is a rule grounded on public policy, but the interests of the agriculturist carried the determination of that policy. The importance of it to the miner lies in the fact that mines are likely to drain wells, and springs, and the subflow of streams in the neighborhood. Will the miner be held liable for taking water that belongs to another? It will be proper to consider that again later. It is enough here to point out that underground water, whether in a defined stream, seeping from a surface stream, or percolating, diffused, unconnected with any stream, may be appropriated for use.

4. It may be added that the surplus over what has been claimed by prior appropriators (13 Cal. 220) or reserved for prior occupants, under the doctrine of riparian rights (102 Cal. 151; 69 Cal. 255), can be appropriated. As to the latter, what constitutes such a surplus over riparian use cannot be examined here. It is enough to say generally that anything over the amount needed for domestic use or for reasonable needs in developing the occupant's land can be appropriated. In fact, a riparian owner is bound to return all surplus to the stream, and so cannot lead the water over a watershed whence it would be impossible for it to flow back. (126 Cal. 135; 113 Cal. 142; 77 Cal. 66).

[NOTE.—The case in 126 Cal. 486, is referred to as upholding the right to appropriate the subflow of a stream by means of a tunnel, as against later claimants. The facts of that case are worth stating. The stream in question was the San Gabriel river, where it flows over Government land. There were three sets of claimants to the water; first, those who had appropriated all the surface flow; then an irrigation company, who posted an appropriation notice and began work on a tunnel for developing water, and who continued the work on the tunnel later under compromise agreement with the surface owners; finally, an irrigation district which began another tunnel on the opposite bank, and finished it first. The tunnel of the company was upheld against that of the district—chiefly because the surface claimants had agreed to it and had not agreed to the district's tunnel; partly also, because the company's tunnel, having been started with a notice prior to the district's tunnel, was, as between the two, prior in time by relation, though completed later than the other one.]

(TO BE CONTINUED.)

## Rock Cleavage.

A publication that will be of material assistance to all structural geologists is a paper on "Rock Cleavage," by Dr. C. K. Leith, which the United States Geological Survey has recently published as Bulletin No. 239. It embodies the results of a very careful and laborious investigation of facts concerning rock cleavage and a discussion of their theoretical significance.

Cleavage is commonly defined in geological textbooks as a structure by which some rocks part or break along certain parallel planes more easily than along others. A considerable proportion of the rocks of the earth's crust possesses lines or planes of cleavage. These lines or planes of parting are either original or secondary—that is, they were either induced in the rock during its solidification from a magma or during its deposition in water, or they were induced by deformation through metamorphic processes subsequent to the formation of the rock. Generally, in discussions, the secondary structure only has been considered as cleavage; but Dr. Leith believes that there is no essential difference between

the original and the secondary structures, and that the term rock cleavage should be applied to both. As used in this paper, therefore, the term cleavage is confined to structure, and has no significance as to origin.

It is fundamentally assumed that secondary cleavage is of two kinds, which are widely different in their essential causes and conditions. The form of cleavage which develops during rock flowage, or the deformation of rock without conspicuous fracture, is called by Dr. Leith flow cleavage and is discussed in the first part of his paper. The other form of rock cleavage, which develops through the deformation of rock by fracture and subsequent cementation, is denominated by Dr. Leith fracture cleavage and is the subject of the second part of this bulletin. Original cleavage of bedding and flow structure are treated independently in Part III. Heretofore one of the principal causes of confusion in the discussion of cleavage has been the attempt of some authors to make the explanation of one kind of cleavage apply to all kinds. Dr. Leith lays especial emphasis on the proof that incipient or cemented parallel fractures, yielding what he calls fracture cleavage, will not explain what he calls flow cleavage, or cleavage dependent upon the parallel arrangement of the mineral constituents. To show this he discusses in detail the internal arrangement of the mineral constituents

find out the actual costs of upkeep of a machine placed in the hands of competent miners and subject to special supervision. The machine was specially prepared before being sent underground, the cylinder being very carefully bored out to insure a glassy-like surface inside and to make it perfectly parallel. A special piston, made from high carbon steel, was made and ground into the cylinder, great care being taken to insure the tightest possible working fit; all of the piston was made dead hard, except the chuck-rod and chuck, a special arrangement being provided on one of the lathes to grind the piston down to the required size. A special valve of tool steel was formed and fitted to the valve chest, after it had been carefully bored out, the same precautions being taken to insure a good tight fit as in the case of piston and cylinder. The remaining portions of the machine received very careful attention, and everything possible was done to insure the machine being in perfect order.

The machine ran fourteen months, double shift, in the hands of the same men, with the exception of four occasions, when it was in the shops for extensive overhaul of cradle and front-head; on each occasion it was laid aside for twenty-four hours. During the entire period under observation there were four new valves fitted, nine chuck-bolts, eleven chuck-bushes, six rotating nuts, twelve sets ratchet pawls and

## The Horseshoe Mines of South Dakota.

The most extensive mining operations in the Black Hills of South Dakota, the Homestake excepted, is the Horseshoe combination of mines, located about the northern base of Terry Peak and vicinity. It comprises some of the oldest and best known mines of the Cambrian formation. The town which has grown up about the Horseshoe properties and its neighbor, the Golden Reward, is called Terry, and is situated at an altitude of 5700 feet, which is the greatest altitude of any town of considerable size in the Black Hills. The Horseshoe mill of 120 stamps, with its extensive cyanide equipment, is situated on the hillside near the town.

The illustration is that of this plant. The company owns 2100 acres of patented mining ground, of which 1000 acres are on Bear Gulch and the remainder on the depression east of Terry Peak known as Ruby Basin. The mill is on the Great Mogul claim. Other mines are the Welcome and Snowstorm—two of the first mines extensively opened on this formation—the Horseshoe, Hardscrabble, Ben Hur and several others. Prior to 1902 these mines produced over \$2,500,000 in gold, most of which was obtained by the chlorination process at the mill at Pluma, on White-

120-Stamp Cyanide Mill Horseshoe Co., Terry, S. D.

of rocks that is peculiar to each kind of cleavage, the relations of this arrangement to the observed cleavage, the nature of the processes that bring about the arrangement, and the relations of the arrangement to pressure. He points out that there is need of systematic microscopical study of cleavage of rocks of all kinds from many localities for the purpose of ascertaining the exact arrangement of the mineral particles, the relations of the observed arrangement to cleavage and the relations of cleavage to the deformation of rocks. In the present paper Dr. Leith has made an attempt to supply in some degree this observational deficiency.

Bulletin No. 239 is among the Survey's gratuitous publications. It may be obtained on application to the Director of the United States Geological Survey, Washington, D. C.

## Maintenance of Rock Drills.

The cost of repairs on rock drills is an important matter in their operation, but it is one which is often not carefully followed by the superintendents of mines. No rock drill, no matter how efficient, can be operated without more or less frequent renewal of working parts, and sometimes of parts which, with proper care, should never require renewal, such, for instance, as the shell, or the heads, front or back. The former are occasionally broken by a careless chuck tender, and the latter by a drill runner who neglects to give proper attention to his work. In time the piston requires renewal and small parts must frequently be replaced by new. The South African Mines publishes the following on the cost of drill maintenance on the Rand. The cost seems excessive—over \$38 per month:

"In the early part of 1897 an effort was made to

springs, three feed-screws, three feed-nuts, six sets front-head bushings; no work was done on the piston proper. So pleased were the men with the performance of the machines that they preferred to lie off during the periods referred to rather than handle another machine. The costs might have been followed up for a longer period, but, unfortunately, the machine got injured due to blasting. On being brought to the surface the wear between the cylinder and piston amounted to  $\frac{1}{16}$  of an inch, as measured by the micrometer. The following were the costs:

	£	s.	d.
Machine repairs at start	15	0	0
Eleven chuck-bushes at 12s.	6	12	0
Nine chuck-bolts at 4s. 9d.	2	2	9
Four new piston valves, including reaming chest	4	15	0
Six rotating nuts at 12s. 6d.	3	18	0
Twelve sets ratchet pawls at 9s.	5	8	0
Three feed-screws at 21s.	3	3	0
Three feed-nuts at 21s.	3	3	0
Six sets front-head bushings and leathers at 20s.	6	0	0
Labor	26	0	0
Allowance for mechanical power	17	10	0
Supervision, office charges, etc.	14	0	0
Total	£107	11	9
Equal to £7 13s. 8d. per month.			

"The approximate footage drilled was 13,104 feet."

In a paper read before the recent meeting of the Physical Society at St. Louis, says the American Manufacturer, W. J. Humphreys gave the results of spectroscopic examination of over 100 samples of fluor spar from all parts of the world. In nearly all the samples yttrium was found to be present in varying proportions, and those richest in this element also contained ytterbium. Three specimens, one from Virginia, one from Texas and one from Bolivia, showed the presence of both elements in considerable proportion. All three were very sensitive to temperature changes, one of them phosphorescing even on being held in the hand.

wood gulch, 2 miles above Deadwood. The company also controls the National smelter at Rapid City, where the high-grade ores are treated, the low-grade material being treated by cyanidation in the mill at Terry.

The peculiar ores of this section—a highly siliceous quartz rock, occurring in beds interstratified with the formation—are found through a vertical range of several hundred feet. It is said that the best ore mined by the Horseshoe Company is from the deepest workings on the lowest contact—that of the Archaean schists with the basal Cambrian quartzite. In the Ben Hur the ore shoots range from a few feet to 100 feet wide, lying nearly flat and from 2 to 12 feet in thickness. This mine produces about 100 tons of \$10 ore daily. The mill is 2 miles from this mine, and the ore is hauled by contract with the railroad company for 25 cents per ton. In the Sunnyside mine is an ore body 40 feet in thickness. This ore body lies 600 feet higher than the ore bodies of the Ben Hur and almost directly over them; but as the Cambrian formation in which these ores occur is known to be not over 250 to 300 feet in thickness, it is presumable that a portion of the 600 feet is represented by one or more intrusive laccolitic sheets or sills of rhyolite, or other eruptive rock. All of the mines of this locality are found under conditions approximately similar. The Ben Hur is opened by a tunnel which has a slight downward grade through the Archaean schists, and, cutting a dike inclosed in the schists, beyond which a fault has brought the quartzite of the Cambrian down to a level with the tunnel, the porphyry dike turning over towards the west into a sill, there being about 6 feet of calcareous shale between the quartzite and the sill. Immediately on the east of the dike and beneath the sill is a large body of ore. This ore is believed to have resulted from solutions passing upward through a vertical fissure associated with the intruded dike rock. This fissure was about 3 inches

in width and filled with large, well formed crystals of quartz, which were attached to a thin selvage of silica lining the fissure, the crystals projecting from either side into the open crevice. This peculiar fissure was also the repository for rich ore. In another mine, about a mile to the northwestward, a vertical fissure, passing through a body of siliceous ore rich in gold, contained a high percentage of lead and was rich in silver and gold. The flat bed of ore associated with the fissure contained no more than a trace of lead, but carried good values in gold. At another claim a white saccharoidal quartzite contained 2000 ounces silver per ton, which was disseminated in grains and scales of chloride of silver.

At one locality in the Ben Hur mine, above referred to, the Cambrian ore bed lies directly upon the up-turned schists of the Archæan.

The number of separate ore horizons in the property of the Horseshoe Co. is not definitely known as yet. Here is an opportunity to do some economical prospecting with diamond drill. The territory of the company has been more or less developed for a distance of 2½ miles.

One of the largest ore bodies known in the Cambrian formation in this district is partly exposed in the Passaic mine in the upper portion of the Cambrian. The ore body has been cut through by a railway cut. The top of the shoot lies just under the grass roots; it is known to be 80 feet in thickness and the bottom not yet reached. It is not less than 100 feet wide. Its length is entirely unknown. It is believed to be the largest body of ore of this character thus far found in the Black Hills.

When the ores of the Cambrian shall have been exhausted there still remains a large zone of gold ore in the underlying Archæan schists, which in some respects resembles the Homestake. Concerning it, the Black Hills Mining Review says it is an enormous vein of free-milling ore in the slates underlying the Cambrian ore in the Great Mogul mine. This body of ore has been developed to a width of 300 feet. In character it is similar to the Homestake.

The cyanide mill of the Horseshoe Co. is the largest wet-crushing cyanide plant in operation. It has 120 stamps and has a capacity of approximately 500 tons per day. At present ninety stamps are operating, handling 350 to 400 tons a day. By the first of the year the company hopes to have the entire mill running. Installations of machinery are now being made with that end in view.

The mill practice at the Horseshoe does not differ materially from other similar plants of the Hills, with the exception of the precipitation method. This is being altered from zinc thread to zinc dust.

The gold-bearing solution is pumped into a vat having a series of small pipes in coils on the bottom which are perforated with small holes, and, when the vat is nearly full, compressed air is turned into the pipes, creating a violent agitation, and a bucket or two full of zinc dust is thrown in. The agitation is continued for several minutes, during which time the solution has come into close contact with the zinc, which precipitates the gold in the form of a fine powder. By forcing the contents of this vat through a filter press, the precipitated gold is separated from the solution and is melted down into marketable bars.

This process is now being introduced at the Horseshoe mill and a new melting room and refinery for the bullion is also being constructed. Other improvements and repairs are constantly being made and the plant is always maintained at the highest standard of efficiency.

E. B. Alsop of Pittsburg, Pa., is president and R. H. Binns of the same city treasurer. W. L. McLaughlin of Deadwood is general manager and Edward Manion of Terry, mine superintendent. John Gross, superintendent of the Maitland, is consulting chemist and spends a portion of his time in looking after the Horseshoe mill.

### Notes on Concrete in Mining and Metallurgical Engineering.\*

Written by F. T. HAVARD, Silberhutte, Anhalt, Germany.

In discussion of Mr. Edwards' interesting and valuable paper, I submit the following notes concerning the advantages and disadvantages of the concrete flues and stacks at the plant of the Anhaltische Blei- und Silberwerke. The flues and smaller stacks at the works were constructed of concrete, consisting generally of one part of cement to seven parts of sand and jig tailings, but in the case of the under-mentioned metal-concrete slabs of one part of cement to four parts of sand and tailings, the cost of constructing the concrete flue approximated 5 marks per square meter of area (equivalent to \$0.11 per square foot).

**EFFECT OF HEAT.**—A temperature above 100° C. caused the concrete to crack destructively. Neutral furnace gases at 120° C., passing through an independent concrete flue and stack, caused so much damage by the formation of cracks that, after two years of use, the stack, constructed of pipes 4 inches thick, required thorough repairing and auxiliary ties for every foot of height.

**EFFECT OF FLUE GASES AND MOISTURE.**—The sides

of the main flue, made of blocks of 6-inch hollow wall sections, 100 by 50 centimeters in area, were covered with 2-inch or 1-inch slabs of metal concrete. In cases where the flue was protected on the outside by a wooden or tiled roof, and inside by an acid-proof paint, consisting of water-glass and asbestos, the concrete has not been appreciably affected. In another case where the protective cover, both inside and outside, was of asphalt only, the concrete was badly corroded and cracked at the end of three years. In a third case, in which the concrete was unprotected from both atmospheric influence on the outside and furnace gases on the inside, the flue was quite destroyed at the end of three years. That portion of the protected concrete flue near the main stack which came in contact only with dry, cold gases, was not affected at all.

Gases alone, such as sulphur dioxide, sulphur trioxide and others, do not affect concrete; neither is the usual quantity of moisture in furnace gases sufficient to damage concrete; but should moisture penetrate from the outside of the flue, and, meeting gaseous SO<sub>2</sub> or SO<sub>3</sub>, form hydrous acids, then the concrete will be corroded.

**EFFECT OF THE ATMOSPHERE ALONE.**—For outside construction work, foundations and other structures not exposed to heat, moist acid gases and chemicals, the concrete has maintained its reputation for cheapness and durability.

**EFFECT OF CRYSTALLIZATION OF CONTAINED SALTS.**—In chemical works floors constructed of concrete are sometimes unsatisfactory, for the reason that soluble salts, notably zinc sulphate, will penetrate into the floor, and, by crystallizing in narrow confines, cause the concrete to crack and the floor to rise in places.

### The Sargent Expansion Gas Engine.

Herewith is illustrated the Sargent double-acting tandem gas engine, which expands the burning charge to practically atmospheric pressure, varies the point of cutoff of the admission inlet with the

extends from end to end of the engine, thereby giving a flat planed surface upon which the engine is erected and aligned. The sub-base and main frame are bolted to the foundation, and the cross head guide, cylinders and distance head, which fasten to the main frame, can come and go as the temperature varies, sliding on the hollow supports rising from sub-base, which maintain the cylinders in line and convey the gas and air from the hollow divided sub-base to the explosion chambers.

The admission of gas and air at full load is cut off from five-eighths to three-quarters of the admission stroke, depending on the fuel used, which after compression and ignition is expanded to the cylinder volume and is released a little above atmospheric pressure with a corresponding temperature of about 400° F.

A side shaft driven by the crank shaft and governor through a pair of worm gears running in oil, carrying two cams for each explosion chamber, one for the igniter and one to operate the valve, comprises all the moving mechanism, except the valves and lever, as shown in Fig. 1, the other side of the engine being plain.

Fig. 2 shows a section through the valves of one of the explosion chambers. By removing six nuts, valve bushing and valves can be removed from the cylinder for regrinding or inspection.

Gas is piped to the chamber A in the sub-base and air to the chamber B, which pass through the cylinder supports to the chambers A and B, ready to pass in the mixing chamber when the cam depression MN passes the roller and the ports F in the piston valve register with the ports E and D in the bushing. When the piston valve goes down to this position, the confined air in the piston valve dash-pot forces open the poppet valve, thus giving free admission to the charge. When the point N of the cam reaches the roller, it is forced down, while the other end of the lever goes up, carrying the piston valve, which cuts off the admission. The poppet valve seats and both valves remain in normal position during the compression, ignition and expansion,

Fig. 1.—The Sargent Complete Expansion Gas Engine.

Fig. 2.—Valve Section.

load, advancing the time of ignition as the mixture gets weaker and the inflammation slower.

The general design is shown in Fig. 1. The sub-base, the top of which comes flush with the floor line,

on at one cylinder puts the starting mechanism into operation and at the same time puts the cylinder out of service as a gas engine.

All mechanism is above the floor line, yet below

\*Discussion of paper by H. W. Edwards, Trans. A. I. M. E.

the center line of the engine. Every explosion chamber is accessible by simply removing the cylinder head, which can be done without further dismantling the engine. The time of ignition and the ratio of the gas and air may be changed while the engine is in operation. This engine is made and furnished by the Wellman-Seaver-Morgan Co., Cleveland, O.

## Cyanide Practice at the Maitland Properties, South Dakota.\*

NUMBER III—CONCLUDED.

Written by JOHN GROSS.

All the zinc used is cut by the mill engineers, who easily cut the 70 pounds per shift that is required, and can cut more than double this quantity if occasion arises.

Data for the last eleven months on zinc box flow are given in Table II.

TABLE II.—DATA OF ZINC BOX RECORDS DURING ELEVEN MONTHS, 1903-1904.

	Solution—Tons.	Zinc—Cable Foot Content.	Quantity of Solution per Day—Tons.	Quantity of Solution per Day—Tons.
1903.				
July	10,365	194	331	1.71
August	15,130	188	388	2.00
September	14,130	200	485	2.43
October	14,777	212	477	2.25
November	12,703	200	426	2.13
December	12,501	220	403	1.75
Average during 6 months in 1903		204	435	2.13
1904.				
January	14,306	230	461	2.00
February	13,696	250	489	1.96
March	14,038	265	453	1.71
April	13,859	237	462	1.95
May	14,753	217	476	2.20
Average during 5 months in 1904		240	465	1.94

Daily measurements of the zinc box flow and assays on the head and tail solutions are taken so that we are enabled to keep very close check on the extractions. The actual bullion returns exceeded the precipitation record by 3.4% for the last six months of 1903, and by 4.7% for the first five months of 1904.

Of the barren solution, about 25% goes for the treatment of sands and the balance for slimes.

The zinc consumption for the past eleven months is detailed in Table III.

TABLE III.—CONSUMPTION OF ZINC DURING ELEVEN MONTHS, 1903-1904.

	Quantity per Ton of Ore Treated.	Quantity per Ton of Solution of Zinc Box Flow.
1903.	Pounds.	Pounds.
July	1.86	0.810

November	1.37	0.317
December	1.19	0.300
Average during 6 months, 1903	1.33	0.298
1904.		
January	1.48	0.309
February	1.17	0.242
March	1.37	0.329
April	1.19	0.285
May	1.27	0.309
Average during 5 months, 1904	1.34	0.295

**CLEANING UP.**—A cleanup is made twice a month, and, in starting, the flow of one box is shut off and water passed through for about fifteen minutes, being sufficient to replace practically the cyanide solution. The zinc from the first compartment is washed in the box and removed, the water being transferred to the second compartment, bailing out as close to the precipitated material as possible; the plug in the bottom is then opened and the remaining water, together with some of the precipitates, flows direct to the acid tank. The precipitates remaining are placed in a tub and carried to the acid tank. The compartment is washed out with a little water, the plug and screen are replaced and the zinc is replaced. The other compartments are cleaned in the same manner, except that the zinc is continually moved to the head compartments until they become filled. As soon as the head compartment is filled, the flow of solution is slowly started in order to avoid undue exposure to the air. The water from the last compartment is poured into an adjoining box. One man in this manner can clean up the five boxes in twelve hours.

The precipitates are allowed to settle in the acid tank until practically clear water remains on top; it is then siphoned direct into the waste sump. When siphoned down as closely as possible (this larger portion of the surface of precipitates being exposed), concentrated sulphuric acid is added and stirred just fast enough to avoid boiling over, the brisk action of the acid raising the temperature. The stirring is done by hand, and no ill effects have been experi-

enced from the fumes, even with the acid tank open. The tank, however, is situated in a well-ventilated portion of the precipitating room. The acid treatment is accomplished in about one hour, at the expiration of which the tank is partly filled with water and filtering is begun at once; no further washing is now attempted; the absolute washing so as to avoid the subsequent production of matte cannot be done, because of the presence of calcium sulphate; furthermore, as explained later in this paper, the production of this matte has become a desirable feature with us.

A vacuum filter is used for filtering the precipitates, which are then taken to the melting room and simply dried in a muffle furnace.

The melting is accomplished with a flux composed of dried precipitates, 10; bicarbonate soda, 4; borax glass, 1, sand tails (60% available  $\text{SiO}_2$ ), 1.5; fluor-spar, 0.2 part, which give good satisfaction; the charge melts easily and quietly and gives a clean and liquid acid slag. The melting is done in a No. 200 crucible and forced draft is used, no skimming is done, as the losses from dusting, in recharging the pot after the skimming, are too heavy.

The bullion goes to the United States assay office at Deadwood and the slags are shipped to smelting plants at Denver.

Formerly, it was customary to add wrought-iron scrap to the melt for the purpose of impoverishing the matte, but later developments, giving us an excess of silver above gold, has led us to flux without iron, thus producing a matte very rich in silver and carrying as high as \$10 per pound in gold. This matte is remelted with sand; a small quantity of flux, and about 10% of its weight in iron, giving a coppery bullion high in silver and low in gold. The average composition of this bullion is about 700 parts silver and 80 parts gold, which we now treat in a small parting-plant. The bullion, in the shape of a button weighing in the neighborhood of 200 ounces, is treated with concentrated nitric acid in a heated porcelain-lined kettle; the operation of parting is not long or tedious, a slime residue being produced that assays 50% gold and 25% silver, which is added to the next clean-up. The silver solution is treated with sodium bicarbonate precipitating the silver as a carbonate, which is roasted at a low-red heat with the formation of silver oxide forming a product which is ready for fluxing and melting into bar silver.

Just beneath the acid tank is placed a waste sump of a capacity of twenty-five tons of water, into which all of the solutions from the acid tank and vacuum filter are allowed to flow. The contents of this sump are found to assay appreciable quantities in soluble gold, but rarely more than a value of \$2 per ton. This solution is treated with fine zinc obtained from the zinc lathe, and sulphuric acid, and is well stirred and allowed to settle after the action has ceased. At the expiration of this time it is found that about 90% of the soluble gold has been precipitated. The sweepings around the zinc boxes after a clean-up are also thrown into this waste sump. These waste sump settlings are cleaned up every six months. All ashes of sufficient richness are crushed, and all sweepings from the melting room are mixed in with slag shipments.

**CYANIDE CONSUMPTION.**—The consumption of cyanide and lime per ton of ore treated during the past eleven months, both for the chemical and mechanical losses, is given in Table IV; the mechanical loss being that which passes out in the waste solutions.

TABLE IV.—CONSUMPTION OF CYANIDE AND LIME PER TON OF ORE TREATED.

TIME.	Consumption of Cyanide.		Consumption of Lime.
	Chemical. Pounds.	Mechanical. Pounds.	
1903.			
July	0.93	0.67	7.18
August	1.03	0.42	7.91
September	1.07	0.46	7.36
October	1.08	0.38	6.14
November	0.82	0.62	5.48
December	0.89	0.41	5.36
Average during six months in 1903	0.98	0.49	6.54
1904.			
January	0.52	0.51	5.03
February	0.80	0.39	5.95
March	0.76	0.39	6.34
April	1.04	0.36	5.24
May	1.23*	0.59	4.93
Average during five months in 1904	0.84	0.45	5.49

\*The increase in the consumption of cyanide during May was due to having raised the solution strength for precipitation purposes.

**GENERAL.**—Although the mill is one of the most modern, the general plan of placing the sand vats higher than the slimes vats was followed; an arrangement which assumes that clean sands are not to be made and requiring an overflow of slimes from the sand vats to pass to the slimes vats. If clean sands are produced in the separation (this can be accomplished), the logical position for the sand vats is at a lower level than that of the slimes vats for two reasons: First, the slimes can be delivered at a higher level than the sands; second, the decantation of the richer solutions from the slimes can be run direct on the sands charges, thus avoiding the unnecessary expense of repumping this solution, and, at the

same time, the gold value of the solution going to the battery is kept lower.

**EXTRACTION RESULTS.**—Table V gives the data of the extractions from the starting of the mill; the returns for both bullion and slag being quoted separately for the gold.

TABLE V.—MILL RESULTS FROM JULY, 1903, TO MAY, 1904.

Time.	Gold.			Silver. Total.
	In Bullion.	In Slag.	Total.	
Average during the first half of 1903	Per Cent. 46.75	Per Cent. 1.81	Per Cent. 48.56	Per Cent. 22.6
1903.				
July	50.23	1.39	51.62	36.8
August	58.09	0.49	58.58	26.6
September	60.26	0.80	61.06	18.6
October	63.44	0.49	63.93	17.8
November	67.32	2.02	69.34	21.4
December	68.23	1.64	69.87	49.2
Average during second half of 1903	61.15	1.07	62.22	26.1
1904.				
January	60.81	1.12	61.93	46.2
February	75.16	1.04	76.20	57.3
March	76.57	3.15	79.72	42.1
April	74.08	1.64	75.72	43.2
May	81.81	1.44	83.25	39.3
Average during five months in 1904	73.81	1.71	75.52	44.3

The extraction shown in Table V, though not high, is regarded as very hopeful, owing to the fairly regular increase, and compared to the difference between head-contents and contents in sands-tails, slimes-tails and waste solutions, show several per cent higher; cyanide tests on mill samples have been made regularly for nine months, and the actual returns exceed the test extractions by from 5% to 10%. Of the extractions 47.9% are obtained in the battery, 27% from the sands leaching and 25.1% from the slimes treatment during the past seven months.

**COST OF TREATMENT.**—The working costs vary from month to month, for the reason that all expenses are taken up and charged out at once, and where these expenses cover several months or more they cause that particular month to have an unduly high cost-sheet; an average of the first five months in 1904 is given in Table VI, whereby the larger part of this discrepancy is eliminated:

TABLE VI.—AVERAGE WORKING COSTS AT THE MAITLAND MILL, JANUARY TO MAY, 1904.

Department.			
Crusher:	Power.....	\$0.014	
	Labor.....	0.049	
	Repairs, etc.....	0.026	
			\$0.089
Sampling:	Power.....	0.004	
	Labor.....	0.013	
	Repairs, etc.....	0.001	
			0.017
Stamps:	Power.....	0.270	
	Sand-pumps.....	0.023	
	Labor.....	0.083	
	Repairs, etc.....	0.073	
			0.449
Leaching:	Pumping solutions.....	0.050	
	Sluicing sands.....	0.009	
	Handling slimes.....	0.022	
	Labor.....	0.069	
	Repairs, etc.....	0.018	
			0.168
Chemicals:	Lime.....	0.027	
	Cyanide.....	0.305	
			0.332
Precipitation:	Labor.....	0.011	
	Zinc.....	0.069	
	Repairs, etc.....	0.005	
			0.115
Clean-up:	Labor.....	0.006	
	Acid.....	0.012	
	Fuel.....	0.005	
	Fluxes.....	0.013	
	Crucibles.....	0.006	
	Repairs, etc.....	0.002	
			0.044
	Assaying.....		0.038
	Mill engineers.....		0.076
	Electric light.....		0.034
	General expense.....		0.244
Total expense of milling one ton of ore.....			\$1.606

NOTE.—The treatment cost is increased by the lack of railroad facilities, all supplies being hauled by wagon from 3 to 5 miles; an average of this hauling cost is 19.6 cents per ton of ore treated.

The sample-room and assaying expenses are equally divided between mine and mill. In the costs of power, the fuel, labor and necessary repairs to the generation of steam are included, the mine and mill being charged equally, which is a very equitable distribution, and the division of the mill power is based on indicator cards taken from the mill engine, the cost of a horse-power day averaged 36.3 cents for the past eleven months.

The costs given in Table VI include every item of expense connected with the operation of the plant, and takes into account also all renewals and changes made, but does not include depreciation of property or amortization fund.

The cleanup cost per ounce of bullion, based on eleven months production of 23,077 fine ounces, was:

	Cents.
Cleaning boxes and acid treatment	2.07
Melting costs	5.87
Marketing the bullion	3.46
Total cost per ounce of bullion	11.40

The men in the mill are advanced from one position to another as occasion arises, which insures a better

grade of labor, because more interest is taken by the men in their work, and they having a more general knowledge of the work. Moreover, the sudden withdrawal of a man is not so keenly felt. This principle of promotion, which has been in vogue for a year, is productive of excellent results.

LABOR.—The labor employed in the mill was:

	Time.	Cost.
DAY SHIFT—		
Sample room man .....	5 hours	\$1 25
Crusher man .....	12 hours	3 50
Battery man .....	12 hours	4 00
Solution man .....	12 hours	3 50
Precipitation man .....	10 hours	3 00
Helper .....	10 hours	2 50
Engineer .....	12 hours	4 00
Total day shift .....		\$21 75
NIGHT SHIFT—		
Battery man .....	12 hours	4 00
Solution man .....	12 hours	3 50
Engineer .....	12 hours	4 00
Total night shift .....		\$11 50
Total labor in mill .....		\$33 25

### New Locomotive.

The use of gasoline engines for motive power is successfully demonstrated by the mining locomotive, of which views are shown herewith. The engine used is

Mining Car.

a 5 H. P. single-cylinder Union, built by the Union Gas Engine Co. of San Francisco, Cal. The car and transmission were built by the Los Angeles Engineering Co. of Los Angeles, Cal. The locomotive is owned by Robert Beyrle of Los Angeles, Cal.

The engine is of the latest type built by the Union Gas Engine Co., is compact, all the wearing parts being of large dimensions and arranged so as to be easily accessible and always within the control of the engineer. It is fitted with a sensitive governor, which allows fuel to be used only in proportion to the work performed, and has a speed controller by which the speed can be set at any desired rate and maintained without any attention on the part of the engineer. The total weight of the locomotive, in running order, is about 3000 pounds. When tested on the track at Los Angeles it was shown to have a draw-bar pull of 600 pounds. The height over all above the rail is 5 feet 9 inches; length over all, 6 feet; width, not including step, 24 inches.

The height could have been considerably reduced if needed. The oil and water tanks are mounted in the rear. It is also fitted with an acetylene headlight.

This locomotive is now used in the tunnel being built to bring water to the city of Santa Barbara, Cal. This tunnel is to be 19,560 feet long and is now in 450 feet. The locomotive is drawing out the dirt and rock as fast as it can be loosened, taking two tons at a load. It has a greater capacity than this, but at present is not taxed to its working limit.

At the Homestake mine at Lead, South Dakota, are found many original arrangements to aid in promoting the economy of mining. The surface plant is an extensive and very costly one, representing more than \$2,000,000. This is all well protected from destruction by fire by the arrangement of numerous fire plugs which are connected with the reservoir on the hillside, affording a heavy pressure. To fight a possible fire underground, the compressed air-pipe system is connected with the water system, and at a moment's notice the water may be made available for use. The Homestake has never had a serious fire in twenty-eight years.

### Notes on Crushing of Metalliferous Ores in the Stamp Battery in Africa.

Written for the MINING AND SCIENTIFIC PRESS by F. O. ROBERTS.

In reduction of metalliferous ores two objects are desired, viz.: (1) The economical pulverization of the ore to any desired fineness, and (2) the effective liberation of the mineral contained in the ore. In other words, the application of the stamp mill as a means of reducing ores, viewed both in its commercial and metallurgical aspects, may be described as an economical method of making abundantly accessible to amalgamation, or other treatment, the gold or other minerals of commercial importance contained in the ores.

This important branch of the industry has been discussed and critically examined for many years, yet if one gives full cognizance to the important advances made in stamp mill practices during the past decade and, indeed, notices the considerations affecting the crushing of ores, some of which have received only ordinary attention, while the significance of others has but recently been recognized, there would seem to be almost as great a field for metallurgical, as well as mechanical, science in this branch of the industry at the present time as there has been in the past, and it would appear that in the further increase

which as much as 55% to 60% of the total gold contents of the ore is accounted for after amalgamation, and while it may be conceded that the extremely fine state of division of the gold particles would, where no variation of amalgamation was shown, largely account for these results, there does not appear to be any mineralogical reason for this, and it is the opinion of the writer that—by giving greater attention to plate area per ton, classification of product, altering the conditions of amalgamation to coincide with the several products produced which are of sufficient value to handle, and observing in general the points affecting amalgamation—a much larger percentage of gold could be retained in the mill.

In Rhodesia, where the auriferous deposits are composed almost wholly of quartz veins, a much greater variety of ores are found and, in consequence, a greater diversity in the character of the ore occurs and a much larger field for variation in amalgamating practices exists.

These fields, however, show no modification of the methods used on the Rand and which have been transmitted to Rhodesia.

It is the very essence of successful metallurgical practice to determine the most effective and economical methods of extracting the mineral contents of individual ores—in other words, to alter the methods to suit the ore being dealt with.

MILL CONSTRUCTION.—In dealing with this subject I will limit myself to giving only a very general out-

Mining Car.

in the crushing capacity of the stamp mill, at least, in so far as this is harmoniously associated with a high, and yet economical, extraction of the gold values, there is a field of sufficient magnitude and promise to warrant the prediction that some very astonishing results will be obtained within the next year or two.

In Africa, generally speaking, the stamp mill is used more as a crushing machine than with any intention of effectively combining the two functions, i. e., crushing and amalgamation—that is to say, the ores are so simple and distinctly amenable to subsequent treatment by cyanide that amalgamation is only considered of importance in arresting the coarser particles of gold, which would otherwise demand longer contact with the cyanide solution before dissolving; hence, more attention is given to the creation of a "large duty per stamp per diem" (within certain limits) than is given to the study of improving the process of amalgamation.

How far amalgamation has been made subservient to crushing capacity can be gathered by the statement that in no instance (at least, in so far as the writer is aware) has any departure been made from the standard 5x12-foot copper plate, arranged directly in front of and in contact with each battery of five stamps. It is, I believe, agreed that the association of gold with the pyrite on the Rand fields is a mechanical one and not a chemical one. In Rhodesia the ores so far dealt with (with one exception) are distinctly free milling, and it would appear that the freely applicable nature of the ores to the cyanide treatment had, to some extent, deflected attention from the importance of crushing and sizing the ores to various degrees of fineness, with the idea of liberating the gold values. It would seem probable that, with more attention directed towards amalgamation and classification of product, some modification of future cyanide plants could be effected, while I dare say in some instances it would be possible to entirely exclude its consideration, without making any sacrifices in the tonnage handled.

Instances on the Rand fields can be recorded in

line of the ideas employed in mill construction, adding that on the Rand fields these methods, from a mechanical point of view, are largely desirable, while no doubt in other countries where the integral parts of the gold mining industry produce a larger degree of speculation many modifications would be called for.

In Johannesburg recognition is given to the economic importance of installing high-class, as well as permanent, plant and the local conditions make it possible to avoid the expensive necessity of constantly increasing the capacity of the plant. Ample provision is also made for auxiliary plant.

The apparently indifferent way in which large sums of money are advanced for surface equipment is to the new comer surprising; but the attention and scrutiny which is later directed towards the "working expenditure" freely sets forth the compensation expected, through this broad and liberal policy.

While a great deal of extravagance is exhibited in Africa, mostly confined to outside districts, on the whole the soundness of boldly tackling the proposition has been the means of establishing an enormous industry in the Transvaal colony.

In Rhodesia the operations are confined wholly to quartz veins; the industry is of a much more speculative nature, and the scale of operations is much smaller. The proximity of the Rand fields, and the magnitude which the term implies, has, in a great measure, adversely affected Rhodesia in the matter of equipment, as well as in other directions.

In the erection of the stamp mill, after the ground contours have been brought to a common level, attention is directed towards the mortar block excavations. In ordinarily hard ground it is usual to build in, anywhere from 2 feet to 3 feet, of concrete at the bottom of the pit for the piles to rest upon, as it is important that a full bearing be obtained, as well as a foundation of unusual hardness. The depth of the excavation is usually 12 feet, but it is not uncommon to find instances where the condition of the ground has rendered it necessary to extend the excavation to a depth of 30 feet to 40 feet.

(TO BE CONTINUED.)

## Forty Mile, Alaska.\*

Written for the MINING AND SCIENTIFIC PRESS by J. S. FRENCH

Since the wonderful gold discoveries in the Klondike in 1896, the territory lying on both sides of the international boundary in "the land of the midnight sun" has been kept prominently before the public by reports made from time to time of new strikes of fabulous richness. Many of these reports have been greatly exaggerated when the actual truth would have been startling enough. What is known as the Forty Mile district of Alaska comprises about 100 square miles. For years before the Klondike diggings on the Canadian side, or Circle City, Rampart and Nome on the American side were discovered, miners were at work on the Forty Mile river.

In those days winter work was virtually unknown, the miners working with their rockers on the river bars during the summer, and spending the greater portion of the winter in their cabins. From their own statements, life did not prove a burden to them during the long winter months. As a rule they had a fair supply of food and drink as well, and should their supply of liquor run short there was always some one in camp who could make "hootch," a drink which it is claimed will make the poorest prospector feel that he is a "bonanza king."

The town of Forty Mile, which is situated on the Yukon river, 52 miles from Dawson, was the base of supplies in those days, the goods being brought up the Yukon by a small steamer from St. Michael. Many thousands of dollars were taken from the river bars during the early days, and the ground then worked is worked now successfully by men with rockers.

Gold has been found in paying quantities on tributaries of the Forty Mile river for about 125 miles from the Yukon, and fair prospects have been found for 25 miles farther, and with the investigations now going on the gold-bearing territory may be considerably added to the coming season.

About 75 miles from Forty Mile the river forks, forming the North and South forks, both of which streams run through a gold-bearing country, but up to the present time the territory drained by the South fork has been proven to be far richer than the North fork. About 30 miles above the forks the South fork divides, forming the Denison and Mosquito forks of the Forty Mile, and here the Mosquito taps the gold belt—the territory drained by the Denison being mostly a granite formation.

The principal gold producing creeks of the Forty Mile are Chicken, Lost Chicken, Jack Wade, Napoleon, Franklin, Walker's Fork and Ingall. Chicken at present is attracting the most attention from the fact that, in addition to having yielded many thousands of dollars of gold the past season, with large dumps being taken out this season, the entire creek has been grouped for the purpose of being worked by hydraulics. This group covers about 4 miles, with an average width for hydraulic working of about 600 feet. As a hydraulic proposition, this will certainly prove a bonanza, a large portion of it having already proved rich drifting ground. Lost Chicken, which lies adjacent to Chicken on the east, is principally bench ground. The first season's working of this ground on a small scale yielded many thousands, and the coming spring will show a good cleanup, as large dumps are being taken out this winter. Jack Wade, which enters Walker's fork about 8 miles from its mouth, has been a heavy producer for several years. The miners are beginning to drop drifting, making use of the open cut instead, and as a result the output for the future will be far heavier, although it has run well up into the thousands during the past couple of years.

Napoleon, which enters the South fork about 16 miles below Chicken, has proved a very rich creek, although little work has been done on it. Discovery claim on this creek has yielded over \$75,000, and but a small space of bedrock has been uncovered. Pay has been shown for 2 miles above Discovery. Franklin, which enters the South fork 6 miles below Napoleon, has for many years proved a very rich creek, many thousands of dollars having been taken from it. This is one of the oldest creeks known in the Forty Mile, and although it has been worked for years, if worked on a large scale could be made to pay handsomely now. Walker's fork, which enters the South fork 2 miles above Napoleon, is proving a paying proposition. The ground is not so rich as on some of the other creeks, but the gold is distributed over a large area, and as the ground is shallow and the water supply good, it will prove a rich producer, when worked on an extensive scale.

Ingall, which enters the Mosquito fork about 7 miles above Chicken, is proving a good producer, and will respond well when worked extensively.

The annual yield from the above mentioned creeks runs into hundreds of thousands of dollars, but with extensive hydraulic plants in operation the output would be a matter of millions. The surface of the ground is covered with a heavy layer of moss, or niggerheads, and below this comes muck, the compo-

sition of which is about 25% decayed vegetation and 75% ice. This muck extends down to the gravel and is easily disposed of in open cut work. After cutting the moss and niggerheads from the surface, plows and scrapers being used for this purpose, thereby exposing the muck to the action of the sun, thawing starts in at once, increasing in volume day by day. Furrows cut in the muck by plows at intervals of several feet greatly facilitate the action of the sun and water in thawing the muck. With the ground in this condition, a fair head of water will run off the muck very rapidly, thus exposing the gravel to the rays of the sun. A big surface of gravel now being exposed, work can be carried on continuously, washing off the gravel as it thaws.

Water begins running in the creeks of the Forty Mile the latter part of April, and active sluicing begins May 1st, continuing until about October 1st. From the latter part of May till August 15th work can be carried on continuously during the twenty-four hours, which fact coupled with the richness of the ground makes the Forty Mile a better proposition for capital than most sections where operations can be carried on during the entire year. The question of how mining work is carried on in Alaska during the winter is apparently a puzzling one to many, yet when once understood is simple enough. Many an old California miner operating in the north has been heard to say that he would rather work in the frozen gravel, thawing as he mined, than in the States where the ground was thawed and where timbering was necessary. In the frozen gravel, shafts and drifts stand without timbering.

The method employed for extracting the gold up to the present has been principally by drifting—in the early days wood fires being used for thawing the frozen gravel and later steam points being introduced. The creeks vary materially as regards formation, some being shallow, with gravel from the surface down to bedrock. Chicken, with a depth of from 12 to 35 feet, has for the most part a soft bedrock. When the depth is 35 feet there are from 20 to 23 feet of muck, but in the shallow ground, say 20 feet to bedrock, there is only 7 or 8 feet of muck, and in ground that only runs 12 or 15 feet to bedrock there is little if any muck. The so-called soft bedrock consists of sand, clay or coal, and the small strip of hard bedrock is a species of iron rock.

When ready for operating the mixer picks his shaft down through the frozen muck until he reaches gravel and then, if thawing with wood, he places dry wood in the bottom of the shaft, blankets it with green wood and then sets fire to it. After the fire has burned out he removes the thawed gravel and repeats the operation. After reaching bedrock he starts his drift in any direction he wishes, piling his wood against the face. This primitive method is a slow way of mining, yet lots of gold has been taken out by it, and there are men in the North who continue to use it, claiming they prefer it.

When thawing with steam the miner uses what are called steam points, which on an average vary in length from 4 to 6 feet. When the points first came into use in the North, rifle barrels were used, as the blacksmiths had bought up large numbers of rifles at their own figures, the majority who had come into the country with the rush finding they had no use for them. Afterwards heavy pipe was used in the manufacture of points. When the miner has reached gravel in his shaft he makes connections with his boiler, extending a pipe down the shaft. For sinking the shaft he will probably use three points. In each of these, about 6 inches from the top, is a nipple, to which is attached a piece of steam hose, the other end of the hose being attached to a header made from a piece of pipe. Each piece of hose is fitted with a valve at its junction with the header, and the header being attached to the pipe by a piece of hose, the connections are now all made and the miner is ready for thawing. The few inches of the point above the nipple is solid and through this a hole has been drilled and a small rod run, which the miner uses to turn the points while driving them. Everything being ready, the engineer turns on steam, the miner places his points and the operations start. At first he only turns a little steam into the points, and as the gravel thaws he continually taps his points, using as a rule a maul and in some instances a sledge, and while driving he turns his points, which aids him in loosening the gravel. After driving the points in for 2 or 3 feet he lets them stand for a while, giving them a fair amount of steam, and then goes back and drives them entirely in, gives them a good head of steam and leaves them.

The time allowed for thawing depends upon the condition of the ground, some gravel being much tighter than others. In sinking a shaft the points, as a rule, would be allowed to steam about eight hours, whereas in drifting they would be steamed for ten hours, or twelve hours. After the points are drawn, the thawing continues for quite a while, consequently the miner aims to keep several thaws ahead when drifting, so as not to have to take out the hot gravel.

These points in drifting will thaw, if properly steamed, a couple of feet beyond the end and about 2 feet on either side of them, so it can be readily seen that with twenty to forty points in use a big body of gravel can be moved by one thaw. As a rule about one horse power is claimed as necessary for a point,

but some miners will only steam twenty points with a 25 or 30 H. P. boiler. Work is carried on during the closed season and about May 1st sluicing begins. After the dumps are sluiced the miner starts with his summer work, which entails far less expense, as he hoists the gravel from his shaft and dumps it into the sluice boxes, doing away with the shoveling in process. Many people imagine that the Forty Mile is an inaccessible region. Such is not the case by any means. The trip from San Francisco to Chicken creek, Alaska, can be made in midwinter without one having to endure any hardship whatever and with but little more inconvenience than would be experienced between San Francisco and New York at the same time of the year. The trip from Skagway to White Horse over the White Pass R. R., though a most picturesque region, is accomplished in a few hours. Here the stage is taken for Dawson, the trip with relays of horses being made in five and one-half days. As there are comfortable accommodations all along the line, the trip proves a novel and pleasant one. From Dawson to Forty Mile, a distance of 52 miles, the trip is made either by stage, cutter or dog team. The trip from Forty Mile up the Forty Mile river to Chicken and intermediate points may be made by cutter or dog team very quickly with good accommodations at all points. The Forty Mile river is a regular boulevard during the winter, four-horse sleds carrying more than a ton to the horse, making the trip from Forty Mile to Chicken, a distance of 110 miles, easily and expeditiously.

The atmosphere is dry, and there is seldom any wind, consequently the cold does not prove so severe, though the temperature may be lower than Chicago or New York. In the early days dog teams were used for freighting, but now horses have taken their places and dogs are only used for passenger traffic, making as much as 50 miles in a day. The writer has run from Napoleon creek to Dawson, about 140 miles, with three dogs in less than three days. A healthier country cannot be found, the miner being able to raise his own garden truck, and he may also gather with but little trouble a supply of wild cranberries, blueberries, currants and raspberries. Game, both large and small, is plentiful. Moose and caribou are fine meat and, although cattle are often driven to the creeks and butchered, the beef fails to take preference over the wild meat. Grouse, ptarmigan and rabbits may always be had in abundance, and last but not least may be mentioned greyling, which is a species of trout which, caught in the fall, may be frozen and stored for winter use.

As regards mining, the Forty Mile possesses many advantages over other sections, among which may be mentioned the plentiful supply of wood and water for operating purposes. The pay lies largely in the gravel, so there is virtually no blank gravel to handle, which greatly enhances the value of the ground for hydraulic work. Another great advantage is that the miner can give title to his ground, which cannot be done on the Canadian side.

For the prospector the Forty Mile offers great opportunities and capital will never find a better mining field for investment.

## Bureau of Forestry Testing Creosote Oil for Preservative Treatment.

The Bureau of Forestry is making exhaustive tests to determine the best grade of creosote oil for use in wood preservative treatment. The supply of the kinds of timber which are naturally most resistant to decay is diminishing so rapidly that substitutes will have to be found within a few years at farthest. Already the railroads are face to face with a tie famine from the exhaustion of the woods hitherto most used, especially white oak. There are plenty of substitutes, but they all decay so fast in their natural state that, though their first cost is low, their use is expensive. In Europe this difficulty was met long ago by devising methods of artificial preservation by which, for example, a beech tie, which if untreated will decay in from four to five years, is made to last thirty years or more. This result is obtained by impregnating it with creosote oil.

Other preservative materials are in experimental use in this country, but none gives more promising results in the increased length of service secured. At present most of the creosote oil for this purpose is being obtained from European sources. Quantities sufficient for our use are produced in this country, but the grades are so many and, for the most part, so inferior that they are but little used.

About 1000 samples of this oil, both native and European, have been tested by the Bureau to determine what grade gives the best results. This involves finding out the grade of oil which both most readily enters the wood and also stays in the longest time. The first will hasten and cheapen the process, the second will insure the greater permanence of the treatment.

The necessity for wood preservative treatment is beyond the theoretical stage. It is a question of recognized and vital importance, especially to the railroads and telegraph and telephone companies, whose bills for constant renewals of ties and poles are enormous. The oil tests the Bureau is making are therefore, of large and immediate practical value.

\*See illustrations on front page.

## Coal in Montana.

Written for the MINING AND SCIENTIFIC PRESS.

The coal fields of the United States are classified under four subdivisions, according to geological age: The Carboniferous, confined to regions east of the 100th meridian; the Triassic, to the Atlantic coast; the Cretaceous, in the Rocky Mountain regions, and the Tertiary, between the 120th meridian and the Pacific coast. These indicate that with advance in geological time, the conditions favorable for the accumulation of coal deposits were within zones successively shifting westward.

Coal fields of Montana are found in the Cretaceous. For 1200 miles southeastward through the United States, from the Canadian boundary, extends a great coal belt whose axis coincides with the main range of the Rocky Mountains. Included in it are portions of Montana, Wyoming, Colorado, Utah and New Mexico. The coal in the plains of this region is mainly lignite, although the lowest beds, which have been subjected to greater pressure, often approach a true coal. Along the flanks of the mountains and in the interior basins, where the inclosing stratum has been folded, the coal is chiefly bituminous, sometimes converted to anthracite in the vicinity of igneous intrusives.

A full description of the various coal fields of the United States appeared in Part III of the twenty-second annual report of the United States Geological Survey. In the fourth annual report of the inspector of mines of Montana, H. F. Walsh has incorporated much of this material that was pertinent to the districts of Montana, bringing it up to date and giving more specific details as to working mines. From this report and other sources, the present description has been compiled to give an idea of Montana's importance as a coal producer. The coal has been found in various districts many of which have been prospected, but often slightly developed. It has been commercially developed in the counties of Carbon, Cascade, Choteau, Custer, Fergus, Gallatin and Park.

In Carbon county the Rocky Fork field has been extensively developed by the Rocky Fork Coal Co., controlled by the Northwestern Improvement Co., a subsidiary company of the Northern Pacific Railroad Co. They operate the largest coal mines in Montana at Red Lodge. H. J. Horn is general manager and Robert Pettigrew is superintendent. During 1903 the output was 541,060 tons. The coal deposits are in a series of massive gray sandstones and shales near the middle of the Laramie formation and within a series of 1000 feet thick. There are seven beds of coal developed, varying in widths from 5 to 14 feet and comprising a total thickness of 54 feet.

The product of these different beds shows some variation in quality, some being preferred as domestic and steam coal, while some are best suited for metallurgical purposes. In addition, thirteen coal horizons are reported to occur below, five of which are said to be of workable character. The coal measures outcrop along the east bluff of Rocky Fork, with a southerly dip of 17° at the Red Lodge mine, but this dip rapidly decreases to the southeast and south. The property is developed by two main slopes 1800 and 2500 feet long. The greatest development has been done in vein No. 4. The roof of this vein is sandstone with a floor of fire clay 1½ to 4 feet thick on sandstone. From slope No. 4 five levels have been driven to the east and four levels to the west. The third and fourth east levels in No. 4 have been driven 9000 feet from the slope. The second level west has been driven 1 mile from No. 4 slope, the workings being ½ mile wide on the pitch of the vein by 3 miles long on the strike of the vein.

A 600-ton washer was completed in 1903. Previous to its completion the slack coal was dumped into the waters of Rock creek until prohibited by law. Such small coal is now washed, making a commercial product, and the overflow water from the washer, carrying the very fine coal and dirt in suspension, is settled alternately in two reservoirs, which prevents any appreciable pollution of the waters of the creek. A regular inspection is daily made for gas which, however, is seldom found in dangerous quantities. The condition of haulage and airways is good.

Other outside improvements consist of new warehouse, blacksmith shop, machine shop, carpenter shop, a large addition to the electric light building, in which another engine, with an alternating generator for lighting the city and an additional direct current generator, has been installed. During the past four years two 250 H. P. water tube boilers, small hoist to haul coal from No. 4 to No. 2 steel tippie, a set of railroad track scales, a new box car loader and three additional fans have been installed, a 20-foot fan at No. 2 (steam), a 5-foot fan at No. 6 (electric) and a 3-foot fan at No. 1½ (electric).

The coal is similar to that of the Canyon City field of Colorado. It does not coke in burning, but produces a bright flame and leaves a small amount of light ash. It is a transitional type, between bituminous coal and lignite. It gives a theoretical calorific

power of 10,500 B. T. U. per pound, and in a stationary boiler test, an actual evaporation of 5.8 pounds of water at working temperature and pressure and a relative efficiency of 94%.

Three miles east of the Rocky Fork field the Clark Fork field is worked at Bridger, the terminus of the Clark Fork branch of the Northern Pacific, by the Bridger Coal Co. The vein pitches 12°, is 4½ feet thick and is developed by a slope 3000 feet long. George Hough is manager and W. R. Dickson, superintendent. S. H. Glidden represents the owners. The main work has been done to the south of the slope, but at the face of the south entries the coal became so thin, owing to a portion of the vein being displaced by a parting of rock, that these entries were stopped. What coal there is makes an excellent steam and domestic coal. The output for the past two years has been about 50,000 tons per year.

This field was made available by the Bighorn mountain uplift which brought the Laramie rocks to the surface along its western side. It crosses the Yellowstone river 22 miles west of Billings and extends thence north to the Musselshell river. The northward extension of this field is not known to contain coal beds of value. About 8 miles south of the Yellowstone river the beds have a workable thickness, which is maintained southward to the Bighorn Basin field of Wyoming. The coal occupies the bottom of the Laramie formation, the "basal sandstone" being exposed but 10 feet below the lowest bed, while the bed now worked is 50 feet above. The inclination of the bed averages about 5° toward the west. The bed which is mined varies in thickness from 5 feet at the northern end of the workable area to 3 feet, about 6 miles north of this point, and again increases to nearly 5 feet within the next 15 miles. There are two other beds at this point, one immediately above the bottom of the Laramie the other about 500 feet higher. Neither of these beds has developed a workable thickness at any of the points where they have been opened. The coal is lignitic, but has a peculiar structure. Bands of bright coal alternate with bands having a dead appearance and closely resembling "bony" coal. The proportion of the latter gradually increases toward the north, where they become shale lenses, so that the product is of little value. Toward the south the coal is very bright and firm.

At Gebo the same field is worked by the Clark Fork Mining Co., where a large modern electric plant has been installed by the Link Belt Machinery Co. of Chicago. The coal is hauled 1 mile from the slope to the tippie, which is of steel, equipped with shaking screens. The vein developed is 6 feet thick. A slope 2000 feet in length has been driven, the pitch of the vein averaging 6°. The coal is lignite, having a peculiar structure. It is much banded—bands of bright coal alternating with bands of a dead luster—and throughout the seam is disseminated considerable "bony" coal, which necessitates much sorting in the mine. The vein has a few inches of fire clay for a floor, and between the top of the coal and the overlying massive sandstones there is several feet of shaly rock which requires considerable timbering to maintain. The manager is H. H. Griffith and the superintendent, J. E. McLaughlin. In 1903, 2000 tons were mined, but the management estimates the output for the year 1904 will approximate 25,000 tons. The Carbon Coal Co., J. C. McCarthy owner and manager, is likewise working the vein.

The Belt field in Cascade county lies along the northern base of the Little Belt mountains. The strata are exposed only along the canyon walls, as the country is deeply covered by glacial drift. The only coal bed of workable thickness is near the center of the field, the thickest point being near the mines at Sand Coulee, where it is 7½ feet thick, with three small shale partings. The extension of the field west of the Missouri river has not been thoroughly prospected, except in the vicinity of Judith basin.

Cascade county has been the biggest producer of coal in the State, reaching its maximum output in 1900 of 1,146,534 tons. During the past four years it has maintained an output of 800,000 tons.

The Cottonwood Coal Co. mines are at Stockett, the terminus of a branch of the Montana Central Railway Co. Lewis Stockett is manager and James Pierson is superintendent. There are five mines opened here, three of which have been worked out, one of which has opened up all available coal and a new mine known as "No. 5," which has been developed during the past two years. The coal is mined from a vein of the Kootenai group of the lower Cretaceous, having a total thickness of 9 feet 3 inches. The vein is nearly horizontal and consists of five coal veins of different quality, separated by sandstone and slate. There are no partings between the different benches of coal, slate and "bone," the vein being very hard and a solid mass from top to bottom, which, with a liberal number of pyrite nodules, scattered promiscuously throughout the vein, make the coal a difficult one to clean. The cleaning was formerly done with indifferent results by the miner at the face, and the nut coal was washed in a jig. Scarcity of water prevented the erection of a plant to wash the whole product and at times necessitated the shutting down of the nut coal washer. After a series of experiments, a scheme of treatment supple-

mentary to the cleaning by the miner was determined upon. It consists of an extensive plant depending upon hand picking and difference of specific gravity for separation of the different products. The machinery started August 10, 1904, and has since been in continuous operation every week day with gratifying results. The output for the past two years has averaged about 400,000 tons. Two additional boilers have been added to the old plant. Two air shafts have been completed in the No. 5 mine and two fans erected. Thirty-four mining machines and twelve air drills are in use on this property.

The Anaconda Copper Co. mines are at Belt, a station on the Neihart branch of the Montana Central Railway, F. W. C. Whyte, manager, and J. J. Kinney, superintendent. The mines at Belt, in Cascade county, are very extensive, having miles of rope haulage and airways. There is one main tail-rope system, about 1 mile long, running through the main entry to the tippie. As the vein of coal has many rolls, there are several independent rope systems which handle the cars from the partings nearest the working faces to the main parting. During the past year 560 men have been employed. Twenty-two Ingersoll-Sergeant punchers are used. The output of the company in coal and coke for the year 1903 was 177,704 tons and the estimated total tonnage for the year 1904 is 142,733 tons.

Rock Springs Coal Co. mines are at Sand Coulee. The vein is the same as opened at Belt and Stockett, but at Sand Coulee is somewhat thicker than at other points in the field, there being about 7½ feet of coal. E. Gerber is manager and superintendent. The output for the 1903 was 104,800 tons and the estimated output for the year 1904 is 75,000 tons.

Nelson Coal Co. mines at Sand Coulee are owned and managed by Nelson Bros. In 1903 the output was 53,000 tons and for the year 1904 this amount has been increased over 100%. The plant of this company has been added to by new boilers and a compressor. A change from pick to machine mining took place Nov. 1, 1904.

In Choteau, Cascade, Fergus, Gallatin and Park counties the Yellowstone River field and its extensions is the main source of supply. The outcrop of the coal-bearing formations can be followed 150 miles from the eastern end of the Boulder river through the Boulder, Livingston-Bozeman and Sixteen Mile and Shields river basins, thence circling around the northern and eastern end of the Crazy mountains and connecting with the western end of the plains field. The Boulder district comprises the area of Laramie along the drainage of the West Boulder, extending thence west as far as the Yellowstone river at Livingston. The area covered by the coal measures is 30 miles in length east and west and from 5 to 18 miles in breadth. The northern border of the field is formed by the edge of the overlying Livingston formation. The strata dip north, away from the Boulder mountains, from 12° to 45°. One coal bed has been discovered in this field which has a maximum thickness of 4 feet at the eastern end on the West Boulder river. The coal cokes, and although it has never been tested on a large scale, laboratory tests indicate that it is a high-grade fuel. The Livingston-Bozeman district consists of the continuation of the Boulder district from the Yellowstone westward. The coal-bearing formations outcrop along the northern base of the mountains westward to the Gallatin range, and their outcrops swings northward along the eastern base of the Gallatin and Bridger ranges. This district contains the maximum thickness of coal in the entire field and is the only portion in which actual mining is now going on. The strike of the bed follows very closely parallel to the neighboring mountains, the dip being everywhere away from them. Numerous minor fault planes occur where the strike of the beds makes an abrupt change in direction, and the dislocation of the strata has been further increased by the subsequent intrusion of igneous rock. Four coal beds have been discovered in this field, one of which never attains workable thickness. As a rule, only one bed is productive at any one point, the others having thinned out beyond the limits of profitable mining. The beds are composed of alternating bands of coal, "bony" coal, "bone" and shale, in varying proportions and the change from one to another is very abrupt. They vary from 4 to 16 feet in width, where mined, the dip varying from 25° to 90°. The only practicable method of mining is by taking out the entire bed and passing it through a washer, the resulting product being a high grade of steam and coking coal. A large proportion of the output is consumed for locomotive fuel on the Northern Pacific Railway, the main line of which crosses the western end of this district. The Sixteen-Mile and Shields River districts extend northward 40 miles from the line of the Northern Pacific Railway to the northern end of the Crazy mountains. From this point they extend westward 45 miles, around the northern end of the Bridger range. Along the many miles of Laramie outcrop exposed the coal has been prospected by a series of open cuts which have failed to show any thickening sufficient to warrant the opening of mines and the extension of the railroad. The Cascade formation is present over a small portion of the western part of this area, and one coal bed has been found a short distance above the measures, but not of workable thickness.

(TO BE CONTINUED.)

## Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 13, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR BELT.—No. 776,744; J. Kane Passaic, N. J.

Belt for ore concentrators having continuous side flanges of vulcanized rubber surmounted by integral transverse upwardly extending edge projections.

CONCENTRATOR.—No. 776,647; F. M. Dillon and W. G. Wilson, Denver, Colo.

Transversely inclined concentrating table having longitudinal vibration whose tendency is to cause material to travel thereon from head toward tail of table, table having longitudinal riffles arranged in groups of varying height, highest group being located upon upper portion of transversely inclined surface, lowest group being centrally located on surface, and third group on lowest portion of table.

APPARATUS FOR RECOVERING PRECIOUS METALS.—No. 777,159; V. Tunbridge, Newark, N. J.

Apparatus comprising a supply channel having backwardly inclined screen at discharge end, separator arranged to receive material from supply channel, and provided with series of sediment collecting hoppers having sediment discharges and separated by ridges which are progressively higher toward outlet, forwardly inclined screen located at outlet of separator and provided with means for holding soap, filtering tank connected with outlet of separator and provided with upright and depending partitions forming series of upward and downward passages, filtering material located in the downward passages, and channel adapted to receive overflow from filter and to direct the overflow against the sediment withdrawn from separator.

SAND CONCENTRATOR.—No. 777,176; E. S. Bennett, New York, N. Y.

Combination with conduit for tailings having discharge opening in its lower side, a deflector projecting into conduit to direct ore particles to discharge opening and grating or guard associated with deflector, both deflector and the grating being adjust-

able and grating being arranged to guard opening between deflector and bottom of conduit.

EXCAVATING MACHINE.—No. 777,204; J. Helm, St. Louis, Mo.

Excavating machine comprising frame, dislodging mechanism pivotally and reciprocatingly mounted in frame, means to automatically reciprocate dislodging mechanism when dislodging mechanism is actuated, and means to yieldingly hold dislodging mechanism to its work.

CRUSHING MACHINE.—No. 777,227; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton Center, Mass.

In rocking-jaw crushing machine, combination with U-shaped machine-frame open at its rear end and having side parts provided with projections to form buttresses for toggles, of fixed or normally stationary jaw mounted in frame, co-operating rocking-jaw, rocking-jaw frame also mounted in machine-frame and carrying rocking-jaw, toggles interposed between rear parts of rocking-jaw frame and buttresses of machine-frame, and means for operating rocking-jaw frame.

AMALGAMATOR.—No. 777,233; E. P. Wilkins, Baltimore, Md.

In amalgamator combination with receptacle of

cylinder adapted to rotate therein, stand-pipe rigidly engaged in and projecting below bottom of cylinder, worm conveyor in stand-pipe projecting below bottom thereof, inwardly-directed beaters on bottom and sides of receptacle and outwardly-directed beaters on bottom and sides of cylinder arranged staggering therewith.

SEPARATION OF THE METALLIC CONSTITUENTS OF ORES FROM GANGUE.—No. 777,273; A. E. Cattermole, London, Eng.

Process of separating metalliferous matter from gangue by mixing pulp with an amount of oil equaling only fraction of metalliferous constituents, agitating mass until oil-coated metalliferous matter is agglomerated into granules and subjecting mixture to classification to remove small non-coated particles from granules.

SHAKING ORE SCREEN.—No. 777,317; J. A. Traylor, Denver, Colo.

In shaking screen, combination with supporting frame, brackets and links, casing comprising bed plates pivotally secured to links, angle irons secured to bed plate, and screen and sash supported by casing, of strips adapted to rest on side edges of screen, brackets secured to one of angle irons at discharge end of screen, arranged to project over adjacent ends of side strips, adjustable clamp screws threaded to arms to bear on adjacent end of clamping strips, slot in opposite end of each of clamping strips, eyes secured to end angle irons at opposite end of screen, eye bolts pivotally secured to eyes, having nuts threaded to ends and arranged to swing into slots in ends of clamping strip and to clamp with nuts clamping strips to screen.

CONCENTRATION OF MINERALS FROM ORES.—No. 777,274; A. E. Cattermole, H. L. Sulman and H. F. Kirkpatrick-Picard, London, Eng.

Process concentrating ore by mixing ore-pulp with soap solution and mineral acid which liberates organic acid from soap, agitating mixture so as to agglomerate coated mineral particles into granules, separating granules from non-coated gangue and adding alkali to granules to produce soluble soap.

# Mining Summary.

SPECIALY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

The Standard Oil Co. is completing the last section of the great pipe line for carrying oil from Red Fork, Indian Territory, across Kansas and Missouri, under the Mississippi river, through Indiana, Ohio and Pennsylvania to their refineries at Bayonne, N. J., and Newton Creek, New York City.

## ALASKA.

The Eagle River M. Co. has thirteen claims on Eagle river, 7 miles from salt water. B. L. Thane is in charge at Eagle. A tram has been built for 3½ miles from the beach and the remaining 3½ miles is reached by wagon road. A 20-stamp mill is in operation. Ore is brought 260 feet from the mine to the mill by a cable tram. Work has been done in thirteen stopes. The ground is loose and requires careful timbering.

The Alaska-Mexican G. M. Co., on Douglas Island, reports for month of October that the 120-stamp mill ran 29 days; crushed 18,210 tons ore; value of bullion, \$27,665. Saved 445 tons sulphurets of value of \$30,571. Working expenses, \$32,326.—The Alaska-Treadwell G. M. Co. for October reports that the 240-stamp mill ran 28 days; 300-stamp mill ran 28 days; crushed 78,746 tons ore; value of bullion, \$89,357; saved 1850 tons sulphurets of value of \$97,000. Working expenses for month, \$83,918.—The Alaska-United G. M. Co. reports the Ready Bullion claim, 120-stamp mill, ran 29½ days; crushed 18,410 tons ore; value of bullion, \$19,257; saved 390 tons sulphurets of value of \$13,233. Working expenses, \$28,521.

At Windham bay the California-Alaska M. Co. has let contract for 100 feet extension to tunnel on the Doctor claim. J. F. Stewart has charge.—At the Yellow Jacket M. Co. claims on south side of Windham bay, the electric plant has been finished and the mines will be worked during winter with machine drills.—J. P. Bartels and E. H. Patten are driving a tunnel on the Dark Horse, ½ mile south of the basin.

## ARIZONA.

### Cochise County.

In the California mining district, near Paradise, \$70,000 has been paid for seven and one-half claims by W. E. Rise of Houghton, Mich., for Michigan parties.

Three of the old furnaces of the Copper Queen smelter have been transferred to the plant in Douglas, and the smelter shed is to be enlarged to accommodate three new furnaces of the same size as those now in use and also two converter stands.

The new power house of the Calumet & Arizona smelter has been completed and two new furnaces have been ordered.

### Graham County.

The Copper Plate & Arizona Co. has been formed at Duluth, Minn., to develop the Copper Plate claims on the west side of Coronado mountain and the Rattlesnake group, north of Chase creek. The president, J. A. McKinley, is at Clifton arranging for development. He will build a road from Pinkard's gulch to the Plate group, put in air drills and erect buildings.

The Arizona C. Co. has put in another Hancock jig. A. Morrison, concentrator superintendent, reports that the two machines are handling 600 tons per day. The machine installed six months ago was the first to be put up in the United States.

J. C. Erman, superintendent of the Tribulation S. & D. Co. at Safford, will put in a concentrating plant.

### Mohave County.

The Gold Hill R. Co. has bought the Arizona & Utah Railroad and is repairing it.

R. C. Walker, superintendent of the Vanderbilt mine, worked by the Cerbat Mountain M. Co., near Kingman, reports completion of a 100-foot shaft. The mine is making water rapidly and a pumping engine will have to be put in.

Huntington mills have been put in by the Gold Road Co. at Acme.

The Savannah mines, 75 miles southeast of St. George, Utah, in Mohave county, Arizona, have resumed work after being closed for two years.

A 10-stamp mill is being put up for the Blue Ridge M. Co. at Acme.

Thos. Ewing of San Francisco, Cal., is developing the Spear's group, Virgin and Victor, near Acme.

### Yavapai County.

A. V. Miller is working the Brooklyn mine and 10-stamp mill, near Dewey station, with ten men.

The Monarch M. & M. Co., operating

the Ryland, 9 miles east of Wickenburg, is building roads to haul machinery, including a 40 H. P. engine and hoist. C. H. Pratt is superintendent and H. A. Suttle, manager.—The ore bins for the Treadwell S. Co. at Mayer will hold 2500 tons.—E. E. Greenwood has sixty-two men at work on the Mt. Union, 12 miles southeast of Prescott. A Huntington mill and concentrating tables are being placed.—J. M. Radcliffe and J. W. Switzer of Prescott have bonded the Gold Standard mines, 3 miles from Skull valley, to the El Dorado M. Co., of which T. Wilkinson of Burlington, Ia., is president and J. J. Hawkins, Prescott, is vice-president. Switzer and Radcliffe will put in necessary machinery to sink 200 feet on the Enterprise, 12 miles from Prescott.—R. McNary has bonded to the El Dorado Co. claims 1½ miles southeast of the Gold Standard.—A 6-stamp mill is being put up by the Pick & Drill M. Co., on the Agua Fria.

Superintendent A. F. Anderson is sinking the shaft with ten men at the Levathan, near Martinez.—J. H. Hise is developing the Monte Carlo, near Hillside.

J. F. Neff, president of the Goddard M. Co., in the Black Rock mining district, 3 miles from Wickenburg, says that they have sunk 150 feet and are planning to put in a gasoline hoist.

### Yuma County.

The 120-stamp mill to be erected 7 miles southwest of Quartzsite is to be started January 15th. The value is found in a cement, 10 to 40 feet thick, and carrying values from \$2.50 to \$15 per ton. Quartzsite is 20 miles east of La Paz, on the east side of the summit of the River range.

The Arizona Quartz King M. Co., owning claims on the Colorado river, 7 miles above Parker, is putting up a 100-stamp mill and propose to put in 1200 stamps.

## CALIFORNIA.

F. D. Ryan, Commissioner of Public Works, has returned from Sioux City, where he attended the session of the Engineering Commission appointed to formulate plans for the improvement of the Sacramento river and the proper drainage of the Sacramento valley, and says that the report of the Engineering Commission will advise the confinement of the river to its course by strong levees, compelling it to carry all its own flood waters, and thus scouring out and deepening its channel. There will be no cut through Sherman island. Strong recommendations against allowing the detritus from the mining streams will be made. The filling of the Sacramento and the consequent floods will be traced to the slickens from mining operations which filled the tributaries and the main streams.

### Amador County.

The 10-stamp mill at Jose gulch, near Butte Basin, southeast of Jackson, is running, employing six men in mine and mill. W. E. Stewart has charge.

At the Rhetta mine, near Plymouth, the mill is running. W. W. Worthing is superintendent.

The Central Eureka for December has declared a dividend of 7 cents per share, amounting to \$28,000.

There is talk of reopening the Empire and Pacific, near Plymouth.

### Calaveras County.

(Special Correspondence).—The 100-stamp mill of the Sticks mine is crushing ore. The new Laidlaw-Dunn-Gordon 20-drill air compressor is working satisfactorily. It is run by a 400 H. P. electric motor.

Angels, Dec. 20.

### El Dorado County.

A 4-stamp mill for prospecting is being put on the Scherrer mine, east of Georgetown. A. P. Frechette has charge.

G. W. Seybold, of the B. S. mine, near Pleasant Valley, reports that a hydraulic plant has been put in. N. H. Berger of Placerville is superintendent.

### Fresno County.

In Coalinga there are forty-three drilling rigs operating and fifteen new ones that will be operating by the first of the year. Nearly 500 of the 1200 inhabitants of Coalinga and vicinity are engaged in the production of oil.

### Mariposa County.

Congress has passed the bill transferring from the Yosemite National Park to Sierra Forest Reserve a large tract in Mariposa county within which are private holdings of mineral lands. This releases the mineral lands from the restrictions of the National Park and will admit of the building of roads, developing electric power from the streams and the operation of the mines at a reduced expense.

### Mono County.

Surveys for the power line of the proposed electric plant on Bishop creek to transmit power 90 miles to Goldfield, Nev., have been made and the work of construction on the plant has been begun.

Interested in the company are L. Oddie, C. F. Potter, R. Curtis of Denver, G. S. Wood, C. Hobbs and F. J. Campbell. Hobbs is at Bishop superintending the work, having secured water rights on Bishop creek capable of furnishing from 3000 to 5000 H. P.

### Nevada County.

A. M. McDonald, inspector of hydraulics for the California Debris Commission, says that the barrier dam below the Omega mine, built by W. M. Wilson of Maybert, is the best in the State.

The Ironclad mine at Rough and Ready is planning to put in electric pumps.

The Champion Mines have sued the Home G. M. Co. of Nevada City for \$300,000, alleging that the Home Co. has taken ore out of the plaintiff's mines during the last two years. The Home mining property adjoins the Champion mines and the defendant's tunnels have been run into the plaintiff's property, it is alleged. A temporary injunction to prevent further extraction of ore by the Home Co. has been granted. Case will be heard in San Francisco Jan. 6, 1905.

### Sacramento County.

A gold dredger is to be built on the Ingleside fruit farm, near Fair Oaks bridge, by El Dorado Gold Dredging Co., headed by H. E. Pickett of Placerville.

### San Bernardino County.

The Big Lode M. Co., 15 miles from Hesperia, J. C. Button, superintendent, is considering putting up a mill.

### Shasta County.

A. C. Brokaw will light the Golden Eagle quartz mine at Indian creek with electricity from the Siskiyou Electric Light & Power Co.

An electric power plant will be put in at the Midas mine, at Harrison Gulch, A. J. Oswald, superintendent. Four thousand inches of water will be taken from Bee Gum creek, in northwestern Tehama county.—C. Webb, leasing the Washington mine, in French gulch, is considering putting in machinery for deeper work.

### Sierra County.

The Swansea mine, near Alleghany, has resumed operations for the winter under the supervision of J. Brock. N. Johnson is foreman.—F. B. Kloff, superintendent of the Deep Blue gravel mine, has returned from the East.

### Siskiyou County.

G. L. Carr, of Carrville, superintendent of the Yellow Rose M. Co., operating claims on the headwaters of Salmon and Union creek, in Coffee Creek mining district, says that the company is driving a 1200-foot tunnel from the Siskiyou county side to tap the ore vein running parallel with the Dorleska mine, now being operated on the Trinity side. They intend to put in an electric power plant from the headwaters of Salmon river.

### Sonoma County.

The Socrates mine, at Pineflat, is shipping 200 flasks of quicksilver a month. C. Bell is superintendent.

### Trinity County.

Eastern men, represented by F. Grotefend of Redding, have options on dredging placer ground along the Trinity river, above Junction City, and are prospecting with a Keystone drill.

The Dorleska, at Dorleska, will work 100 men in the spring, and are preparing to put in machinery for crushing with a larger milling plant. H. Z. Osborne of Los Angeles, Cal., is president and manager.

The Globe mine, near Dedrick, has closed for the winter. Henry Randohr is superintendent.

The 5-stamp mill on the Lappin mine is crushing. Manager Beacham will soon put in an air compressor and power drill.

### Tuolumne County.

At the Woodside mine, near Sonora, owned by the Ranch M. Co., the shaft is being enlarged from top to bottom by three shifts.—A Gates canvas plant has been put in at the Black Oak mine at Soulsbyville and it is proposed to do away with the cyanide process, as the new plant will save the values.

W. T. Beveredge and B. Harter have bonded to H. G. Comstock & Co. of San Francisco the Roberts placer claim, containing 139 acres, near Montezuma.

C. W. Ayers of San Francisco has bonded to Chicago parties the Omega and Joe Hooker quartz mines near Rawhide.—B. Bacon and C. Dorsey of Columbia are working the Mexican and Bauman veins on Bald mountain, the property of J. F. Rooney.—The Horseshoe Bend mine is putting in a new mill. E. Goss of Sonora is superintendent.—The mill on the Experimental Gulch mine will soon be completed.—Hawsett & Anderson of Columbia are working the dump of the Over mine on Bald mountain.

A deposit of talc 4500 feet in length and over 100 feet in width has been discovered by H. Shaw in Hunter canyon, southeast of Tuolumne.

## COLORADO.

### Clear Creek County.

A 300 H. P. Rand Imperial, type 10, air compressor has been set up by the Dives-Pelican Seven-Thirty M. Co. at Silver Plume. It will have a capacity of 1700 cubic feet. A mill is under construction. Manager J. H. Eaton is making arrangements for boilers and other machinery for the new mill. O. O. McReynolds is engineer.

### Fremont County.

The United Oil Co., at Florence, has struck oil on the Walters ranch at 2900 feet. The well has been equipped with pumping apparatus producing 200 barrels a day.

The Junction Oil Co. has completed its derrick and is drilling.—The Florence field is producing 3500 barrels paraffine base crude oil that will refine 60% illuminating.

### Gilpin County.

A 2000-foot hoisting plant is being put up by the Pewabic Con. G. M. Co. at Central City. J. C. Feschhut is manager.—The McClelland tunnel will underlay the mine 1500 feet, obviating trouble with water.

The Hall mine in Russell district, operated by the Electric Spark G. M. Co., is shipping milling ores to Black Hawk. G. N. Rogers is manager.

### Gunnison County.

I. J. Johnson, manager of the East Gold Hill M. & M. Co., operating near Quartz station, has started a 1200-foot tunnel to develop the Gold Cup from Middle Willow gulch. He is putting machinery on the Sylvan Dell.

The Continental Fuel Co. at Mt. Carbon has a payroll of 120. Jos. Watson is superintendent at the Alpine mine, where the main shaft is down 150 feet, main entry 1800 feet and two cross entries 1200 to 2000 feet. The coal vein is 7½ feet thick. A day shift produces 500 tons of coal. This mine is equipped with an electric hoist, two Sullivan coal cutting machines, a Jeffrey cutter, and an Ottumwa box car loader.

### Hinsdale County.

The Hidden Treasure mine and mill, operated by L. Kafka of Lake City, will increase the force to eighty men.—The Hanna G. M. & M. Co., operating the Moro mines at Capital City, will resume operations about January 1. The mill will be overhauled.

### San Juan County.

The Keystone, Del Mino and Boycotter groups in Prospect gulch, near Silverton, belonging to Frank Wetzel, have been sold to the Galt Boy Co. for \$20,000.

The 4000-foot aerial tramway from the Old Hundred property down to Howardsville will be completed in January, 1905. The angle of the line is 45°, rendering the construction slow, the towers having to be ironed and bolted to the rocky sides of the mountain.

### San Miguel County.

Wagner Bros., working the Seventy-six claim of the Smuggler-Union at Telluride, and the dumps of the Sheridan, have found the Crane automatic ore dresser and sorting apparatus to be satisfactory. The ore is first screened and washed, the fine ore and screenings being run into a bin or conveyor belt, and the larger lumps discharged automatically into a large drum, inside of which a spiral screw agitates the mass, worming the ore through a hot water bath, melting any snow or ice and cleansing the rock. From this drum the slimes settle into a tank below and the coarse ore falls upon the picking belt. As the ore on this belt is washed clean of dirt and slimes, it is rapidly sorted by hand with greater efficiency than when covered with dirt, which hides the mineral. One machine handles 250 tons per day, using two barrels of water to 100 tons.

They will add twenty more stamps to the Cimarron mill in the spring.

### Sammit County.

The Providence-Colorado E. & D. Co., under management of H. S. Whitehead, at Breckenridge, will probably put in a concentration milling plant.—M. G. Evans, manager of the French Creek G. M. Co., is figuring to drive a crosscut tunnel 1000 feet into Mount Baldy near Breckenridge.

### Teller County.

The operators on the Jack G. of the Doctor-Jack Pot at Cripple Creek will put in machinery to increase ore tonnage.

## IDAHO.

### Boise County.

At the Gold Eagle M. & M. Co., at Neal, a Chilean mill, a 1000-foot steam hoist, an 80 H. P. boiler, five Willey tables and amalgamating plates are being put up. A cyanide plant will be put in by the Gold Eagle M. & D. Co.

### Idaho County.

The Bradley Engineering Co. have sold the 400-ton cyanide plant of the Republic

Power & Cyaniding Co. to W. Hogan, president of the Crooked River M. & M. Co. of Orogrande, Elk City district.

The Gold Coin M. Co., working at Black Lake, near Grangeville, has a 100-ton cyanide plant in operation and has rebuilt the mill burned last year. — The Iron Springs Co., in the Rapid River district, near Grangeville, will probably put in a 100-ton cyanide plant next season. C. A. Sutherland has succeeded C. F. Macey as superintendent.

The 7200-foot aerial tramway, connecting the Sunnyside mine with its 40-stamp mill on Marble creek, at Belleco, is in operation.

#### Shoshone County.

(Special Correspondence).—The output of the Cour d'Alene will be about \$13,000,000 for 1904.—The production of the larger mining companies lately has been restricted because of water shortage. The tailings accumulations have diverted the streams so as to damage property below.—The Monarch M. Co., near Murray, is putting in a 50-ton concentrator for lead-silver ore, and will ship to the smelters by January 1. E. P. Spaulding is manager.—The Bear Top M. Co. is moving the Black Bear mill on Canyon creek to their mine, 5 miles east of Murray. The manager is C. C. Groesbeck.—The Tamarack & Chesapeake M. Co. at Custer Peak has found cerussite and galena at 500-foot level. F. E. Culbertson, formerly manager for the Tiger-Poorman mine at Burke, is interested.

The Iron Spar M. Co. has closed down till spring. The ore is chalcopryite in quartz gangue in a bedded greenish slate, probably Cambrian. J. J. Curran is manager.

Wallace, Dec. 19.

In conjunction with the Big Divide M. Co., the Headlight company is installing a compressor to drive a joint tunnel, giving a depth of 1800 feet upon the Headlight and 1400 feet upon the Big Divide. A. McCullom at Wallace is interested.

#### NEVADA.

##### Humboldt County.

The Glasgow & Western M. Co. will extend the narrow-gauge railway, between Golconda and Adelaide, 50 miles to Kennedy.

##### Lincoln County.

M. McKee has charge of the New Era mill at Searchlight. J. A. Jester is superintendent.

#### NEW MEXICO.

##### Eddy County.

On the west slope of the Guadalupe mountains, 20 miles northwest of Carlsbad, T. F. Teegarden is prospecting for oil. He has one standard rig at work, another on the sidetrack at Carlsbad, and four more in transit, and claims to have a high-grade oil with paraffine base. C. F. Ricksecker of Roswell is interested.

##### Lincoln County.

The five Huntington mills on the Vera Cruz mine, south of White Oaks, are crushing.

##### Rio Arriba County.

It is reported that the deposits of mica 15 miles from Tres Piedras, in the Cribbenville district, are to be operated. The district is divided into six groups known as the Sandoval, Lincoln, Petaca, Webster, Cribbenville and Superior groups. The mica is found in a vein of feldspar and quartz in schist. The Sandoval, Cribbenville and Petaca are owned by M. Leichte and R. W. Tandy of Tres Piedras, the Webster by T. J. Stout of Edinburg, Indiana, and the Lincoln by J. C. Lincoln of Cleveland, Ohio. These have all been developed, but are awaiting better prices from an independent market.

L. E. Shale of Tres Piedras is developing the Owl claim, Bromide district.

The Pennsylvania M. & M. Co., operating 10 miles west of Tres Piedras in Bromide district, expects to place machinery on the Elliott consisting of an 80 H. P. boiler and a 1000-foot hoist. F. A. Elliott is working the property.

##### Socorro County.

The zinc mines of the Magdalena and Kelly districts are shipping high-grade ore. The Tri-Bullion M. & S. Co. of Chicago, Ill., owns the Kelly. The Little Juanita, owned by E. W. Eaton, H. M. Dougherty of Socorro, is being worked under supervision of C. T. Brown. The Graphic group is owned by the Williams-Sherwin Paint Co. of Cleveland, O. The town of Magdalena is the shipping and business point of the district.

#### OREGON.

##### Douglas County.

The Umpqua Coal Co. is opening up two coal veins at Elkton and propose a gravity tram line 1½ mile from the mine to the Umpqua river. R. W. Fenn is secretary.

##### Grant County.

The Mountain View mine, belonging to J. Chambers of John Day, is being worked

by O. Peone, E. Chambers and L. George of John Day.

The Red Boy mine near Granite is being developed by Superintendent W. H. Reeves.

#### Josephine County.

Dr. Ray of Gold Ray plans to put a dredger on the McDonough placer, near Tolo, which T. Kahler is working. Pumps and pipe line will be needed to force water 2 miles. Electric power will be used.

Power drills are to be put in at the Blue Ledge copper mine, on the divide between Elliott and Joe creeks. Surveys have been made for an electric transmission line and for a 27-mile railroad from Joes Bar to Jacksonville. C. W. Gedder is superintendent.

At Waldo the Waldo S. & M. Co. is prospecting its copper claims with a power drill under the management of M. Draper.—C. W. Thompson and Wm. Breevoort of Greenback will place a 10-stamp mill on the Scenic mine, on Coyote divide. The wagon road from Wolf creek to Greenback has been completed over the Coyote Divide.—The Golden Drift M. Co. at Dry Diggings has put in four turbines, generating 3000 H. P., and will operate four giants on its placers, water being carried 1 mile by a new pipe line from its power dam on Rogue river.—F. W. Lillegram is managing the Eagle mine, near Gold Hill.—A. C. Hofer, manager of the Mount Pitt Hydraulic & Quartz M. Co., operating at Jump-Off-Joe, near Grants Pass, intends to put in a 10-stamp mill.

#### SOUTH DAKOTA.

##### Lawrence County.

The Puritan G. M. & M. Co., C. F. Hutchins, Jr., of Deadwood, secretary, has authorized the manager to add ten stamps to the mill, put in slime tables and other machinery.—The Hidden Treasure shaft is 160 feet deep. P. T. Baird is superintendent at the mine, below Texana station.—The cyanide mill of the Gilt Edge-Maid G. M. Co. near Deadwood is operating at full capacity. Work is supervised by J. Terry.

The Queen of the Hills Co. has appropriated \$40,000 to erect a 10-stamp mill, combining amalgamation and cyanidation, crushing in water. E. P. Farnham of Deadwood is superintendent. A. Varney of Deadwood will be the millwright.

#### UTAH.

##### Salt Lake County.

The Deseret Evening News states that Bingham Canyon is annually handling 1,000,000 tons of ore in its mills and smelters and gives the following as the daily output in tons: Utah Consolidated 750, Utah Copper 700, Bingham Consolidated 400, United States 400, Boston Consolidated 250, Yampa 200, Ohio Copper 125, Bingham-New Haven 60, Utah-Apex 50, other producers 150, with a total of 3085.—The Utah Copper Co. will probably construct an addition to its present \$200,000 plant to handle 3000 tons per day. The Ohio Copper Co. will build a 500-ton plant, an increase of 375 tons a day. The Yampa is preparing to double its output.

The Wahsatch M. Co., in Wahsatch canyon, on the west side of the Wahsatch range, 4 miles south of Bingham, has done 5500 feet of development and proposes to sink a shaft. The ores are low-grade galena, containing gold and silver. The equipment is a 150-ton concentrator, an aerial tramway connecting the mine with the mill, and a blower plant.

##### Summit County.

M. Ferry of Park City is fitting the Ferry-Hancock property with a 500 cubic foot straight line compressor, one 100 H. P. high pressure steam boiler, one 100 H. P. steam heater and two air receivers, also a double-action 10x14 geared hoisting engine, including cable.

#### WASHINGTON.

##### Ferry County.

R. L. Boyd, president of the Keller & Indiana Con. S. Co., has purchased a 150-ton smelter, a sampling plant, a turbine water wheel and an electric plant for mines at Keller.

##### Lincoln County.

The trial run of the furnaces of the Turk smelter in Cedar canyon, near Davenport, made by Superintendent W. B. Van Osdell, was satisfactory. A few minor changes will be made in the arrangement of the machinery. The feed doors of the furnaces will be altered and it is expected to blow the furnaces for a permanent run the first of the year.

##### Okanogan County.

The International M. & S. Co. has been organized at Cheshaw by W. C. Peay, J. P. Blaine and H. Thompson to work three claims on Copper mountain, near the international boundary. The claims were purchased outright, and work will be started immediately with a large force of men.

#### Snohomish County.

The mining engineering class at the Washington University will spend their Christmas vacation at the copper mines near Index and gain practical knowledge of mining by actually operating the property, as it is idle.

#### Stevens County.

D. J. Zent and Superintendent J. Keough of the Frisco-Standard mine, 8 miles east of Boundary, have the road completed and are shipping concentrates to the Everett smelter.

## FOREIGN.

### BRITISH COLUMBIA.

#### Boundary District.

The November output in tons was: Granby mines, Phoenix camp, 45,089; Mother Lode, Deadwood camp, 15,376; Brooklyn-Stemwinder, Phoenix camp, 7650; Emma, Summit camp, 2650; Athelstan-Jackpot, Wellington camp, 720; Senator, Summit camp, 415; Mountain Rose, Summit camp, 132; Oro Denoro, Summit camp, 99; miscellaneous, 175, or a total of 72,306 tons. Most of this ore was treated at Boundary Falls, Greenwood or Grand Forks.

Manager Kellor of the British Columbia C. Co., Ltd., operating the Mother Lode mine and smelter at Deadwood and Greenwood, will put in new furnaces to double the output of the smelter. For three weeks the average number of men employed at the Mother Lode mine, including miners, muckers, engineers, carpenters, bosses and all others, was sixty-four; the output shipped per week averaged 3253 tons, giving an average per week per man of fifty-one tons of ore.

M. F. Madden of Chicago, president of the Providence M. Co., has bought the Gold Finch, at Greenwood.

There are three smelters running and ten furnaces in blast, including the second furnace of the Boundary Falls smelter. The Granby mines are shipping the ore needed for six furnaces at Grand Forks—about 1800 tons daily. The company will add to its furnace capacity next year, it being the intention to spend \$125,000 on two furnaces and to increase the daily output to 2700 tons. The British Columbia Copper Co., operating the Mother Lode smelter, will also add two more smelters at once, thus doubling the capacity of its plant. The Great Northern Railway expects to have its trains running into Phoenix by Jan. 1.

#### Cassiar District.

J. Haskins of the Rosella Hydraulic M. Co. announces that it is proposed to build a railway, to be known as the British Columbia Northern & Mackenzie Valley line, forming a junction with the Grand Trunk Pacific near Dease river. The ocean port will be on Nasoga gulf and the line will be carried to Dawson. The trunk line will have a length of 1500 miles, and twin branches of the same length will give 3000 miles in all. One of the chief objects of the line is to open the rich gold-bearing gravels district of Cassiar.

#### Roseland District.

Because of increase in price of copper and silver the Spitzee mine at Trail creek was started this week, expecting to output 1000 tons per month from the ore reserves in the mine. During 1903, 483 tons were shipped, employing fifteen men; 120 feet of shafting, 160 feet of driving, 80 feet of raising and 130 feet of crosscutting were done. Additions to plant amounted to \$8000.

The tonnage of ore shipped from and crushed at the Roseland mines for the week ending December 17th and for the year to date was as follows:

Mine.	Week.	Year.
Le Roi	2,727	138,841
Center Star	1,440	70,549
Center Star (milled)	440	14,460
War Eagle	1,260	54,826
War Eagle (milled)	350	3,960
Le Roi No. 2	350	23,231
Le Roi No. 2 (Elmore)	350	10,900
Spitzee	350	900
Kootenay	350	5,084
Jumbo	132	12,679
CHF	30	1,340
Velvet-Portland (milled)	30	2,635
I. X. L.	30	986
White Bear (milled)	30	2,000
White Bear	135	135
Iron Mask	30	70
Roseland View	30	80
Totals	6,404	332,976

J. J. Warren, managing director of the White Bear at Trail, has been running the mine and mill since Nov. 23d. Two of the four units of the oil plant are in operation, and the concentrates being turned out carry 8% copper, giving five tons per day. Superintendent Demuth has resumed charge.

At the next session of the British Columbia Legislature the Kettle Valley Railway Co. will apply for a subsidy to build a railway from Grand Forks up the North Fork through Franklin camp to Fire valley, along Fire Valley river through the Monashee mountains to Vernon, following the Government wagon road. From Ver-

non it will connect with the Sicamous branch and will be continued to the Nicola coal fields.

M. R. Galusba, the manager of the Jumbo, reports striking a good ore body in 450 feet in the intermediate level. R. H. Clarke of Spokane, Wash., is making a survey for the aerial tramway to connect the Jumbo mine with the Red Mountain Railway for the Bradley Engineering Works.—Increased ore shipments from Roseland caused an additional gold-copper furnace to be blown in at the Trail smelter.

#### Slocan District.

P. J. Hickey, Jr., superintendent of the Ivanhoe mine, owned by the Minnesota Silver Co. at Sandon, B. C., says that the Ivanhoe is working 90 men. The mill is actively at work and is producing lead concentrates, which go to Trail, B. C., and zinc concentrates, which are sold to Batchelder Bros. of Spokane. They have a contract for 500 tons, which they are shipping to Europe. The zinc concentrates run about 45% in the base metal and 30 ounces in silver. The total output of lead and zinc for the year will run about 2000 tons. The feed is low grade and the concentration is about 20 into 1. The Payne mine is being worked solely by lessees. Manager M. Gintzberger of the Monitor mine, near Three Forks, is interested in the custom zinc mill, with magnetic separator and jigs, which is being built at Rosebery. The buildings for it are up.

#### West Kootenay District.

B. White of Nelson has bonded the Morning group at Poplar.—Minneapolis men are driving a 1½ mile tunnel to tap the Silver Cup and Nettie L. leads as found in the Union Jack. — The Horse-shoe, near Trout Lake City, is being operated.—The Triune, in the upper Lardeau, is being operated by the Metropolitan M. Co. under management of R. H. Batty of Ferguson.—D. Morgan is working the Surprise on the North Fork of the Lardeau with six men.

#### MEXICO.

##### Guerrero.

E. D. Elson, manager of La Dihca M. & S. Co. of La Dicha, says their 200-ton smelting plant will be operating by Feb. 1st. Their mines are 60 miles from Acapulco, on the Pacific.

##### Oaxaca.

The Ures Con. M. Co. at Santa Fe has contracted with the Vega M. Co., operating the San Jose mine, to treat the ores from that mine, while the Ures Con. Co. is sinking its shaft from 340 feet to 450 feet and drifting to develop the ore body. The reason for this contract is that men will not work in the bottom of the shaft or slope with the hoist running, on account of the danger of pieces of ore continually falling from the cars. The contract made with the Vega company is for three months, on a basis of \$10 each ton of ore milled.

##### Sonora.

The Lucky Tiger Combination G. M. Co. mines are in the Tiera mountains, 32 miles east of Yzable station, on the Nacozari railroad, the station being 40 miles south of Douglas, Ariz. The two principal veins are opened through adits and crosscuts. It is stated that shipments of selected lots at regular intervals for the first six months of this year averaged \$200 per ton in silver and gold. A recent shipment of 500 tons ran \$200 per ton. The milling ore will, it is said, run \$35 per ton. These ores consist of iron-lead sulphide, carrying gold and silver. A mill is under construction, intended mainly for concentration, although amalgamating plates will be put in. The Lucky Tiger is controlled by Bisbee and Douglas, Ariz., and Kansas City, Mo., men, with B. F. Graham of Douglas manager.

O. Riechenbach, president of the Tarasca M. Co., operating near Torres, reports the mines producing steadily and development progressing. Ore shipments are regularly made to San Francisco by water, and returns are satisfactory.

##### Vera Cruz.

P. N. Furber, president of the Oil Fields of Mexico Co., says that the Mexican National intends to build a branch line to connect with the company's oil fields at Cugua, Veracruz. Well No. 1, having a depth of 1269 feet, is now overflowing naturally. The oil is of good quality and comes from the well at 65° F. Well No. 2 is down 500 feet, and the oil is steadily increasing. Well No. 3 has been located, and the erection of the derrick is being pushed as quickly as possible. Earthen tanks are being constructed for the storage of oil, 250,000 barrels capacity having to be provided. A tram line is being constructed from the property to the Tecoluta river, a distance of fifteen kilometers. All machinery is brought to the mouth of the river on the Gulf coast, and barged up to the point, where the tram line will have its terminal.

## NORWAY.

The production of copper in Norway during 1903 amounted to 1340 metric tons, not including the copper in ores exported. At the Sulitjelma mine 1300 men are employed, the output amounting to 60,434 tons. The smelter produced 640 tons of Bessemer copper. The company has installed a new concentrator at the Alten mine. The Roros mine produced 740 tons of copper and 13,808 tons of pyrite. The mines of Kjolli, near Roros, are being worked by an English company.

## Personal.

THE address of C. M. Neyman is wanted.

W. L. COBB is examining mines west of Shingle, Cal.

C. ANDERSON is manager of the Keystone M. Co. at Sandy, Nev.

W. T. BEANE is manager of the Golden Empire M. Co. at Lead, S. D.

J. S. FREE is superintendent of the E. & F. Co. mines at Pioche, Nev.

F. E. WILSON is manager at the Sinker Tunnel, near Silver City, Idaho.

E. B. EASTWOOD is superintendent of the Hathaway mine, Ophir, Cal.

B. F. RICHMOND is superintendent at the Jupiter mine, at Nespillem, Wash.

D. M. SMITH is superintendent of the Golden Eagle mine, New Central, Nev.

P. J. MCENRY is general manager of Beamer M. Co., of Quartzsite, Arizona.

CLYDE JACKSON is now superintendent of the Ida Mitchell mine, Placerville, Cal.

C. W. PLATT is superintendent of the Ryland mine, 9 miles east of Wickenburg, Arizona.

J. QUALEY is superintendent of the Porcionera mine at Santa Eulalia, Chihuahua, Mexico.

R. J. LAYNG is superintendent of the Zada mine, 14 miles from Caliente, Kern county, Cal.

JOHN BEATHAM is general manager of the Lappin mine at Deadwood, Trinity county, Cal.

H. WM. STEVENS has returned from an Eastern visit to Prescott, Ariz., 1-2 Lawlor Bldg.

H. C. ROLFE is superintendent of the Santa Margarita M. Co., near Soyopa, Sonora, Mexico.

MANAGER ROBINS, of the Last Chance mine at Coloma, Cal., is at Gold Hill, Or., for the holidays.

P. L. YOUNG, M. E., has returned to California from Mexico, where he had been investigating mining properties.

A. E. STAHLER is general manager and Frederick Aude superintendent of the Banker M. & T. Co., Winfield, Colo.

A. HOWLAND is superintendent of the Cook & Howland placer mine on Jump-off Joe, near Grants Pass, Or.

C. S. VERRILL is superintendent of the Mountain Boy mine, at Park City, near Republic, Ferry county, Wash.

W. B. CLOETE, managing director of the Grand Central M. Co., is at La Colomada, Sonora, Mexico, from London, England.

R. L. KEELY has been appointed professor of mechanical engineering in the University of South Dakota, Vermillion, S. D.

C. R. TROXEL of Chihuahua, Mexico, is at Ojinaga, in the eastern part of Chihuahua, investigating niter and oil possibilities.

L. HUNDESHAGEN, a mining engineer of Loeboe Sikaping, Padang, Sumatra, is investigating mining conditions in California.

A. S. ROSECRANS, superintendent of the Standard mines at Metcalf, 6 miles from Clifton, Ariz., is visiting Guadalajara, Mex.

ERNEST JOHNSTON has been appointed receiver of the American Con. C. Co., owning mines in the Lordsburg district, Grant county, N. M.

A. MOOREHEAD has resigned as superintendent of the Nevada Chief mine, of Rockland, and Superintendent Anderson, his successor, is at the mine.

H. R. KLAUSER AND H. GERBER of Toledo, Ohio, have been visiting the smelter of the Yaqui River S. & R. Co. at Toledo, Sahuaripa district, Mexico.

C. D. GALVIN is in Redding, Cal., as consulting engineer for a Boston syndi-

cate exploring on the Sugar Loaf group, north of Iron Mountain.

C. P. B. BARTLETT, manager of the Fearnot M. & M. Co., Victorville, Cal., is in Chicago on business connected with his company. They expect to put in a 100-ton concentrator plant.

JESSE SCOBEE, formerly manager for the Pride of the West M. Co., at Washington Camp, Arizona, is at Chiplona, Sonora, Mexico, superintending the erection of reverberatory furnace for the Cieneguita Copper Co.

M. D. STACKPOLE, M. E., of The Gold & Silver Extraction Co. of America, Ltd., has returned to Denver, Colo., from a professional trip to the States of Chihuahua and San Luis Potosi, Mexico, and leaves shortly to examine properties in Montana and Oregon.

C. W. WHITNEY has resigned his position with the McGraw Publishing Co., New York, and is now with the Abner Doble Co., San Francisco, Cal., engineers and manufacturers of tangential water wheels and needle regulating nozzles, in charge of their publicity department.

EDMUND B. KIRBY has resigned the management of the War Eagle, Center Star and Roseland Power Companies, Roseland, B. C., to attend to private affairs and business elsewhere. Mr. Kirby expects to leave Roseland Jan. 15. He went to Roseland in August, 1899, as the successor of J. B. Hastings in the general management of the Center Star and War Eagle mines, and accomplished much for those interests, conceiving and successfully introducing many economies and improvements, especially in the cost of mining.

## Commercial Paragraphs.

THE Stevens-Adams Manufacturing Co., of Aurora, Ill., are doubling the capacity of their machine shop, to take care of their increased business. F. G. Adams, of this company, has just returned from a trip covering England and Scotland.

THE city of Alameda, Cal., awarded a contract for furnishing a new engine for a municipal electric plant to the Charles C. Moore Co., 63 First street, San Francisco, Cal., for \$7719. The same establishment has a contract for providing the plant with a generator, to cost \$4888.

THE United States Consul in France reports that French quarries desire information as to cost and utility of American stone breakers, particularly those producing a minimum of dust. Manufacturers interested may address Thomas Sankey, 51 rue Hippolyte de Tocqueville, Cherbourg, France.

THE Union Gas Engine Company of San Francisco, Cal., is shipping to the Pfau Gold Mining & Reduction Co., Arizona, two double-cylinder, vertical, stationary gas engines, fitted to run on low-grade distillates or crude oil; one engine is 100 H. P. and the other 30 H. P. They are intended to drive air compressors, pumps and other machinery.

THE World's Fair exhibit of the Weber Gas & Gasoline Engine Co., Kansas City, has been sold to the E. Hertlein Co., New York. The plant consists of 150 H. P. Weber engine and 150 H. P. Weber suction gas producer, direct connected to a 75 K. western electric generator. This, they state, is the first producer gas power plant to be located in New York.

O. A. STRANAHAN has been appointed manager of the power department of the Allis-Chalmers Co. and will have charge of the sales of reciprocating engines, gas engines and steam turbines. Mr. Stranahan has been in charge of the engine business of the British Westinghouse Electric & Manufacturing Co. and has given much attention to gas engine developments, particularly with regard to producer and blast furnace gas—developments which are farther advanced in Europe than in the United States.

W. ORR is now general manager of the Gold & Silver Extraction Co. of America, Ltd. This company introduced the MacArthur-Forrest cyanide process in the United States, and has exerted a great influence in the improvement of the methods of ore treatment throughout the West. Under Mr. Orr's management the company will make a specialty of the examination of mines, and the determining of methods of treatment, retaining for this purpose a staff of specially qualified engineers.

COLORADO IRON WORKS CO., of Denver, Colo., report the following orders: One 42x120 copper matting furnace and complete sampling plant for the National Metallurgical Co., Mexico; one 200-ton silver-lead furnace for Laurium, Greece;

two C. I. W. impact screens for the Braden Copper Co., in Chile, S. A.; two double three compartment jigs for the El Cobre mines in Cuba; sampling machinery for the Con. Mercur Co., in Utah; two C. I. W. impact screens for the Puzzler M. & L. Co., also in Colorado; one C. I. W. impact screen for the San Juan R. Co., also in Colorado.

A MERGER of the S. S. Machinery Co., the Machinery Supply & Implement Co., the Thomas Crow Machinery Co. and the Colorado Iron Metal Yards Co. has been made at Denver, Colo. The new concern, which is capitalized at \$150,000, will be known as the Second Hand Machinery Co. They have leased the premises at 1626 Blake street, and the stocks of the different concerns entering into the merger will be moved to that building. The company will buy and sell mining machinery and supplies and will keep on hand stock for immediate shipment. Some of the companies in this combination have been in the machinery business in Denver for twenty-five years. The officers are: H. Stewart, president and treasurer; Thomas Crow, vice-president and superintendent; Morris Block, secretary; D. C. McNerny, general manager. The new company will start business January 1, 1905.

A MEMORABLE incident of the morning following the close of the St. Louis Exposition was the formal shut-down and inspection of the 600 H. P. Westinghouse steam turbine generating unit in the palace of machinery after a continuous run of 3962 hours. The machine was started on its long run at 9:20 A. M., June 20, and was stopped at 11:32 o'clock A. M., December 2. During the five and a half months that the unit was in operation, it supplied current for light and power throughout the Westinghouse exhibits in the palaces of machinery, electricity and transportation. C. F. Foster, chief operating engineer of the exposition; H. M. Holman, supervising engineer of the Government exposition gas engines tests, formerly president of the St. Louis board of public works, and a number of Westinghouse representatives, including W. Franklin of Detroit, C. C. Chappelle of Chicago, and W. K. Dunlap, managing director of the Westinghouse exhibits, were present when the engine was stopped. It was found to be in excellent condition, giving little sign of wear, the bearings still retaining the tool marks as they had come from the shops. There have been at least two instances on record in America in which piston engines have been run continuously for about the same length of time as that of the record run of the Westinghouse turbine. A remarkable feature of the turbine run was the maintenance under load of a speed of 3600 revolutions a minute for such a long period. From 8:30 o'clock in the morning to 10:30 o'clock in the evening, the load carried throughout the exposition varied from 25% under load to 25% over load. The total number of revolutions was 855,792,000.

## Books Received.

"The Fourth Annual Report of the Inspector of Coal Mines of the State of Montana," by H. W. Welsh, gives a description of the present condition of coal mining in Montana.

Under title of "Mineral Resources of the United States for 1903," the United States Geological Survey has issued "The Production of Coal," "Statistics of the American Iron Trade" and the "Production of Gas, Coke, Tar and Ammonia at Gas Works and in Retort Coke Ovens."

Bulletin No. 9 of the University of Texas Mineral Survey is a "Report of a Reconnaissance in Trans-Pecos Texas," by G. B. Richardson. It gives a detailed description of the geology and mineral resources of the region, with special reference to the occurrence of underground water.

The Bisbee Folio, No. 112, is the latest addition to the geologic atlas of the United States published by the United States Geological Survey. It contains a descriptive text, topographic maps, areal geology maps, economic geology maps, structure section sheets, fault diagram, columnar section sheet and illustration sheets. Price is 25 cents.

## Obituary.

JACKSON MCCracken died December 17 near Wright's Station, Cal., at the age of 82 years. He was the locator of the silver mines bearing his name in Mohave county, Arizona, and was prominent in mining and politics.

## Latest Market Reports.

SAN FRANCISCO, December 23, 1904.

## METALS.

SILVER.—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61½c, refined (1000 fine); San Francisco, 61½c; Mexican dollars, 52c San Francisco, 48½c New York.

COPPER.—New York: Standard, \$14.87½; Lake, 1 to 3 casks, \$14.87½@15.12½; Electrolytic, 1 to 3 casks, \$15.12½; Casting, 1 to 3 casks, \$14.75; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: £66 spot per ton.

Copper stands steadily at, or just above, the 15-cent mark, despite the rapid and large fluctuations in leading copper stocks. Further comment on the causes which have led to the present anomalous situation seems unnecessary, in view of the widespread publicity given the matter in the daily press of the country. Copper is in good demand, fully up to the production, and the price of the metal will in all likelihood remain at about the present figures for a time.

Following are the figures of the German consumption of foreign copper for the months January-October, 1904, compared with the same period of time for 1903 and 1902:

	1904.	1903.	1902.
	Tons.	Tons.	Tons.
Imports.....	65,797	70,958	68,815
Exports.....	7,399	8,477	7,516

Consumption ..... 88,488 62,481 61,299

Out of the above, 80,693 tons were imported from the United States.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, \$4.85. London: £12 10s ½ long ton.

SPELTER.—New York, \$5.87½; St. Louis, \$5.00; London, £24 12s 6d ½ ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

TIN.—New York, pig, \$29.00 @ 29.25; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½c @ 35c. London, £132 5s spot.

PLATINUM.—San Francisco, crude, \$18.50 ½ oz.; New York, ingot, \$19.00 ½ Troy oz. Platinum ware, 75 @ 82c ½ gram.

QUICKSILVER.—New York, \$40.00 @ 41.00, large lots; London, £7 15s San Francisco, local, \$39.00 ½ flask of 75 lbs.; Denver, \$45.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100 lb. lots, 16.25c.

ZINC.—Metallic, chemically pure, ½ lb., 50c; dust, ½ lb., 10c; sulphate, ½ lb., .04c.

NICKEL.—New York, 40@47c ½ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

## STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$16.35 @16.60; gray forge, \$15.85; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c ½ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½ c ½ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½ c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city ½ bbl.

CEMENT.—Imported, \$2.15@2.65 ½ bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 ½ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

## GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*,

## New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING DECEMBER 13, 1904.

777,365.—RAIL JOINT SHOE—J. B. Anderson, Portland, Or.  
777,060.—RAILWAY SIGNAL—R. Avery, Sausalito, Cal.  
777,591.—CRUSHING MILL—M. P. Boss, S. F.  
777,193.—DOOR OPENER—W. A. Fagan, S. F.  
777,411.—PUTTING KNIFE—J. O. Hall, Phoenix, Ariz.  
777,305.—PUZZLE—C. Henry, S. F.  
777,514.—HOOF PAD—Jennings & Tuttle, San Mateo, Cal.  
777,346.—CHALK HOLDER—Kraus & Links, S. F.  
777,381.—KINETOSCOPE—W. W. Ladd, Seattle, Wash.  
777,590.—STEPPER FOR AUTOS—H. M. Landes, Sacramento, Cal.  
777,522.—CHALK HOLDER—Links & Kraus, S. F.  
777,427.—BAG TURNER—S. T. Lockwood, Portland, Or.  
777,262.—TYPEWRITER—W. A. Lyman, S. F.  
777,530.—ELEVATOR—T. J. McCarthy, S. F.  
777,389.—WRENCH—J. N. Noyer, Gould City, Wash.  
777,532.—DRAWING APPARATUS—V. Pfaff, S. F.  
777,309.—DERRICK—W. G. Read, Davisville, Cal.  
777,392.—TIME CHECK—G. Stockton, S. F.  
777,507.—PRUNING SHEARS—Taylor & Boeck, Medford, Or.  
777,318.—POWER SET WORKS—Tullock & Barnes, Seattle, Wash.  
777,329.—POWER TRANSMITTING—C. C. Vaughn, S. F.  
777,269.—TOOL SHARPENER—F. Watkins, Burton, Wash.  
777,357.—GARMENT HANGER—E. M. Webster, Los Angeles, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINED CHALK HOLDER AND SHARPENER.—No. 777,346. Dec. 13, 1904. B. Kraus and A. Links, San Francisco, Cal. The object of this invention is to provide a simple, handy and practical device which will combine a chalk holder and a means for sharpening the chalk and retaining the shavings or chalk powder, so that the latter will not get upon the hands or be scattered over the cloth and table.

RAILWAY SIGNALING DEVICE.—No. 777,060. Dec. 13, 1904. R. Avery of Sausalito, Cal. Giacinto Corsini Avery, executrix of R. Avery, deceased. This invention relates to an apparatus which is especially designed for signaling the presence of trains upon the line of track over which other trains are liable to approach and to give warning to the approaching train of such other train in time to prevent collisions. It consists of a series of torpedoes or equivalent devices and means by which they are temporarily placed above the rails in line of the approaching train, so that the officials of such train will be given an audible warning of the presence of another train upon the track in front.

STEPPER ATTACHMENT FOR AUTOMOBILES.—No. 777,260. Dec. 13, 1904. H. M. Landes, Sacramento, Cal. This invention relates to improvements in auxiliary propeller devices for motor vehicles. Its object is to provide a suitable adjunct to the ordinary engine of self-propelling vehicles to enable the vehicle to get over a particularly heavy or hilly piece of road that otherwise it would not be able to traverse. It consists in various combinations of mechanism and parts adapted to bring about the desired result.

PORTABLE DERRICK.—No. 777,307. Dec. 13, 1904. W. G. Read, Davisville, Cal. The object of this invention is to provide a rigid, compact, economically constructed device, which can be compactly crated in a knockdown form for shipment and can be quickly set up and made ready for use, and when thus set up can be easily moved from place to place contiguous to the point of use. It consists, in part, of a compound truss support for derrick masts and the like, comprising a step for the bottom of the mast, a guide sleeve for the mast located in line above the step, a base, converging timbers extending from the base and supporting the sleeve, tension rods between the sleeve and the step, and other rods between the step and base frame.

CHALK HOLDER.—No. 777,346. Dec. 13, 1904. A. Links and B. Kraus, San Francisco, Cal. The object of this invention is to provide a simple, cheap and practical holder and protector for the chalk or marking substance, such as is used by tailors and the like. It consists in the combination with a chalk holder having jaws engaging the opposite sides of the chalk, of a removable cap or protector adapted to enclose the protruding end of the chalk and embrace the jaws; and other details of construction by which a useful device is obtained.

**STOP THAT SPRAY** and dripping of water and oil from the exhaust pipe that rots rusts and does all manner of damage to the roofs and walls of your plant, by equipping your exhaust pipes with **THE BURT EXHAUST HEAD**.

It will save its cost many times over in repairs. "We are pleased to report the three Burt Exhaust Heads at our plant are giving entire satisfaction."—The Western Automatic Machine Screw Co., Elyria, Ohio.

The Burt Exhaust Head is sent anywhere on approval.

**THE BURT MFG. CO.**  
Largest Manufacturers in the World.  
221 Main St., Akron, Ohio, U. S. A.  
Supplied also by Engine Builders, Dealers and Power Contractors.

## Trade Treatises.

Catalogue No. 30 from the Jeffrey Mfg. Co., Columbus, Ohio, treats more particularly of their pulverizing machinery of various types and uses, together with other labor-saving machinery.

The 100-page booklet of the Smooth-On Manufacturing Co., Jersey City, N. J., shows in illustrated detail how Smooth-On repairs are made. The booklet will be sent on request to any address.

Bulletin No. 351 of the National Electric Co., Milwaukee, Wis., is devoted to motor-driven air compressors. S. I. Wailes, 519 Mission street, San Francisco, Cal., is their Pacific coast representative.

Crawford & McCrimmon Co., Brazil, Ind., manufacturers of hoisting and hauling engines, ventilating fans and acid proof pumps, send an attractive catalogue giving full details of their line. A unique device attached to their engine is the safety stop, an automatic device which immediately stops the engine when the least overwinding occurs. This is said to be the only engine on which such a device occurs. The catalogue is worth the perusal of any mine superintendent or manager, and will be sent upon request.

## ASSESSMENT NOTICES.

**EUREKA CONSOLIDATED DRIFT MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on Friday, the 16th day of December, 1904, an assessment (No. 41) of one-half (1/2) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 3, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of January, 1905, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 13th day of February, 1905, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,  
CHAS. W. DIXON, Secretary.  
Office—Room 3, No. 214 Pine street, San Francisco, California.

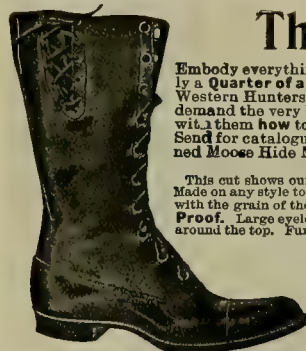

**MARINA MARSICANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1904, an assessment (No. 41) of five (5) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 207 Battery street, Room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of January, 1905, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 6th day of February, 1905, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,  
CHAS. BOVONE, Secretary.  
Office—207 Battery street, Room 15, San Francisco, California.

**DEWEY, STRONG & CO.,**  
PATENT AGENTS, S. F., Cal. & Washington, D. C.

## The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tanning) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Out Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

**H. J. PUTMAN & CO.**

23 BRIDGE SQUARE, MINNEAPOLIS, MINN.

## SMOOTH-ON

## Repaired This Pump.

Our new catalogue, showing how repairs are made with **SMOOTH-ON**, is interesting and is Free.

## Engineering in Alaska.

The engravings on this page illustrate one phase of mining in Alaska, where some of the greatest mining undertakings in the world are in successful operation, and is merely indicative of what may be accomplished by the employment of engineering skill and money in overcoming the difficulties which nature has placed in the way. The attempts to drain this basin have been numerous but previously futile, while it now appears that the difficult feat has been at last accomplished and the various obstacles successfully overcome. It is seldom that flumes for mining purposes are built of such large size, but the necessities of the case demanded that the conduit should be capable of carrying off all of the flood waters of the stream running through the canyon draining the basin, and this required the building of such an artificial channel as is here illustrated. The engineers seem to have taken some risk in basing a portion of the dam on gravel instead of on bedrock, but they have probably satisfied themselves that there is no grave danger of the water undercutting the structure, rendering it temporarily useless, and have taken steps to prevent it. Should this actually occur, it is safe to say that the dam will be reconstructed in a more substantial manner made possible by the cutting out of the gravel.

THE United States mints, having coined all the silver bullion on hand, are now unable to turn out more fractional coinage, which is much needed in merchandising throughout the country. Silver has advanced slightly in price the past few weeks, but whether directly due to the shortage of silver bullion in the mints or not it is difficult to say, as the Secretary of the Treasury has no authority to purchase silver bullion for subsidiary coinage. The higher price of silver, however, is gratefully viewed by the producers of silver. Indeed, miners at present have cause to feel unusually thankful, as not only is silver somewhat higher, but copper, zinc, tin and lead are also up; and in view of the present peaceful state of affairs between the mine operators and organized labor unions, the outlook for a prosperous year during 1905 is most auspicious.

RECENT attempts have been made to introduce Japanese laborers into Mexico and also into the northern portion of British Columbia. In the former instance many of the Japanese quit and refused to go on with the work for which they were imported. In British Columbia the strenuous opposition of white miners resulted in the attempt not being carried to a conclusion. In California there are a large number of Chinese engaged in mining, but the greater number of these are working individually for themselves or for Chinese companies owning the mines, mostly placer. To this little objection is made by the white miners, for the reason that in most instances the Chinese work over placer ground usually believed to be too poor to pay the white men for their labor. Although the introduction of Chinese labor into the mines of the Rand has been successfully accomplished, owing to the peculiar conditions at present obtaining there, it is safe to say that any attempt to similarly employ Asiatic labor in the mines of Western America will be vigorously resisted.

## Retrospective.

With this issue is closed the 89th volume of the MINING AND SCIENTIFIC PRESS. Within its life history there have been issued 2319 numbers of this paper which has always been the faithful exponent of the mining industry. As time passed on it has taken up and exploited the manifold branches of mining, metallurgy and engineering, and it has been its constant aim, while being enthusiastic in the cause and endeavoring to put forward all that was good in the lines it represents, to be at the same time, dignified and conservative and above all else to be correct. While errors occasionally creep in, yet it is gratifying to know that they have been neither numerous nor serious.

A review of the work of the past year gives a good idea of the province and aim of the MINING AND SCIENTIFIC PRESS. Within this period has been published herein all that was latest and best relating to mining and metallurgy and their kindred topics. Many of the articles have been written by men who stand high in their profession and some have been furnished by the regular staff of this paper. They embrace a very wide range of subjects and treat of the present condition of the mining industry in every part of the world.

Among the practical subjects treated may be mentioned articles on mine development and operation (among which are the Homestake methods); mine drainage; costs in mining; various types of mill construction; equipment of mines; automatic ore sampling; the cyanide process, and its varied applications to the treatment of gold ores; copper smelting; gold milling; concentration; the mining law, and a large number of articles on other miscellaneous subjects. In geology, the occurrences of veins and ore deposits in every portion of the world have been discussed, with more particular attention to the most important sections.

The "Concentrate" page has continued to supply the information demanded by an army of inquirers in as prompt and accurate a manner as possible. In this department there has been much of mining law, and those who desire information in the legal branch of the mining industry will find in "Concentrates" an epitome of mining decisions on the most important questions. It is also a source of valuable technical, engineering and metallurgical information, which has taken up almost every phase of these varied topics.

"The Prospector" is a new department introduced within the year, in order to respond to the numerous requests for information as to the character of rocks and minerals which came under the observation of the prospector in the pursuit of his investigations, and which he is often at a loss to understand or fails to recognize.

The illustrative features of the paper have been kept up to the standard, and within the year have appeared illustrations of mining methods in almost every country of the world where mining is an important industry. There have been engravings of scenes on the verge of the Arctic circle; from the heart of Africa, from South America, from the interior of China and Japan, from Australia, and from many other more easily accessible parts of the world.

In the advertising section the mine manager and metallurgist have long learned to look weekly in search of the innovations and improvements constantly being made in mechanical appliances, realizing that the advertising pages of a journal such as the MINING AND SCIENTIFIC PRESS possess educational features that cannot be neglected if they desire to keep abreast of the times, when changes are so frequent and so radical as at this period.

While much has been accomplished in the past, still it is with the feeling and belief that much still remains to be done, and that the coming year will see many more changes and new departures from old methods and practice, and these it shall be the privilege of the MINING AND SCIENTIFIC PRESS to give to the world as heretofore, as promptly as they make their appearance, or can be anticipated.

IN discussing the labor situation on the Rand, in South Africa, Lord Milner is reported as saying, at Johannesburg, that the importation of 7000 Chinese coolies to labor in the mines of the Transvaal has resulted in giving employment to 1000 additional white men, and every 1000 white men employed in

the mines involves an additional population of at least equal number, and probably more, in subsidiary industries, as artisans, traders, etc. Of these latter a larger proportion are married, with families, than the miners, and altogether it is probable that from 8000 to 10,000 white people have found employment and means of livelihood as the direct outcome of the importation of 7000 Chinese. The importation of laborers from China continues, and since the time referred to by Lord Milner a large number of additional Chinamen have been received at Johannesburg for distribution to the mines. A statement by the Chamber of Mines is to the effect that, up to Nov. 26, there had arrived 17,078 Chinese, since which date over 2000 more had reached Johannesburg, so there are at present in Johannesburg nearly 20,000 Chinese. If Lord Milner's estimate holds good, this will mean an increase in the white population of not less than 25,000.

## Mine Valuation.

There appear to be a great many people who do not understand that the value of a mine can not be ascertained by merely visiting it and looking at it. Mine valuation is a science which requires a broad technical knowledge and wide practical experience. An engineer, with technical training and knowledge of the methods of ore sampling, may go through the workings of a mine, and carefully take a large number of samples, which, when assayed, will give, together with the measurements of exposed ore bodies at the places sampled, an approximate idea of the gross value of the ore available in the mine. If the engineer does not have the experience necessary to make proper estimates on the cost of mining and reducing this ore, his report will possess little of practical value, but when it embodies the amount of ore in sight and its value, together with the costs of the varied operations necessary to recover this value, it becomes a tangible proposition, which can be utilized to advantage, either as a basis of investment or as a substantial deterrent to further expense in connection with the property. If mines could be placed in the market on the showing of gross value in sight, the introduction of new mining projects would be easy of accomplishment. Some years since, an elaborate report stated that a certain ore deposit showed several millions of dollars of value in sight. An engineer, who was sent to see if the statement was true, in his report verified all that had been said as to the value in sight, but also submitted the opinion that it would cost two to three millions more than were there to get it out.

The engineer who accepts a commission to examine a mining property for possible purchasers undertakes a responsible task, and he should be guided by the facts both as to values and as to costs. A noted mine was sold on the report of well-known engineers some twenty years ago. The mine was equipped and work was prosecuted for a time, but at a loss, and the property was abandoned. This mine is now in operation and paying, not because the ore is more valuable than formerly, for it is a gold mine, but for the reason that the engineers who made the former report were inexperienced in the district where the mine was situated—a remote one—and underestimated the cost of operating in that region. The conditions existing at that time have been changed by the building of a railroad, and the cost of operation has been decreased by improved mining methods, and also by making available a better class of labor, while the possible saving of values has been greatly increased by the introduction of the cyanide process.

Instances of this kind are more numerous than is generally supposed. It is quite as important the writer of a mining report should be capable of judging the cost of operating a property under the existing conditions as that he should know how to take mine samples, and mathematically compute his averages and gross values.

THE contents of this journal for the six months ending to-day will be found suitably indexed in this issue for convenient reference. This index shows the varied and valuable character of what appears herein. It is recommended that this index be bound with the volume for ease in referring to any desired topic. This is the 89th index so prepared for our readers and is at least equal in value to any of its 88 predecessors.

## CONCENTRATES.

CYANIDE OF POTASSIUM is employed in some charges in the assay office, particularly in assaying tin ores. It is a powerful reducing and desulphurizing agent.

THE owner of land through which a stream of water flows may appropriate the water and divert it from the stream for use elsewhere, provided he in no way conflicts with the established rights of others in so doing.

THE electric wires should be carried down the manway compartment of the shaft, and placed in a corner away from the compressed air, ventilating and water pipes, to lessen danger of the electric current being communicated to the pipes.

WHERE a flume is built on a curve, the outside of the curve should be raised slightly above the inner edge to prevent the water splashing over the top of the flume and to keep the depth of water in the cross-section of the flume as nearly equal as possible.

THE advantages of heating boiler feed water can scarcely be overstated. By employing the heat from the engine exhaust in a suitable heater the feed water can be brought nearly to boiling point. It will save from 40% to 60% of the fuel bill, whether it be coal, wood, oil or gas.

IT is said that nine out of ten mining claims are defective in the location work, and where valuable mines are discovered the title is often successfully attacked, due to the careless manner of locating claims. Every mine locator should familiarize himself with the law and follow it to the letter.

GRAPHITE can be employed as a lubricator in many places where oil is undesirable for some reason. To make it adhere, a little oil may be mixed with it. Pure graphite only can be safely used as a lubricator, as that containing earthy or gritty impurities is likely to be worse than the oil or grease for which graphite has been substituted.

THE splicing of a running rope, such as is used in rope transmission, should be entrusted to none but those who thoroughly understand the art of splicing. A poor splice is worthless and is not cheap, as it must soon be done over again, with a probability of the necessity of having to cut out the strands previously spliced by an inexperienced hand.

A CAVED SHAFT can best be recovered by throwing heavy stringers across the caved hole and hanging the timber sets from these reachers as the work of excavation proceeds downward. It is well to make the upper sets of liberal dimensions to allow some lee way in making connection with timbers that may be found in place lower down.

IN the event of a contract having been made to sink on a vein and in sinking the vein disappears, the contractor is not obliged to sink in the barren country. (Woodworth vs. McLean 11 S. W. 43.) If the contract makes provision for this contingency then the contractor is required to complete the job in compliance with the terms of the contract.

THE fact that an ex-employee made a location adjoining a working mine, basing his location upon the knowledge that the workings of the mine had extended into adjoining and unclaimed ground, which knowledge was gained while he was in the employ of the owners of the mine, will not void his right and title to the claim taken under such circumstances.

CHAINS, when properly made, have links as short as is consistent with the free working and play of the chain, as long links are more liable to become kinked than short ones. The weight of a chain of close links is usually about three times the weight of the bar iron from which it is made for equal length. A chain has about 25% more strength than the bar from which it is made.

WHEN, owing to the position of the pulleys, it is inconvenient to ascertain the length of belt required by passing a tape line around the pulleys, the information may be gained by adding the diameter of the two pulleys together, dividing by 2, and multiplying this by 3.14, to which add twice the distance between the centers of the shafts. This gives the length of belt required.

DIAMONDS have been reported found in Mexico, in the State of Guerrero, in the district of La Union. Between the Pueblo La Union and the Hacienda Coahuayutla is a conical peak called Cero del Diamantes, "Hill of the Diamonds," where the diamonds are supposed to have originated, but no scientific exploration has been undertaken in the district, as far as known, for many years.

ALL unpatented mining claims upon which the assessment work has not been done within the past year, if the same was located prior to Jan. 1, 1904, are subject to relocation at midnight to-night, Dec. 31, 1904, except in

such instances as where the claim holder is at work on the annual assessment, but has not yet completed the same; but to make this of avail the work must be continued to its completion.

THE topographical situation at a mine is a matter of secondary consideration. The first requisite is to find a promising vein or ore deposit, then if the surface topography is unsuitable it must be made so by such means as seem necessary, such as grading, building concrete or masonry walls, or by cribs of timber filled with waste rock. The prospector who looked for a good place for a dump is still abroad and is heard from occasionally.

THERE are few minerals which have a more uniform distribution than manganese. It occurs in nearly all rocks. Some rocks which in themselves show no trace of manganese are found to have in the planes of fracture and jointing, detritic infiltrations, called "forest rock," picture rock, etc. It is found associated with iron oxides in rocks and in veins, and is a widely distributed mineral, though workable deposits are comparatively scarce.

A PATENT issued for a placer mine will not carry with it known lodes, unless these lodes be specifically mentioned and claimed in the application. The area of mining ground which may be consolidated for the purposes of patent is unlimited. Where placer claims are on surveyed lands and conform to the legal subdivisions of the Government survey, no further survey or plat is required. Where the lands have not been surveyed, a mineral survey must be made.

A FLUX is a substance which if added to another substance, which is itself infusible, or fusible with great difficulty, will cause it to fuse. Quartz is very difficultly fusible, but if sodium carbonate (a basic flux) be added to the quartz, which is acid, it will fuse readily on application of comparatively low heat, and any metallic substance contained in the quartz sinks through the molten mass, which is a silicate of soda, and may be recovered. Briefly, this is the chemistry of the fire assay and of smelting.

EXPERIENCED AMALGAMATORS contend that the best work is done with the battery water at a moderate and even temperature. From 50° to 55° is known to give good satisfaction. If the battery water is pumped back for reuse and it is found to contain oil it would be improved by passing through a filter bed composed of various sizes of screened gravel and sand, or the water could be pumped to a reservoir or tank, which should be kept full. The oil will rise to the top and the water may be drawn from the bottom of the tank free from oil.

WHERE ore must be shot down from a higher to a lower level on the surface by means of a chute, the force of the descending stream of rock may be broken by arranging several heavy poles inside the chute, which will necessitate the ore passing beneath them. This can only be done with comparatively dry rock, and is only required where the slope angle of the chute is equal to or exceeds 35°. If the slope angle is much greater than 35°, the chute must be covered and the chute allowed to fill from top to bottom, when it may be drawn off as required by means of a gate or chute door at the bottom of the chute.

WHEN a tunnel is driven through "rim rock" to tap a gravel channel it is of first importance to know that the tunnel is located low enough to strike as low as the bedrock of the gravel channel, if not below it. A great many tunnels have been run for this purpose whose location was largely a matter of guess work, and, failing to strike bedrock, being started too high, were useless. If the depth from the surface to bedrock in the channel of the stream is unknown, an effort should be made to ascertain what it is by means of drilling a series of holes. A single hole is insufficient, as it is misleading, for this one hole may be on the rim instead of in the channel.

BLASTING CAPS are charged with mercury fulminate, and the caps are marked with the letter X to denote the amount of fulminate used. X caps contain 3 grains of mercury fulminate; XX, 6 grains; XXX, 9 grains; XXXX, 12 grains, etc. This varies somewhat with the different makes of this class of explosives. These caps explode easily and should be handled with care, as a slight blow will cause them to go off, and as low a temperature as 367° F. will also cause an explosion. The mercury fulminate absorbs water readily, and the presence of moisture will prevent or lessen the likelihood of explosion, for which reason caps should be stored in a dry place.

THE costs on application for patent for a placer claim in California are approximately as follows: Payment, twenty acres, \$50; surveyor-general deposit, \$40; publication of notice, \$25; affidavits, etc., \$5; surveyor, deputy, \$40; land office fee, \$10; total, \$170. In addition to which comes the items of attorney's fees and of incidentals. This estimate is based upon the assumption that no adverse claim is filed, but that all things go regularly, without exceptional features. It is impracticable to state with any considerable accuracy what the maximum will be. If the claim is upon land over which the governmental surveys have been extended, the item for surveyors' charges may be unnecessary.

THE method of operating pumps in mines by means of rods actuated by machinery situated on the surface is known as the Cornish system of pumping. In order to overcome the danger of settling of the machinery about the shaft, and also to make room for hoisting and other machinery, the pumping machinery is placed opposite the end of the shaft, instead of directly in front or behind it. Many of the large pumping engines of the Cornish system on the Comstock lode were thus arranged. There are usually three hoisting engines, two to handle cages or skips and a third to lower and raise the pump when it was necessary to place it in a new position.

THE casting of fly wheels "extra heavy" will not have a tendency to reduce the likelihood of "exploding" if run at too high speed. Recent tests have shown that the cast iron fly wheel which will not burst at 400 feet rim speed per second is the rare exception. The safe speed is between 5000 and 6000 per minute. Any balance weight attached to a fly wheel increases its tendency to burst, as at a high velocity the outward pressure of this mass of metal, due to centrifugal force, becomes an important factor. Some fly wheels which are required to be run at dangerously high speed are wound with wire, and otherwise reinforced to render them safe.

A MILL SITE may be taken and held in conjunction with a lode claim whether a mill be built on the site or not. Five acres are allowed for a mill site. It must be non-mineral land—that is, no lode must be known to exist in the site. The site must be occupied or used by the claim owner for mining or milling purposes. If mine timbers and houses for supplies are located on the land it is sufficient use. A mill site may also be taken up which has no connection with any lode claim. In this case a mill or reduction works must be built on the tract. A plant located on the site to furnish power to neighboring mines not owned by the owner of the mill site is not sufficient use in this case. Where \$500 has been expended on a lode claim and it is desired to obtain a patent, this expenditure on the lode claim is sufficient to carry the mill site with it if the latter has been actually and properly occupied.

IF a suitable site for building the headframe is not naturally available at the shaft, the frame may be anchored with timbers or steel cables, heavily weighted, to resist the pull. This arrangement will take the place of the back braces usually built in headframes to take the strain. On level or nearly level ground headframes are sometimes built in sections, lying on the ground or inclined slightly toward the foot on "horses." The members of the frame opposite each other in the same set are joined by the permanent ties and braces, and this is raised into position by means of blocks and tackle and gin pole. If the section is very high it is well to have extra ropes at center and top to sustain the weight and keep the frame from bending too much. When raised to the proper place and secured by guy ropes, the second section may be raised in the same manner, and the two sections then tied to each other permanently. This method is superior to raising each corner separately, though it requires more power to raise the heavier section.

A CLEAN-UP BARREL may be well suited for treating auriferous black iron sands of rivers, but has not been employed for this purpose as far as is known to "Concentrates." There would appear to be no mechanical difficulty in the way of its success, and the gold should be more readily subject to amalgamation by the attrition of the particles in the barrel. It is a question how long each charge would have to be kept in the barrel before amalgamation would be complete. Ordinarily, gold is concentrated on various fabrics, in washing machines of several patterns, including sluices, beach washers, etc., but the separation of gold from the sands is incomplete, owing to the high gravity of the iron sands. The best way to get information as to the adaptability of the barrel to this work is by trying it. The test should be made by one familiar with the clean-up barrel. How quickly and completely amalgamation would take place can only be determined by trial. The recovery of the amalgam should offer no insurmountable difficulty, though not so easily effected as where the sands are of quartz in place of iron.

HANGING BOLTS for shaft timbers must be heavy enough to sustain the weight and strain which they will be called upon to withstand, and the hooks must be so formed that they will not straighten out when the strain comes upon them. Bars of  $\frac{3}{4}$ -inch iron are heavy enough for 8x8-inch timbers;  $\frac{1}{2}$ -inch for 10x12, and 1 inch for most heavier timbers used in this class of work. There should be on hand at least forty hooks, making twenty full sets of two each. Generally the hooks are left in position until four sets of timbers are in place, when the hooks from the upper set of the last four may be removed for use on the next set below. This will require thirty-two hooks, the remaining eight hooks being for immediate substitution for a defective hook, or for one which may be seriously damaged by blasting. If the ground is very heavy it is sometimes an advantage to leave the hanging bolts in position permanently. In this case it is less expensive to employ straight rods of iron, with the usual nuts and large-sized washers. No hanging bolts are required for the end plates if the shaft timbers have been properly framed.

## Notes on Crushing of Metalliferous Ores in the Stamp Battery in Africa.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
F. C. ROBERTS.

Masonry is largely employed in Africa and the piles are usually surrounded by walls 2 feet to 2 feet 6 inches in width, leaving a space 6 inches in width between the piles and the masonry, which is subsequently filled and tamped with clean sand. In cases where the piles have been "grouted in," a good deal of trouble has arisen through shrinkage of the cement, and this has resulted in general dissatisfaction. These masonry walls are built up to a level 6 feet below the bottom of the mudsills as a vertical wall. From this point they are extended 5 feet 6 inches toward the front of the mill and 8 feet toward the back of the mill, in order to give support to the central mudsills.

The arrangement is shown in the accompanying sketch.

Fig. 1.—Mortar Block in Masonry Foundation.

Beyond this the only heavy masonry used is that below the back bin posts. The mudsills are usually anchored to masonry with 12x4-inch round iron bolts. The masonry walls carrying the mill building are usually 18 inches wide, of any desired depth, and pointed on the weather side with cement mortar.

The amount of masonry used in Africa (this class of work costs from \$10 to \$12 per cubic yard) is largely in excess of that employed in America, and it is a question open to discussion whether it is necessary to build up an artificial foundation on ordinarily good ground, particularly where such an extensive base is offered, as that given in a mill of more than ten stamps.

In one or more instances on the Rand fields masonry pillars have been substituted for "pitch pine" mortar blocks, but this practice has not been looked upon with favor, and it is thought to give less satisfaction than timber. Probably in a climate where "dry rot" was prevalent, or from other causes the life of timber was very limited, the masonry pillar would prove the more economical method of support; but, speaking generally, the idea has not appealed to mining men out here, and, theoretically, the practice does not appear to be a good one.

It appears to the writer that if the cubical contents of the pitch pine blocks, used as a support for the mortar boxes, be increased to such an extent (the superficial area always remaining the same, i. e., 7.5 square feet) that the force of the blow produced by the falling stamp and the resulting vibration be compensated for in the inherent properties of the timber, not only is effective work to be expected, but the wear and tear generally should be largely decreased.

In one instance the writer has had an opportunity of putting this theory into practical use, in which case each battery of five stamps was supported by ten pieces of 12x15-inch pine 26 feet in length, bolted together in the usual manner. The resulting vibration, not only to the mortar boxes, but to the whole of the driving arrangements, was observed to be very slight, and the experiment has resulted in general satisfaction.

Between the top of the piles and the bottom of the bed plate of mortar box a rubber slab of  $\frac{1}{4}$  inch in thickness is inserted. The common support for each battery of five stamps is ten 12x15-inch pitch pine timbers 13 feet in length. These are bolted together and tarred before being placed in the pit.

The ideas embodied in mill construction in Johannesburg show a wide range of variety, while in Rhodesia so much cannot be said.

The dimensions of the heavier timbers and the distances between centers may also be said to be "constants;" indeed, so similar are these factors in Rhodesian practice that the manufacturers carry "standard drawings," which are furnished with a mill

order. This method of operation no doubt saves a large amount of time to the engineer which otherwise would be taken up in calculations of breaking and crushing strains, estimation of quantities, etc., but it is doubtful if the best results accrue when the variety of local conditions met with are made to fit the one design.

The mudsills used are of 14x14-inch pitch pine, and the streak sills, which directly support the battery and bin posts, line shafting etc., are of 12x18-inch, usually 32 feet in length, in one piece. The battery posts are framed of 12x24-inch timbers, 22 feet in length; but where three posts are used for every two batteries of five stamps, the dimensions of the central post are extended to 20 inches by 24 inches by 22 feet in length. Where four battery posts can be economically employed for every two batteries of five stamps, this arrangement is preferable, as greater rigidity is obtained, the interior of the mill is made more roomy and convenient and the ore bins are largely increased in capacity without adding height to the structure. The battery posts are tied together with 6x8-inch binders, or "tie pieces," one across the full length of the span at the top, and just above the streak-sill level individual binders for each ten stamps are used, both back and front.

This whole framework is then securely tied to the mill bins, 7 feet above the cam floor level and immediately below the same, with 8x8-inch timbers.

The bin posts and cap pieces are of 12x12-inch timbers, while the bracing and top cap pieces are framed of 10x12-inch timber. The only variation shown in bin construction is in the method of bracing. Probably the most satisfactory and certainly the most economical method of bracing the lower bents is in employing single braces, which are cut short of the span, and the remaining space taken up with wedges, which can easily be made to compensate for any shrinkage in the timbers.

The bins are lined with 3x9-inch deals, and the interior areas which are subjected to violent contact with the moving rock, are protected with  $\frac{1}{4}$ -inch steel plates. The bin capacity usually arranged for is at the rate of ten tons per stamp.

There are two classes of ore bins used, as shown in the accompanying sketches.

Fig. 2.—Ore Bin.

Fig. 3.—Ore Bin.

The advantage claimed for (a) bin, which contains an offset at the bottom, is that larger capacity is

gained without making any sacrifice in the height or width, but the free delivery of the ore is greatly impeded, by reason of its movement being on ore, and the constant bridging of the rock, especially when moisture is present, makes this arrangement less satisfactory than the older type (b), in which interior work is entirely avoided.

On small properties it is not uncommon to find the grizzlies, sorting arrangements and rock breakers erected immediately above the mill ore bins. This results in a good concentration of plant and the gravitation of the rock minimizes handling, but the extreme height required necessitates a proportional increase not only in the timbers directly affected, but in the whole of the superstructure, as well as the building. In the larger plants arrangements are made for sizing, sorting and crushing, either at the head gears or in independent stations, where automatism is practiced to such an extent as to almost entirely avoid handling.

In all of the more recent larger mills the batteries are being placed back to back, in which case the bins resemble an inverted V, the dumping arrangements being such as to provide for an equal distribution of the ore to either bin. The mortar boxes, however, retain the same relative position to the bins as in case of the single row of batteries.

The power is transmitted either direct to the line shaft, in which case the shaft is coupled to the crank shaft of the engine, or transmission is made either by rope or belt drive. Of the latter, the rope drive no doubt gives the most economical and more satisfactory results. In direct coupling a distinct advantage is gained in the decrease in floor space required. In the smaller plants erected by the writer direct transmission has been employed. The more common type of mill engine used is the horizontal tandem, compound, Corliss, while in many instances the twin-compound engine is used. The vertical type engine is rarely met with. The horizontal tandem engine offers a very economical means of dealing with an increase in power, in case it were found possible at any time to increase the capacity of the plant originally erected. If the engine in the first instance is so designed that the high pressure cylinder may be erected alone, it is possible at any time to couple the low pressure cylinder and thus double the capacity of the engine with practically no loss of time.

In the single mill all power is transmitted from the line shaft, which is extended through the entire length of the mill, the bearings resting on the streak sills at a point 4 feet 3 inches back from the center line of piles. The length of drive and the relative position of the line shaft to the cam shafts is such as to require the use of belt tighteners. The position of the line shaft might be largely improved, if not to such an extent as to avoid the use of belt tighteners, certainly so that the dust and fine rock would not come in contact with and have such an injurious effect upon the belts. The arrangement—sometimes practiced in America—of carrying the line shaft through at the back of the bins and at the cam floor level is a more economical method, in so far as the cost of belting is concerned. The difficulty of obtaining a friction clutch suitable for this purpose has deterred many from using this arrangement.

**CORRECTION.**—In the issue of Dec. 24, in the fifth line from the bottom of the third column, page 425, in reference to mortar block foundations, it should have read "a foundation of uniform hardness," not "unusual" hardness.

(TO BE CONTINUED.)

## An Alaska Dam and Flume.\*

Written for the MINING AND SCIENTIFIC PRESS.

The dam and flume of the Jualpa Co., in Last Chance basin, within 1 mile of Juneau, Alaska, has been designed and built to intercept and divert the water, at all stages of Gold creek, for the purpose of draining the basin, and controlling the water so that hydraulic operations can be started and carried on with safety. The dam is built at the upper end of the basin diverting the water into the flume which is constructed along the south side of the basin and returns the water to the creek channel at the lower end of the basin. All the drainage water on the south side is picked up in small side flumes and dumped into the large flume. The drainage from the north side is handled in another way. The dam and flume were put into successful operation on November 27, 1904, in the presence of 300 residents of Juneau with appropriate ceremonies. The dam is a solid, rock-filled crib resting on bedrock and gravel, 24 feet wide and 12 feet deep, with piers and abutments rising 13 feet higher and also rock filled. Upon this foundation, between the piers and abutments, are placed the intake of the flume, 42 feet wide, and the superstructure 12 feet high, in twenty sections of 6 feet each, any one of which can be removed and accumulations of gravel and debris sluiced out over the dam. The dam is not intended to have water overflow its crest. The entrance to the flume is 42 feet wide and 12 feet deep and reduces by curves in the distance of 76 feet to the headgates in the flume 10 feet in the clear. The

\*See illustrations on front page.

water is controlled by two gates 10 feet 6 inches by 12 feet 8 inches, weighing over 2000 pounds each and moved by a train of gears by which two men can operate the gates at any stage of the water. There are also twelve gates in the side of the headpiece 4x4 feet operated by special gearing, which have a greater combined discharge than the carrying capacity of the flume, in case such an emergency is required. Out of these gates such water will be discharged as will be required for bywash in the operation of the mine, the water for piping being obtained from a high line flume on the north side of the basin. (See engraving first page and accompanying illustrations.) The face of the dam is two thicknesses of 2-inch plank, laid to break joints, and is carried down below the foundation crib as much as 8 feet to tight gravel, and puddled with clay. A hydraulic jet pump was used in sinking the facing. The structure is 196 feet over all.

The flume is 4250 feet in length and 20x9 feet in cross-section on a grade of 1.66 feet per 100 feet, except at the head where there is an increased grade for the first 400 feet to rapidly bring the water up to its velocity. The sills are 6x8 inches and the posts and caps are 6x6 inches; the sides and bottom are of 2-inch plank battened and the bottom has a false bottom of 1 inch, making a total thickness of 3 inches. The projecting ends of the caps and sills are swayed to the posts top and bottom to overcome the wind strains. The trestle work is 24 feet wide with bents 12 feet, centers of hewed mud sills, 8x8-inch posts and caps carrying six stringers of 6x12-inch timbers. There is about 2250 feet of trestle, the highest of which is 14 feet. There is about 2000 feet of grading through earth and rock 26 feet wide. The flume has a capacity of about 240,000 cubic feet of water per minute, and is designed to carry all the flood waters of Gold creek. In the construction of the flume and dam 1,200,000 feet of lumber has been used, over 6000 linear feet of hewed timber, and about twenty tons of nails and drift bolts. Work was commenced June 15 and the structure completed November 20, 1904, after being subjected to numerous delays through shortage of material.

A tunnel 2000 feet long taps the gravel in the basin 90 feet below the surface and is being extended 400 feet farther, 8x8 feet in the clear, when an upraise will be made to the surface and hydraulicking commenced next season.

This operation was commenced after a favorable report and careful examination by W. H. Hile of Philadelphia, with Eastern capital. The work of constructing the large flume was successfully completed by William H. Hampton, manager.

### Air Compressor Plant Homestake M. Co.

Herewith is illustrated what its makers say is the largest air compressor in the world. It is located at

drills. The steam pressure is about 130 pounds. The exhaust steam is received by a Wheeler surface condenser in connection with a cooling tower. The total weight is about 300 tons.

This machine is used exclusively for operating machine drills in the underground workings, assisted by two smaller machines built by the same maker and both of Corliss type, with piston inlet valve. One of these machines, at the Old Abe shaft, is a duplex machine, steam cylinders 24 inches diameter, air cylinders 26½ inches, stroke 60 inches. Its capacity in free air is about 4400 cubic feet per minute. The other compressor is at the Highland shaft and is of the same type—stroke, 42 inches; air cylinders, 22½ inches; steam cylinders, 20 inches diameter. At rated speed its free air capacity is about 2600 cubic feet per minute. These two compressors, together with the one at the Ellison shaft, are operating over 200 Ingersoll-Sergeant rock drills in the mine workings.

### The Extralateral Right Law.

The law of the extralateral right is always one of interest. It has been the law of the West ever since mines were first discovered there, and even if a new law be passed by Congress by which the existing law is replaced by one providing for vertical side lines, the law of the extralateral right will still be with us, for a new law cannot be made to apply to claims located prior to the passage of the law. There still exists a divergence of opinion on this matter, and following are the views of two mining men, each of whom offers substantial reasons in support of his contention:

TO THE EDITOR:—In the course of every few years it has become fashionable for some ambitious mining lawyer or engineer to make the grand discovery, as did E. A. Belcher recently, that "the extralateral right should be utterly abolished. It is a thing of evil. Within my reading no one statutory provision has been so productive of endless and costly litigation as this," etc., as reported in your issue of the 10th inst. Has Mr. Belcher never heard of the statute of old institution and use, which is short and to the point, "Thou shalt not steal?" For under it there have been endless litigation and lawsuits, and prosecution—far more than under all other laws combined. It is the breaking of this law, "thou shalt not steal" ore from your neighbor's claim, and not the just provision of the extralateral right, that is at fault, as we find that when the mining property or claim boundary is a vertical side line, as it is the case under the square location, the unlawful act of stealing ore goes on just as easily and often as under the law of the apex or extralateral right, when miners desire to be dishonest. The proof of that is in the fact that the theft of ore, under the laws where vertical side

is prevented or good mining ground is tied up or reserved from operation. Hence it is that where the square location exists little prospecting and mining are done. It, therefore, stops industry in mining, and as industry is the secret of happiness among civilized people, it is not a law or condition which is in the best interest of the miners of the State. The first provision of the United States mining law is discovery and full freedom to prospect or explore. After discovery work is required to retain title, hence industry is encouraged and made compulsory, which after a time develops economic value. The pursuit of obtaining values in depth underground is the business of mining, but as almost all mineral deposits depart from the vertical line in taking depth, the miner is forced by the peculiar geological conditions under which his vein or deposit dips from the vertical to follow it. Consequently the most just miner's boundary is that which is parallel to the apex or dip and strike of his vein or deposit as developed by actual mining work underground, as is the case in the Western United States.

The square location or vertical side line is a good surface condition or a good farmer's boundary, and says, "This far and no farther." Hence it is not a law or condition in the favor or benefit of both labor and capital invested in work underground, except in coal mining or flat deposits.

In countries where it is in force great injustice and legalized fraud has been done to capital that has been invested in deep metallic mining, and through its operation the mineral wealth of the country has been given to others who chanced to own the adjoining land, or the minerals have been locked up, and the mining industry retarded by it. If proof is demanded, that can be given. Under the extralateral rights industry and deep mining are made possible and labor and capital get their just reward. Mining disputes are carried into courts of law, where the fight is often continued for years, whereas it would be different if all mining disputes regarding the boundary lines of a claim, or trespass on a neighbor, were settled "on the ground at the mine" by arbitration of mining men who have examined and understand the local conditions at the mine. Those who desire a change in the law, as at present, have good intentions, but they base their argument on wrong premises, and have not had experience under the same conditions that they seek to impose on the Western United States, and to go from the present condition to a worse state of affairs. An experience of about forty years in mining in Europe, Canada and the Eastern and Western United States enables me to give facts on this important question for protecting the best interests of capital and labor invested in mining.

JOHN STEUART.

Los Angeles, Dec. 15.

TO THE EDITOR:—The defenders of the extralateral law claim that it benefits the prospector most of all, and that it encourages and protects him.

Any one who gives the question a little thought and studies the records of the past, will, I am sure, be convinced of the doubtful benefits derived by the prospector from this law. Long before the shadow of extralateral complications dims the horizon, the original locator has "folded his tent" and hies himself to new prospecting fields; for we all know that the prospector rarely, if ever, goes so deep that he can not hop out of the hole-in-the-ground when he so desires. If by chance he should retain possession of his property and he appeals to the law for protection, what is the usual result? He may be arrayed against a wealthy corporation and he has not the means to fight it. The services of mining lawyers and geological engineers come high, and by the time he secures final judgment, if he does not find himself in debt he is fortunate, indeed.

If final judgment would be rendered within a reasonable time, it would not be so discouraging, but in the United States, where the history of such cases is one of continuous appeals and vexatious delays, the outlook for the prospector of small means is gloomy, in the extreme. To support this fact, the writer will cite one instance, of many that have come under my observation. In this case the original locator is now surrounded by powerful mining corporations. When he found he was being robbed he appealed to the courts. This was six years ago, and during that time he has secured judgments in four different courts for a sum well up in six figures, and the end is not yet. In fact, the president of the opposing corporation on being approached by a reporter when the case was last decided against him, said: "Why we have just begun to fight this case; Mr. — can leave it as a legacy for his children and grandchildren."

There is no doubt in my mind but that it will be so.

This law, no doubt, was intended to benefit the prospector at its inception, but that was at a time when lode mining in the United States was in its infancy and the apex was supposed to be an ideal condition. That these ideal conditions rarely exist is now conceded by all, and this law, which was intended to benefit, is now an obstacle to legitimate mining. It has been proven in countries where the change was made that no serious hardship was imposed either on the prospector or investor. It seems to me that where claims are 1500 feet wide and the vertical plane extension a law, that a

Air Compressor Homestake Mining Co., Lead, S. D.

the Ellison shaft of the Homestake Mining Co., Lead, S. D., and is a cross compound condensing two-stage Corliss machine, built by the Ingersoll-Sergeant Drill Co. of New York. The high and low-pressure steam cylinders have a diameter of 32 and 60 inches, respectively, the air cylinders are 52½ by 32½ inches in diameter, the stroke is 72 inches. At rated speed of 50 R. P. M. the free-air capacity is 9000 cubic feet per minute, this volume being sufficient, under average conditions of mine work, to operate 125 rock

lines are the boundaries of mining claims, is as common as where the extralateral right prevails, and there is as much litigation and stealing of ore as there is in the Western United States. If proof is demanded, that can be given. The square location is also undesirable on account of its covering more leads or deposits than the vein or deposit which is the subject of location. The parallel vein may or may not be the same class of mineral as the vein or deposit which is operated, and as a consequence prospecting

prospector has all the ground he needs. If there were any obstacles to prevent him from locating a side claim, there might be some cause for complaint.

The laws of location should be so simple that any locator, no matter how ignorant he may be regarding the location laws, may reasonably expect to hold his discovery. The ordinary prospector is, as a rule, ignorant of the extralateral law. He may have a vague idea that such a thing exists, but if the subject is broached to him he is very liable to regard you with open-mouthed astonishment. What he sees on the surface, or near it, he is very liable to locate properly; but when he has to locate with regard to the probable distribution of ore under ground, his task becomes a most hopeless enigma. Here is where the simplicity of the vertical side lines appeals to the ordinary prospector. One of the most prominent mining lawyers in the United States, whom I approached on this subject, said that nine out of ten mining locations could be successfully contested before patent was issued, for not complying with some legal condition imposed. And these are the laws for which the American mining fraternity should be grateful.

What prospector considers the existence of this law, as with feverish haste he hoists his outfit on the hurricane deck of a cayuse and wanders forth on mountain steep, or desert waste, to delve in the bosom of Mother Earth for the treasure that may lie there concealed? A. R. MACDONALD.

Rosslund, B. C., Dec. 24.

## The Genesis of the Copper Deposits of Clifton-Morenci, Arizona.\*

Written by WALDEMAR LINDGREN.

The Clifton mines, always important, are at present the largest in the Territory, the output in 1902 having reached 50,000,000 pounds of copper, chiefly divided between the two principal producers, the Arizona and the Detroit Copper Cos. The Shannon Copper Co. also contributed to this figure, and its output has greatly increased since then. The total output of the district to the end of the year 1903 is estimated at a value of about \$49,000,000.

**TOPOGRAPHY AND GEOLOGY.**—Clifton is situated on the San Francisco river, a few miles above its confluence with the Gila river, in the southeastern part of the Territory, and not many miles from the New Mexican boundary. An irregular mountain region, without well-defined ranges, lies here north of the broad, detritus-filled valley of the Gila river, which has an elevation of about 3000 feet. The highest elevations in the mountains scarcely attain 8000 feet.

Between the San Francisco river and Eagle creek, both tributaries to the Gila river from the north, a

porphyry, which extends in a northeasterly direction between the foothills near Eagle creek across to the Copper King granite ridge overlooking San Francisco river. The main stock, which is about 8 miles long and up to 1½ mile wide, breaks up, at the southwest end, into a network of irregular dikes and sheets, and at the northeast into a system of northeasterly trending dikes cutting through the granite. Laccolithic masses of porphyry occur in the Cretaceous shales and sandstones. The rock of the main stock ranges from a granite-porphry to a quartz-monozonite porphyry. The sills and laccoliths are usually composed of diorite-porphry, but the different types of rock are clearly facies of the same magma, connected by transitions and forming a single geological unit. Dikes of diabase occur in a few places.

The intrusion of porphyry took place during the latest Cretaceous or the earlier Tertiary, and was accompanied by great disturbances in the immediately adjoining rocks, particularly well noticeable in the Paleozoic sediments; but these disturbances of the strata did not extend far from the contacts.

The intrusion of the porphyry was followed by important structural movements. The surface of the granite, together with the whole covering sedimentary series, was buckled into dome-shaped folds and then extensively fractured, the blocks sinking successively deeper towards the valley and settling unequally around the two great buttresses, or "horsts"—the Coronado and Copper King mountains—the maximum throw of the normal faults being 3000 feet.

An epoch of erosion followed, but floods of Tertiary lavas soon surrounded and largely covered the old rocks, which have only lately emerged by the energetic action of a second epoch of erosion. The effects of the large faulting movements, which preceded the lavas, are still visible in the greater topographic features of the region, especially in the bold escarpment of the Copper King ridge.

**OCCURRENCE AND GENERAL FEATURES OF THE ORE DEPOSITS.**—The geographical distribution of the copper deposits is practically coextensive with the great porphyry stock and its dike systems. The deposits occur either in the porphyry or close to its contacts, or along dikes of porphyry in some other rock. Areas in which no intrusions have taken place are practically barren. This intimate connection with the porphyry is certainly a most important fact. There is only one small division of deposits, namely, that connected with the diabase dikes, which deviates from this rule.

Practically all types of deposits contain copper as the most valuable metal. Gold and silver occur, as a rule, only in minute quantities, except in some of the outlying districts, where they become of more importance. The two most important mining centers, Morenci and Metcalf, which are 3 miles apart,

kaolin, willemite, calamine, diopside, chrysocolla, copper pitch ore, morencite (a new mineral, chiefly ferric silicate), calcite, dolomite, zinc carbonate, malachite, azurite, libethenite (copper phosphate, not previously found in the United States), brochantite, alunite, gypsum, spangolite (basic chloro-sulphate of copper and aluminum), chalcantinite, goslarite, epsomite and gerhardtite (basic copper nitrate forms green crusts on weathered surfaces of porphyry and is, in these, associated with a copper chloride, possibly atacamite).

The deposits with payable copper ore take many widely differing forms, as follows:

**Deposits in limestone and shale, not connected with fissure vein—**

Irregular bodies near contacts of main stock or dikes. Tabular bodies near contacts of main stock or dikes following stratification.

Tabular bodies, following contacts of porphyry dike (all of these carrying oxidized ores, almost exclusively; rarely chalcocite).

**Fissure veins—**

Normal veins in porphyry or in any of the other rocks near porphyry contacts. Include central veins and surrounding partly replaced porphyry forming together a lode. Carry chalcocite as the important ore; in upper levels also sometimes oxidized ores.

Normal veins, following porphyry dikes in granite. Chalcocite and oxidized copper ores.

Normal veins following diabase dikes. Chalcocite and oxidized copper ores.

**Stock-works—**

Irregular disseminations in porphyry, quartzite and other rocks. Contain chalcocite and oxidized copper ores.

The above classification is based on the occurrence and form.

Native copper, all of the oxy-salts of copper, and chalcocite are wholly secondary minerals produced by direct or indirect oxidation from primary pyritic ores. In all of the divisions given above, this primary ore consists of pyrite and chalcopyrite, with some zinc blende and molybdenite. The scant gangue of veins consists of quartz, while the deposits in the first division are usually accompanied by garnet, epidote, magnetite, diopside, tremolite, or their products of oxidation.

**METAMORPHIC PROCESSES.**—The region is practically unaffected by regional or dynamic metamorphism, and even the ordinary hydro-metamorphism has affected the rocks but little, producing some slight changes in granite and porphyry and introducing cherts into the limestones. Epidote, chlorite, and a little pyrite are apt to develop in the hornblende phases of the porphyry.

**CONTACT METAMORPHISM.**—The contacts of the porphyry with sedimentary rocks often show typical instances of this class. The granite porphyry and the quartz-monzonite porphyry show themselves most effective in this direction, while there is usually but little metamorphic action at the contacts of the diorite-porphry. The effect seems in direct proportion to the amount of quartz contained in the porphyry. Granite and quartzite are unaltered; the shales and sandstones of the Cretaceous series are hardened and baked.

The Paleozoic limestone series comes in contact with the main stock in two places—at Morenci and at Metcalf. In both places extensive copper deposits are encountered. Dikes also occur at both places and along some of these radiating out into the unaltered areas the metamorphic process may be studied to best advantage.

Along dikes it is found that the metamorphism varies greatly in the different strata and even in apparently similar limestone layers there may be great difference in the degree of alteration. A well-defined dike, 50 feet wide, on Modoc mountain was studied with special care, as it cut through all the formations present. Where contained in the Longfellow limestone the metamorphism extends at most 20 feet outward into the limestone and generally only a few feet. Garnet, epidote, diopside, specularite and magnetite are the minerals which form abundantly by metasomatic replacement along the contacts, and intergrown with them are chalcopyrite, pyrite, and zinc blende, unquestionably of contemporaneous formation. The contact metamorphic limestone has certainly a very different composition from the unaltered rock, and it is apparent that much silica, iron, copper and zinc at least have been added. Epidote often forms in considerable quantities close to the contacts, while a little farther away garnet prevails. The Morenci shales overlying the Longfellow limestone are hardened and baked, but not materially altered in composition. Finally, when the dike enters the pure limestone of the Modoc formation, garnet forms in enormous quantities from the latter; the metamorphism exerted by the dike here merges in that affecting the whole block of limestone, due to the contact of the main stock of porphyry.

The principal metamorphic area at Morenci is about 2 miles long; its width is from 1000 to 1500 feet. The Modoc formation, however, has been affected to an extraordinary degree and extends as a stratum of garnet and magnetite 2000 feet away from the contact between almost unaltered Devonian and Cretaceous sediments.

(TO BE CONTINUED.)

The Shannon Copper Co.'s Concentrator and Shops, Near Clifton, Arizona.

core of older rocks of about 70 square miles is exposed, consisting of pre-Cambrian granites, Cambrian quartzites, Paleozoic limestones and a capping formation of Cretaceous beds—all intruded by post-Cretaceous granitic porphyries. This older core, which seems to represent the broken-down edge of the great plateau province, is completely surrounded and largely covered by volcanic flows of Tertiary age, including basalts, andesites and rhyolites, which have been extensively eroded; hence the lack of regularity so plainly apparent in the mountain complex.

The copper deposits are all contained in the older rocks and distinctly antedate the Tertiary lavas.

The sedimentary rocks rest on a basement of red, coarse granite, forming two great buttresses, the Coronado and the Copper King mountains, both rising over 3000 feet above the San Francisco river.

All of the rocks are intruded by a great stock of

are both situated at the main contact of the porphyry stock and the series of Paleozoic limestones. Elsewhere the intrusive rock generally adjoins granite or Cretaceous sediments.

The ores consist of chalcocite, chalcopyrite, malachite, azurite, chrysocolla, brochantite, cuprite, and native copper. Covellite and bornite are practically absent. Brochantite, the basic copper sulphate, is very commonly present, especially in the oxidized veins in porphyry, and, in fact, constitutes in places an important ore. On account of its similarity to, and intimate intergrowth with, malachite it has usually been overlooked.

The following named minerals have been found: Native copper, native gold, quartz, chalcedony, rutile, magnetite, hematite, limonite, pyrolusite, coronadite (a new mineral, chiefly PbO and MnO<sub>2</sub>), cuprite, pyrite, chalcopyrite, zinc blende, galena, molybdenite, chalcocite, diopside, tremolite, garnet, epidote, muscovite, chlorite, serpentine, asbestos,

\* Abstract Trans. Am. Inst. Min. Engs

## Water Rights in California.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by  
SAMUEL C. WIEL.

In the preceding number it was said that no appropriation can be made on or interfering with private or occupied lands because an appropriation cannot be initiated by a trespass and cannot interfere with established riparian rights. It must be understood by this that adverse occupancy is meant. The rights of one claiming solely as an appropriator were under discussion. If one claims also under the consent of an occupant, the occupancy to that extent ceases to be an objection. Likewise if the occupant himself seeks to make an appropriation on his own land his occupancy ceases to be a factor. An occupant may make an appropriation on his own land so long as the rights of other occupants or appropriators are not interfered with, as in the case of any appropriation.

"The fact that plaintiff or his grantor was a riparian owner does not warrant the conclusion that he could not be an appropriator—there is, as is said in a play, 'no consonancy in the sequel.' The notion seems to be that becoming a riparian owner estops one, in some sort of way, from being an appropriator of water, although there be no one in existence in whose favor the estoppel can be evoked. \*\*\*\*\* Counsel for respondents seems to think that because plaintiff's grantor, as a riparian owner, could have prevented subsequent appropriators from diverting the water above his land and away from it, therefore he could not divert the water himself; but that is a confusion of the distinction between meum and tuum. Counsel complain that this view gives great advantage to the first possessor and appropriator of the water of a stream. This is no doubt true, but it is the advantage which the law gives, and which necessarily follows prior occupancy and appropriation." 97 Cal. 464.

**HOW AN APPROPRIATION IS MADE.**—Having found that water can be appropriated and a proper place to appropriate it, the right to the water is not complete until the water is actually taken into one's possession, or, rather, until all construction work preparatory to the actual use of the water is completed, since that is the equivalent of taking possession (6 Cal. 548). As between the Government and the appropriator there are only two requisites for this—the preparatory work must be actually completed and there must be an intention to apply the water to a beneficial use. If there are no rival claimants of any kind, up to such actual completion, that is enough to satisfy the Government, who is then alone concerned, and the right is complete against later attack on this ground. (Wells vs. Mantes, 99 Cal. 583.) The head note to that case sums up the decision as follows: "The scope and purpose of the provisions of the Civil Code upon water rights was merely to establish a procedure for the claimants of the right to the use of the water whereby a certain definite time might be established as the date at which their title should accrue by relation; and a failure to comply with the rules there laid down does not deprive an appropriator by actual diversion, of the right to the use of the water, as against a subsequent claimant who complies therewith."

But as against rival claimants who appear before completion, to guard himself against them, four requisites in all must be complied with: First, a notice must be posted at the start; second, there must be an intention to apply the water to a useful purpose; third, the work must be prosecuted with diligence; fourth, it must be actually completed.

1. Notice must be posted. In the Civil Code, Sec. 1415, 1421, it is provided that a notice must be posted at the point of intended diversion, stating the amount and purpose and place and means of use, and be recorded within ten days.\*

This serves to warn others. It does not actually withdraw the water then and there from use by others entirely, as a notice of discovery withdraws mining ground, but it warns others that later on, when you have completed your works, you will have the right to so much water. It has been held that in the meantime anyone can come in temporarily and

\*—1415. NOTICE OF APPROPRIATION.—A person desiring to appropriate water must post a notice, in writing, in a conspicuous place at the point of intended diversion, stating therein:

1. That he claims the water there flowing to the extent of (giving the number) inches measured under a 4-inch pressure.

2. The purposes for which he claims it and the place of intended use.

3. The means by which he intends to divert it, and the size of the flume, ditch, pipe or aqueduct in which he intends to divert it. A copy of this notice must, within ten days after it is posted, be recorded in the office of the recorder of the county in which it is posted.

After filing such copy for record, the place of intended diversion or the place of intended use or the means by which it is intended to divert the water, may be changed by the person posting said notice or his assigns if others are not injured by such change. This provision applies to notices already filed as well as to notices hereafter filed.

En. March 21, 1872. Am'd. 1903., 361.

use the water, and you will have no action against him unless he interferes with your construction work or continues to use the water after you have actually completed your works. Until that time you will have no action for his diverting the water. In Nevada Water Co. vs. Kidd, 37 Cal. 282, the Court says:

"In view of this principle, suppose by way of illustration that the plaintiff has located its site for a dam and canal and claimed the waters of the South Yuba river, and commenced the construction of the dam and canal, but in consequence of the magnitude of the work, was unable for several years to divert or use the water, and in the meantime the defendants, being men of greater pecuniary ability, should subsequently locate another claim above or near the plaintiff's, and a canal running parallel with the plaintiff's, and be in a condition to divert and use the water in half the time; their acts, provided there was no interference with plaintiff's site and location, or obstruction to the prosecution of its work, would be no injury to plaintiff or cause of action in its favor. The plaintiff in such case has, as yet, no right to the water so far perfected that a diversion or use by other parties is any interference or injury. But if the plaintiff's work should be prosecuted with diligence and completed, so as to entitle it to divert and use the waters, its right to the waters thenceforth would date by relation from the commencement of the work, and, should defendants thereafter continue to divert the waters and deprive the plaintiffs of their use, an injury to their water rights then vested and perfected would result, and a right of action for the injury to such a right accrue." The case so held.

For all purposes except to make such temporary use of the water actionable, however, the right to the water on completion relates back to the time of posting notice if the work has been prosecuted diligently, and dates from the posting of the notice as against those who come later (C.C. 1418; 99 Cal. 583).

Failure to post a notice constitutes a waiver of all advantages that such a warning gives. As seen above, it is not fatal if the work is nevertheless completed before others intervene. But it is fatal as against intervenors who comply with the code (C.C. 1419). As between rival claimants neither of whom has posted a notice, they are on the same footing as though the code were never enacted, since those provisions were enacted for their own benefit and they refused to take advantage of them (117 Cal. 106). Their rights are the same as before the code (when no notice was needed, 80 Cal. 397-406) giving the better right to the man who began work first, or if he fails in diligence, to the one who first prosecuted it to completion with diligence (7 Cal. 261).

As to underground water, it seems that the code provisions, and the rules just stated, apply, if it is in a definite stream, or subflow of a definite surface stream; the code governs all cases of definite streams, and a notice must, it seems, be posted on the surface (126 Cal. 486). But it is said, in Katz vs. Walkinshaw, 141 Cal. 116, that the code does not apply to mere diffused percolating water; and that the appropriation of this must be governed by the same principles as those which established the law of appropriation in the early days, before the code was enacted. It will probably be found that the code, however, merely enacted the law as it existed before, without materially changing it, except to require posting of notice, and that the requisites for the appropriation of percolating water will be otherwise substantially the same as those for water in streams; viz., intention to apply it to a beneficial purpose, diligence, and actual completion, leaving out only the details as to notice, length of time, etc., fixed by the code. In Katz vs. Walkinshaw, 141 Cal. 116, the Court says:

"The principles which, before the adoption of the civil code, were applied to protect appropriators and possessory rights in visible streams will, in general, be found applicable to such appropriators of percolating waters, either for public or private use, on distant lands, and will suffice for their protection as against other appropriators. Such rights are usufructuary only, and the first taker who, with diligence, puts the water in use, will have the better right."

How far an appropriator is bound by the declaration in his notice as to amount, purpose, means or place of use will be a matter for consideration later. It may be said here that the appropriator is not bound by his notice to a preliminary base line for ditches or flumes, but may later, in the course of construction, within a reasonable time, change his surveyed line, as necessity points out, without having to start and post a notice all over again (C.C. 1415, 6 Cal. 548).

2. There must be an intention to use the water for a beneficial purpose (C.C. 1411). What constitutes a beneficial purpose will best be seen from examples. A ditch for mere drainage does not fulfill this requirement; another may hence go up stream and cut off the water (7 Cal. 261). Irrigation is a useful purpose, and water may hence be appropriated for irrigation (23 Cal. 453). An appropriation for sale of the water is good (60 Am. St. Rep. 804 note, and Cal. Constitution, Art. XIV, Sec. 1), but mere speculation is not allowed; e. g., a reservoir built to hold

water indefinitely without any definite use in mind (15 Cal. 271).

"Water is diverted to propel machinery in flour mills and sawmills, and to irrigate land for cultivation, as well as to enable miners to work their mining claims; and in all such cases the right of the first appropriator, exercised within reasonable limits, is respected and enforced" (Basey vs. Gallagher, 87 U. S. 670).

Malice and ill will toward another do not enter into the question (42 Cal. 339; 46 Cal. 218; 137 Cal. 39). It is usually said that an act otherwise lawful does not become unlawful merely through a malicious motive to injure another, though this wide statement is open to question.

The intent alone, by itself, is not enough; the other requisites we are considering must also be complied with (13 Cal. 33). A design two years before to appropriate a certain creek as a connecting link in a long canal was held, in 6 Cal. 105, not to prevent another man from coming in the meantime and building a dam. In extensive operations of this kind, involving several streams, each, it appears, must be separately appropriated.

How is the intention shown? First, of course, from the notice; but it may be drawn, also, from the appropriators' acts, the manner in which they work, the general size of the ditch, etc. (8 Cal. 443). They aid in interpreting the notice.

3. There must be diligence in prosecuting the construction work (C.C. 1416). The code has specified certain requirements for diligence. The work must commence within 60 days after posting the notice. It must continue thence uninterruptedly unless prevented by rain or snow (C.C. 1416). Interruptions, even by sickness or lack of money, are not allowed (37 Cal. 282 at 314; 12 Cal. 27).

What constitutes diligence must be determined on the facts of each case. In Kimball vs. Gerhart, 12 Cal. 27, the court says that the following statements, among others, are an accurate statement of the law:

"In appropriating unclaimed water on public lands only such acts are necessary, and only such indications and evidences of appropriation are required as the nature of the case and the face of the country will admit of and are under the circumstances and at the time practicable; and surveys, notices, stakes and blazing trees, followed by work and actual labor without any abandonment, will in every case where the work is completed give title over subsequent claimants." \* \* \* "In determining the question of the plaintiffs' diligence in the construction of their ditch, the jury have a right to take into consideration the circumstances surrounding them at the date of their alleged appropriation, such as the nature and climate of the country traversed by said ditch, together with all the difficulties of procuring labor and materials necessary in such cases."

Perhaps the mere fact that another began later than you and finished sooner would be evidence of lack of diligence on your part (37 Cal. 282), but it would hardly be conclusive. (80 Cal. 397.)

The failure to use diligence in the construction work is like the failure to post notice already discussed. If there are no rival claimants before completion, the right is complete as against attack thereafter (cases cited supra). But as against intervenors who are diligent it is fatal (37 Cal. 282, C. C. 1419). It seems, however, that a revival of diligence, after inactivity, will constitute a good new start as against those coming later, although no new notice was posted; or, as it is said, the right on completion will probably relate back to the last diligence. (60 Am. St. Rep. 801, note).

4. The construction work must be actually completed. (C.C. 1416.) "By completion is meant conducting the waters to the place of intended use." (C. C. 1417). It is sometimes said that there must be an actual diversion of the waters; but this is too narrow a term, since, in peculiar cases, the appropriation may be accomplished without any diversion at all. Thus, straightening out a bed of a stream by dykes or dams constitutes an appropriation, though there is no diversion at all. (6 Cal. 105, 7 Cal. 46, 142 Cal. 350.) So, simply putting a large water wheel in the stream itself would doubtless be an appropriation of enough water to run it. In general, however, there will be no completion without diversion.

(TO BE CONTINUED.)

The total imports of pig iron for the calendar year will fall below 85,000 tons as against 599,574 tons last year and 619,354 in 1902, says the American Manufacturer. The total cost of the pig iron imported this year will not exceed \$1,600,000 as compared with nearly \$11,000,000 last year and \$7,500,000 in 1902. The imports of pig iron for October were 8074 tons, for the ten months ending October there were 69,294 tons. This compares with 566,090 tons in the first ten months of last year and 400,581 in 1902.

The recent outbreak of a racial war between Kaffirs and Chinamen on the Rand, in which several of each race were killed, points to the probability that the mines of the Transvaal must be worked by all Kaffirs or all Chinese. At all events, it is evident both can no longer be safely employed in the same mine.

### The Free-Milling Process.

A few years ago the process best known to miners was the free-milling process. Ores which could not be satisfactorily treated by this "process" were called "base," "rebellious," "refractory," etc., and if rich enough were sent to the smelter for reduction. From the earliest days of quartz mining in California the amalgamating stamp mill was the most important factor, and is still in that State. The California stamp mill and the free-milling process was introduced into Colorado, Montana, Idaho and other Western States, and in time throughout the world. In some instances the process extracted more than 90% of the gold values from ores, but the miner usually believed that he had done the best that could be done if he could secure 70%. He was not contented with this, however, and constantly experimented with a view to increasing this saving, and various were the expedients he tried. It was soon learned that when the sulphide zone was reached that the values were often associated with the sulphurets, and the values in free gold obtainable sank from 70% to sometimes 40%, or even less. The early millman soon came to understand that concentration after amalgamation was a necessity, so he devised various ways to separate the sulphides from the gangue, and then, after he got them, they were of little value, for he did not know how to extract the gold from the base combinations of sulphur with iron, lead, zinc and copper. Still he saved them in many cases in the hope that some day a way would be found to extract this gold from sulphurets at a profit.

To accomplish this concentration he reverted to the practice of the Cornish tin miner and put in inclined tables or sluices in which he placed skins with the hair side up, or coarse blankets, burlap or some other fabric which would entangle and hold the par-

ticles of sulphide, which, owing to their greater specific gravity, would settle and find a resting place in the inequalities of the surface of the table.

It was found that the sulphurets could be treated by smelting when rich enough to pay for the cost of transportation and metallurgical treatment. At one time a standing offer of \$5000 was made by the MINING AND SCIENTIFIC PRESS for a method which

would successfully treat these concentrates.

The value of sulphurets having been demonstrated, the inventive genius of the country was stimulated to produce a mechanical device which would effect a separation of the sulphides from the pulp of the stamp mill. As a result, scores of concentrators were invented, some of which were good and many were bad and impracticable. But these devices of

Concentrator Room of a Modern Mill.

The Plate Floor of a Gold Mill.

the early days cannot be compared with the finely built and efficient concentrators of to-day.

The early stamp mill was as inefficient as the early concentrator. Both have been improved as new and greater demands were made of them until they have reached a highly satisfactory stage.

Beside the stamp mill there may have been seen, in the early days, the Chile mill, the arrastra, the ball or tube mill, rolls, and various other forms and types of machinery for reducing ores from coarse lumps of fine sand.

For years it was the practice to feed stamp batteries by hand with a shovel, notwithstanding the fact that more than 50 years ago there were mills equipped with automatic feeders, actuated by a blow from the falling tappet, in much the same manner as now. Although these feeders were automatic, the ore was shoveled into them from a pile lying on the floor at the back of the battery.

In the modern "free-process" mill, built after the most approved design and with a view to the greatest economy compatible with the largest output, the ore arrives at the top of the mill, having passed through one or more breakers which have reduced the rock to a size suitable to introduce to the stamps—this should not be larger than will pass a 1½-inch ring, and even a smaller size is advisable. It is desirable to have the ore enter the mill at the end, rather than at the back, as by this arrangement it may be

Distribution of Pulp on Slimes Table.

A Double Row of Canvas Tables in a Slimes Plant.

dumped into the bins where it may be needed, and thus keep the distribution of rock in the bins even. It also obviates dumping all the coarse rock at one part of the bin and the fines at another, as is often the case with a mill having the rock breakers and grizzlies in the mill above the bin.

Ore bins should be of liberal size and should have inclined bottoms—not less than 35°. Some believe flat bottoms to be an advantage, as by their means greater storage capacity is secured. This advantage is more than offset by the increased cost of shoveling the ore into the chutes leading to the feeders in case the ore supply from the mine fails to keep the bins full. The excess ore—that is, the ore lying on the floor of the flat bin and sloping back at an angle of 40°—picks so tight with most ores as to make it necessary to pick down every bit of it, and when about half shoveled to the feeders, in a good-sized bin, the remainder must be handled twice by the shoveler. The cost of shoveling this ore will reach, if not exceed, 15 cents per ton where wages for this class of labor is \$2 per day. If bin capacity be required by reason of the erratic production of the mine—not an uncommon feature where the milling plant exceeds the capacity of the mine—let it be provided in bins beneath the breaker or in the mine itself.

From the ore bins the ore should pass by gravity through inclined chutes to automatic feeders—preferably of the suspended type, as they allow more light and permit the feeder floor being kept clean at little expense of time. The mortar should be suited, as to inside dimensions, to the ore. An ore readily amalgamated can be satisfactorily crushed and amalgamated in a narrow rapid-discharge mortar, but an ore slow and difficult to amalgamate will do better in a wider mortar with a higher discharge. All mortars should be lined, and the height of discharge regulated by chuck blocks of differing height. This can be partly accomplished by having the screen frames made with a greater width on one side than the other. Then by reversing the screen the height of discharge can be changed in a few minutes at any time that it may be deemed necessary.

Inside amalgamating plates must be provided or rejected, as the character of the ore suggests. The mesh and kind of screen employed must rest with the mill man, who will know by experience what is best adapted to the ore.

Silver-plated copper plates, if not indispensable, are, at least, to be preferred to raw copper plates, as they require less care usually, though care of the plates is one of the first essentials of good results in amalgamation.

From the apron plates the pulp passes to concentrators. These are various in design and in method of operation. It has been the practice of the "free-milling" foreman to cut a stream of pulp from a 5-stamp battery into two equal parts, each of which is sent to a separate concentrating machine. That this is the best practice there is every reason to doubt.

Modern practice has proven that if the pulp from the apron plates is sent to a hydraulic classifier for the purpose of making a separation of fine and coarse material, and the pulp thus sized sent to separate concentrating machines, far better results are obtainable than by the old method.

As an outcome of this old time practice, and the one still largely in use, fine sulphides escape when a clean separation of the coarser material is being made, or if the machine be so adjusted that both coarse and fine sulphides are saved, much sand is saved with them. In some mills this is the practice—saving both coarse and fine sulphides and some sand, and the releaning of the dirty concentrates. By employing a hydraulic sizer and treating the sands and slimes separately, cleaner concentrates result, and no necessity for releaning remains.

It has been previously stated that concentration without classifying is the more common practice, and the result, being unsatisfactory, has led to the re-introduction of inclined tables covered with canvas as a substitute for the old-time bullock's skin, or gunny sack. By means of the inclined canvas tables, extremely fine slimes, high-grade in gold, may be separated from the tailings by concentrating machines. The canvas, or slimes plants, as they are called, differ considerably in construction, and to some extent in method of operation, depending somewhat upon the character of the ore, and to some degree upon the ideas of the operator. However, the canvas plant has proven a valuable adjunct in the economy of the free-milling process, where hydraulic classifiers are not in use between the battery and the concentrating machines.

The concentrates, which are the results of all of this careful and painstaking manipulation, are treated by chlorination or cyanidation, or are sent to the smelters. These latter processes are entirely beyond the range of undertaking of the free-gold amalgamation mill man, who has had concentration forced upon him, but who usually turns the operation of cyanide and chlorination plants over to another department, and gives all of his attention to the matters more directly connected with his specialty.

The accompanying illustrations show a portion of the battery of a large modern stamp mill; the concentrating floor of the same, and two views of a broad, short canvas table with the method of dis-

tributing the pulp evenly over the inclined surface; also the launders which carry concentrated sulphides and the tailings away. By the use of the long, hinged aprons, situated at the foot of each table, the stream can be turned into either the sulphide launder or to the waste way.

## Coal in Montana.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS.

In Choteau county there are several small operations where lignite is mined for local use. The largest of these are located near Havre and supply Havre and vicinity. The total production of this field is estimated to be about 7000 tons a year.

In Fergus county there are no records of the production of coal prior to 1899, when the output was 3000 tons. This output was increased to 10,000 tons in 1900, and has gradually increased to the maximum production in 1903 of 32,000 tons. The completion of the Montana railroad, which connects with the Northern Pacific at Lombard, from Harlowtown to Lewistown, opens up a new country. The best developed mine in this section is operated by the Spring Creek Coal Co., located 3 miles from Lewistown, the principal market for its output. John Borgh is manager.

In Gallatin county the Chestnut coal mine is owned by the Northern Pacific Railway Co., which has also acquired the property of the Mountinside Coal Co. adjoining. There are several beds of coal in this district, but only one is worked. The vein which has been developed varies from 5 to 20 feet in width and the dip varies from 25° to 90°. The vein is very dirty, being composed of alternating bands of coal, bony coal, bone and shale, the proportions of which vary greatly and abruptly. H. J. Horn is manager and T. J. Evans is local superintendent. The output for 1903 was 43,224 tons and the estimated output for 1904 is 50% greater. During 1903, the plant was increased by additional boilers and a compressor and air replaced steam as a motive power for the hoisting engine, located inside of the mine. The large washing plant which was destroyed October, 1904, by fire has been rebuilt. The tunnel and shaft at Chestnut is 3000 feet from the Mountinside workings. The vein, which is nearly perpendicular at Chestnut, inclines from 90° going toward the Mountinside, until half way between the workings, where it is again perpendicular. From this point it again inclines from the perpendicular, the pitch of the vein varying much in the Mountinside workings. A water level drift, connecting the workings of the two mines, has been completed. A main slope is being sunk at Mountinside and is now over 500 feet long. The vein is much distorted and faulted at Mountinside, the strike varying from north-south and east-west. The coal produced, when washed, makes an excellent steam coal. A large proportion of the output has been used and will be used for local fuel on the Northern Pacific railroad.

The property at Storrs, owned by the Amalgamated Copper Co., was practically closed down during the summer of 1904. One of the most modern and complete plants in the United States was installed on the property. The plant consists of a large washer, 100 completed and 100 uncompleted coke ovens, a store and hotel, an electric light plant and water system; also a large number of substantial houses for employees.

In Park county the Trail Creek field, Yellowstone field and Cinnabar field have been developed. The Trail Creek field is a small synclinal basin of the Laramie, 9 miles south of Mountinside. There are three coal beds of workable thickness throughout the northern end of the field. It yields a large proportion of lump coal, and is semi-bituminous. The Cinnabar field extends northward from the northern border of the Yellowstone Park. There are four coal beds in the main portion of this field, all of which are of workable thickness, the thickest being 5½ feet. The coal has all been highly altered by the eruptive rocks of Electric Peak, several intrusive sheets from which have invaded the coal-bearing rocks. The coal from three of the beds makes a good grade of coke, that of the other being semi-anthracite, very hard, and having the characteristic luster and cleavage of anthracite.

The Montana Coal & Coke Co., H. G. Merry manager and J. F. Kent superintendent, is the principal source of coke in Park county. The main workings are in one of the four workable beds found in this Cinnabar field. The field is much faulted. The plant and mines are located at Electric and Aldridge, respectively. The field tributary to the present workings lies between Mulherin creek and the Yellowstone river and comprises an area of several square miles. The mines, which are located at Aldridge, are nearly 3 miles distant from Electric by wagon road. The company has built a tramway from Electric to the top of the mountain, nearly a mile long, the grade being as high as 43%. The car is pulled up the slope by an electric hoist and serves to convey both people and

supplies from the town to the mine. At the top of this plane there is a trolley line which runs to the store and mines. The ovens are 250 in number and a coke extractor is used to pull the ovens. The coke is loaded into small cars by the coke extractor and then is hoisted by a small motor to a bin, from which it can be automatically loaded into box cars for shipment. The washer is located below the tipple at the mine. Until this washer was completed the coke produced was of an inferior quality. It is carried by water in sluice boxes to large bunkers near the coke ovens, where it is dried by steam. The steam used is the exhaust steam from the electric plant, which is also used to heat the company's buildings at Electric. The water for the washer is carried by a new water line recently constructed several miles in length. The power plant is equipped with four 150 H. P. boilers, two 500-volt generators and an 800-light dynamo. Under the present management there have also been made many improvements in the mine. The slope of the company is down 700 feet. Four entries have been driven, known as No. 1, the main entry; No. 2 and No. 4. No. 1 has been driven 1 mile. The main entry is 1½ mile in length; No. 2 is over 4000 feet long. No. 4 is now 3000 feet long. An electric motor hauls the cars in the main entry to the tipple.

Cokedale Coal & Coke Co. mines at Cokedale, 9 miles west from Livingston, are reached by a short branch of the Northern Pacific Railroad. Geo. H. Hill is manager of the property and Thomas Good superintendent. Much development work has been done during the past year. The 100 coke ovens have been repaired and the necessary buildings needed in such an operation have been built. The coal is of good coking quality. No shipments have been made, only enough coal being mined for steam purposes. Sufficient narrow work has been completed and enough rooms opened up to develop coal sufficient to keep the ovens running without interruption.

There are a number of other fields which have not been developed as yet. Along the headwaters of the West Gallatin river and between the Gallatin and Madison ranges there are several isolated areas of the Laramie formation. Their location, however, is so remote that little attention has hitherto been given to the coal. The only one of the several areas in which coal of value has been found is on Taylor's Fork of the West Gallatin, 75 miles from the Northern Pacific at Bozeman. This area occupies the high divide between the West Gallatin and Madison rivers. It forms a synclinal area 6 miles across, with dips on the northern margin of 20° and on the southern margin of 6°. There are three coal beds in this field ranging from 4 to 6 feet in thickness. The character of the coal is still in doubt, as none of the development work has exposed any of the beds to a sufficient depth to get beyond the effect of weathering. The other areas in this field offer promising fields for detailed prospecting. Owing to the proximity of large bodies of eruptive rocks, the coal will doubtless be found highly altered. These areas are located on the west fork of the West Gallatin and immediately north of the Sphinx mountain.

The Ruby Valley field is 30 miles west of the Gallatin field, and has received even less attention than the latter. The rocks are of Laramie age and do not present any indications of serious disturbance. The only prospecting done in this field consists of a series of open cuts along the outcrop. These have as yet failed to develop beds of workable thickness.

The Toston area is isolated, containing 6 square miles of the Cascade formation, 3 miles south of the town of Toston, and crossed by the main line of the Northern Pacific Railroad. The strata are badly broken and the field is so small that the erection of a large mining plant would not be warranted. The field could doubtless be operated with profit on a small scale, especially as the coal is coking. There are portions of the bed in which the coal has been altered beyond the coking stage and is essentially graphite.

The Sweetgrass Hills field is on the eastern slope of the foothills of the Rocky mountains, in the extreme northern portion of Montana. The coal occurs in the Belly River formation, which extends south from Canada. But little development has been done in this field and there are no producing mines. There are three coal beds exposed to workable thickness, which are capable of yielding a fair grade of semi-bituminous coal.

Along the summit of the main Rocky mountain range and westward there are numerous areas of Neocene lake beds, which contain some lignitic coal. None of these areas have as yet developed any coal of value.

The rocks of some of these areas were deposited in the basins of the granite, and others upon more recent beds. They form a series of isolated basins distributed over a region which extends westward 90 miles from the continental divide and southward into Idaho. They are probably to be correlated with the areas at the base of the Boise mountains. There are several points at which these lake beds have been subjected to the influence of the later eruptions, and further prospecting may develop coal of a higher grade than that thus far discovered.

THE operating cost at the Alaska-Treadwell mine, Alaska, for the month of November was \$1.021 per ton of ore treated.

### Hornsby-Akroyd Oil Engine.

Herewith is illustrated an oil engine designed for using crude oil as fuel—the Hornsby-Akroyd—built by the De La Vergne Machine Co., New York, and also by several makers in Europe, where it was invented and first put on the market. The makers say that in the Russian oil fields this engine is largely used for operating pumps and other purposes, and also in the oil fields of Ohio and Indiana. A number

in various units in operation, actuating the concentrating and other machinery in connection with their lead mines. Two of these engines have recently been installed by the United States Navy Department in the long-distance wireless telegraph stations in Cuba and Panama.

Fig. 3 shows a portable air compressing outfit, designed for prospecting and other purposes where compressed air is required for operating pneumatic machinery, such as rock drills, and which is required to be removed frequently and quickly to different localities.

Fig. 1.

Fig. 2.

Fig. 3.

are also used in various districts burning crude oil.

Fig. 1 is a sectional view of this engine, which operates on the Beau de Rochas, or four-cycle system. The vaporizer is attached to the cylinder and is at all times open to the cylinder. With this engine the oil is injected into this vaporizing chamber and not into the cylinder, that where crude oil or fuel oil is used any deposit which may be formed it is not deposited in the cylinder, but in the vaporizer cap, not coming in contact with the piston or piston rings. On the larger engines, or where otherwise required, a flanged cover is added to the vaporizer cap, the removal of which facilitates the process of cleaning out such deposit. This only is required after about every sixty hours' run and does not interfere with the operation of the engine.

Fig. 2 shows a 50 H. P., two-cylinder type oil engine for use in mining and other purposes in the arid zone. The Luna Lead Co., Deming, N. M., have 200 H. P.

This outfit, as will be seen in the illustration, consists of the oil engine geared to a slow-speed air compressor placed on rigid steel truck, the air receiver being placed under the truck. The circulating water required to maintain the proper temperature of the air compressor and engine is cooled by a patented apparatus placed at the front end of the truck, and which utilizes the pressure of the exhaust to create a current of air passing through the water, thus cooling it.

The makers say that the fuel consumption guaranteed for these engines is less than one pound per horse power hour, and that where crude oil can be obtained at \$1 per barrel the cost is approximately 0.2 cent per horse power hour.

Further detailed information regarding engines of this type will be furnished on request by the De La Vergne Machine Co., foot of East 138th St., New York City.

### THE PROSPECTOR.

The rocks from Ainsworth, B. C., are identified as follows: No. 1 is siliceous chlorite schist, probably the result of alteration of a basic eruptive rock—diorite or diabase. No. 2 is a feldspathic dike rock, in which are developed numerous secondary minerals (zeolites), formed in what were probably originally vesicles in the rock. No. 3 is an altered intrusive rock and may have resulted from the alteration of either No. 1 or No. 2, probably the latter; it is not at all uncommon to find rocks like Nos. 3, 4 and 5 altered from a greenstone schist like No. 1. No. 4 is similar to No. 3, but suggests even more than No. 3, that it is due to the alteration of No. 1, as indicated by the schistose structure, though this structure, so pronounced in No. 4, may have been induced locally by pressure from a more massive rock than No. 1. No. 5 belongs to the same group—either an altered schist or massive rock like No. 1. The green mineral in No. 5 is chromium mica and resembles the mariposite so common in some parts of California. Nos. 3, 4 and 5 contain small amounts of disseminated iron and copper sulphide. No. 6 is a chlorite schist. Nos. 1 and 6 would be classified as amphibolite schist in accordance with the classification of the United States Geological Survey, that is a rock in which amphibole or its alteration products were the chief dark mineral. The rock from which No. 6 was derived was probably diorite. No. 2 is an unusual and very interesting rock and not of common occurrence. Rocks of this character are more likely to alter into masses of kaolin than rocks like No. 1. The latter is more likely to form slabs of talc schist than masses of clay upon extreme alteration due to pressure and mineralogical change. It is most difficult to say what effect this intrusive rock (No. 2) will have upon a fissure occurring within an older dike (No. 1). A vein accompanied by a dike like No. 2 is likely to be permanent, but the dike is no index of value or size of ore shoots. The condition of the vein walls is often far more suggestive and reliable as a guide. For instance, if an ore body pinches out in a fissure with a heavy clay gouge, it is a good idea to crosscut to foot and hanging, where it is not infrequently found that the pay shoot has formed a lap. Spots of sulphide mineral in the gouge are a "good sign," and a crosscut should be run wherever they are found. When the crosscut enters hard ground quit, for in all probability you have gone beyond the limit of that particular vein.

The rock specimens from Washoe, Nev., are all very much altered, and consequently difficult of determination. No. 1 is evidently an andesite, but greatly altered. It is this rock that was originally described as propylite on the Comstock lode—a rock in which the minerals are much decayed and in which there is a greenish discoloration of feldspars and groundmass. It was a name applied by the early geologists on the Comstock to a variety of greatly altered rocks, including diorite, diabase and various andesites. No. 2 is also so badly altered as to make its identification uncertain. It is evidently a lava, possibly originally an andesite. It shows evidence of amygdaloidal condition and contains small fragments of volcanic glass. No. 3 is a trachytic rock. No. 4 is similar to No. 2, but somewhat less altered. What appears to have been olivine is now found altered to serpentine. No. 5 is mostly silica, probably replacing feldspar or other mineral. It carries many fine grains of pyrite. No. 6 is similar to No. 2. No. 7 is andesite. A rock of this character probably by alteration produced a rock like No. 1. No. 8 is an eruptive rock, in which the original hornblende or augite is almost wholly altered to epidote. It was probably an augite andesite.

The rocks from Nevada City, Cal., have been classified as follows: No. 3, magnetite (a magnetic iron oxide); No. 4, granitic gabbro, consisting of a large amount of plagioclase (feldspar), some quartz and abundant magnetite. The original diagenesis, a mineral characteristic of gabbro, has been altered apparently into hornblende by paramorphism, and by further alteration has become epidote (the yellowish-green mineral). No. 5 is a granular quartz rock, such as sometimes occurs in aplite dikes in a granite country.

The rock samples from Searchlight district, Nev., are determined as follows: No. 1. Diorite. No. 2. A granitic rock (probably dike), much altered. No. 3. Aplite (micaless granite). No. 4 is diorite. Nos. 5 and 6 are porphyritic hornblende andesite (andesite porphyrite). No. 7. An aluminous silicate, probably a variety of kaolinite, resulting from decomposition of feldspar, and containing some finely disseminated quartz grains.

The rocks from Isabella, Cal., are: No. 1 is composed of striated feldspar (plagioclase), quartz and hornblende, which determines the rock to be diorite. No. 2 is quartz carrying mispickel (arsenical pyrite). No. 3 is an interesting aggregate of green and brown garnet grossularite, with bluish calcite (lime spar) and glassy quartz. This rock is probably the result of contact metamorphism.

## Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 20, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METHOD OF GRANULATING SLAGS.—No. 777,388; J. G. McDowell, Pittsburg, Pa.

Method of treating liquid slag consisting in spreading stream of fluid slag into sheet form and driving water against slag sheet after spreading and while dropping through air.

PULVERIZING MACHINE.—No. 777,787; S. Hughes, Summerville, S. C.

Feed hopper for grinding or pulverizing machines and the like, comprising hopper having fixed spout, adjustable spout telescoping on fixed spout, longitudinal extension depending from fixed spout to guide adjustable spout, and means for securing adjustable spout at any level.

GOLD SEPARATOR.—No. 777,803; T. Pollock, Santa Barbara, Cal.

In gold separator, combination of U-shaped pipe having its arms of different lengths and disposed vertically, sand hopper carried by longer arm, valve on bottom of hopper, water inlet tube beneath and adjacent to valve and disposed obliquely to pipe, normally sealed discharge outlet arranged in lowest part of bend of pipe, mercury chamber carried by shorter arm of pipe, valve in pipe beneath chamber, and outlet pipe at top of chamber.

HOISTING APPARATUS.—No. 777,790; W. H. Jessup, Sheridan, Ind.

In device of class described, track rope, carriage supported upon same and having plurality of guide pulleys, plurality of winding drums, bucket having bail, hinged bottom and guide pulleys upon the side of bucket, link connected with bucket, lever supported by link, flexible element connecting inner end of lever with hinged bottom of bucket, flexible connection between free end of lever and one of winding drums, suitably guided hoisting rope supporting bucket by pulley connected with bail of latter and having its ends connected respectively with carriage and with winding drum, and suitably guided flexible element connecting bottom of bucket with winding drum.

FURNACE.—No. 777,814; W. Simpkin, Orange, N. J.

Furnace comprising tunnel structure having central combustion chamber, cars within structure, cars having air tight couplings and aprons extending into lutes or troughs, air admitted beneath cars at one end of furnace, and air admitted above cars at other end of furnace, air passing over cars and combining with fuel in combustion chamber, and products of combustion escaping over cars.

SAFETY DEVICE FOR HOISTING MECHANISMS.—No. 777,661; W. Burkart and H. A. Williams, Denver, Colo.

Hoisting mechanism, cage, rigid collar secured to cage, draw-bar adapted to move vertically in collar, projections at lower extremity of draw-bar, links pivotally connected to projections, rock-shafts adjacent to lower ends of links, arms rigidly attached to rock-shafts and pivotally secured to lower extremities of links, dogs rigidly secured to rock-shafts, coiled springs surrounding rock-shafts, one end of each spring being secured to stationary member and other ends of springs being secured to arms.

ORE CONCENTRATOR.—No. 777,837; I. A. Cammett, Denver, Colo.

In ore concentrator, combination of bowl having discharges respectively for concentrates and waste, adjustable distributor supported directly from wall of bowl and water seal below distributor variable through adjustment of latter.

MINE CAR.—No. 778,097; J. B. Bell, Windber, Pa.

Mine car having end-gate, projecting platform, platform being perforated adjacent gate, curved segment carried by and spaced from gate, angled rod adapted to slide between segment and gate and to engage perforation in platform, rod having cranked portion adapted to rest on segment, and stop-block arranged on gate centrally above segment.

OIL BURNER.—No. 777,680; V. F. Lasso, New York, N. Y., and L. D. Lovekin, Philadelphia, Pa.

In oil burner, combination of tube for supplying spraying medium under pressure having front end closed by transverse structure having shallow outwardly-pointing conical oil chamber formed by front and rear walls arranged close together and provided with circular series of apertures through each of walls outer of which are conical with large ends directed outward whereby air may be forced from air-tube through apertures and oil-chamber, and means for spraying oil under pressure against one of walls of oil-chamber whereby it is mechanically subdivided and directed radially toward apertures so as to meet and be taken up by air passing through apertures.

CONCENTRATOR.—No. 777,838; W. L. Card and F. S. Card, Denver, Colo.

In concentrator, combination of revolving crank, oscillating crank adapted to have quadrant travel arc, intermediate pitman, vibrating device actuated by oscillating crank, and concentrator table actuated by vibrating device.

# Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

The November report of the Alaska-Treadwell shows that the 240-stamp mill ran 30½ days; 300-stamp mill ran 30½ days; crushed 82,887 tons ore. Estimated value of the bullion, \$75,242; saved 1900 tons of sulphurets. Estimated realizable value of same, \$70,319. Working expenses for month, \$84,696.

## ARIZONA.

### Cochise County.

At the smelters of the Copper Queen Con. M. Co. at Douglas three new 350-ton furnaces are to be put in, making eight in all, and the second largest copper smelting plant in the United States. At present the plant is turning out 6,000,000 pounds of blister copper monthly.

Superintendent J. Champion of the Columbia, Belle and Martinez mines has obtained title to a millsite at Cochran station, on the Phoenix & Eastern Railroad, and contemplates the erection of a concentrating and smelting plant.

The Duluth & Chiricahua Development Co.—M. Pattison of Duluth, Minn., president; G. H. Crosby of Duluth, secretary and treasurer; E. F. Sweeney, resident director living in Paradise—have bought the Sullivan mine and will start development. Estimates have been prepared for machinery and equipment. The Chiricahua Development Co.'s shaft has been sunk 380 feet through limestone mineralized with iron and copper sulphides. They are now in granite and upon reaching the 500-foot level they will cut their first station and begin crosscutting. The Mars shaft of this property is down 350 feet.—The Cochise Con. Copper Co. will increase their force to forty-five men.

The Tombstone Con. M. Co., E. W. Walker, superintendent, at Tombstone, is continuing tests for cyanidation of low-grade ores, subsequent to possible construction of a mill.—Superintendent Shaw of the Lucksure M. Co., ½ mile southwest of the Consolidated shaft, expects to be shipping a carload of ore per day early in the new year. The one-compartment incline shaft is down 200 feet.

### Maricopa County.

(Special Correspondence).—New ground is being opened up at the Vulture mine by drifts and crosscuts. A number of old drifts are being cleaned out, and it is supposed that the mine will again be a producer of bullion. At the Union mine, 18 miles north of Phoenix, the force has been increased and ore is being taken out for the mill. Hull & Duke are doing considerable work on their claims near the Garcia mine in the Vulture district. The Buffalo-Arizona M. Co., operating northeast of Morristown, have increased their force and will install machinery at an early date. The Gila Gold Lode Co. are working men on their property in the White Tank mountains. It is reported that they will install a mill. Phoenix, Dec. 26.

### Mohave County.

Work on the German-American mines, near Acme, is progressing and it is probable that a milling plant will be put in by Manager C. Schrader.—T. R. Garnier has taken and is working the St. Louis mines at Cerbat from J. Barry.—A blower has been put in at the Independence mine of the Union Pass group, where Jorgenson, Bohne & Richardson have a contract to sink the shaft 50 feet deeper.

### Yavapai County.

(Special Correspondence).—The Mountain Lion Gold Co., with mines on Rich Hill, at Stanton, will put in a power drilling plant and will increase the scale of work as justified by five years of hard work. They will put in a new or second-hand 5-drill compressor and a 75 H. P. oil or gas engine, and wish bids for mine cars, rails, corrugated sheet iron, etc. C. A. Devlan is manager at the mine. Stanton, Dec. 26.

The Castle Creek M. & Dev. Co., organized by J. H. Aagaard, J. M. Fike & Sons, is developing the Quishenbury mine and adjoining claims, 2 miles from Briggs. The ore carries values in gold, silver, lead and copper.

L. A. Davies of Prescott says that the Sun Dance M. Co. properties on the Hasayampa are to be worked under his management, with the backing of the Western Trust & Guarantee Co. of Chicago.

The Baumann C. Co. at Dewey will put in a 1000-foot capacity hoist and an 80 H. P. boiler on the Swiss Girl claim, which now has a double-compartment shaft down 110 feet. Later a hoist may be put on the Laura claim, which has a double-

compartment down 214 feet, exposing high-grade copper ore. H. P. Anewalt is president, J. Baumann secretary and manager and W. S. Goldsworthy treasurer, all of Prescott.

## CALIFORNIA.

### Amador County.

(Special Correspondence).—A new and important development has been made on the 1400-foot level of the Wildman mine in an ore body 15 feet wide. The mill is running.

Sutter Creek, Dec. 27.

Robinson, McLaughlin & Glenn are working the Glenn or Whitmore mine, near Volcano. The 4-stamp mill has been repaired and a 25 H. P. engine put in. Five more stamps will probably be added to the mill by the first of July.

The Empire mine in Murphys gulch, adjoining the Amador Queen No. 2, near Jackson, is being worked mainly for pockets under management of Green. It is said that the ore carries platinum in sufficient quantity to justify the extraction of that rare metal.

At the Defender mine a 5-foot ledge of ore is being worked from the old shaft and a new shaft, now 90 feet deep, is being sunk on the south end of the mine. F. B. Joyce of Defender is superintendent.

### Calaveras County.

The Emma M. Co. has been reorganized as the Outlook M. Co., with W. T. Robinson of Mokelumne Hill as superintendent, and A. E. Moyer of Boston as financial agent. Ten men are putting the mine and 10-stamp mill in readiness. They also own six mines in the Whiskey Slide and Jesus Maria districts, where they have at present a number of men employed.

At the Union Copper mine, at Copperopolis, thirty graders are at work for a new smelter. G. McM. Ross is superintendent.—The Welsh mine has closed down for a time and the owner, A. Arents Sr., has gone to Alameda, Cal.

### El Dorado County.

The Georgetown M. Co. has been capitalized for \$2,000,000 by G. Schmidt, C. R. Lord, C. E. Jones, F. A. Ring and T. Graber, with main office in Postoffice building, Berkeley, Cal.

A 4-stamp mill is being put up for prospecting purposes on the Scherrer mine, east of Georgetown.—At the Berry & Rupeley placer mine at Sugar Pine point hydraulicicking will be commenced.—The Oakland Dev. Co. has men building a restraining dam on Mameluke hill, near Georgetown, preparatory to working the ground. M. W. Sargent is in charge.—Work is being pushed on the Delwisch gravel mine, Georgetown district. The mill is being shipped from San Francisco.

### Fresno County.

A new pipe line is to be built to a point on the San Joaquin river, by the Producers' Union Pipe Line Co., A. Dollas, agent in Fresno. It is reported that 6,000,000 barrels have been signed for. The length will be 100 miles, and will be 8-inch or 10-inch pipe. Preliminary surveys have been made. The company offered 25 cents per barrel for fuel oil of the same grade as that being sold for 15 to 20 cents per barrel to other pipe-line companies.

### Nevada County.

The Central Con. Co. has bought the 20-stamp mill of the Coe mine at Grass Valley, including mill building, concentrators, rock breaker, ten tons of T-rails and five iron ore cars. The copper plates will be removed at once, but the mill and the remainder of the property will remain at the Coe until spring.

### Placer County.

The Santa Fe M. Co. has been formed by L. Hanke, G. Stark, A. R. Green D. Kirby, J. W. Morgan to work the Santa Fe and Dewey placer mines at Canada hill. L. Hanke is superintendent.

### San Diego County.

Phosphate is reported discovered in paying quantities in the Grapevine district, east of Banner, San Diego county, by D. McGregor. The phosphate occurs as apatite, together with calcite and tremolite, in several parallel ledges, included within 2000 acres of ground, located by the discoverer.

### Shasta County.

The Sugar Loaf claims at Copley will be worked under the superintendency of E. B. Burtis. C. D. Galvin, the consulting engineer of the company, has gone to Boston to report to the stockholders, and on his return development will be commenced on the Spring creek side of Sugar Loaf mountain, and tunnel No. 2, already started, is to be extended. A diamond drill will be put in.

The Copper Crest group of copper claims, adjoining the Mammoth mine, near Kennett, where a 750-ton smelter is being put up, will be developed by I. O.

Jillson, of the Gladstone mine at French Gulch, and M. E. Dittmar.

### Sierra County.

At the Mountain mine, near Sierra City, the power house, bunk house, blacksmith shop and part of the aerial tramway has been burned. Superintendent L. H. Carver says that the plant can not be replaced until spring because of difficulty of transportation in winter. The stamp mill had been started two days before the fire. Thirty men are thrown out of work.

The Poker Flat M. Co. at Poker Flat via Table Rock will finish the equipment for amalgamation, as the plant was built for concentrating without amalgamation. Tests show that \$6 per ton can be got on plates and \$5.18 from concentrates.—J. B. Lassiat of Table Rock, superintendent of the Lassiat mine at Poker Flat, will put in canvas tables and settling tanks.

### Trinity County.

The 50-mile power line of the North Mountain Co., from Junction City, Trinity county, to Eureka, Humboldt county, is nearly completed. The generators will be started by the first of the year, Eureka and Humboldt county being served with electric light and power manufactured in Trinity county. The plant generates 40,000 volts and is to be duplicated.

### Tuolumne County.

Work has been resumed at the Green Jumper mine, near Confidence. W. Conn is superintendent and J. Ryan of Sonora is manager.—The Roberts placer mine, near Montezuma, has been bonded by W. T. Beveridge and B. Harter to H. G. Comstock & Co. of San Francisco. After sixty days from the date of the agreement, until which time is allowed to begin operations, the first payment on this purchase must be made.—Nine men are now at work at the Omega mine. C. W. Ayers has assigned his bond on the property to the American Industrial Co. of Chicago.—The Shawmut mine, near Chinese Camp, is working 250 men.

The Morris Tunnel M. Co., after three years work, have reached the end of the upraise, 187 feet, connecting the tunnel and shaft. Development has been completed and the company will now work the several claims. J. Wainwright of Sonora has been interested.

At the Horse Shoe Bend at Columbia two raises are being run from the Englewood tunnel to the crest of the hill. At the 90-foot shaft operations have been resumed. Machinery for a 100-stamp mill is being collected.

## COLORADO.

(Special Correspondence).—An indication of an increase in business and general prosperity are the reports of the various railroads doing business in the State. These reports show a decided improvement over one year ago, and it is believed will be better the coming year.

—There has been a drouth in several parts of the State for several months past, and as a consequence some of the streams are getting low, but the snows of the last few days will have a tendency to increase the flow of water. In places water is badly needed for milling purposes.—It is rumored that the Red Mountain railroad, operating between Red Mountain and Silverton, in San Juan county, will be extended to Ouray this coming season. At present a stage line is run over the old toll road from Ouray to Red Mountain to connect with the railroad. During the winter months, traffic is suspended on the railroad and passengers and mail are carried by stage.—According to reports, Eldora, in Boulder county, will soon be connected with the outside world by railroad. The Colorado & Northwestern is now within a short distance of the town. The completion of this branch of their road should give an impetus to mining in Boulder county. Denver, Dec. 26.

### Chaffee County.

The Banker M. & T. Co. of Winfield is working nine men underground and completing putting in machinery. They have a sawmill running. F. Aude is superintendent, with A. E. Stahler as general manager.

### Clear Creek County.

The stamp mill of the United G. M., M. & T. Co. on Fall river, near Idaho Springs, is running steadily upon ore from the Specie Payment mine. The company owns a large territory on Bellevue mountain, for which a crosscut tunnel is now being driven from the level of the mill. Machinery for power drills will be installed in the near future.

### Gilpin County.

The El Dorado M. Co. at Central City is sinking on its Lynn shaft, west of the El Dorado, with two shifts, the shaft being down 80 feet. S. T. Harris is in charge.

### Hinsdale County.

The Big Casino mine at Lake City is being worked by Superintendent Miner. A large body of ore has been opened during recent work.

The Max M. Co. has been incorporated at Lake City for \$300,000 by N. H. Schenck, E. W. Hurlburt and B. Guionneau to work the Guionneau group on North Fork of Henson creek.

### Lake County.

The mill at the mouth of the Yak tunnel has been roofed. When the interior work is completed and the plant in operation the zinc production of Leadville will be increased.—The South Mosquito M. Co. is working its tunnel south of the South London mine, driving westward into the main Mosquito range. They expect to cut the contact 1500 feet from the mouth.—T. S. Schlessinger is operating the Bon Air, near Leadville.

The Empire T. Co. has the lease of all the land formerly held by the Home Extension M. Co. from the city of Leadville. The lease was forfeited by the Home Extension M. Co. and a new lease executed in favor of the Empire Co., giving the mineral rights under streets and alleys and other city property on the east side, between Harrison avenue and the Midas M. & L. Co.—At the Cloud City shaft the 10-inch water column, to carry water from the mine, has been completed. The engine and boiler house have been enlarged and a new 100 H. P. boiler has been put in. A 200-gallon pump has been put in the station at the 500-foot level. Sinking has been resumed from 562 feet, now that the water is under control.

A strike is reported in the breast of the Woods G. M. & M. Co., at Pie Plant, in the Taylor Park country, 20 miles west of Twin Lakes. The company has completed a cyanide mill, and expects to have it in operation by the first of the year.

The stamp mill and concentrator at Romley, belonging to the Golf M. & M. Co., has been destroyed by fire.

### Ouray County.

(Special Correspondence).—The tunnel on the property of the Bankers Con. M. Co. is being driven at the rate of 30 feet per week. They have recently opened up a vein 14 feet wide, which carries good values, and are at present working on this vein. The tunnel is now in over 700 feet. The object of the tunnel is to cut several known veins in the hill. Air drills are being used in the work. Seventeen men are employed. This property adjoins Camp Bird. Camp Bird Mills, Dec. 26.

### San Juan County.

J. C. O'Neill of Silverton has an option on the Mayflower group on Round and King Solomon mountains from Malchus Bros., on condition that he develop to some depth. The Arrastra Gulch tunnel will be continued to cut the Mayflower vein.

The Pride of the West mine, near Silverton, is putting in 250 feet of water pipe, extending from flume to power house. Power drills are to be put in.

### Summit County.

The \$50,000 Revett gold-dredging boat, near Breckenridge, is ready for the heavy machinery which has been ordered for delivery in March.

### Teller County.

Machinery, including a compressor, will be put on the Little Puck and Abdallah, on the south slope of Squaw mountain, by Swanson & Dillon of the Ocean Wave of the Little Puck Co., and Anderson and associates, lessees of the Climax.—Machinery is being placed at the shaft piercing Beacon hill in the Rocky Mountain property. As soon as it is in readiness sinking will be resumed. The work is being done for Ralph Airheart and H. L. Shepherd.

At the Gold King mine, at Poverty Gulch, near Cripple Creek, a 65-foot winze has been sunk 700 feet below the level, which is showing the entire width in smelting grade ore. They are shipping regularly and plan to sink to 800 feet in the main shaft.—The lessees of the June Blizzard on Battle Mountain, near Cripple Creek, are putting in new machinery and developing the ore body.—Mine machinery will be put in by the Sunset Eclipse, on Squaw mountain.

J. M. Hower & Co., leasing the Jo Dandy on Bull hill, near Cripple Creek, are unwatering the property preparatory to sinking.—Cripple Creek reports that J. E. Parkinson has a bond and lease on the May claim survey No. 7934 for two years from J. S. Jones and N. H. Partridge.—J. B. Fore & Co. have a two years' lease on the Maid of Erin claim on Raven hill belonging to the Elkton Co. and will continue sinking from 110-foot level. The lessees operating the Gregory claim of the same company have ore in sight in the second and fourth levels and are working ten men.

At Cripple Creek, articles of incorporation have been filed by the Pinto-Bison M. Co. for \$150,000, by J. O. A. Carper,

J. L. Dibble, W. K. Mansfield, E. R. Conway and C. D. Barnes.

J. K. Walsh and associates, working the Forest Queen claim, on Ironclad hill, will put in a 6-drill air compressor and new 80 H. P. boiler.

The Kimball Investment Co. of Denver, through Manager Leshor of Cripple Creek, has contracted with W. Watson for sinking 200 feet on the Saturday claim, on Rosebud hill. The shaft is down 203 feet. Water is being pumped from the mine at the rate of 1000 gallons per minute. It will be necessary to put in another sinking pump, of larger capacity.

The City of Cripple Creek G. M. Co. has put in an 8-drill air compressor, and after January 1 will begin sinking the shaft from the 200-foot level. The water flow from the El Paso drainage tunnel shows a slight increase in volume, due to the fact that the El Paso management is now drifting on the extension of the C. K. and N. vein in the bottom level.

## IDAHO.

The United States assay office at Boise, H. S. Woolley in charge, gives the following as Idaho's mineral production in 1903:

Counties.	Gold, Fine Ozs.	Value.	Silver, Fine Ozs.	Value.
Ada	570	\$ 11,907	106	106
Bannock	511	10,593	95	95
Bingham	641	13,256	128	128
Blaine	1,143	23,627	513,141	513,141
Boise	14,803	308,072	4,361	4,361
Canyon	413	9,157	83	83
Cassia	545	11,298	122	122
Custer	6,113	125,367	79,088	79,088
Elmore	5,193	105,488	2,470	2,470
Idaho	11,440	236,671	3,912	3,912
Lemhi	11,870	245,374	2,542	2,542
Lincoln	459	9,488	173	173
Oneida	539	11,142	157	157
Owyhee	30,479	623,338	756,569	756,569
Shoshone	7,651	158,160	5,473,655	5,473,655
Washington	1,312	27,121	76,363	76,363
<b>Totals</b>	<b>83,787</b>	<b>\$1,730,997</b>	<b>6,915,036</b>	<b>6,915,036</b>

Adding 214,252,369 pounds of lead, valued at \$9,641,356, and 1,111,423 pounds of copper, valued at \$138,928, gives the mineral production of Idaho a total value for 1903 of \$20,451,933.

### Blaine County.

At the Eureka mine at Bullion, near Hailey, new pumps and other machinery have been bought and winter supplies laid in. Six men are repairing the shaft.

### Custer County.

The Mt. Estes M. Co. has been formed by J. A. Czizek, E. G. Rowe, C. E. Gable, J. H. Richards and R. E. Collier to work the Montana mine, 6 miles north of Custer, and opposite the Golden Sunbeam Co.'s mines, upon which a 40-ton mill has been placed. C. E. Gable of Custer is secretary of the new company and manager of the Golden Sunbeam. The Montana mine has been opened through an incline shaft to a depth of 500 feet. A tunnel is to be run 1600 feet to open the mines 500 feet beneath the old workings.

### Idaho County.

The Rapid river and its tributaries in the Seven Devils range drain 500 miles. There is a good wagon road from Council, Washington county, the terminus of the P. & I. N. R. R., by the way of the Meadows, and down the Little Salmon river to Pollock, for 60 miles. Pollock is near the confluence of the Rapid river with the Little Salmon. A good wagon road runs from Pollock up the Rapid river for 3 miles, intersecting the trail that leads up the grade on Kings mountain to the property of the Hawkeye and Badger group of mines. On these claims the upper tunnel No. 1 has been driven 540 feet; tunnel No. 2, 250 feet; tunnel No. 3, 80 feet.

I. H. Friar, manager of the Pueblo M. Co., on Smith creek, reports that the shaft is down 80 feet. A mill is to be put in. Because of lack of transportation, 10 cents per pound is charged for hauling freight.

S. L. Abbott, superintendent of the Sunnyside and H. Y. Climax mines, states that the 40-stamp mill at Belleco is dropping thirty stamps and that the 7200-foot aerial tramway and rock breaker at the Sunnyside head house have been completed. The Blake crusher is operated by power developed by gravity on the load-line of the tramway. At the H. Y. Climax 200 feet are to be run on the Paloduro tunnel and the shaft is being sunk 2 feet per day.

F. Brown, manager of the Jumbo mine at Hump, reports that the chlorination plant for the property will start working about January 15. When the electrical machinery arrives they will resume work on the lower tunnel, which is now in 1000 feet. Ten stamps are working at the Jumbo. F. Brown states that he has resigned the management of the Crackerjack. Work is to be started in the Little Giant adjoining the Jumbo. It has a tunnel 200 feet long, which will be driven in another 100 feet. The Mother Lode No. 2 is working twenty men. The Atlas is working twenty men and the new mill is nearly ready. The Dollar Bill M. & M. Co. of Lewiston has purchased the Oro and Denver claims at Hump from J. J. Howery of Grangeville, and will

start work in the spring. H. Heitfeld is president, E. C. Steele vice-president, G. W. Thompson treasurer and J. M. Malloy secretary.

### Owyhee County.

The War Eagle Con. M. Co. will continue Sinker tunnel in War Eagle mountain, near Silver City, under management of H. L. Woodburn. When work was suspended a year ago the tunnel was in 6350 feet. It will pass beneath the summit of War Eagle mountain at a depth of over 2000 feet and will develop a large number of valuable properties. A 16-inch air pipe of No. 24 iron exhausts the air from the tunnel. The tunnel is 8x9 feet and has a tramway laid with 30-pound rails.

### Shoshone County.

The total output of silver in the Cœur d'Alene district for 1903 was 5,471,620 fine ounces; that of lead was 207,382,448 pounds.

### Washington County.

L. Gilson, of the Idaho Gold Coin Co., in the Black Lake district, Seven Devils region, reports the new 150-ton milling plant to be working satisfactorily. The mine and mill are connected with a 2-mile tram and with one shift and a force of five men is handling seventy-five tons of ore per day. Next spring the plant will be worked up to capacity. The amalgamation and cyaniding makes a saving of over 90% of the ore value.

At the Wardenhoff the big tunnel is in 750 feet. Ninety men are employed in the entire camp. Weiser is the supply point for these mines.

## KANSAS.

During 1903 Kansas produced 1,118,000 barrels of oil. The production up to November 30, 1904, has been 4,827,756 barrels. A year ago there were less than 1500 producing wells in Kansas and the Indian Territory. Now there are more than 4000, and the number is increasing at the rate of 400 per month. J. O'Brien, assistant general superintendent for the Standard Oil Co. in Ohio and Kansas, says the 8-inch pipe line to Whiting, Ind., of which 175 miles has been laid, will be paralleled in the places where the capacity of the line will be retarded, and later the entire line will be doubled.

## MONTANA.

### Beaverhead County.

The Indian Queen mine at Farlin, in the Birch creek district, is being developed by the Amalgamated C. Co. A contract has been let at Farlin for 140,000 feet of lumber for timbering the Indian Queen. The old winze is being retimbered and the shaft is to be sunk to 1000 feet, with a pump station at the 300-foot level. The McKinley M. Co., operating at Argenta, is contemplating putting up a mill. A 50-foot shaft is being sunk and crosscuts driven on the Snowball in the Birch Creek district, owned by J. G. Jewell of Dillon and B. Stanfield of Farlin.

### Broadwater County.

R. A. Bell is shipping ore from the East Pacific, near Winston. The capacity of the mine is to be increased by placing a cage in the shaft and the addition of another boiler.

### Fergus County.

It is reported that A. S. Wright of Gilt Edge will reopen the Spotted Horse mine. The Gold Reef mine, near Gilt Edge, have put in sawmill machinery for framing the mine timbers and a condensing plant. The company has bought coal teams and wagons and hereafter will haul its own coal instead of contracting it. The mill has been enlarged and repaired. The company now employs eighty-five men.

### Granite County.

L. C. Parker of Deer Lodge is working fifteen men on the Mammoth mine, near Garnet, Granite county, owned by S. E. Laribie of Deer Lodge.

### Jefferson County.

The Eva May mine, owned by the Montana Mineral Land Development Co., and located in Cataract district, is being worked under superintendence of J. Hume. E. J. Wexel of Pittsburgh is interested. Work is done with three shifts. The company will sink 300 feet deeper, to 1000 feet depth, and drift east and west when the vein is cut at the 900. The 400-foot drift is to be lengthened to 1000 feet.

A. M. Morgan is developing the Bob Ingersoll claim, 1½ miles from the Eva May.

### Lewis and Clarke County.

The American S. & R. Co., owning the smelter at East Helena, has announced a reduction in smelter charges to conform to the reduction in rates made by the Montana Central Railway on the lower grades of ore produced at Neihart. The railway company cut down the freight rate on ores running between \$15 and \$25 a ton in silver from \$2.50 to \$1.50 a ton, and the smelter now reduces its charges on the same basis, making a saving to the

producer on this class of ores of \$2 a ton.

Near Unionville, 4 miles south of Helena, the Whitlatch Co., working the Whitlatch Union, have sunk a three-compartment working shaft 425 feet and are crosscutting. F. L. Sizer is manager.

The Pittsburg & Montana M. & S. Co. of Butte have the Spring Hill claims, 4 miles south of Helena, and are preparing to ship the iron sulphide ore to their smelter in Butte.

### Silver Bow County.

The ore hoisted by the Butte mines between June 1, 1903, and June 1, 1904, was as follows:

Companies.	Tons.
Boston & Montana	988,865
Anaconda	983,001
Colorado	206,035
Parrot	165,108
Butte & Boston	202,256
Montana Ore Purchasing Co.	212,080
Original	278,776
Hypoka	118,817
Speculator	90,352
Johnstown	15,895
Alice	7,316
Clark Leases	8,000
Lexington	3,825
Goldsmith	3,000
<b>Total</b>	<b>3,296,651</b>

The gross value of the ore extracted by the several companies is as follows:

Companies.	Value.
Boston & Montana	\$12,720,281.97
Anaconda	10,761,472.83
Colorado	1,016,497.20
Parrot	1,270,627.32
Butte & Boston	1,576,622.02
Montana Ore Purchasing Co.	1,064,014.80
Original	2,426,000.00
Hypoka	750,051.42
Speculator	761,667.36
Johnstown	271,829.90
Alice	48,684.48
Clark Leases	8,369.85
Lexington	43,489.08
Goldsmith	200,000.00
<b>Total</b>	<b>\$34,149,641.24</b>

The monthly payroll of the mines at Butte is summarized by the Anaconda Standard:

Companies.	Men Employed.	Monthly Payroll.
Amalgamated Copper Co.	6,870	\$1,130,000
W. A. Clark	1,000	100,000

### Teton County.

The well of the Swift Current-Boulder Oil Co. of Butte has been drilled 1700 feet through shales, and will be cased before drilling further.

## NEVADA.

### Goldfields District.

Goldfields, in Nevada, was revisited in November of this year by J. E. Spurr, of the United States Geological Survey. This district lies 23½ miles south of Tonopah, and was located late in the spring of 1903. Shortly after the discovery of gold in this district it was visited by Mr. Spurr. A little work was then in progress on what is now known as Columbia mountain, but up to that time no good strikes had been made. In January and February, 1904, however, rich finds were made in certain spots south of Columbia mountain. The district has now a population of 6000. The town of Goldfields has sprung up, and a number of small adjacent camps have been established. It is estimated that up to the present time \$2,000,000 worth of ore has been shipped from the district. Most of these shipments have been made in the last five months. This district is bounded on the west by a lava-capped mesa, the erosion of which has laid bare the underlying gold-bearing rock. The auriferous region is characterized by numerous low, irregular ridges standing out from the lower and more nearly level surface. These ridges owe their origin to hard reefs of quartz which form their crests. Their resistance to erosion has left them protruding thus above the general elevation, and in these quartz reefs the auriferous deposits are found.

Near the south end of Columbia mountain the rock is alaskite (an igneous rock consisting of quartz and feldspar), which is sometimes of granitic structure, and sometimes very fine grained, even resembling quartzite. White mica or muscovite is sometimes present, and pure quartz veins or dikes of similar origin also occur. These alaskitic rocks are intrusive into a dark siliceous rock (jasperoid), which is probably the result of the silicification of an original limestone. On the north end of the mountain the rock is an altered rhyolite; in this rhyolite are broad masses of white to purplish and reddish cherty quartz, which extend irregularly in a northerly direction. This quartz is a highly silicified rhyolite. The silicified areas have ill defined walls, and the highly mineralized portions which

they enclose are very irregular. The area of known ore bodies has spread since last year so far beyond Columbia mountain that values are now found over an area 6 miles square. The most productive area measures 2 to 2½ miles in either direction. The chief mines at the present time are the Jumbo, the Combination, the January and the Florence, all grouped together about a mile south of the southeast end of Columbia mountain. Some 5 miles southeast of Columbia mountain is the Diamondfields group, including the Vernal, the Quartzite, and Black Butte, from which shipments have also been made. Other ore deposits have been developed in various parts of the field. The rocks of Columbia mountain, Diamondfields, and the Jumbo group of mines were found to be rhyolites, rhyolite tuffs, andesites and basalts, all probably of Tertiary age. The alaskite and jasperoid of Columbia mountain are hardly represented in the surrounding district, although at the Tonopah Club (mine) a patch of probable jasperoid (silicified shaly limestone), in this case constituting the ore, was seen. The predominant rocks are abundant rhyolites and andesites, while basalt is rare. One andesite examined microscopically from near the Tonopah Club is a hornblende andesite, resembling the early andesite at Tonopah; a patch of basalt from near the Florence is an augite basalt, like the basalt of Siebert mountain at Tonopah. The rhyolite resembles the rhyolite of the Gold Mountain district, which lies about 4 miles south of Tonopah, on the road between Tonopah and Goldfields; and this Gold Mountain rhyolite, again, resembles closely some of the phases of the earlier rhyolite at Tonopah. The relative age of the rocks at Goldfields has not been determined, but it probably corresponds to that of similar rocks at Tonopah. At Goldfields the ores occur in both rhyolites and andesites, showing that mineralization occurred subsequent to the eruption of both lavas. At Gold Mountain the deposition of the ores evidently followed the eruption of the rhyolites, and at Tonopah the eruption of the earlier (dacitic) andesites was succeeded by a period of mineralization which produced irregular veins that frequently carry a larger proportion of gold than the locally more important veins formed after the eruption of the early andesite. There is, therefore, the possibility that the Goldfields deposits are identical in origin with the later series of veins at Tonopah. Indeed there are at Tonopah, in one place at least, mineralized quartz reefs in rhyolite tuffs that have the same peculiar characteristics as the tuffs of the Goldfields reefs; and assays of these Tonopah deposits, as was known to Mr. Spurr two years ago, have shown a moderate amount of gold and no silver.

At Goldfields there are no definite veins. The outcrops of the quartz bodies are irregular, straggling, branching, and apt to disappear suddenly. Neither were any definite systems observed, though further study might reveal them. There seems, however, to be a tendency to elongation in a northerly direction. The outcrops may even be nearly circular, or crescentic, and frequently they are roughly lenticular and intermittent. The quartz itself is gray and jaspery; it is almost entirely due to the silicification of the volcanic rock in which it occurs. Practically no ordinary crystalline vein quartz was observed. All indications show that this silicification (and the accompanying mineralization) is the work of hot springs, and that these irregular reefs represent the horizontal sections of columns of rocks traversed by rising columns of hot water. Had the rocks been strongly fractured we should have had veins, like those of the early andesite at Tonopah, which were also probably due to hot spring action; but at Goldfields the lack of such a fracture system resulted in this curious and rather unusual type of deposit. It follows that the quartz reefs will probably as a rule extend deeper vertically than horizontally, and so have roughly the nature of columns or pipes. Although showing disseminated pyrite, the greater part of one of these jaspery quartz reefs contains little or no gold. Microscopic investigation has shown in one case that in such quartz the iron of the pyrite is probably mainly indigenous—that is, that the iron sulphide has been formed by the action of sulphur contained in the hot spring waters upon the iron silicates contained in the hornblende and biotite. This explains the absence of gold, as the pyrite has the same origin as the barren pyrite near the ore bodies in the country rock at Tonopah. Within some of these barren reefs of silicified volcanic rock at Goldfields, however, prospectors have sometimes discovered portions containing gold, even in large quantities. Such portions are usually lenticular or irregular, like the main quartz reefs, and they are not easily distinguishable from the barren

quartz, except by panning or assaying; but it seems probable that these shoots are the real ore deposits, and that the mass of the reefs constitutes merely a siliceous jacket or casing, such as is shown to surround ore bodies in some other parts of the world. While this siliceous casing may be 25 or 30 feet wide, the auriferous portion may be only 1 to 2 feet; and the form and extent of this portion become evident only after the ore has been extracted. It is then seen to have a definite channel-like shape, often more regular than that of the whole outcropping reef, though it has usually a limited extent in the direction of its greatest elongation. It seems probable that these pay shoots represent the main channels of hot water circulation, while the siliceous casings are the result of the water soaking through the adjacent rock. The ores are often of very high grade. As an extreme example may be noted a shipment of 14 tons from the Sandstorm (Kendall claim), which when worked in a stamp mill yielded \$45,783 net, while the tailings still contained about \$1000 to the ton. From the McKane-Bowes lease on the Jumbo, \$600,000 was taken out in five months from a space 100 feet horizontally and 200 feet vertically on the shoot. One small shipment of 917 pounds of ore from this lease gave gross returns of \$4766. The whole production of the camp has been from ore which may be roughly estimated as averaging \$200 to \$300 per ton, or more. The values are all in gold—silver is usually practically absent—although the shipping ore from the Combination mine contains from 1 to 3 ounces. It is important to consider the origin of this rich ore in order to make prophecies for the future. Most of that which up to the present time has been extracted has been oxidized ore. The ores are mixed sulphides—usually pyrite and oxides—clear up to the surface. The oxidized material, which follows cracks and seams, is usually several times—sometimes several hundred times—as rich as the unoxidized portion. The irregular spongy nature of the free gold particles in such oxidized material completes the proof that this gold has been dissolved and re-deposited in a concentrated form during the process of oxidation. Iron sulphate derived from oxidation of the pyrites is the probable agent. Other sulphates, such as alum and gypsum, are abundant. These oxidized ores are prepared for shipment by screening, the fines being shipped and the coarse quartz rejected. As the water level at Goldfields is usually high for this desert country—water having been encountered in several shafts at from 150 to 200 feet—it is plain that this oxidized ore is only a temporary supply. In the Combination and the Florence, however, sulphide ores of very high grade have been found below the oxidized zone. In these mines a dark gray copper-bearing mineral, which is very rich, is most intimately connected with the gold. A specimen from the Combination, analyzed by Dr. Hillebrand, proves to be a sulpho-salt of copper, antimony and arsenic, which, so far as qualitative composition goes, may be tetrahedrite. Tellurium is also present in this ore, and the same element has been reported elsewhere in the district. Therefore, the sulphide ores may be very rich. Moreover, while the difference between the oxidized and the unoxidized portions of the ores within the zone of oxidation is in general so great, certain shoots occur, as in the January and the Jumbo, where the unoxidized quartz of this zone is of extremely high grade. Such ore appears to be mostly pyrite, but in view of the fact that tellurium is found in the district, it is very possible that gold telluride may be present. It appears probable that the rich oxidized ores owe their richness not primarily to concentration during oxidation, but to the existence of shoots of rich antecedent sulphide ore. It is probable that some of these sulphides are primary, while others have been formed subsequently to the main silicification of the reef, as in the Combination mine. Here the rich auriferous sulphides have formed in a broken zone in the silicified barren reef, and occur as seams and often as coatings on the pebbles in the breccia. The question arises, however, as to whether the subsequent mineralization was the result of descending or ascending waters. Concerning this the evidence is not conclusive, but there is no sufficient evidence that these rich ores have been concentrated from the lean antecedent quartz mass. The presence of elements like arsenic, antimony and tellurium in the subsequent sulphide ore suggests a deep-seated origin. Beside the element mentioned above, bismuth occurs in the ore. In the January it occurs in the oxidized ores in the form of silvery scales, which is, as determined by Dr. Hillebrand, bismuth—perhaps the oxide bismite. In the Combination, long needle-like crystals have been found, which, according to the man-

ager, Mr. Collins, give the chemical tests for bismuth sulphide—bismuthinite. The silvery mineral above noted is sometimes found in the January, arranged in long rod-like forms, and these are probably pseudomorphs after the sulphide. In the January this silvery mineral is usually, but not always, an indication of rich ore. Barite is a common mineral in all these deposits, but is not abundant. The indications are, therefore, not unfavorable to the continuance of high grade, or at least good grade, ores down to considerable depths. There is, however, as has been already demonstrated by exploitation, no continuous regularity to the ore shoots, whether sulphide or oxidized. They are curving, irregular, and often lenticular, but it may happen that below a shoot which has come to an end another shoot may be found occupying a slightly different relative position, or even overlapping the first. Similarly, the main quartz masses as a whole can be expected to show little regularity in depth; they may increase in size, or diminish, or even disappear, at least temporarily.

#### Lincoln County.

F. Palmer, president of the Louisiana Purchase M. & M. Co., has bought four copper claims, 11 miles east of Caliente, from H. Empey and W. Keele, and will develop them.

#### Nye County.

The Pacific Construction Co. of San Francisco, Cal., H. L. Willis local superintendent, has laid 8-inch pipe to Tonopah from Rye Patch, where fifty wells have been sunk to supply water.

Electric power will undoubtedly be supplied to operate the gold mines of Tonopah and Goldfield, but it does not seem likely that each of the following apparently well authenticated statements can be true. The Tonopah Bonanza says that the Owens River Water & Power Co. has begun the actual work of constructing their power plant upon the Owens river. They have purchased the land and water rights held by W. C. Watson and associates and those of Booth, Brougher & Parker, so that they have 6 miles of the river. The Owens river is the only stream within a radius of 150 miles of Tonopah that does not freeze up during the winter months. One of the reasons is its large volume and the large flow of hot water into the river from the Diablo hot springs. This insures continuous power every month in the year. W. E. Condon is at work with a party upon the final surveys for the hydraulic development and transmission line. This power will be distributed both to Tonopah and Goldfield, and the line will go as far south as Bullfrog if the demand for current warrants the expenditure. Specifications for the electrical machinery and water wheels are ready and the contracts will be let at an early date. The company intends installing three 1500 K.W., 25-cycle generators in their first power house. The distance from the power house to Tonopah is 87 miles and to Goldfield 78 miles. This line will pass through Silver Peak. The surveying corps will reach Tonopah about Jan. 5th.

E. DeSaba and J. Martin of the Bay Counties Power Co. and F. Drumm of the Tevis estates will build an electric power line 120 miles into Tonopah and Goldfield from Lavinia and Rush creeks, which flow into Mono lake. T. L. Oddie of Tonopah is interested.

### NEW MEXICO.

#### Grant County.

The North American M. Co. of the Lordsburg district has put in power drills. —S. W. Maltbie of the Boney M. Co. of the District of Columbia is in Lordsburg developing claims purchased in the Lordsburg district.

#### Rio Arriba County.

A rich platinum strike is reported on the Piedra lumber grant, on which J. Carpenter of Denver, Colo., holds an option. The Bromide district is 14 miles west of Tres Piedras, in the Conejos range. Burnt mountain and Kiowa mountain form natural boundaries on the north and south, and the Tusas and Vallecitas rivers on the east and west. The Western Review gives an extended account of the prospects of this region, showing that much development work is yet to be done. The ore is a gold and silver proposition with a copper base. The shaft of the Sixteen to One, owned by Green Hall, is down 150 feet. The Danbury, belonging to J. P. Rinker, is down 100 feet with crosscut. The Whale has a 50-foot and a 100-foot shaft; belongs to estate of A. Royal. The Keystone M. Co. has a 250-foot shaft with hoist and engine on the Payroll. The St. Michael M. & M. Co., R. Cole, manager, have developed with a combination hoist and 60 H. P. boiler. The Tusas Peak G. & C. Co., F. Bolton, manager, are developing the Tampa through a 390-foot shaft, which is to be continued to 500-foot level. The Straw-

berry, operated by the New Mexico M. & M. Co., has a 60 H. P. boiler, hoist and Norwalk compressor and pump. An electric drill has been put in the 700-foot tunnel of the Dillon Development Co.

#### Sierra County.

R. Woolsey has returned to Hillsboro from a trip East, where he organized a company to work claims in the placer fields, near Hillsboro.—The Empire G. M. & M. Co., owning the Good Hope-Bonanza mine and mill, near Hillsboro, estimates that the output for December will be \$6000.

#### Socorro County.

The Kelly mine at Kelly is employing seventy-five men and producing fifty tons of ore daily. L. A. Babcock is superintendent.—Under the management of J. Brown the Graphic mine, near Magdalena, is producing six cars of zinc ore a week, employing thirty-five men.

#### Taos County.

The Red Fissure M. & M. Co. of the Bromide district is planning to put in machinery for treating of ore. The workings have reached the 300-foot level.

### OREGON.

#### Grant County.

At the Copperopolis mine, Quartzburg, Manager W. W. Gibbs states that the new tunnel has reached the Copperopolis vein, it having been thrown farther than was first estimated. The ore is chalcopyrite in quartz gangue, estimated to carry 12% copper, \$15 gold and 3 ounces of silver per ton.

J. Waddell, manager of the Prairie Diggings mine, near Prairie City, says that the Jupiter G. M. Co. of Ann Arbor, Mich., will resume mining and milling operations at the Prairie Diggings in the spring.

#### Josephine County.

At the Golden Spike claim on Wagner creek, near Talent, the main tunnel is in 670 feet and 180 feet of shaft has been sunk to connect with the tunnel.—J. T. Pierce & Co. of Gold Hill have bonded land on Kanes creek and are prospecting with two drills, intending to put in a dredger.—The Lois mine on Briggs creek, operated by the Lois M. Co. of Portland, N. M. Bain manager, has 270 feet of tunneling and is milling with an arrastra, run by a water turbine wheel. Development work will be continued all winter and next summer, if the ledge continues to show up good; a large mill will be erected.

The Crescent M. & M. Co., owning eighty acres of land on the Applegate, near Murphy, are developing their ledge and may put in a 10-stamp mill. C. Richton, secretary and manager, is at the mine. A. A. Pompe of Vancouver, Wash., is president.—The Maid of the Mist, on Thompson creek, owned by H. M. White of Portland and B. Thurston of Applegate, has 180 feet of development work.

The Strong ledge on Applegate, near Murphy, has been bought by the Michigan M. & M. Co., C. D. Peters, president, and R. L. Sowers, secretary and treasurer, at Charlotte, Mich. W. T. Perry of Portland is vice-president and manager. The 100-foot shaft will be sunk another 100 feet and drifts will be run at the 50-foot level and 100-foot levels. If sufficient water can be had from the mine, the mill will be placed at the mine, otherwise on the banks of the Applegate river,  $\frac{1}{2}$  mile from the mine, and the ore transported by a gravity tram.

The metal occurring as black, irregular nuggets which has been found in the placers of western Josephine county has been identified by the chemists of the United States Geological Survey as a natural alloy of nickel and iron, containing 23.36% iron and 60.47% nickel, from which is deduced the chemical formula  $Fe_{1.5}Ni_{1.5}$ . It differs from meteoric iron in containing no phosphorus. The nuggets range in size from that of a grain of sand to a goose egg. They are found particularly along the serpentine belt of western and southern Josephine county. This is the only district in the world where the strange alloy is known to exist. It has been called josephinite.

### SOUTH DAKOTA.

The report of Thomas Gregory, State Mine Inspector, gives the production of the mines of the State as \$7,090,481.71 in gold bullion for the twelve months ending November 1, 1904. There are 3500 workers in the mines, and the average daily pay of the miner is \$3.50; helpers, \$3; and ordinary shovelers and mill hands, \$2.50. The average daily tonnage milled is 5700.

#### Lawrence County.

The Victoria M. Co. has elected A. B. Smith of Omaha president; A. C. Smith, Omaha, vice-president; A. J. Malterner, Deadwood, treasurer; J. C. Carson, Deadwood, secretary; W. M. Glass, Omaha, managing director; G. S. Jackson, Dead-

wood, general manager. The company decided to erect a 200-ton cyanide plant at its mine on Spearfish creek at Maurice station in the spring. The plans drawn by J. Hartgering, millwright, were accepted. The mill will be built close to the Burlington standard gauge track, and the ore will be trammed about 3000 feet.—The Custer Peak M. Co. will put up an experimental plant on its property south of Custer Peak.

The Victoria G. M. & M. Co. will put in a 200-ton dry crushing cyanide mill near Maurice station, on the Spearfish branch of the Burlington railway, 1300 feet from the mine. An aerial tram of this length will deliver the ore. The mine will be equipped with electric cars that will dump automatically into the buckets of the tramway. Steam will be used for power. J. Hartgering is millwright; G. S. Jackson of Deadwood, general manager.—The Imperial mill at Deadwood is treating 4000 tons per month, and making a gold production of \$22,000. Plans are made to increase the leaching capacity of the mill 50%. W. S. Elder of Deadwood is president of the Imperial G. M. Co., and T. J. Milliken mill superintendent.

#### Pennington County.

The Black Hills Electric Power & M. Co. controls 1280 acres of mineral and timber land and several miles of water rights on Rapid creek, between Mystic and Pactola, to expend about \$15,000, and will put in a placer plant with a capacity of 2500 yards of gravel daily. S. E. Ockerlund, Chicago, is president; C. A. Hutchinson, Chicago, secretary; J. F. Skeel, Joliet, Ill., treasurer.—At Keystone the Lucky Boy mine is being developed by J. G. Mattes. On the 300-foot level drifting and crosscutting is being done.—F. H. Long of Keystone expects to put a mill on the Bullion.

The Gopher M. & M. Co. of Hill City has bought the 5-stamp mill of the Sunnyside Co. and will remove it to the Gopher mine. The plant will be completely overhauled and some new machinery added to complete the equipment. A. D. Arundel is the general manager.

### UTAH.

#### Salt Lake County.

Manager A. L. Jacobs of the Butler-Liberal at Bingham says that they will be shipping copper ore by the first of the year. J. Langton is secretary of the company at 221 State street, Salt Lake City, Utah.

The management of the Boston Con. at Bingham has resumed ore shipments, after a shut-down of over a month. During the year the Boston has mined 50,000 tons of ore, treated at the Bingham Con. smelter. L. S. Cates is superintendent of the Boston.

#### Summit County.

At the Comstock, at Park City, Superintendent J. Hickey and Manager M. Dusseldorf have ordered a 5-drill Rand compressor, piping, hose and other materials and equipment, and a large water heater to be used with the boilers.

Manager W. I. Snyder of the California mine, near Park City, says that the property has been turned over to the stockholders and that all indebtedness would be cleared off by the first of February, after which the development of the mine will be continued.

### WASHINGTON.

#### Ferry County.

D. F. Anderson of Rosalia, president of the Belcher Co., says that the company will put in a compressor at the Belcher mine, near Republic. A wagon road from West Fork has been completed. They are working twenty-five men on the Mountain Boy and are shipping silver ore.

### FOREIGN.

#### AUSTRALIA.

##### New South Wales.

The gold yield of New South Wales for November amounted to 37,087 ounces, valued at £125,224. The yield for the first eleven months of the present year was 284,582 ounces, valued at £1,024,736.

##### Western Australia.

The output of black tin for the year showed an increase compared with 1902 of £16,107, with an excess of 197 tons, or an increase in tonnage of 32%. The quantity of coal showed a decrease of 7457 tons, the value of the output being £17,060 less than that of the previous year, owing to the stoppage of the Collie Proprietary mine because of a labor dispute. Boring operations for coal are being carried on near Mingenew. The copper ore produced during the year was 20,526 tons, valued at £56,541, as against 2262 tons for 1902.

The production of silver, obtained as a bye-product, was 168,113 fine ounces, valued at £19,153. The production of

ironstone and limestone was 220 tons and 1280 tons.

The report of the Department of Mines shows that the value of the total mineral output for 1903 was \$8,971,937, an increase of 11% on the value for 1902, 97% of this being gold; the total gold output for the year being valued at \$8,770,719. The number of men engaged in gold mining was 20,716. The gold output was 2,064,801 ounces. East Coolgardie showed an increase of 157,012 ounces, Murchison 30,977 ounces, East Murchison 11,587 ounces, North Coolgardie 10,410 ounces, Broad Arrow 10,294 ounces, and West Pilbarra 5936 ounces. There were sixteen State batteries—seven equipped with cyanide plants, one tin dressing plant and one Huntington mill in operation—treating 49,233 tons, yielding 58,305 ounces, valued at \$221,567, an increase of 25% over 1902, and an increase in gold of 1050 ounces. The total tonnage cyanided for the year amounted to 32,369 tons, which produced 6582 ounces fine gold, valued at \$28,016. The value of gold produced by battery and cyanide treatment during the year amounted to \$249,583.

## BRITISH COLUMBIA.

The ore shipments for November from mines in Kootenay and southern Yale were: Bluebird at Sandon, 20 tons; Slocan Star at Sandon, 264; Payne at Sandon, 17; Reco at Sandon, 87; Ruth at Sandon, 29; Black Grouse at New Denver, 30; Idaho at Three Forks, 40; Ivanhoe at Sandon, 130; Club at Slocan Lake, 6; Graphic at Slocan Lake, 4; Neepawa at Slocan Lake, 30; Ottawa at Slocan Lake, 130; Rob & Robin at Slocan Lake, 2; Wakefield at Silverton, 24; Enterprise at Slocan Lake, 20; Kokanee Chief at Kootenay Lake, 17; Lucky Boy at Trout Lake, 20; Triune at Trout Lake, 30; Silver Cup at Trout Lake, 126; Silver King at Nelson, 100; Iron Mask at Kamloops, 278; Alice at Creston, 52; Alice at Creston, 39; St. Eugene at Moyie, 572; St. Eugene at Moyie, 488; St. Eugene at Moyie, 666; American Boy at McGuigan, 21; North Star at Kimberley, 222; Last Chance at Sandon, 42; Lucky Jim at Bear Lake, 97; Vanmoerkkerke at White-water, 15; Whitewater at White-water, 24; Hunter V. at Ymir, 24; Hunter V. at Ymir, 940; Hunter V. at Ymir, 302; Hunter V. at Ymir, 1159; Kootenay Belle at Erie, 20; Queen at Salmto, 20; Relief at Erie, 20; Ymir at Ymir, 209; Le Roi No. 2 at Rossland, 2070; Center Star at Rossland, 9433; War Eagle at Rossland, 5023; Jumbo at Rossland, 1728; White Bear at Rossland, 120; Athelstan, Boundary district, 744; Brooklyn, Boundary district, 848; Brooklyn, Boundary district, 6140; Emma, Boundary district, 591; Emma, Boundary district, 156; Emma, Boundary district, 1563; Stemwinder, Boundary district, 610; Stemwinder, Boundary district, 336; Sunset, Boundary district, 1120; Arlington at Erie, 93; Granby mines at Phoenix, 44,670; Oro Denoro, Boundary district, 139; Senator, Boundary district, 314; Skylark, Boundary district, 40; Mother Lode, Boundary district, 11,730; Last Chance, Boundary district, 30; Elkhorn, Boundary district, 44; E. P. U., Boundary district, 20; Providence, Boundary district, 20; Le Roi, at Rossland, 10,327. Total, 104,337.

### Boundary District.

At the Nickel Plate the 3½-mile tramway from the mine to the mill at Hedley City has been in operation for several months. The 40-stamp mill has been running since June, and it is stated that it is to be increased to 100 stamps by the Daly Reduction Co. It is on the east side of Twenty-Mile creek. M. K. Rodgers is manager.

The Montreal & Boston Con. Rawhide mine at Phoenix is shipping to the company's smelter at Boundary Falls, where the second furnace has been blown in. The 300-foot tramway is working in good shape.

The British Columbia Institute of Assayers met recently and elected the following officers to serve during 1905: President, W. F. Robertson, provincial mineralogist, Victoria; vice-president, A. J. McNab, Canadian Smelting Works, Trail; secretary-treasurer, A. A. Cole, Center Star mine, Rossland. The following were elected members of the council: J. C. Welch, smelter manager, Montreal & Boston Copper Co., Boundary Falls; A. McKillop, Nelson; T. Kiddie, smelting manager Tyee Copper Co., Ladysmith; H. Carmichael, provincial assayer. The following scale of minimum assay charges is recommended by the Institute for use throughout the province:

### FIRE ASSAYS

Gold	\$ 1.50
Silver	1.00
Lead	1.00
Gold, silver and copper in one sample	3.00
Gold, silver and lead in one sample	3.00

### WET ASSAYS.

Alumina	2.50
Antimony	5.00
Arsenic	5.00
Chromium	5.00
Cobalt and nickel, not separated	5.00
Cobalt, separate from nickel	10.00
Copper	2.00
Iron	2.00
Lead	2.00
Lime	2.50
Magnesia	3.00
Manganese	5.00
Nickel separated from cobalt	10.00
Phosphorus, rough determination in an ore	5.00
Silica	3.00
Silica, insoluble matter, no fusion	1.00
Sulphur	3.00
Zinc	2.50

For control work, i. e., assayed in duplicate, add 50% to above figures. For umpire work, i. e., assayed in triplicate, or more, double above figures. Discounts—When five samples are submitted at one time, 10%; when ten or more samples are submitted at one time, 20%. "The Extraction of Oil in Oil Concentration Products," by L. C. Wynne; "The Determination of Silver in the Sulphide Ores of the Slocan," by D. Lay, were read.

### Nelson District.

The discovery of 10 feet of good ore in 600 feet on the crosscut level and 500 feet below 10 feet of similar ore on the surface indicates that the Foghorn at Ymir has a continuous shoot. C. Wolfe, superintendent of the Golden Monarch Co., owning and operating the Foghorn, expects that a milling plant will be put in.

### New Westminster.

J. C. McClure has found fire clay 3 miles from Abbotsford. The first deposit discovered at Matsqui, B. C., was found to contain sufficient iron to render it of no value as fire bricks, though it was suitable for building bricks and other purposes. The present deposit contains but 1.8% iron.

### Slocan District.

The annual report of the Hastings Syndicate, operating the Arlington mine at Erie, shows a year of profitable work. Leslie Hill, the local manager and engineer, reports that the ore shipped to the smelter realized \$47,300 after deducting cost of freight and treatment. During the year 1170 feet of development work was accomplished, at a cost of \$7.66 per foot. The 1086 tons of clean ore shipped to the smelters averaged, gold \$52.40 a ton, silver \$3.73. The net profits were \$14,666. A cyanide plant will be put in at the Chateau mine, near Slocan City, by Fred Stock, who has leased the property. Twenty-five and thirty men are employed in two shifts, and two cars of the best ore are being sent monthly to the Trail smelter.

### Yale District.

(Special Correspondence).—M. K. Rodgers, representing the Daly Reduction Co. of Montana, and manager of the Nickel Plate mine at Hedley, Similkameen, B. C., has bonded the Maggie group, on the Bonaparte river, north of Hat creek, from Wm. Hocking and L. M. Harley of Butte, Mont., for \$2400. The ore occurs as brass-yellow octahedral crystals in a cherty quartz of the Cache creek formation, which extends 60 miles from Spence's Bridge, on the Thompson, to north of Clinton, with an average width of 5 miles. It contains thin beds of limestone, dark argillites, cherty quartzites and serpentine. The eruptives are decomposed diabase-porphyrates.

Ashcroft, Dec. 20.

## CANADA.

### Ontario.

At the Williams iron mine, on the Algoma Central Railway, north of the Soo, new bodies of hematite ore have been struck, showing 23 feet of clean ore with 10 feet of second-grade ore, in a total width of 60 feet. This is a new field. North of Temagami iron pyrites and arsenical pyrites prospects are promising. The Huronian Co., a subsidiary of the Canadian C. Co. of Copper Cliffs, is completing water-power works at the falls on Spanish river, 4 miles north of the Canadian Pacific Railroad, at Turbine. They are to be of concrete, and 11,000 H. P. is to be developed. It is expected that the copper company's mines and smelters will be operated by this power next year at a much lower cost.

J. Wharton of Philadelphia, Pa., has extracted 3000 ounces of palladium from 300,000 tons of refuse from the nickel smelting furnaces of Sudbury. Palladium is of value because of its high fusing temperature, which makes it suitable for crucible evaporating dishes and in the chemical laboratories, while its silvery appearance and non-corrodible property makes palladium valuable to the maker of delicate instruments, such as chronometers, verniers, surgical instruments, etc. Palladium is not mentioned in any of the reports of the Dominion of Canada or in the metallic and mineral resources of the Dominion.

### Yukon Territory.

L. Bergholz, American Consul at Dawson, gives the following information to the Department of Commerce and Labor: The Yukon Territory, which prior to 1898 formed a part of the Northwest territory, has an area of 196,976 square miles, 196,327 being land and 649 being water; the population is estimated at 12,000, of whom 7200 are Americans. It is purely a mineral country and has produced since 1885, when the output of gold was first recorded, to the end of 1903, \$97,063,500 in gold. During the same period the gold mined in the Saskatchewan district was valued at \$292,946; in the Province of Ontario, \$2,086,393; in the Province of Quebec, \$103,940; in the Province of British Columbia, \$40,545,398, and in Nova Scotia, \$9,318,984; a total of \$52,347,661. Dawson has a population of 3500 persons, the Americans with 2450, greatly predominating and forming 70% of the total. The city is easily reached during the season of navigation (from about May 15 to October 10) in six to eight days from Seattle, Wash., or Vancouver, B. C., by three lines of steamers to Skagway, Alaska (three to four days), where connection is made by rail to White Horse (one day), the head of navigation on the Yukon river. From White Horse the White Pass Line runs comfortable boats to Dawson in from three to four days. The company operates, between White Horse and Dawson, twelve vessels and five barges, with capacity of 3500 tons. During the season of 1904 it handled 22,417 tons and carried 4932 passengers. Passenger rates from Seattle to Dawson are \$80 first class and \$65 second class. Freight rates from Seattle to Dawson by the carload are \$3 to \$4.25 per 100 pounds. Commodity rates from the Pacific coast points during the midsummer are \$2.37 per 100 pounds. From Dawson the rates to Eagle, Chena or Fairbanks, and Fort Gibbon, Alaska, are, per ton, \$10, \$70 and \$40, respectively. The White Pass Rail Division between Skagway and White Horse, 111 miles, operates daily passenger and freight service, with a capacity of at least 5000 tons a day. The company is under the Canadian flag, but American capital is largely invested in it. There is a second though much longer route, taking twenty-three days, from Seattle to Dawson by way of St. Michael, Alaska. Two steamboat lines, both American, run on the lower Yukon river between St. Michael and Dawson—the Northern Commercial Co. and the North American Transportation & Trading Co. The former operates twenty-two steamers and barges, with a total net tonnage of 7851 tons, and the latter nine steamers and barges, with a total gross tonnage of 6083 tons. The passenger rate by these two lines is \$125 from Seattle to Dawson, and the average rate per ton on freight is \$60. Besides the boats of the above companies, there are eleven independent steamers, American and Canadian, plying between White Horse and Dawson and points in Alaska on the Yukon river. Some of these have comfortable accommodations for passengers. Postal rates from the Yukon Territory are the same as from other points in the Dominion of Canada. From October to May, only first-class matter and single copies of newspapers are brought (by stage) by the postal authorities to Dawson. Other mail matter will, if requested, be forwarded by express on the stage, the charge to be paid by the consignee.

## MEXICO.

### Chihuahua.

On the Cusihiuiriachic district, 85 miles west of Chihuahua, Jones and Dixon are prospecting and developing near the Josephina. The 70-foot shaft is to be sunk deeper. MacManus and Urueta have the Santa Rita shaft down 121 feet. They have put in a gasoline hoist, and expect to have their water jacket furnace in operation early in the new year: the La Reina mine, worked by C. Barbier and F. Ramirez, has been producing silver by pan-amalgamation since April; at Milpillas, 18 miles southwest of Cusihiuiriachic, the lead mines are attracting attention and a number of denouncements have been made. Vanadium has been found as vanadate of lead.

The Parral Corporation, under the management of C. R. Henderson, is working the San Patricio mine, north of the Palmilla mine, in Parral district. H. H. Miller is superintendent.—Pedro Alvarado is equipping the Palmilla mine with electric Worthington turbine pumps—a six-stage turbine built in two sections, with a 100 H. P. motor between, throwing 500,000 gallons per day against a 600-foot lift, and two sinking pumps with a combined capacity of 500,000 gallons per day.—A. G. Urquhart is working the La Esmeralda mine, in Parral district, and has put in a steam hoist.

According to the Mining Journal, the following gives the relative importance

and exploitation of the mines in the district of Hidalgo: La Palmilla, owned by P. Alvarado, Parral; El Refugio, owned by F. A. Garcia, Parral; Quebradillas, owned by F. Stallforth, Parral; Los Muertos, owned by J. Almazan, Parral; Terrenates, owned by J. J. Long, Parral; La Presena y Anexas, owned by J. Almazan, Parral; La Sierra Madre, owned by J. Sandoval, Parral. On a small scale: Guadalupe, owned by V. Visconte, Jimenez; San Patricio, owned by F. Gomez, Parral; Las Cruces, owned by Hidalgo M. Co., Parral; La Esperanza, owned by P. Alvarado, Parral; San Juanico, owned by Hidalgo M. Co., Parral; Santa Ines, owned by J. M. Botello, Parral; La Union, owned by Parral M. Co., Parral; Mina del Agua, owned by Montezuma Lead Co., Santa Barbara; San Francisco del Oro, owned by Cia. San Francisco del Oro, Santa Barbara; Tecolotes, owned by Guggenheim Bros., Santa Barbara; El Toro y Anexas, owned by Cia. del Toro, Santa Barbara; San Jose y Anexas, owned by N. Pettit, Parral. The following refining plants have been regularly working: Patio of F. Stallforth, Lixiviation Two of Angel Garcia and Parral M. Co. The following are agencies for buying metals: The foundries of Monterey and Torreón, the Stallforth plant and five others.

The Mines Corporation, Ltd., is developing the Senorita mine in Victorino camp, 25 miles north of Chihuahua, under management of G. H. Arlett.

### Durango.

The State Government of Durango has contracted with the America-Mexico M. & Dev. Co. to build a smelter and reduction plant at San Lorenzo, on the Velardena branch of the Mexican International railroad. It is to be a 60-ton McDonald pyritic smelter, to be followed by a 100-ton furnace of the same kind.

### Guerrero.

(Special Correspondence).—In the La Union district, Americans are working the rich placers of the Rio Petatlan, 30 leagues from the port of Siuatanejo. Siuatanejo, Dec. 13.

### Mexico.

G. B. Burbank and G. S. Simons of New York are in Mexico, planning to utilize Malinaltenango Falls for power purposes. The falls are in the Tenancingo district of the State of Mexico, 45 miles southwest of City of Mexico. The volume of water is small, but it drops a distance of 2740 feet, and it is estimated that 25,000 H. P. can be generated. It is proposed to supply power to surrounding mining camps, and transmit it to City of Mexico for manufacturing purposes.

### Michoacan.

(Special Correspondence).—At the mines of the Carrizal G. M. Co., in the Ario district, a steam hoist is being installed at the main shaft. The second level of the main shaft has been connected with shaft No. 3. Sinking is in progress below the third level, the west face of which contains ore 4 feet in width, assaying \$20 per ton. A new grinding mill has been added to the milling plant. Owing to the copper in the ore, the cyanide tests have proved a failure. Over 80% of the values are saved on the plates by amalgamation. C. Briscoe is chemist.—The Columbia mine, east of Carrizal, owned by Hampson & Smith, has suspended work. It is a copper claim containing shipping values in gold and silver.—A big body of iron-copper ore has been struck between Ario and Morelia, near the Mexican National Railway. An assay of a hand-sample gave returns of 70% iron, 11% copper, 8 ounces silver and \$7 gold. It has been denounced by Ario-Carrizal parties.

Carrizal, Dec. 15.

### Sonora.

The annual report of the Greene Con. copper mines, Cananea, for year ending July 31, 1904, shows the production from the smelters to have been 27,507 tons of fine copper, 479,350 ounces of silver and 3752 ounces of gold, with a gross value of \$7,340,180. The total receipts for the year were:

27,414 tons of copper sold	\$5,901,584.75
7,555 tons of copper on hand	1,887,256.53
Value of silver produced and on hand	305,723.70
Value of gold produced and on hand	92,291.76
Profit on store, etc.	14,803.69

Total	\$9,501,660.43
Cost of operations	7,727,401.05

Net profit on operations for year \$1,774,259.38

Of the profit \$518,400 was paid in dividends. There were mined 489,352 tons of copper ore and 147,099 tons of lime, iron and fluxes; 262,466 tons of ore were smelted; 209,868 tons concentrated; 12,745 tons exported. The total cost of smelting and converting was \$3.19 per ton less for the last quarter of 1904 than the average for 1903.

The dredge of the Chicago & Sonora Gold Placer M. Co., on the Tecoripa river near Suagui Grande, is in operation.

Personal.

T. L. GREER of Chihuahua, Mexico, is in Peru.

F. H. NASH is manager of the Deer Lick mine at Spearfish, S. D.

T. C. WOODWORTH is putting in a 10-stamp custom mill at Goldfield, Nev.

G. S. JACKSON is manager of the Victoria G. M. & M. Co. at Deadwood, S. D.

J. CLEAVER is superintendent of the Libertad mine, near Toledo, Sonora, Mex.

O. K. FRANKLIN has returned to Nogales, Ariz., from a business trip to Chicago, Ill.

R. E. LINDER of You Bet, Nevada county, Cal., has been visiting Bellingham Bay, Wash.

R. H. BROWN is manager of the Yaqui Copper Co. mines at Suaqui de Batuc, Sonora, Mexico.

EMERSON GEE of Los Angeles, Cal., is in Sinaloa, Mex., and will return to Los Angeles Feb. 1, 1905.

S. B. SMITH is superintendent of the Mina Grande, near San Antonio de la Huerta, Sonora, Mex.

C. OLSEN is manager of the Pacific Concentrating M. & M. Co. at San Pedro, Santa Fe county, N. M.

J. U. JONES of Dallas, Texas, will hereafter represent the Allis-Chalmers Co. in Texas and its tributary territory.

WM. CAPP is manager of the Eagle Rock G. M. & R. Co. and the Siloam M. Co., Sugar Loaf, Boulder county, Colo.

E. O. DAUE has returned from the mines of La Leonesa M. Co. at Matagalpa, Nicaragua, C. A., and is stopping in Oakland, Cal.

H. J. RYAN of Cornell has been appointed head of the department of electrical engineering at Stanford University, California.

J. C. SMITH of San Francisco, Cal., has succeeded C. C. Leavitt as superintendent of the Monumental mine, at Monumental, Josephine county, Or.

W. L. WATTS has returned to Los Angeles, Cal., after spending several months investigating the mineral resources of south central Mexico.

SAMUEL J. HENDY, proprietor of the Joshua Hendy Machine Works, has returned to San Francisco, Cal., from an extended European tour.

R. L. EDWARDS, manager of the Burton mines at Ulysses, Lemhi county, Idaho, has been consulting with stockholders at Houghton, Mich.

J. M. PURRINGTON succeeds the late C. E. Elliott as San Francisco secretary of the Chollar, Potosi, Brunswick lode and other Comstock, Nev., mining companies.

H. SCHIFFLIN has been made assistant manager of the mining and crushing machinery department of the Allis-Chalmers Co., with headquarters in the New York Life Building, Chicago.

J. M. WILSON of Chihuahua, Mex., has resigned as manager of the Hearst interests in Mexico, to manage the mining interests of the Ryan Syndicate and the Morton Trust Co. of New York.

W. L. LOVELAND, the newly appointed head of the mining and crushing machinery department of the Allis-Chalmers Co., took up his duties October 18th at the main offices of the Allis-Chalmers Co., Chicago.

Commercial Paragraphs.

THE Pacific Construction Co. of San Francisco, Cal., have the contract for building the South Front St. bridge, Portland, Or., for \$58,000.

THE Pacific Hardware & Steel Co. of San Francisco, Cal., has bought the entire business of the Pacific Pump & Windmill Co., of the same city, and will hereafter handle all sales through its main office.

THE Springfield Boiler & Mfg. Co., Springfield, Ill., report the following installations: Twenty-eight 800 H. P. internally fired boilers for the Union Electric Light & Power Co., St. Louis; water jacketed smelters for the California & Arizona M. Co., Bisbee, Ariz.; four sets of water jacketed smelters for the Serro de Pasco M. Co., Brazil.

Books Received.

Upon studying the current engineering literature it is noticeable that the contributions often deal with difficult and unusual cases, ignoring the common details. These are undoubtedly suggestive and valuable to the practicing engineer, but he would also appreciate a detailed description of another man's solution of some problem that he meets in his own everyday practice. C. E. Fowler has brought together a concise statement of actual methods in "Ordinary Foundations." This was written with special reference to the needs of the bridge constructor, but contains much information that will aid in working in treacherous ground. After briefly tracing the historical development, the author minutely describes the construction and practice of various cofferdams, including crib dams, pile driving, sheet piles, metal construction, cylinders and caissons. The degree of success attained in their construction is indicated by the amount of pumping necessary to keep the interior dry. Methods and costs of pumping and dredging are fully discussed. All the elements entering into the choice and necessities of location and design for foundations are detailed, and he then advises as to what construction is best for different conditions. The materials of construction and typical specifications close the work. The subject is presented in a clear and able manner that will prove valuable to both the student and practicing engineer. It is published by John Wiley & Sons, 43-45 East 19th street, New York City, at \$3.50. It will be sent postpaid by the MINING AND SCIENTIFIC PRESS upon receipt of price.

Trade Treatises.

Friskie clutch pulleys form the subject of the story tersely told by the Eastern Machinery Co., New Haven, Conn., in their catalogue, which can be had for the asking.

"Bombas de Vapor" is the Spanish edition of a descriptive catalogue from the A. S. Cameron Steam Pump Works, foot of E. 23rd St., New York City, which is of much interest to all who use the Castilian tongue.

One of the neatest and handiest of the Christmas and New Year remembrances received is a handsome diary and reference book from the Vulcan Iron Works Co., Toledo, O., "chcock" full of up-to-date information.

Flour City gasoline engines, stationary and portable, are portrayed in a fine trade treatise received from the Kinnard-Haines Co., 44th Ave. North and Bryant Ave., Minneapolis, Minn., containing illustrated description and numerous testimonials of their successful operation.

The Word Bros. drill maker and sharpener, a labor-saving and money-saving machine, is finely described in a handsome booklet, issued by Word Bros., 24 First St., San Francisco, Cal. It will be sent anywhere on request and is worth seeing by any one who has anything to do with making or sharpening drills.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CANISTERS.—No. 778,065. Dec. 20, 1904. C. A. Norvell, Sacramento, Cal. This invention relates to an improved receptacle or container for teas, coffees, spices and the like. Its object is to provide a novel device of simple construction for use particularly as an advertising medium for grocers and others to be used by their customers exclusively or the buyers of their own particular wares or merchandise and which, when once filled by the vendor of the specific grade or quality of goods, it will be impossible of refilling by any one unauthorized by the vendor, the idea being, in other words, to furnish a vendee with an attractive container, which he is entitled to use so long as he purchases supplies from a particular vendor, but which can not be opened or refilled by the vendee or a competitor of the original vendor without the latter's consent.

STEM HOLDING AND CUTTING SHEARS.—No. 778,140. Dec. 20, 1904. Charles Paff, San Francisco, Cal. This invention consists in a stem cutting and holding device of fulcrumed handles and cutting members, a plate fixed to the inner line of one of said members and having a corrugated surface, said plate having an elastic extension substantially following the edge of the other cutting member and returning upon itself above the surface of said member, and a part against which the elastic portion acts to normally open the cutter. In order to hold the stem of a plant or flower against the cutting blade and prevent its slipping, one of the gripping surfaces may be roughened or corrugated.

Latest Market Reports.

SAN FRANCISCO, December 30, 1904.

METALS.

SILVER.—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61½c, refined (1000 fine); San Francisco, 61½c; Mexican dollars, 52c San Francisco, 48½c New York.

It is reported that there is a shortage of silver bullion in the United States mints, and silver is slowly advancing. December 1 it was 59½c, since which time it has advanced to the present quotation of 61½c. The advance is not large, but it is substantial, and in most instances means an increase in clear profit to the producer.

COPPER.—New York: Standard, \$15.12½; Lake, 1 to 3 casks, \$15.12½@15.25; Electrolytic, 1 to 3 casks, \$15.25; Casting, 1 to 3 casks, \$14.85; San Francisco: \$16.00. Mill copper plates, \$17.00; bars, 18@24c. London: £67 15s spot per ton.

Copper remains firm and is at a somewhat higher price than last week, the advance in the various grades being from 12½c to 25c, justifying the conclusions previously published herein. Copper at \$15.25 is very gratifying to the producers of that metal, and will have the effect of stimulating new equipment with increased production wherever possible.

LEAD.—New York, \$4.70; Salt Lake City, \$3.50; St. Louis, \$4.12½; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½; pig, \$4.85. London: £12 15s long ton.

SPELTER.—New York, \$6.00; St. Louis, \$6.12½; London, £24 17s 6d long ton; San Francisco, ton lots, 6½c; 100-lb. lots, 7c.

The price for zinc has advanced materially the past month—from \$5.87½ in New York to over \$6—which, in consideration of the former price, is a substantial advance.

TIN.—New York, pig, \$29.35 @ 29.50; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 31c; bar tin, 32½@35c. London, £134 10s spot.

PLATINUM.—San Francisco, crude, \$18.50 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 82c per gram.

QUICKSILVER.—New York, \$40.00 @ 41.00, large lots; London, £7 15s San Francisco, local, \$39.00 per flask of 75 lbs.; Denver, \$45.00.

BABBIT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100 lb. lots, 16.25c.

ZINC.—Metallic, chemically pure, 3½ lb., 50c; dust, 3½ lb., 10c; sulphate, 3½ lb., .04c.

NICKEL.—New York, 40@47c per lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 31@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$16.35 @ 16.60; gray forge, \$15.85; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ¾c. per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, \$24.00@25.00; extra sizes higher; redwood, \$28.00@30.00; lath, 4 feet, \$4.50 @ 5.00; pickets, \$21.00; shingles, \$2.50 for No. 1 and \$2.25 for No. 2; shakes, \$13.50 for split and \$15.00 for sawed; rustic, \$28.00 @ 35.00.

NAILS.—This week the basic prices are: Wire, \$2.77; Cut, \$3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, \$3.35; Cut, \$3.55; 10d to 16d, Wire, \$3.45; Cut, \$3.35; 8d Wire, \$3.50; Cut, \$3.50; 6d and 7d, Wire, \$3.60; Cut, \$3.60; 4 and 5d, Wire, \$3.70; Cut, \$3.70; 3d, Wire, \$3.85; Cut, \$3.85; 2d, Wire, \$4.10; Cut, \$4.10. Special rates for carload lots.

LIME.—Santa Cruz, \$1.25 country, \$1.25 city per bbl.

CEMENT.—Imported, \$2.15@2.65 per bbl.; California carload lots, \$2.10 f. o. b. at works; small lots, \$2.40 per bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lb., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less

than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2.00 per keg.

CAPS.—3x, \$5.50@6 per 1000; 4x, \$6.50 @ 7; 5x, \$8@8.50; Lion, \$9@9.50, in lots not less than 1000.

FUSE.—Triple tape, \$4.00 per 1000 feet, double tape, \$3.50; single tape, \$3.10; Hemp, \$2.75; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c per set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.; carloads, 23@23½c; in tins, 30c; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb.; Cal. s. soda, bbls., \$1.10@1.20 per 100 lbs.; sks., 90c@1.00; chlorate of potash, 12@13c; nitrate of potash, 6½@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2½c; powdered sulphur, 2½@2½c; flour sulphur, French, 2½@—c; alum, \$2.00@2.25; California refined, 1½@2c; sulphide of iron, 8c per lb.; copper sulphate, 5½@5½c; chloride of lime, spot, \$2.50@2.75; sulphuric acid, in carboys, 66% B, 1½@2c per lb.; nitric acid, carboys, 8c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.00; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8.00; Cumberland, \$13.00; Cannel, \$8.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13.00 in sacks; Sunnyside, \$8.50, long ton.

OILS.—Linseed, boiled, bbl., 55c; cs., 60c; raw, bbl., 53c; cs., 54c; Lucol oil boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 19½c; Astral, 19½c; Star, 19½c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 63c; Bleached, do., 57c; Whale Oil, cs., 52@57c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

BORAX.—Concentrated, 6@7c per lb.; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

BONE ASH.—Extra No. 1, 5@6c per lb., No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, 7½c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c per lb.

MOLYBDENUM.—Best, \$2.75 per lb.

CHROMIUM.—90% and over, per lb., 80c.

PHOSPHORUS.—American, per lb., 70c.

SILVER.—Chloride, per oz., 90c@1.00; nitrate, 55c.

MAGNESIUM.—Pure, N. Y., 60c.

MANGANESE.—per lb., \$2.75.

SODIUM.—Metal, per lb., 50c.

BISMUTH.—Subnitrate, per lb., \$2.10.

URANIUM.—Oxide, per lb., \$3.50.

MERCURY.—Bichloride, per lb., 77c.

FIRE BRICK.—Domestic, carloads per 1000, f. o. b., factory square, \$25.00; soap and split, \$22.50; arch and wedge, \$27.50; skewback, \$30.00; circle, \$32.00.

FIRE CLAY.—Domestic, per ton 2000 lbs. in 125-lb. bags, double, and dry ground, f. o. b., factory, \$8.50.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING DECEMBER 20, 1904.

777,769.—BOTTLE CASE.—R. Baermann, Anaheim, Cal.

777,770.—DRAFTING INSTRUMENT.—P. Barnes, Seattle, Wash.

778,165.—BOILER FIREBOX.—W. N. Best, Los Angeles, Cal.

777,718.—DEMILJOHN.—W. E. Brown, Los Angeles, Cal.

778,124.—VEHICLE BRAKE.—W. M. Flewelling, Santa Rosa, Cal.

777,851.—ELECTRIC BATTERY.—W. H. Gregory, Vallejo, Cal.

778,190.—CAR STEP.—J. A. Halbrook, Bridgeport, Wash.

777,728.—FURNACE.—J. H. Haskins, San Diego, Cal.

777,789.—FURNACE.—E. W. Jackson, Sausalito, Cal.

777,903.—HOIST.—J. J. Jordan, Tonopah, Nev.

778,065.—CANISTER.—C. A. Norvell, Sacramento, Cal.

778,140.—STEM HOLDING SHEARS.—C. Paff, S. F.

778,066.—SEWING AWL.—A. M. Parker, Los Angeles, Cal.

777,803.—GOLD SEPARATOR.—T. Pollock, Santa Barbara, Cal.

777,815.—CARPET FASTENER.—C. R. Shaffer, Eureka, Cal.

777,815.—CAN.—G. H. Stewart, Los Angeles, Cal.

777,982.—TOY.—M. L. Wicks, Jr., Los Angeles, Ca

INDEX TO VOLUME LXXXIX  
OF THE  
Mining and Scientific Press  
FROM JULY TO DECEMBER, 1904.

	PAGE.
<b>A</b>	
Abandonment of a Claim	20
Acetylene Lamp in Mine	270
Acton, Cal., Specimens	312
Actualities	387
Actual Discovery Necessary	134
Accidents and Emergencies	334
In Drifting	321
In Mining	353
In Throwing Dynamite	371
Regulations for Decreasing	375
Actuating Mechanisms for Concentrating	43
Tables	38
Adams, W. J.	90, 91, 303, 322, 341
Admiral	152
Adhesive Preparation for Mica and Other Articles	59
Adjusting Device for Oil Well Pumping Apparatus	43
Advance in Copper Prices	336
In Iron, Steel, Copper Prices	386
Advertising and Export Business	74
Adversing Agricultural Fillings on Mineral Land	91
Aerial Tramway, Ride on	340
Tramway Supports, Spacing of	175
Tramway Towers	175
African Crushing of Metalliferous Ores	425, 435
Mines, 15, 31, 47, 80, 97, 130, 147, 183, 200, 249, 333, 350, 388, 401.	
Afterthought Mine, Cal.	303, 311, 313
Akation of Ore in Tanks by Compressed Air	3
Of Pulp for Cyaniding	188
Akator, a Novel	91
Agricultural Fillings on Mineral Land	91
Land, Extralateral Right Under	118
Or Mineral, Determining of	118
Aguanga, Cal., Specimens	141, 183
Alinsworth, Wm. & Sons	317, 334, 344
Air Blasts	430
Chamber on Pump	84
Compressor	43, 92
Compressor, Capacity of	204
Compressor, Geared	106
Compressor, Hydraulic	10
Compressor, Pressure Control for	244
Compressor, Valve Mechanism	75
Compressors in Pairs, Gold Placers of	426
Currents, Direction of in Ventilation	157
Hammer Rock Drill	157
Pipe, Slip Joints on, for Temperature	102
Changes	102
Substitution of, for Steam in Lake Superior	269
Stamp Mills	122
Weight of	189
Akron Chilian Mill	189
Alabama Mine, Cal.	430
Alkali Lakes	435
Alaska Dam and Flume	117
Alaska Ditch Litigation	433
Engineering in	38
Extension of Mining and Land Laws to	426
Fairbanks District, Gold Placers of	426
Forty Mile	240, 250, 260, 274, 392, 310, 325, 344.
Juneau Gold Belt	121
Mines, 11, 28, 44, 60, 76, 93, 110, 127, 144, 164, 180, 215, 202, 280, 297, 313, 330, 346, 364, 399, 414, 429.	
Mines, Labor in	101
Mining in	101
Not a Territory	118
Quartz Mining in	2, 22
Tin in	395
Tin Mines	287
Treadwell Mine, Cost Mining at	441
York District, Tin Deposits of	106, 125, 142
Alderson, M. W.	4, 24, 37, 137, 157, 178, 237
Algonkian & Archean	82
Allis-Chalmers Co., 17, 32, 48, 81, 169, 285, 302, 394, 351.	
Allopathic Minerals	68
Alloy, Expanding	236
Anti-friction	161
Specific Gravity of	182
Alloys, Magnetic of Manganese	53, 188
Of Antimony	68
Almaden, Cal., Report	319
Alternating Current Electric Motor Hoist	25
Alteration of Mine Reports	125
Altitude, Effect of, on Boiling Point of Water	125
Effect of, on Compressed Air	220, 305
Effect of, on Miners at Work	353
Of Death Valley, Cal.	321
Of Mines	118, 353
Alton, F.	157
Alumina-thermics	68
Aluminum for Spinning Mill Bobbins	58
For Electric Transmission	446
For Electric Transmission Lines	236
Ores	305
Production on	305
Alum Deposits in Nevada, an	237
*Almaden, Cal., Salt Pyramids	241
Amalgam, Base, Treatment of	220
Cleaning	3
Retorting	3, 71
Theft in Cal. Gold Mill at St. Louis	206
Amalgams	20
Amalgamating Machine	327, 312
Plates, Cleaning Up of	204
Plates, Discoloration of	387
Plates Shaking	135
Water for	152, 288
Amalgamation in the Battery	420
And Cyanidation Simultaneously	420
Of Auriferous Sulphurets	36
Of Gold Ores in Presence of Graphite or Molybdenite	135
Of Silver Ores	52
Pan, Quicksilver in	306, 322, 341
Shaking Tables	405
Tests of Ore	120
*Amazonator	152
Amazonite	178
Amalie, Kern Co., Cal., Specimens	305
Amended Locations in Nevada	387
Amending Mining Locations	343
American Carnotite, Radium	122
Institute of Mining Engineers	134, 143, 156, 157
Locomotive	67
Mining Schools	320
Or British Capital in Mexico	172
Ammonia as a Fire Extinguisher	387
Amphibole, Varieties of	118
Amplification	404
Analysis of Report of Stratton's Independence, at Cripple Creek	244
*Analytical Balance, Short Beam	270
Andesite and Andesine	17
An Engineering Student's Notes	382, 358
Aneroid Barometers	103
*Angels, Cal., Gold Mines of	
Camp, Cal., Geology of	

\*This mark indicates that the article indexed is illustrated.

	PAGE.
Annual Report of Con. Mercur G. M. Co	151
Report of Quicksilver M. Co., Cal	319
Anomaly in Ore Enrichment	171
Another Tailings Case	161
Antidote for Cyanide Poisoning	3, 118
Antifurcation Alloy	68
Antimony, Effect of, on Cyaniding	3, 118
Hardening Qualities of	68
Supply and Uses of	270
*Auriferous Blocks for Mill	372
Apex beneath Lava	68
And Location of Vein	20, 321
Of Vein Covered by Lava, Gravel, Etc	305
Of Vein on Agricultural or Placer Land	305
Suit in Cripple Creek, Colo	35
Apex of Ore Shoots	430
*App Mine, Cal	234, 351
*Apparatus, Classifying	244
Excavating	13, 143, 211
For Boring Wells	195
For Distilling Crude Oils	43
For Extracting Gold from Auriferous Sand, Etc	361
For Extracting Sulphur from Ores	125
For Feeding Ore, Coal, Etc	92
For Handling Mine Cars	109
For Laying or Settling the Dust or Pulverized Rock Created in Boring or Blasting Holes in Mining	75
For Opening or Closing Mine Doors	178
For Recovering Values from Sand or Dirt	48
For Removing Dirt from Excavations	10
For Separating Materials of Different Gravities	244
For Separating Ore	27
For Use in Certain Processes of Extracting Sulphides from Ores	109, 311, 357
Gold Saving	10
Mining and Excavating	211
Well Sinking	236
Appearance of Pure Gold Given to Alloyed Articles	82
Archaeon and Algonkian	217
Architects' and Builders' Pocket Book	52
Argentine Copper, Treatment of	56, 61
Argentina's Mines	152
*Argentine, Colo	186, 193
Argentine Republic, Mining in	24
Arid Regions, Power in	100, 175
Arizona, Bisbee, Geology of	100
*Bisbee, Ore Deposits of, 39, 58, 72, 87, 105, 126, 140, 175.	
C. C. Clifton, Ariz.	100
Clifton District Mines	438
Clifton-Morenci Deposits	239
Coal Field, A.	1
Graham Co., Tailings Case	6
*Harshaw Mines	1, 28, 44, 60, 76, 93, 110, 127, 144, 164, 180, 215, 202, 280, 297, 313, 330, 346, 364, 380, 399, 414, 429, 444.
Val Verde Smelter, Burning of	219
Arkansas Lead and Zinc Deposits	53
Mines	76, 164, 196, 262, 280, 313, 346, 364
Arsenic and Mercury, to Separate	370
Compounds	152
Artificial Chloride of, from Magnesite	204
Stone, Manufacture of, from Magnesite	387
Asbestos and Its Uses	270
Occurrence of	179, 295
Asphalt for Paving	53
*Assay Balance	4
Balance and Static Electricity	160
Balance, Finding the North Pole by	135
Distribution, the	188
*Maps	3
Of Low Grade Copper Ores by Cyanide Method	396
Assayer, Knowledge of Mineralogy Necessary	188
Assaying, Cyanide Method, for Copper	243
For Rare Metals	3
*Furnace, Crude Oil for	84
Ores and Fluxes in	152
Asbestos	52, 253, 288, 321, 353
Assessment Work	20, 253
On a Claim, to Hold Several	135
Work by Co-owners	122
Work for Patenting Relocated Claims	249
Work in California	819
Work in Year of Location	372, 354
Work on Group of Claims	20
Work on Placer Claim Owned by a Company	872
Work on Placer Groups	329
Work, Recording Notice of	88
Work, Value of	377
*Atlantic Steam Shovel	191, 206, 239
Atlas Car & Mfg. Co.	420
*Atlin, B. C., Dredger	36
Atmospheric Pressure and Barometer Readings	193
Atoms and Valence	387
Attachment, Law Protecting From	372
*Auger for Earth and Rock	278
*Augusta Natural Ridge, Utah	277
Auriferous Bench Diggings of Bonanza, Yukon	301
Mispickel Treated by Bromo-Cyanide	296
Ores in New Zealand, Milling of	410
Pyrite, Cyanidation of	277
Sulphurets, Amalgamation of	277
Austin, Or., Specimens	277
Australia, Duty on Mail Matter to	277
Tin at Lohat	277
*Bridge" in Mine Timbering	277
Australian Methods of Ore Treatment	277
Mines, 15, 31, 47, 80, 97, 130, 183, 200, 231, 249, 265, 282, 350, 367, 388, 398, 416, 446.	
Mining and Metallurgy	301
*Automatic Cage Loader	329
*Counterbalancing System for Inclined Railways	296
Dumping of Skips in Headframe	410
*Excavator for Placer Mining	277
*Loader, An	277
*Loading Machine	277

INDEX TO VOLUME LXXXIX.

(Continued From Preceding Page.)

	PAGE.
*Level, Distance Between, in Mine.	109
Speed in Connecting.	120
Leyner, J. Geo., Engineering Works Co.	114
*Rock Drill Exhibit at St. Louis.	156
Liability of a Mine for Labor Done for Lessee.	84
License for Stationary Engineer.	152
*Lidgerwood Hoisting Engine and Boom Swinging Gear.	308
Mig. Co.	208, 249, 317
Life of Machinery.	187
*In the Yukon Basin.	418
Of a Hoisting Rope.	405
Of Mine Timbers.	270
Light in Empty Oil Tanks, Danger of Open.	270
Minerals Floating on Water.	84
*Lightner Mine, California.	352
Lime in Cyanide Process.	270, 285
Making in Baku Oil Fields.	118
Lines of Junior Locator Over Senior.	288
Limit to High Voltage in Electric Transmission.	8
Lindrooth, A. E., Shubart & Co.	351
Line Shaft of Mill.	321
Lines, Slotted, for Stamp Batteries.	354
Litigation Over Extralateral Rights.	112
Shaft, With Cement.	320
Link Belt Machinery Co.	334, 351
Liscum, Ariz., Specimens.	243
List of Patents, 17, 32, 49, 65, 81, 99, 115, 132, 150, 169, 185, 201, 217, 233, 251, 267, 285, 302, 317, 335, 352, 369.	204
Lithium Minerals in the United States.	156
Production in 1903.	156
Litigation Over Extralateral Rights.	102
*Little Giant Drill Sharpener.	314
Livermore, Cal., Specimens.	301
*Loader, Automatic Cage.	329
Load, Increase of, in Hoisting.	337
On Wire Rope.	152
*Loading Machine, Automatic.	277
Locating Claims.	172
Lodes in Placer Claim.	204
Mineral by "Dividing Rods."	270
"Location" and "Claim."	3
And Development of a Claim.	57
By Agent.	151
Lines of Junior Crossing Senior.	288
Of Claims by an Employee.	135, 435
Of Lodes.	68
Of Desert Land for Mineral.	172
Of Lode Outside of Placers Whose Apex Is Inside of Placer.	305
Of Water Rights.	188, 220
Of Adjoining Claims.	337
Of Placers in Groups.	337
Of "Tunnel Sites."	335
Locations, Amending Mining.	184
Discovery Necessary for.	134
On Blind Lodes Not Outcropping.	36
On Public Domain.	305
On Veins with Two Apices.	405
Mining.	151
Locators and Prospectors.	232
Locomotive, Gasoline Mine.	478
Lode Locations.	68
Locations, Number of, by One Man.	204
Mining in Alaska.	2
Lodes in Placers.	305, 435
In Placers, Location of.	204
In Placers, Prospecting for.	305
Relation of, to Derived Placers.	337
Longest Tunnel.	337
*Longitudinally Adjustable Crushing Rolls.	270
Looking Up Ore in Mexico.	291
Lord, G. W., Co.	74
*Los Angeles, Cal., Salt Making.	205
Specimens.	9, 141
Lower Depths of the Earth, Exploration of.	191
*Tumbler and Ladder End for Elevator.	211
Dredgers.	211
Low Grade Veins and Their Development.	336
Lowering Timber in Vertical Shaft.	405
Lubricants.	172
Lubricant, Graphite as.	258, 435
Lundstrom, F.	32
Lunkenheimer Co.	58
Exhibit at St. Louis.	58

M

MacDonald, A. R.	438
*Machine, Amalgamating.	237, 312
*Chamfering for Making Mine Ties.	59
*Coal Hoisting and Cutting.	320
Drill, Time of Setting Up.	420
Drills, Cost of Operating.	387
Drills, Frost on Exhaust of.	68
Dry Blowing.	270
*Excavating.	163, 179
*Incline Gravity.	163
*Mooring.	75, 312
*Ore Washing.	3
*Placer Mining.	165
Drills, One Chuck Tender for Two.	337
*Rock Drilling.	275
*Shop, Traveling.	278
Machinery Foundations.	172
Life of.	187
Supply and Implement Co.	270
Importations to Canada.	372
On Mining Claims, Ownership of.	401
Madagascar Mines.	372
Madera Co., Cal., Flume.	74
*Madras, India, Transportation at.	188
Magnesian Fireproof Materials.	323
Magnetite Production.	323
Sources of.	420
Magnetite.	420
Magnetic Alloys of Manganese.	53, 188
Minerals.	420
Needle in Presence of Electric Currents.	305
Needle, Variation of in California.	36
*Ore Separator.	59, 143, 244, 312
Separation, Slight Roast Necessary for, at Mt. Lyell.	243
Maintenance of Rock Drills.	422
*Maitland Properties, Cyaniding at.	397, 407, 424
Malay Peninsula Mines.	300
*"Malgamatin."	306
*Main Electrolytic Cyanide Plant.	178
Management of Mines, Specimenate and Practical.	314
Of Mines, Inexperience in.	312
Mancos, Colo., Specimens.	243
Manganese, Magnetic Alloys of.	53, 188
In Steel.	372
Metallic.	172
Occurrence of.	372, 437
Ores.	288
Production in 1903.	241
Manual Labor and Mechanical Devices in Mines.	320
Manufacture of Metal Products at the Mines.	78
Of Artificial Graphite.	405
Manvel, Cal., Specimens.	141
*Maps, Assay.	160
Marion Co., Mex., Specimens.	243
Mariposa Co., Cal., Specimens.	243
Market Price of a Mining Stock.	50
Marking Supplies for Mining Contract Work.	84
Marks on Side of Reel for Hoisting Engineer.	354
Marysville, Mont., Specimens.	243
Massive Rocks, Ore Deposits in.	52
Matheula, Mex., Specimens.	243
Matrix, Diamonds in.	35
Matte, Copper, Bessemerizing of.	305, 354
Gold and Silver-Bearing, Treatment of.	253

*Mazepa Mine, Cal.	268
*McCully Gyratory Crusher.	259
McLaughlin Manufacturing Co.	325
*McLaughlin Fractor.	325
*McNamara Mine, Nev.	238
McNulty, J. G.	294
*Means for Treating Pieces of Mica to Prepare Them for Adhesive Union With Each Other or With Other Articles.	59
Measuring Depth of Workings on Veins.	305
Tonnage of Solution in Tank.	204
*Measurement of Ore in Dumps.	22
Of Streams, New Method of.	7
Mechanical Devices vs. Manual Labor in Mines.	320
Rock Drills.	118
*Melones Flume, Cal.	268
Mercury and Cyanide.	52, 84
Compounds of.	30
Ores.	38
Separation of From Arsenic.	34
Weight of Cubic Foot.	188
*Metal, Extraction of From Ores.	163, 227
Bearing Rocks.	236
Tamping Rods.	405
Metals, Native.	278
Process for Obtaining.	275
*Process of Smelting and Reducing.	275
Volatilization of.	137
Rare.	321
Metallic Manganese.	172
Standards for Volumetric Work.	375
Metallurgy in Cyanide Solutions.	305
*Metallurgical Furnace, Tilting.	211
Invention, Evolution of.	134
Process.	345
*Metalurgy at Deadwood, S. D.	355, 369
Briquetting in.	236
*By-Products in.	343
Electricity in.	19
Modern.	160
Of Zinc and Iron.	160
Problems in.	117
*Metamorphosis.	375
*Method of Blasting.	327
*Of Extracting Moisture From Air for Blast Furnaces or Converters.	244
*Of Recovering Values From Ores by Dissolving in Molten Bath.	126
*Of Sampling Copper.	125
Of Separating Arsenic and Mercury.	84
*Of Separating Dust From Dust-Laden Air.	377
*Methods of Saving Flour Gold.	377
Mexican Dynamite Duty.	187
Mines Worked by American and British Capital.	320
Mines.	16, 31, 48, 64, 80, 97, 114, 131, 148, 167, 184, 200, 216, 232, 249, 265, 284, 300, 301, 316, 334, 350, 368, 383, 401, 416, 430, 447.
Mining Law.	135
Mining Terms.	84, 118, 152, 172
Ore, Looking Up.	291
Mexico, Iron in.	152
Diamonds in.	435
Labor in.	19
*Mines at Cananea.	170
*Mines of Moctezuma C. Co.	186, 193
Mining on Volcano Popocatepetl.	238
Railroads in.	238
Reworking Tailings Piles in.	386
Tin in.	84
Mica, Commercial.	188
*Means of Making It Adhesive.	59
Prices.	3
Schists, Mines in.	372
Micas.	135
Michigan Mines.	13, 46, 199, 214, 230, 247, 264, 282, 299, 348.
Midas, Nev., Specimen.	124
Mietz, A.	106, 327
Milliken, J. T.	178
Militia in Labor Troubles.	35
Mill Arrangements, Improper.	118
And Compressor Operated by Water on Same Pipe Line.	118
Bins, Arrangement of.	172
Concrete Floor in.	288
Construction and Choice of.	67
Covering Cam Shaft Boxes in.	118
*Crushing.	163, 211
Equipment, Charges for.	405
Equipment, Modern.	107
For Sort and Shining Ores.	102
Grade Excavations.	220
*Grinding.	345
Main Line Shaft of.	321
Operations and Cyanide Practice.	171
Plates.	372
*Pulverizing.	163, 239
Pumpkin Water for.	140
*Quartz.	195
Quartz, Timber in.	337
Rock Breakers in.	3
Shafting.	118
*Stamp.	179, 329
*Tubular Ball.	275
*Millstone, Grading of by Sluicing.	18
Choking of.	253
Holding.	435
Locating.	174, 253
Milling Auriferous Ores in New Zealand.	191, 206, 239
Gold.	38, 56, 70, 89
Gold, Observations on.	294
*In Nova Scotia.	254, 379
Ores, Preliminary Examination of.	188, 253
With Mine Water.	52
Gravel in Calaveras Co., Cal.	338
*On the Rand.	291
Mine & Smelter Supply Co.	169, 284, 294
*Car.	227, 350
*Cars, Apparatus for Handling.	92
Development, Systematic.	116
Equipment, Modern.	107
Equipment of for Ore Reduction.	353
Fires.	37
Foul Air in.	420
*Gate.	179
Levels, Distance B'tween.	236
Management, Corporate and Practical.	304
Management, Inexperience in.	311
Pump, Care of.	19, 173
Reports, Alteration of.	2
Report, Some Essentials of.	324
Reports, Character in.	55
Sampling, Notes on.	345
*Shafts, Safety Device for.	84
Supplies, Marking for Contract and Com.pany Work.	256
*Surveys, Simple Instrument for.	52
Timbering, "Bridge" in.	321
Timbers, Eucalyptus for.	321
Timbers, Life of.	270
*Track System.	244

## INDEX TO VOLUME LXXXIX.

(Continued From Preceding Page.)

	PAGE.		PAGE.		PAGE.
Similarity in Physical Appearance of Minerals	74	Stoddard Metal Co.	317	*Deposits of the York Region, Alaska	106, 125, 142
*Simmons Boiler	177	Stope Timbering	188	In Alaska	365
Simonds, E. H., & L. M. King	150	Storms, W. H.	189, 200, 210, 234, 257, 251, 257, 268, 271, 306, 307, 322, 323, 343	In Mexico	365
*Simple Drawing Board Attachment	178	Stratton's Independence Report	288	In the United States	365
*Instrument for Mine Surveys	256	Stream Measurement, New Method of	7	In South Dakota	118
Simpson Tunnel, Completed	118, 253	Strike of Vein	52	In the Transvaal	205
*Tunnel, Hot Springs in	68	Telluride Declared Off	371	Mines of Rancho San Jacinto, Cal.	405
Sinking of Working Shafts With Reference to		Strikes and the Referendum Vote	327	Mining in Alaska	287
Formations	270	Stripping Waste From Placer Before Sluicing	220	In the United States	19
Shafts, Rate of	280	Stromberg-Carlson Telephone Mfg. Co.	132, 169, 266, 285	Scrap for Precipitation of Copper	172
Site for Mill	174	Structural Iron, Freight on, From New York to Spokane, Wash.	220	Screens, Burning of	84
*Sizing Apparatus	244	Materials Containing Gold	405	Tinned Screens	172
"Sheet"	354	Lowering in a Vertical Shaft	405	Tintin Tin Co., South Dakota	19
*Skip Car or Hoist for Blast Furnaces	179	Students in Mine	419	*Tioga, Cal., Views Near	8, 9
Increasing Capacity of	405	Study of Rocks by the Miner	335	Tombstone, Ariz., Specimens	243
Skips and Cages for Hoisting	230	Sturtevant, B. F., Co.	25	Ton	304
Automatic Dumping of, in Head Frame	253	Mill Co.	224	Tonnage of Solution in Tank, Measuring	304
For Boiling Water	172	*Sucker Rods, Hoisting Mechanism for	126	*Tonopah and Goldfield, Nev., Observations on Ore Formation of	387
For Hoisting and Bailing	270	Suction Dredger	320	*Tonopah-Belcher Mine, Nevada	25
Slag Dumps at Butte, Mont.	320	Suez Canal	320	*Tonopah Extension Mine, Nevada	238
From Crucible Smelter	288	Sullivan Machinery Co.	128, 334, 350	*Tonopah, Nev., Mines	238
*Slimer, Ore	10	Sulphide Ores of Copper, Fusion of	152	*New, Columnar Andesite at	359
Slimes, Cyanide for	118	Sulphides, Action of Cyanide on	204	*Tool for Making Deep Wells	179
From Copper Refinery, Treatment of	345	Auriferous, Cyaniding of	52, 68	*Hindle, Cripple Creek	227
*Process of Filtering	345	*From Ores, Apparatus for Extracting	27, 163	*"Semi-Diamond"	327
Saving by Oil	405	Of Gold	52	Topographical Situation of a Mine	435
*Separator	59	*Testing of, for Zinc Blende	3, 54	Towers for Aerial Tramways	175
Setting	387	Sulphate of Alumina to Fireproof Timbers	337	For Carrying Electric Wires	52
*Vat and Accessories	373	Of Copper Mine	152	Track Curves and Turnouts Underground	2
Sliming, Prevention of	102	Sulphurets, Amalgamation of Gold in	36	*System for Mines	244
Slip Joint on Hoisting Cable	102	Sulphuretted Hydrogen to Precipitate Gold From Chloride Solutions	354	*Traction Engine	325
Slipping of Hoist Brakes	204	Sulphur Deposits	102	Trade Unions, Results of	325
Slotted Liners for Stamp Batteries	354	In the United States	288	*Tramming, Rate of	387
Sluices for Placer Mine, Placing of	253	Industry, The	57	Tramway, Aerial, Towers for	175
*Sluicing to Grade a Mill Site	18	Pyrite Being Substituted for	391	Aerial, Ride on	340
Small Mines, Custom Works for	219	Refining	236	Gravity, at Hedley, B. C.	122
*Smelter, a Hot Blast	353	*Sulphuric Acid Plant	163	Transformer Oil	270
Or Mill?	353	Acid Plant, Lead-Lined Chambers in	236	Transit	3
Smoke, Damages by	352	*Acid, Process of Making	75	Transmission, Electric, of High Voltages	8, 118, 122
*Smelting Furnace	312	Acid, Pyrite for	371	Of Power	37, 172
Furnace, Fuel for Charging	372	Sulphurous Fumes, Damage From	74	Of Power Electrically	37, 172
In Reverberatory Furnace, Cost of	36	Summerduck, Va., Specimen	74	*Transportation at Madras, India	74
Iron and Zinc in	220	*Summit Co., Colo., Mines	56, 61, 124	Costs in Hump District, Idaho	83
Of Fine Ores, Briquetting for	152	Supplies, Mining, Marking of, for Contract and Company Work	84	Transvaal, Chinese in	2, 208, 285, 434
*Process	68, 185	Surcharge	354	Faults and Dikes in	150
Pyritic, Coke in	372	Surface Buildings of Mines	51	Tin in	286
Silica in	372	Equipment of Mines Under One Roof	9	*Trap Door for Mines	27
Sulphide Ores of Copper	152	Indications in Prospecting	188	*Traveling Machine Shop	278
